Primitives

Literals

Nil	nil
Boolean	true, false
Integer	150I, 1_000_000I, 0x1FFI
Long	1500, 1_000_000, 0x00A055FF
Double	3.569, 2.0E+10
BigDecimal	6.897M, 2.345E+10M
BigInteger	1000N, 1_000_000N
Char	#\A, #\π, #\u03C0  #\space, #\newline, #\return, #\tab, #\formfeed, #\backspace, #\lparen, #\rparen, #\quote
String	"abcd", "ab\cd", "PI: \u03C0"  ""{ "age": 42 }""
String interpolation	"~{x}", ""~{x}""  "~(inc x)", ""~(inc x)""

Collections

Collections

Generic	count	compare	empty-to-nil	empty

Other	str/levenshtein

Chars

Use	char char? char-escaped char-literals
Conversion	str str/lower-case str/upper-case
Test char	<div>str/char? str/digit? str/letter?</div> <div>str/whitespace? str/linefeed?</div> <div>str/lower-case? str/upper-case?</div>

Other

Nil	nil? some?
Keywords	:a :blue keyword? keyword
Symbols	'a 'blue symbol? qualified-symbol? symbol
Just	just just?
Boolean	boolean not boolean? true? false?

## Byte Buffer

Create	bytebuf bytebuf-allocate bytebuf-from-string
Test	empty? not-empty? bytebuf?
Use	count bytebuf-capacity bytebuf-limit bytebuf-to-string bytebuf-to-list bytebuf-sub bytebuf-pos bytebuf-pos!
Read	bytebuf-get-byte bytebuf-get-int bytebuf-get-long bytebuf-get-float bytebuf-get-double
Write	bytebuf-put-byte! bytebuf-put-int! bytebuf-put-long! bytebuf-put-float! bytebuf-put-double! bytebuf-put-buf!

	merge merge-with merge-deep map-invert map-keys map-vals select-keys
Entries	map-entry key val entries map-entry?
Nested	get-in assoc-in update-in dissoc-in
Test	map? sequential? hash-map? ordered-map? sorted-map? mutable-map? contains? not-contains?

## Stack

Create	stack
Access	peek pop! push! into! conj! count
Test	empty? stack?

## Queue

Create	queue
Access	peek into! conj! count
Sync	put! take!
Async	offer! poll!
Process	docoll transduce reduce
Test	empty? queue?

## DelayQueue

Create	delay-queue
Access	peek count
Sync	put! take!
Async	poll!
Test	empty? delay-queue?

## DAG (directed acyclic graph)

Create	dag/dag dag/add-edges dag/add-nodes
Access	dag/nodes dag/edges dag/roots count
Children	dag/children dag/direct-children
Parents	dag/parents dag/direct-parents
Sort	dag/topological-sort dag/compare-fn
Test	dag/dag? dag/node? dag/edge? dag/parent-of? dag/child-of? empty?

Base64	<code>str/encode-base64</code>	<code>str/decode-base64</code>
Hex	<code>str/hex-to-bytebuf</code> <code>str/format-bytebuf</code>	<code>str/bytebuf-to-hex</code>

## Regex

General	<code>regex/pattern</code>	<code>regex/matcher</code>
	<code>regex/reset</code>	<code>regex/matches?</code>
	<code>regex/matches-not?</code>	<code>regex/matches</code>
	<code>regex/group</code>	<code>regex/groups</code>
	<code>regex/count</code>	<code>regex/find?</code> <code>regex/find</code>
	<code>regex/find-all</code>	<code>regex/find+</code>
	<code>regex/find-all+</code>	

## Math

Arithmetic	<code>inc</code> <code>dec</code> <code>min</code> <code>max</code> <code>mod</code> <code>mod-floor</code> <code>abs</code> <code>sgn</code> <code>negate</code> <code>floor</code> <code>ceil</code> <code>sqrt</code> <code>square</code> <code>pow</code> <code>exp</code> <code>log</code> <code>log10</code>
Util	<code>digits</code>
Random	<code>rand-long</code> <code>rand-double</code> <code>rand-gaussian</code>
Trigonometry	<code>math/to-radians</code> <code>math/to-degrees</code> <code>math/sin</code> <code>math/cos</code> <code>math/tan</code> <code>math/asin</code> <code>math/acos</code> <code>math/atan</code>
Statistics	<code>math/mean</code> <code>math/median</code> <code>math/quartiles</code> <code>math/quantile</code> <code>math/standard-deviation</code>
Algorithms	<code>math/softmax</code>

### Constants

E	<code>math/E</code>
PI	<code>math/PI</code>

## Transducers

Use	<code>transduce</code>
Functions	<code>map</code> <code>map-indexed</code> <code>filter</code> <code>drop</code> <code>drop-while</code> <code>drop-last</code> <code>take</code> <code>take-while</code> <code>take-last</code> <code>keep</code> <code>remove</code> <code>dedupe</code> <code>distinct</code> <code>sorted</code> <code>reverse</code> <code>flatten</code> <code>halt-when</code>
Reductions	<code>rf-first</code> <code>rf-last</code> <code>rf-every?</code> <code>rf-any?</code>
Early	<code>reduced</code> <code>reduced?</code> <code>deref</code> <code>deref?</code>

## Functions

## Lazy Sequences

Create	<code>lazy-seq</code>
Realize	<code>doall</code>
Test	<code>lazy-seq?</code>

## Arrays

Create	<code>make-array</code> <code>object-array</code> <code>string-array</code> <code>int-array</code> <code>long-array</code> <code>float-array</code> <code>double-array</code>
Use	<code>aget</code> <code>aset</code> <code>alength</code> <code>asub</code> <code>acopy</code> <code>amap</code>

## Concurrency

Atoms	<code>atom</code> <code>atom?</code> <code>deref</code> <code>deref?</code> <code>reset!</code> <code>swap!</code> <code>swap-vals!</code> <code>compare-and-set!</code> <code>add-watch</code> <code>remove-watch</code>
Futures	<code>future</code> <code>future-task</code> <code>future?</code> <code>futures-fork</code> <code>futures-wait</code> <code>futures-thread-pool-info</code> <code>done?</code> <code>cancel</code> <code>cancelled?</code> <code>deref</code> <code>deref?</code> <code>realized?</code>
Promises	<code>promise</code> <code>promise?</code> <code>deliver</code> <code>deliver-ex</code> <code>realized?</code> <code>then-accept</code> <code>then-accept-both</code> <code>then-apply</code> <code>then-combine</code> <code>then-compose</code> <code>when-complete</code> <code>accept-either</code> <code>apply-to-either</code> <code>all-of</code> <code>any-of</code> <code>or-timeout</code> <code>complete-on-timeout</code> <code>timeout-after</code> <code>done?</code> <code>cancel</code> <code>cancelled?</code>
Delay	<code>delay</code> <code>delay?</code> <code>deref</code> <code>deref?</code> <code>force</code> <code>realized?</code>
Agents	<code>agent</code> <code>send</code> <code>send-off</code> <code>restart-agent</code> <code>set-error-handler!</code> <code>agent-error</code> <code>await</code> <code>await-for</code> <code>shutdown-agents</code> <code>shutdown-agents?</code> <code>await-termination-agents</code> <code>await-termination-agents?</code> <code>agent-send-thread-pool-info</code> <code>agent-send-off-thread-pool-info</code>
Scheduler	<code>schedule-delay</code> <code>schedule-at-fixed-rate</code>
Locking	<code>locking</code>
Volatiles	<code>volatile</code> <code>volatile?</code> <code>deref</code> <code>deref?</code> <code>reset!</code> <code>swap!</code>
ThreadLocal	<code>thread-local</code> <code>thread-local?</code> <code>thread-local-clear</code>

Create	<code>fn</code> <code>defn</code> <code>defn-</code> <code>identity</code> <code>comp</code> <code>partial</code> <code>memoize</code> <code>juxt</code> <code>fn!</code> <code>trampoline</code> <code>complement</code> <code>constantly</code> <code>every-pred</code> <code>any-pred</code>
Call	<code>apply</code> <code>-&gt;</code> <code>-&gt;&gt;</code>
Test	<code>fn?</code>
Misc	<code>nil?</code> <code>some?</code> <code>name</code> <code>qualified-name</code> <code>namespace</code> <code>fn-name</code> <code>callstack</code> <code>coalesce</code>
Load Source	<code>load-module</code> <code>load-file</code> <code>load-classpath-file</code> <code>read-string</code> <code>eval</code>

## Embedding in Java

### Eval

```
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        final Venice venice = new Venice();

        final Long result = (Long)venice.eval("(+ 1 2)");
    }
}
```

### Passing parameters

```
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        final Long result = (Long)venice.eval(
            "(+ x y 3)",
            Parameters.of("x", 6, "y", 3L));
    }
}
```

### Dealing with Java objects

```
import java.awt.Point;
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        // returns a string: "Point=(x: 100.0, y: 200.0)"
        String ret = (String)venice.eval(
            "(let [x (:x point)                                \n" +
            "        y (:y point)]                                \n" +
            "  (str \"Point=(x: \" x \"\", y: \" y \"\")\"))",
            Parameters.of("point", new Point(100, 200)));

        // returns a java.awt.Point: [x=110,y=220]
        Point point = (Point)venice.eval(
            "(. :java.awt.Point :new (+ x 10) (+ y 20))",
            Parameters.of("x", 100, "y", 200));
    }
}
```

### Precompiling

```
import com.github.jlangch.venice.IPreCompiled;
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
```

```

public static void main(String[] args) {
    Venice venice = new Venice();

    IPreCompiled precompiled = venice.precompile("example", "(+ 1 x)");

    for(int ii=0; ii<100; ii++) {
        venice.eval(precompiled, Parameters.of("x", ii));
    }
}
}

```

## Java Interop

```

import java.time.ZonedDateTime;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        Long val = (Long)venice.eval("( . :java.lang.Math :min 20 30)");

        ZonedDateTime ts = (ZonedDateTime)venice.eval(
            "(. (. :java.time.ZonedDateTime :now) :plusDays 5)");
    }
}

```

## Sandbox

```

import com.github.jlangch.venice.SecurityException;
import com.github.jlangch.venice.Venice;
import com.github.jlangch.venice.javainterop.SandboxInterceptor;
import com.github.jlangch.venice.javainterop.SandboxRules;

public class SandboxExample {
    public static void main(final String[] args) {
        final SandboxInterceptor sandbox =
            new SandboxRules()
                // Venice functions: blacklist all unsafe functions
                .rejectAllUnsafeFunctions()

                // Venice functions: whitelist rules for print functions to offset
                // blacklist rules by individual functions
                .whitelistVeniceFunctions("*print*")

                .sandbox();

        final Venice venice = new Venice(sandbox);

        // => OK, 'println' is part of the unsafe functions, but enabled by the 2nd rule
        venice.eval("(println 100)");

        // => FAIL, 'read-line' is part of the unsafe functions
        try {
            venice.eval("(read-line)");
        }
        catch(SecurityException ex) {
            System.out.println("REJECTED: (read-line)");
        }
    }
}

```

## VeniceDoc

**VeniceDoc** is a documentation generator for the *Venice* language for generating API documentation in HTML format from *Venice* source code. It is used internally for generating the PDF and HTML cheatsheets. The function `doc` makes use of it to display the documentation for functions.

## Example

Define a function `add` with documentation:

```
(defn
  ^{ :arglists '(
      "(add)", "(add x)", "(add x y)", "(add x y & more)"
    :doc
      """
      Returns the sum of the numbers.
      `(add)` returns 0.
      """
    :examples '(
      "(add)",
      "(add 1)",
      "(add 1 2)",
      "(add 1 2 3 4)"
    :see-also '(
      "+", "-", "*", "/"
    ) }

  add

  ([] 0)
  ([x] x)
  ([x y] (+ x y))
  ([x y & xs] (+ x y xs)))
```

Show its documentation from the REPL:

```
venice> (doc add)
```

REPL Output:

```
(add), (add x), (add x y), (add x y & more)

Returns the sum of the numbers. (add) returns 0.

EXAMPLES:
  (add)

  (add 1)

  (add 1 2)

  (add 1 2 3 4)
```

#### SEE ALSO:

[+](#), [-](#), [\\*](#), [/](#)

## VeniceDoc Format

The documentation is defined as a Venice metadata `map` :

```
{ :arglists '("add)", "(add x)")
  :doc "Returns the sum of the numbers."
  :examples '("add 1)", "(add 1 2)")
  :see-also '("+", "-", "*", "/") }
```

key	description
:arglist	the optional arglist, a list of variadic arg specs
:doc	the documentation in <a href="#">Venice markdown</a> format
:examples	optional examples, a list of Venice scripts. Use triple quotes for multi-line scripts
:see-also	an optional list of cross referenced functions

# Markdown

## Venice Markdown

### Headings

To create a heading, add one to four `#` symbols before the heading text. The number of `#` will determine the size of the heading.

```
# The largest heading
## The second largest heading
### The third largest heading
#### The fourth largest heading
```

### Paragraphs and Line Breaks

```
A paragraph is simply one or more consecutive lines of text, separated by
one or more blank lines (a line containing nothing but spaces or tabs).
```

```
Within a paragraph line breaks can be added by placing a `pilcrow`
```

```
Line 1¶Line 2¶
Line 3
```

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines (a line containing nothing but spaces or tabs).

Within a paragraph line breaks can be added by placing a `¶`

Line 1  
Line 2  
Line 3

### Styling

Venice markdown supports *italic*, **bold**, and ***bold-italic*** styling

```
This is *italic*, **bold**, and ***bold-italic*** styled text.
```

This is *italic*, **bold**, and ***bold-italic*** styled text.

### Lists

Unordered List

```
* item 1
* item 2
* item 3
```

- item 1
- item 2

- item 3

#### Ordered List

```
1. item 1
2. item 2
3. item 3
```

1. item 1
2. item 2
3. item 3

#### Multiline list items with explicit line breaks:

```
* item 1
* item 2
  next line
  next line
* item 3
```

- item 1
- item 2  
next line  
next line
- item 3

#### Multiline list items with auto line breaks:

```
* item 1
* Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod
  tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim
  veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex
  ea commodo consequat. Duis aute irure dolor in reprehenderit in
  voluptate velit esse cillum dolore eu fugiat nulla pariatur.
* item 3
```

- item 1
- Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur.
- item 3

## Links

Links are created by wrapping link text in brackets `[ ]`, and then wrapping the URL in parentheses `( )`.

```
[Venice](https://github.com/jlangch/venice)
```

[Venice](https://github.com/jlangch/venice)

## Tables

A simple table

JAN	1
FEB	20
MAR	300

JAN	1
FEB	20
MAR	300

Column alignment

:---	:---:	---:
1	1	1
200	200	200
30000	30000	30000

1	1	1
200	200	200
30000	30000	30000

Width header

Col 1	Col 2	Col 3
:---	:---:	---:
1	1	1
200	200	200
30000	30000	30000

Col 1	Col 2	Col 3
1	1	1
200	200	200
30000	30000	30000

PDF rendered tables have always a width of 100%. In some use cases an additional left aligned column can trick the rendered table:

Col 1	Col 2	Col 3	
:---	:---:	---:	:---
1	1	1	
200	200	200	
30000	30000	30000	

Col 1	Col 2	Col 3
1	1	1
200	200	200
30000	30000	30000

Line breaks in cells

JAN	1 2 3
FEB	20
MAR	300

JAN	1
	2

	3
FEB	20
MAR	300

### Column format using CSS styles

The Venice markdown supports a few CSS styles

Text alignment:

- `text-align: left`
- `text-align: center`
- `text-align: right`

Column width:

- `width: 15%`
- `width: 15pm`
- `width: 15em`
- `width: auto`

```
| Col 1 | Col 2 |
| [![text-align: left; width: 6em]] | [![text-align: left; width: 6em]] |
| 1      | 1      |
| 200    | 200    |
| 30000  | 30000  |
```

Col 1	Col 2
1	1
200	200
30000	30000

## Code

Code can be called out within a text by enclosing it with single backticks.

```
To open a namespace use `(ns name)`.
```

To open a namespace use `(ns name)` .

Code block are enclosed with three backticks:

```
```
(defn hello []
  (println "Hello stranger"))

(hello)
```
```

producing

```
(defn hello []
  (println "Hello stranger"))

(hello)
```

## Function Details

[top](#)

### #{}

Creates a set.

```
#{10 20 30}  
=> #{10 20 30}
```

[top](#)

### ()

Creates a list.

```
'(10 20 30)  
=> (10 20 30)
```

[top](#)

### \*

```
(*)  
(* x)  
(* x y)  
(* x y & more)
```

Returns the product of numbers. (\*) returns 1

```
(*)  
=> 1
```

```
(* 4)  
=> 4
```

```
(* 4 3)  
=> 12
```

```
(* 4 3 2)  
=> 24
```

```
(* 4I 3I)  
=> 12I
```

```
(* 6.0 2)  
=> 12.0
```

```
( * 6 1.5M )
=> 9.0M
```

## SEE ALSO

[+](#)

Returns the sum of the numbers. (+) returns 0.

[-](#)

If one number is supplied, returns the negation, else subtracts the numbers from x and returns the result.

[/](#)

If no denominators are supplied, returns 1/numerator, else returns numerator divided by all of the denominators.

[dec/add](#)

Adds two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

[dec/sub](#)

Subtract y from x and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

[dec/mul](#)

Multiplies two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, ...

[dec/div](#)

Divides x by y and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

[dec/scale](#)

Scales a decimal. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

[top](#)

## \*ARGV\*

A list of the supplied command line arguments, or `nil` if the instantiator of the Venice instance decided not to make the command line arguments available.

\*ARGV\*

```
=> nil
```

[top](#)

## \*ansi-term\*

`true` if Venice runs in an ANSI terminal, otherwise `false`

\*ansi-term\*

```
=> false
```

[top](#)

## \*err\*

A `:java.io.PrintStream` object representing standard error for print operations.

Defaults to `System.err`, wrapped in an `PrintStream`.

`*err*` is a dynamic var. Any `:java.io.PrintStream` can be dynamically bound to it:

```
(binding [*err* print-stream]
 (println "text"))
```

## SEE ALSO

[with-err-str](#)

Evaluates `exprs` in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[\\*out\\*](#)

A `:java.io.PrintStream` object representing standard output for print operations.

[\\*in\\*](#)

A `:java.io.Reader` object representing standard input for read operations.

[top](#)

## `*in*`

A `:java.io.Reader` object representing standard input for read operations.

Defaults to `System.in`, wrapped in an `InputStreamReader`.

`*in*` is a dynamic var. Any `:java.io.Reader` can be dynamically bound to it:

```
(binding [*in* reader]
 (read-line))
```

## SEE ALSO

[read-line](#)

Without `arg` reads the next line from the stream that is the current value of `*in*`. With `arg` reads the next line from the passed stream ...

[read-char](#)

Without `arg` reads the next char from the stream that is the current value of `*in*`. With `arg` reads the next char from the passed stream ...

[\\*out\\*](#)

A `:java.io.PrintStream` object representing standard output for print operations.

[\\*err\\*](#)

A `:java.io.PrintStream` object representing standard error for print operations.

[top](#)

## `*loaded-files*`

The loaded files

```
*loaded-files*
=> #{} 
```

[top](#)

## `*loaded-modules*`

The loaded modules

```
*loaded-modules*
=> #{:crypt :csv :xchart :trace :java :fonts :xml :semver :json :cidr :app :geoip :hexdump :test :inet :io :
maven :grep :sandbox :ansi :benchmark :str :gradle :excel :core :regex :component :pdf :parsifal :shell :math :
time :config :kira :qrref}
```

[top](#)

## \*newline\*

The system newline

```
*newline*
=> "\n"
```

[top](#)

## \*ns\*

The current namespace

```
*ns*
=> user

(do
  (ns test)
  *ns*)
=> test
```

[top](#)

## \*out\*

A `:java.io.PrintStream` object representing standard output for print operations.

Defaults to `System.out`, wrapped in an `PrintStream`.

`*out*` is a dynamic var. Any `:java.io.PrintStream` can be dynamically bound to it:

```
(binding [*out* print-stream]
  (println "text"))
```

### SEE ALSO

[with-out-str](#)

Evaluates `exprs` in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[\\*err\\*](#)

A `:java.io.PrintStream` object representing standard error for print operations.

[\\*in\\*](#)

A `:java.io.Reader` object representing standard input for read operations.

[top](#)

## \*run-mode\*

The current run-mode one of `:repl`, `:script`, `:app`

```
*run-mode*  
=> :script
```

[top](#)

## \*version\*

The Venice version

```
*version*  
=> "0.0.0"
```

[top](#)

## +

```
(+)  
(+ x)  
(+ x y)  
(+ x y & more)
```

Returns the sum of the numbers. (+) returns 0.

```
(+)  
=> 0
```

```
(+ 1)  
=> 1
```

```
(+ 1 2)  
=> 3
```

```
(+ 1 2 3 4)  
=> 10
```

```
(+ 1I 2I)  
=> 3I
```

```
(+ 1 2.5)  
=> 3.5
```

```
(+ 1 2.5M)  
=> 3.5M
```

### SEE ALSO

—

If one number is supplied, returns the negation, else subtracts the numbers from x and returns the result.

[\\*](#)

Returns the product of numbers. (\*) returns 1

[/](#)

If no denominators are supplied, returns 1/numerator, else returns numerator divided by all of the denominators.

[dec/add](#)

Adds two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

[dec/sub](#)

Subtract y from x and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

[dec/mul](#)

Multiplies two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, ...

[dec/div](#)

Divides x by y and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

```

## SEE ALSO

### [import](#)

Imports one or multiple Java classes. Imports are bound to the current namespace.

### [proxify](#)

Proxies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

### [java/as-runnable](#)

Wraps the function `f` in a `java.lang.Runnable` (<https://docs.oracle.com/javase/8/docs/api/java/lang/Runnable.html>)

### [java/as-callable](#)

Wraps the function `f` in a `java.util.concurrent.Callable` (<https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/Callable.html>)

[top](#)

```
::
```

```
(.: type-name args*)
```

Instantiates a custom type.

Note: Venice implicitly creates a builder function suffixed with a dot:

```
(deftype :complex [real :long, imaginary :long])
(complex. 200 300)
```

For readability prefer `(complex. 200 300)` over `(.: :complex 100 200)`.

```
(do
  (ns foo)
  (deftype :complex [real :long, imaginary :long])
  (def x (.: :complex 100 200))
  [(:real x) (:imaginary x)])
=> [100 200]
```

## SEE ALSO

### [deftype](#)

Defines a new custom record type for the name with the fields.

### [deftype?](#)

Returns true if type is a custom type else false.

### [deftype-of](#)

Defines a new custom wrapper type based on a base type.

### [deftype-or](#)

Defines a new custom choice type.

### [deftype-describe](#)

Describes a custom type.

# Object

Defines a protocol to customize the `toString` and/or the `compareTo` function of custom datatypes.

Definition:

```
(defprotocol Object
  (toString [this] (to-str false this))
  (compareTo [this other] (compare this other)))
```

`compareTo` returns a negative integer, zero, or a positive integer as *this* value is less than, equal to, or greater than the *other* value.

```
(do
  (deftype :point [x :long, y :long]
    Object
    (toString [this] (str/format "[%s %s]" (:x this) (:y this)))
    (compareTo [self other] (. (:x self) :compareTo (:x other))))

  ; custom `toString`
  (println "toString:" (point. 1 2))

  ; custom `compareTo`: sort by 'x' ascending
  (println "compareTo:"
    (sort [(point. 2 100) (point. 3 101) (point. 1 102)])))
toString: [1 2]
compareTo: [[1 102] [2 100] [3 101]]
=> nil
```

## SEE ALSO

[defprotocol](#)

Defines a new protocol with the supplied function specs.

[deftype](#)

Defines a new custom record type for the name with the fields.

top

`[]`

Creates a vector.

```
[10 20 30]  
=> [10 20 30]
```

top

## abs

`(abs x)`

Returns the absolute value of the number

```
(abs 10)  
=> 10
```

```
(abs -10)  
=> 10
```

```
(abs -10I)  
=> 10I
```

=> 10.1
```

```
(abs -10.12M)  
=> 10.12M
```

### SEE ALSO

[sgn](#)  
sgn function for a number.

[negate](#)  
Negates x

top

## accept-either

`(accept-either p p-other f)`

Returns a new promise that, when either this or the other given promise completeness normally, is executed with the corresponding result as argument to the supplied function f.

```
(-> (promise (fn [] (sleep 200) 200))  
    (accept-either (promise (fn [] (sleep 100) 100))
```

```
(fn [v] (println (+ v 1)))  
(deref))  
101  
=> nil
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

### [then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

### [then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

### [then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

### [when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

### [apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

## acopy

```
(acopy src src-pos dest dest-pos dest-len)
```

Copies an array from the `src` array, beginning at the specified position, to the specified position of the `dest` array. Returns the modified destination array

```
(acopy (long-array '(1 2 3 4 5)) 2 (long-array 20) 10 3)  
=> [0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 3, 4, 5, 0, 0, 0, 0, 0, 0]
```

[top](#)

## add-watch

```
(add-watch ref key fn)
```

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

```
(do  
  (def x (agent 10))  
  (defn watcher [key ref old new]
```

```
(println "watcher: " key))
(add-watch x :test watcher))
=> nil
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

## agent

(agent state & options)

Creates and returns an agent with an initial value of state and zero or more options.

Options:

- :error-handler handler-fn
- :error-mode mode-keyword
- :validator validate-fn

The `handler-fn` is called if an action throws an exception. It's a function taking two args the agent and the exception. The mode-keyword may be either `:continue` (the default) or `:fail`. The `validate-fn` must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the `validate-fn` should return false or throw an exception.

```
(do
  (def x (agent 100))
  (send x + 5)
  (sleep 100)
  (deref x))
=> 105
```

## SEE ALSO

### [send](#)

Dispatch an action to an agent. Returns the agent immediately.

### [send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

### [await](#)

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

### [await-for](#)

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout ...

### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [set-error-handler!](#)

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

### [agent-error](#)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

[top](#)

## agent-error

(agent-error agent)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns `nil` if the agent is not failed.

```
(do
  (def x (agent 100 :error-mode :fail))
  (send x (fn [n] (/ n 0)))
  (sleep 500)
  (agent-error x))
=> com.github.jlangch.venice.VncException: / by zero
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

### [set-error-handler!](#)

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

### [agent-error-mode](#)

Returns the agent's error mode

[top](#)

## agent-send-off-thread-pool-info

(agent-send-off-thread-pool-info)

Returns the thread pool info of the ThreadPoolExecutor serving agent send-off.

<i>core-pool-size</i>	the number of threads to keep in the pool, even if they are idle
<i>maximum-pool-size</i>	the maximum allowed number of threads
<i>current-pool-size</i>	the current number of threads in the pool
<i>largest-pool-size</i>	the largest number of threads that have ever simultaneously been in the pool
<i>active-thread-count</i>	the approximate number of threads that are actively executing tasks
<i>scheduled-task-count</i>	the approximate total number of tasks that have ever been scheduled for execution
<i>completed-task-count</i>	the approximate total number of tasks that have completed execution

(agent-send-off-thread-pool-info)

```
=> {:core-pool-size 0 :maximum-pool-size 2147483647 :current-pool-size 2 :largest-pool-size 2 :active-thread-count 0 :scheduled-task-count 10 :completed-task-count 10}
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

### [send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

[top](#)

## agent-send-thread-pool-info

(agent-send-thread-pool-info)

Returns the thread pool info of the ThreadPoolExecutor serving agent send.

<i>core-pool-size</i>	the number of threads to keep in the pool, even if they are idle
<i>maximum-pool-size</i>	the maximum allowed number of threads
<i>current-pool-size</i>	the current number of threads in the pool
<i>largest-pool-size</i>	the largest number of threads that have ever simultaneously been in the pool
<i>active-thread-count</i>	the approximate number of threads that are actively executing tasks
<i>scheduled-task-count</i>	the approximate total number of tasks that have ever been scheduled for execution
<i>completed-task-count</i>	the approximate total number of tasks that have completed execution

```
(agent-send-thread-pool-info)
```

```
=> {:core-pool-size 10 :maximum-pool-size 10 :current-pool-size 9 :largest-pool-size 9 :active-thread-count 0 :
scheduled-task-count 9 :completed-task-count 9}
```

## SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send](#)

Dispatch an action to an agent. Returns the agent immediately.

[top](#)

## aget

```
(aget array idx)
```

Returns the value at the index of an array of Java Objects

```
(aget (long-array '(1 2 3 4 5)) 1)
=> 2
```

[top](#)

## alength

```
(alength array)
```

Returns the length of an array

```
(alength (long-array '(1 2 3 4 5)))
=> 5
```

[top](#)

## all-of

```
(all-of p & ps)
```

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, then the returned promise also does so. Otherwise, the results, if any, of the given promises are not reflected in the returned promise, but may be obtained by inspecting them individually.

```
(-> (all-of (promise (fn [] (sleep 100) 1))
           (promise (fn [] (sleep 100) 2))
           (promise (fn [] (sleep 500) 3)))
    (deref))
=> nil
```

#### SEE ALSO

##### [promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

##### [any-of](#)

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

[top](#)

## alter-ns-meta!

```
(alter-ns-meta! n f & args)
```

Alters the metadata for a namespace. `f` must be free of side-effects.

```
(do
  (ns foo)
  (alter-ns-meta! foo assoc :a 1))
=> {:a 1}

(do
  (ns foo)
  (def n 'foo)
  (alter-ns-meta! (var-get n) assoc :a 1)
  (pr-str (ns-meta (var-get n))))
=> "{:a 1}"
```

#### SEE ALSO

##### [ns-meta](#)

Returns the meta data of the namespace `n` or nil if `n` is not an existing namespace

##### [reset-ns-meta!](#)

Resets the metadata for a namespace

##### [ns](#)

Opens a namespace.

[top](#)

## amap

```
(amap f arr)
```

Applies `f` to each item in the array `arr`. Returns a new array with the mapped values.

```
(str (amap (fn [x] (+ 1 x)) (long-array 6 0)))  
=> "[1, 1, 1, 1, 1, 1]"
```

[top](#)

## and

```
(and x)  
(and x & next)
```

Ands the predicate forms

```
(and true true)  
=> true
```

```
(and true false)  
=> false
```

```
(and)  
=> true
```

### SEE ALSO

[or](#)

Ors the predicate forms

[not](#)

Returns true if x is logical false, false otherwise.

[top](#)

## ansi/ansi

```
(ansi style)
```

Output an ANSI escape code using a style key.

If `*use-ansi*` is bound to false, outputs an empty string instead of an ANSI code.

```
(println (str (ansi/ansi :blue) "foo"))
```

```
(println (str (ansi/ansi :underline) "foo"))
```

```
(println (str (ansi/ansi (ansi/fg-color 33)) "foo"))
```

[top](#)

## ansi/bg-color

```
(bg-color code)
```

Defines an extended background color from the 256-color extended color set. The code ranges from 0 to 255.

(ansi/bg-color 197)

top

## ansi/fg-color

(fg-color code)

Defines an extended foreground color from the 256-color extended color set. The code ranges from 0 to 255.

(ansi/fg-color 197)

top

## ansi/progress

(progress & options)

Returns a progress handler that renders the progress as a percentage string.

The returned progress handler takes two args:

- progress, a value 0..100 in :percent mode otherwise any value
- status, one of {start :progress :end :failed}

E.g: Download: 54%

Progress options:

:caption txt	A caption text. Defaults to empty.
:start-msg msg	A start message. Defaults to "{caption} started".
:end-msg msg	An end message. Defaults to "{caption} ok".
:end-col col	An end message ansi color code.
:failed-msg msg	A failed message. Defaults to "{caption} failed".
:failed-col col	A failed message ansi color code.
:mode m	A mode {percent, custom}. Defaults to :percent.

```
(let [pb (ansi/progress :caption "Test:")]
  (pb 0 :progress)
  (sleep 1 :seconds)
  (pb 50 :progress)
  (sleep 1 :seconds)
  (pb 100 :progress)
  (sleep 1 :seconds)
  (pb 100 :end))

(io/download "https://foo.org/image.png"
  :binary true
  :user-agent "Mozilla"
  :progress-fn (ansi/progress :caption "Download:"))
```

top

## ansi/progress-bar

(progress-bar & options)

Returns a progress handler that renders a progress bar.

The returned progress handler takes two args:

- progress (0..100%)
- status {:start :progress :end :failed}

E.g:

- Download: [#####]
- Download: [#####] 70%

Progress bar options:

:caption txt	A caption text. Defaults to empty.
:width val	The width of the bar in chars. Defaults to 25.
:start-msg msg	A start message. Defaults to "{caption} started".
:end-msg msg	An end message. Defaults to "{caption} ok".
:end-col col	An end message ansi color code.
:failed-msg msg	A failed message. Defaults to "{caption} failed".
:failed-col col	A failed message ansi color code.
:show-percent bool	If true shows the percentage. Defaults to 'false'.

```
(let [pb (ansi/progress-bar
          :caption "Test:"
          :width 25
          :show-percent true)]
  (pb 0 :progress)
  (sleep 1 :seconds)
  (pb 50 :progress)
  (sleep 1 :seconds)
  (pb 100 :progress)
  (sleep 1 :seconds)
  (pb 100 :end))

(io/download "https://foo.org/image.png"
  :binary true
  :user-agent "Mozilla"
  :progress-fn (ansi/progress-bar
                :caption "Download:"
                :width 25
                :show-percent true))
```

top

## ansi/style

(style text styles)

Applies ANSI color and style to a text string.

```
(println (ansi/style "foo" :green))

(println (ansi/style "foo" :green :underline))

(println (ansi/style "foo" :green :bg-yellow :underline))
```

```
(println (ansi/style "foo" (ansi/fg-color 21) (ansi/bg-color 221) :underline))

(println (ansi/style "foo" nil))
```

[top](#)

## ansi/with-ansi

```
(with-ansi & forms)
```

Runs the given forms with the *use-ansi* variable temporarily bound to true, to enable the production of any ANSI color codes specified in the forms.

```
(ansi/with-ansi (println (ansi/style "foo" :green)))
```

[top](#)

## ansi/without-ansi

```
(without-ansi & forms)
```

Runs the given forms with the *use-ansi* variable temporarily bound to false, to suppress the production of any ANSI color codes specified in the forms.

```
(ansi/without-ansi (println (ansi/style "foo" :green)))
```

[top](#)

## ansi/without-cursor

```
(without-cursor & forms)
```

Runs the given forms with the cursor turned off.

[top](#)

## any-of

```
(any-of p & ps)
```

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, the returned promise also does so.

```
(-> (any-of (promise (fn [] (sleep 300) 1))
            (promise (fn [] (sleep 100) 2))
            (promise (fn [] (sleep 500) 3)))
    (deref))
=> 2
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

### [all-of](#)

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

[top](#)

## any-pred

```
(any-pred p1 & p)
```

Takes a set of predicates and returns a function `f` that returns the first logical true value returned by one of its composing predicates against any of its arguments, else it returns logical false. Note that `f` is short-circuiting in that it will stop execution on the first argument that triggers a logical true result against the original predicates.

```
((any-pred number?) 1)  
=> true
```

```
((any-pred number?) 1 "a")  
=> true
```

```
((any-pred number? string?) 2 "a")  
=> true
```

[top](#)

## any?

```
(any? pred coll)
```

Returns true if the predicate is true for at least one collection item, false otherwise.

```
(any? number? nil)  
=> false
```

```
(any? number? [])  
=> false
```

```
(any? number? [1 :a :b])  
=> true
```

```
(any? number? [1 2 3])  
=> true
```

```
(any? #(== % 10) [10 20 30])  
=> true
```

```
(any? #(>= % 10) [1 5 10])  
=> true
```

## SEE ALSO

### [every?](#)

Returns true if the predicate is true for all collection items, false otherwise.

### [not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

### [not-every?](#)

Returns false if the predicate is true for all collection items, true otherwise

[top](#)

## app/build

```
(app/build name main-file file-map dest-dir)
```

Creates a Venice application archive that can be distributed and executed as a single file.

E.g.:

```
staging
├── billing.venice
├── utils
│   ├── util.venice
│   └── render.venice
└── data
    ├── bill.template
    └── logo.jpg
```

With these staged files the archive is built as:

```
(app/build
  "billing"
  "billing.venice"
  { "billing.venice"      "staging/billing.venice"
    "utils/util.venice"   "staging/utils/util.venice"
    "utils/render.venice" "staging/utils/render.venice"
    "data/bill.template"  "staging/data/bill.template"
    "data/logo.jpg"      "staging/data/logo.jpg" }
  ".")
```

Loading Venice files works relative to the application. You can only load files that are in the app archive. If for instances "billing.venice" in the above example requires "utils/render.venice" just add `(load-file "utils/render.venice")` to "billing.venice".

The app can be run from the command line as:

```
> java -jar venice-1.10.39.jar -app billing.zip
```

Venice reads the archive and loads the archive's main file.

Or with additional Java libraries (all JARs in 'libs' dir):

```
> java -cp "libs/*" com.github.jlangch.venice.Launcher -app billing.zip
```

[top](#)

## app/manifest

```
(app/manifest app)
```

Returns the manifest of a Venice application archive as a map.

[top](#)

# apply

```
(apply f args* coll)
```

Applies f to all arguments composed of args and coll

```
(apply + [1 2 3])  
=> 6
```

```
(apply + 1 2 [3 4 5])  
=> 15
```

```
(apply str [1 2 3 4 5])  
=> "12345"
```

```
(apply inc [1])  
=> 2
```

[top](#)

# apply-to-either

```
(apply-to-either p p-other f)
```

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result as argument to the supplied function f.

```
(-> (promise (fn [] (sleep 200) 200))  
    (apply-to-either (promise (fn [] (sleep 100) 100))  
                     (fn [v] (+ v 1))))  
    (deref))  
=> 101
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

### [then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

### [then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

### [then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

### [when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

### [accept-either](#)

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result ...

### or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

### complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

top

## as->

```
(as-> expr name & forms)
```

Binds name to expr, evaluates the first form in the lexical context of that binding, then binds name to that result, repeating for each successive form, returning the result of the last form. This allows a value to thread into any argument position.

; allows to use arbitrary positioning of the argument

```
(as-> [[:foo :bar] v
      (map name v)
      (first v)
      (str/subs v 1))
=> "oo"
```

; allows the use of if statements in the thread

```
(as-> {:a 1 :b 2} m
      (update m :a #(+ % 10))
      (if true
         (update m :b #(+ % 10))
         m))
=> {:a 11 :b 12}
```

### SEE ALSO

->

Threads the x through the forms. Inserts x as the second item in the first form, making a list of it if it is not a list already.

-->

Threads the x through the forms. Inserts x as the last item in the first form, making a list of it if it is not a list already. If ...

-<>

Threads the x through the forms. Inserts x at position of the <> symbol of the first form, making a list of it if it is not a list already.

top

## aset

```
(aset array idx val)
```

Sets the value at the index of an array

```
(aset (long-array '(1 2 3 4 5)) 1 20)
=> [1, 20, 3, 4, 5]
```

top

## assert

```
(assert expr)
(assert expr message)
```

Evaluates `expr` and throws an `:AssertionException` exception if it does not evaluate to logical true.

```
(assert (= 3 (+ 1 2)))
=> true

(assert (= 4 (+ 1 2)))
=> AssertionError: Assert failed.
Expression:
(= 4 (+ 1 2))
```

## SEE ALSO

### [assert-false](#)

Evaluates `expr` and throws an `:AssertionException` exception if it does not evaluate to logical false.

### [assert-eq](#)

Assert that expected and actual are equal. Throws an `:AssertionException` exception if they are not equal.

### [assert-ne](#)

Assert that unexpected and actual are not equal. Throws an `:AssertionException` exception if they are equal.

### [assert-throws](#)

Evaluates `expr` and throws an `:AssertionException` exception if it does not throw the expected exception of type `ex-type`.

### [assert-does-not-throw](#)

Evaluates `expr` and throws an `:AssertionException` exception if it does throw any kind of exception.

### [test/deftest](#)

Defines a test function with no arguments.

[top](#)

## assert-does-not-throw

```
(assert-does-not-throw expr)
(assert-does-not-throw expr message)
```

Evaluates `expr` and throws an `:AssertionException` exception if it does throw any kind of exception.

```
(assert-does-not-throw (/ 2 1))
=> true

(assert-does-not-throw (/ 2 0))
=> AssertionError: Assert failed.
Unexpected exception: :com.github.jlangch.venice.VncException
Expression:
(/ 2 0)
```

## assoc

```
(assoc coll key val)
(assoc coll key val & kvs)
```

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, returns a new vector that contains val at index. Note - index must be  $\leq$  (count vector). When applied to a custom type, returns a new custom type with passed fields changed.

```
(assoc {} :a 1 :b 2)
=> {:a 1 :b 2}

(assoc nil :a 1 :b 2)
=> {:a 1 :b 2}

(assoc [1 2 3] 0 10)
=> [10 2 3]

(assoc [1 2 3] 3 10)
=> [1 2 3 10]

(assoc [1 2 3] 6 10)
=> [1 2 3 10]

(do
  (deftype :complex [real :long, imaginary :long])
  (def x (complex. 100 200))
  (def y (assoc x :real 110))
  (pr-str y))
=> "{:custom-type* :user/complex :real 110 :imaginary 200}"
```

### SEE ALSO

#### [dissoc](#)

Returns a new coll of the same type, that does not contain a mapping for key(s)

#### [update](#)

Updates a value in an associative structure, where `k` is a key and `f` is a function that will take the old value and any supplied fargs ...

[top](#)

## assoc!

```
(assoc! coll key val)
(assoc! coll key val & kvs)
```

Associates key/vals with a mutable map, returns the map

```
(assoc! nil :a 1 :b 2)
=> {:a 1 :b 2}

(assoc! (mutable-map) :a 1 :b 2)
=> {:a 1 :b 2}

(assoc! (mutable-vector 1 2 3) 0 10)
=> [10 2 3]

(assoc! (mutable-vector 1 2 3) 3 10)
=> [1 2 3 10]

(assoc! (mutable-vector 1 2 3) 6 10)
=> [1 2 3 10]
```

### SEE ALSO

[dissoc!](#)

Dissociates keys from a mutable map, returns the map

[update!](#)

Updates a value in a mutable associative structure, where k is a key and f is a function that will take the old value and any supplied ...

[top](#)

## assoc-in

```
(assoc-in m ks v)
```

Associates a value in a nested associative structure, where ks is a sequence of keys and v is the new value and returns a new nested structure. If any levels do not exist, hash-maps or vectors will be created.

```
(do
  (def users [ {:name "James" :age 26}
                {:name "John" :age 43}])
  (assoc-in users [1 :age] 44))
=> [{:name "James" :age 26} {:name "John" :age 44}]

(do
  (def users [ {:name "James" :age 26}
                {:name "John" :age 43}])
  (assoc-in users [2] {:name "Jack" :age 19}))
=> [{:name "James" :age 26} {:name "John" :age 43} {:name "Jack" :age 19}]
```

[top](#)

## asub

```
(asub array start len)
```

Returns a sub array

```
(asub (long-array '(1 2 3 4 5)) 2 3)
=> [3, 4, 5]
```

[top](#)

## atom

```
(atom x)
(atom x & options)
```

Creates an atom with the initial value x.

Options:

- :meta metadata-map
- :validator validate-fn

If metadata-map is supplied, it will become the metadata on the atom. validate-fn must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the validate-fn should return false or throw an exception.

```
(do
  (def counter (atom 0))
  (swap! counter inc)
  (deref counter))
=> 1
```

```
(do
  (def counter (atom 0))
  (reset! counter 9)
  @counter)
=> 9
```

### SEE ALSO

#### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

#### [reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

#### [swap!](#)

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

#### [compare-and-set!](#)

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

#### [add-watch](#)

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

#### [remove-watch](#)

Removes a watch function from an agent/atom reference.

[top](#)

## atom?

```
(atom? x)
```

Returns true if x is an atom, otherwise false

```
(do
  (def counter (atom 0))
  (atom? counter))
=> true
```

[top](#)

## await

```
(await agents)
```

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

```
(do
  (def x1 (agent 100))
  (def x2 (agent {}))
  (send-off x1 + 5)
  (send-off x2 (fn [state]
                 (sleep 100)
                 (assoc state :done true))))
;; blocks till the agent actions are finished
(await x1 x2)
=> true
```

### SEE ALSO

#### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

#### [await-for](#)

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout ...

[top](#)

## await-for

```
(await-for timeout-ms agents)
```

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout (in milliseconds) has elapsed. Returns logical false if returning due to timeout, logical true otherwise.

```
(do
  (def x1 (agent 100))
  (def x2 (agent {}))
  (send-off x1 + 5)
  (send-off x2 (fn [state]
                 (sleep 100)
                 (assoc state :done true))))
```

```
;; blocks till the agent actions are finished
(await-for 500 x1 x2))
=> true
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

### [await](#)

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

[top](#)

## await-termination-agents

```
(shutdown-agents)
```

Blocks until all actions have completed execution after a shutdown request, or the timeout occurs, or the current thread is interrupted, whichever happens first.

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (await-termination-agents 1000))
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

## await-termination-agents?

```
(await-termination-agents?)
```

Returns true if all tasks have been completed following agent shut down

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (await-termination-agents 1000)
  (sleep 300)
  (await-termination-agents?))
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

## bases

(bases class)

Returns the immediate superclass and interfaces of class, if any.

```
(bases :java.util.ArrayList)
=> (:java.util.AbstractList :java.util.List :java.util.RandomAccess :java.lang.Cloneable :java.io.Serializable)
```

[top](#)

## benchmark/benchmark

(benchmark expr warmup-iterations iterations & options)

Benchmarks the given expression.

*Note:* All macros in the expression are expanded before running the benchmark phases.

Runs the benchmark in 4 phases:

1. Run the expression in a warm-up phase to allow the JIT compiler to do optimizations
2. Run the garbage collector to isolate timings from GC state prior to testing
3. Runs the expression benchmark
4. Analyzes and prints the benchmark statistics

Options:

:chart b        If true generates a chart and saves it to 'benchmark.png'. Defaults to false.  
:steps n        the number of steps for the quantization, defaults to 100  
:median b       show the median value in the chart {true/false}, defaults to false  
:outlier b       show the outlier range in the chart {true/false}, defaults to false  
:gc n            the number of GC runs

```
(do
  (load-module :benchmark ['benchmark :as 'b])

  (b/benchmark (+ 1 2) 120000 10000)

  (b/benchmark (+ 1 2) 120000 10000 :chart true :median true)

  (b/benchmark (+ 1 2) 120000 10000 :chart true :outlier true)

  (b/benchmark (+ 1 2) 120000 10000 :chart true :steps 100))
```

[top](#)

## bigint

(bigint x)

Converts to big integer.

```
(bigint 2000)
=> 2000N

(bigint 34897.65)
=> 34897N

(bigint "5676000000000")
=> 5676000000000N

(bigint nil)
=> 0N
```

[top](#)

## binding

```
(binding [bindings*] exprs*)
```

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

```
(do
  (binding [x 100]
    (println x)
    (binding [x 200]
      (println x))
    (println x)))
100
200
100
=> nil

;; binding-introduced bindings are thread-locally mutable:
(binding [x 1]
  (set! x 2)
  x)
=> 2

;; binding can use qualified names :
(binding [user/x 1]
  user/x)
=> 1
```

### SEE ALSO

[def-dynamic](#)

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[top](#)

## boolean

```
(boolean x)
```

Converts to boolean. Everything except 'false' and 'nil' is true in boolean context.

```
(boolean false)
=> false
```

```
(boolean true)
=> true
```

```
(boolean nil)
=> false
```

```
(boolean 100)
=> true
```

[top](#)

## boolean?

```
(boolean? n)
```

Returns true if n is a boolean

```
(boolean? true)
=> true
```

```
(boolean? false)
=> true
```

```
(boolean? nil)
=> false
```

```
(boolean? 0)
=> false
```

[top](#)

## bound?

```
(bound? s)
```

Returns true if the symbol is bound to a value else false

```
(bound? 'test)
=> false
```

```
(let [test 100]
  (bound? 'test))
=> true
```

```
(do
  (def a 100)
  (bound? 'a))
=> true
```

## SEE ALSO

### [let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

### [def](#)

Creates a global variable.

### [defonce](#)

Creates a global variable that can not be overwritten

[top](#)

## butlast

```
(butlast coll)
```

Returns a collection with all but the last list element

```
(butlast nil)
=> nil
```

```
(butlast [])
=> []
```

```
(butlast [1])
=> []
```

```
(butlast [1 2 3])
=> [1 2]
```

```
(butlast '())
=> ()
```

```
(butlast '(1))
=> ()
```

```
(butlast '(1 2 3))
=> (1 2)
```

```
(butlast "1234")
=> (#\1 #\2 #\3)
```

## SEE ALSO

### [str/butlast](#)

Returns a possibly empty string of the characters without the last.

[top](#)

## bytebuf

```
(bytebuf x)
```

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, a string

```
(bytebuf [0 1 2])  
=> [0 1 2]
```

```
(bytebuf '(0 1 2))  
=> [0 1 2]
```

```
(bytebuf "abc")  
=> [97 98 99]
```

#### SEE ALSO

[io/bytebuf-out-stream](#)

Returns a new `java.io.ByteArrayOutputStream`.

[top](#)

## bytebuf-allocate

```
(bytebuf-allocate length)
```

Allocates a new bytebuf. The values will be all zero.

```
(bytebuf-allocate 20)  
=> [0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0]
```

[top](#)

## bytebuf-capacity

```
(bytebuf-capacity buf)
```

Returns the capacity of a bytebuf.

```
(bytebuf-capacity (bytebuf-allocate 100))  
=> 100
```

[top](#)

## bytebuf-from-string

```
(bytebuf-from-string s encoding)
```

Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-from-string "abcdef" :UTF-8)  
=> [97 98 99 100 101 102]
```

#### SEE ALSO

[bytebuf-to-string](#)

Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8

## bytebuf-get-byte

```
(bytebuf-get-byte buf)
(bytebuf-get-byte buf pos)
```

Reads a byte from the buffer. Without a pos reads from the current position and increments the position by one. With a position reads the byte from that position.

```
(-> (bytebuf-allocate 4)
    (bytebuf-put-byte! 1)
    (bytebuf-put-byte! 2)
    (bytebuf-get-byte 0))
=> 11
```

## bytebuf-get-double

```
(bytebuf-get-double buf)
(bytebuf-get-double buf pos)
```

Reads a double from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the double from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-double! 20.0)
    (bytebuf-put-double! 40.0)
    (bytebuf-get-double 0))
=> 20.0
```

## bytebuf-get-float

```
(bytebuf-get-float buf)
(bytebuf-get-float buf pos)
```

Reads a float from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the float from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-float! 20.0)
    (bytebuf-put-float! 40.0)
    (bytebuf-get-float 0))
=> 20.0
```

## bytebuf-get-int

```
(bytebuf-get-int buf)
(bytebuf-get-int buf pos)
```

Reads an integer from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the integer from that position.

```
(-> (bytebuf-allocate 8)
    (bytebuf-put-int! 1I)
    (bytebuf-put-int! 2I)
    (bytebuf-get-int 0))
=> 1I
```

[top](#)

## bytebuf-get-long

```
(bytebuf-get-long buf)
(bytebuf-get-long buf pos)
```

Reads a long from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the long from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-long! 20)
    (bytebuf-put-long! 40)
    (bytebuf-get-long 0))
=> 20
```

[top](#)

## bytebuf-limit

```
(bytebuf-limit buf)
```

Returns the limit of a bytebuf.

```
(bytebuf-limit (bytebuf-allocate 100))
=> 100
```

[top](#)

## bytebuf-pos

```
(bytebuf-pos buf)
```

Returns the buffer's current position.

```
(bytebuf-pos (bytebuf-allocate 10))
=> 0
```

## bytebuf-pos!

```
(bytebuf-pos! buf pos)
```

Sets the buffer's position.

```
(-> (bytebuf-allocate 10)
     (bytebuf-pos! 4)
     (bytebuf-put-byte! 1)
     (bytebuf-pos! 8)
     (bytebuf-put-byte! 2))
=> [0 0 0 0 1 0 0 0 2 0]
```

## bytebuf-put-buf!

```
(bytebuf-put-buf! dst src src-offset length)
```

This method transfers bytes from the src to the dst buffer at the current position, and then increments the position by length.

```
(-> (bytebuf-allocate 10)
     (bytebuf-pos! 4)
     (bytebuf-put-buf! (bytebuf [1 2 3]) 0 2))
=> [0 0 0 0 1 2 0 0 0 0]
```

## bytebuf-put-byte!

```
(bytebuf-put-byte! buf b)
```

Writes a byte to the buffer at the current position, and then increments the position by one.

```
(-> (bytebuf-allocate 4)
     (bytebuf-put-byte! 1)
     (bytebuf-put-byte! 2))
=> [1 2 0 0]
```

## bytebuf-put-double!

```
(bytebuf-put-double! buf d)
```

Writes a double (8 bytes) to buffer at the current position, and then increments the position by eight.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-double! 64.0)
    (bytebuf-put-double! 200.0))
=> [64 80 0 0 0 0 0 0 64 105 0 0 0 0 0 0]
```

[top](#)

## bytebuf-put-float!

```
(bytebuf-put-float! buf d)
```

Writes a float (4 bytes) to buffer at the current position, and then increments the position by four.

```
(-> (bytebuf-allocate 8)
    (bytebuf-put-float! 64.0)
    (bytebuf-put-float! 200.0))
=> [66 128 0 0 67 72 0 0]
```

[top](#)

## bytebuf-put-int!

```
(bytebuf-put-int! buf i)
```

Writes an integer (4 bytes) to buffer at the current position, and then increments the position by four.

```
(-> (bytebuf-allocate 8)
    (bytebuf-put-int! 4I)
    (bytebuf-put-int! 8I))
=> [0 0 0 4 0 0 0 8]
```

[top](#)

## bytebuf-put-long!

```
(bytebuf-put-long! buf l)
```

Writes a long (8 bytes) to buffer at the current position, and then increments the position by eight.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-long! 4)
    (bytebuf-put-long! 8))
=> [0 0 0 0 0 0 0 4 0 0 0 0 0 0 0 8]
```

[top](#)

## bytebuf-sub

```
(bytebuf-sub x start) (bytebuf-sub x start end)
```

Returns a byte buffer of the items in buffer from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count bytebuffer)

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 2)
=> [3 4 5 6]
```

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 4)
=> [5 6]
```

[top](#)

## bytebuf-to-list

```
(bytebuf-to-list buf)
```

Returns the bytebuf as lazy list of integers

```
(doall (bytebuf-to-list (bytebuf [97 98 99])))
=> (97I 98I 99I)
```

[top](#)

## bytebuf-to-string

```
(bytebuf-to-string buf encoding)
```

Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-to-string (bytebuf [97 98 99]) :UTF-8)
=> "abc"
```

### SEE ALSO

[bytebuf-from-string](#)

Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8

[top](#)

## bytebuf?

```
(bytebuf? x)
```

Returns true if x is a bytebuf

```
(bytebuf? (bytebuf [1 2]))
=> true
```

```
(bytebuf? [1 2])
=> false
```

```
(bytebuf? nil)
=> false
```

## callstack

(callstack)

Returns the current callstack.

```
(do
  (defn f1 [x] (f2 x))
  (defn f2 [x] (f3 x))
  (defn f3 [x] (f4 x))
  (defn f4 [x] (callstack))
  (f1 100))
=> [{:fn-name "callstack" :file "example" :line 29 :col 18} {:fn-name "user/f4" :file "example" :line 28 :col 18}
{:fn-name "user/f3" :file "example" :line 27 :col 18} {:fn-name "user/f2" :file "example" :line 26 :col 18}
{:fn-name "user/f1" :file "example" :line 30 :col 5}]
```

## cancel

(cancel f)

Cancels a future or a promise

```
(do
  (def wait (fn [] (sleep 400) 100))
  (let [f (future wait)]
    (sleep 50)
    (printf "After 50ms: cancelled=%b\n" (cancelled? f))
    (cancel f)
    (sleep 100)
    (printf "After 150ms: cancelled=%b\n" (cancelled? f))))
After 50ms: cancelled=false
After 150ms: cancelled=true
=> nil
```

### SEE ALSO

#### [future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

#### [promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

#### [done?](#)

Returns true if the future or promise is done otherwise false

#### [cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

## cancelled?

```
(cancelled? f)
```

Returns true if the future or promise is cancelled otherwise false

```
(cancelled? (future (fn [] 100)))  
=> false
```

## SEE ALSO

### [future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

### [promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

### [done?](#)

Returns true if the future or promise is done otherwise false

### [cancel](#)

Cancels a future or a promise

[top](#)

## cartesian-product

```
(cartesian-product coll1 coll2 coll*)
```

Returns the cartesian product of two or more collections.

Removes all duplicates items in the collections before computing the cartesian product.

```
(cartesian-product [1 2 3] [1 2 3])  
=> ((1 1) (1 2) (1 3) (2 1) (2 2) (2 3) (3 1) (3 2) (3 3))
```

```
(cartesian-product [0 1] [0 1] [0 1])  
=> ((0 0 0) (0 0 1) (0 1 0) (0 1 1) (1 0 0) (1 0 1) (1 1 0) (1 1 1))
```

## SEE ALSO

### [combinations](#)

All the unique ways of taking `n` different elements from the items in the collection

[top](#)

## case

```
(case expr & clauses)
```

Takes an expression and a set of clauses. Each clause takes the form of `test-constant result-expr`

```
(case (+ 1 9)  
  10 :ten  
  20 :twenty  
  30 :thirty  
  :dont-know)  
=> :ten
```

## SEE ALSO

### [cond](#)

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the ...

### [condp](#)

Takes a binary predicate, an expression, and a set of clauses.

[top](#)

## cast

(cast class object)

Casts a Java object

```
(do
  (import :java.awt.image.BufferedImage)
  (import :java.awt.Graphics)

  ;; cast the graphics context to 'java.awt.Graphics' instead of the
  ;; implicit cast to 'java.awt.Graphics2D' as Venice is doing
  (let [img (. :BufferedImage :new 40 40 1)
        gd (cast :Graphics (. img :createGraphics))]
    (. gd :fillOval 10 20 5 5)
    img))
=> BufferedImage@5ae63ade: type = 1 DirectColorModel: rmask=ff0000 gmask=ff00 bmask=ff amask=0
IntegerInterleavedRaster: width = 40 height = 40 #Bands = 3 xOff = 0 yOff = 0 dataOffset[0] 0
```

## SEE ALSO

### [class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

### [formal-type](#)

Returns the formal type of a Java object

### [remove-formal-type](#)

Removes the formal type from a Java object

[top](#)

## ceil

(ceil x)

Returns the largest integer that is greater than or equal to x

```
(ceil 1.4)
=> 2.0

(ceil -1.4)
=> -1.0

(ceil 1.23M)
=> 2.00M
```

```
(ceil -1.23M)
=> -1.00M
```

## SEE ALSO

[floor](#)

Returns the largest integer that is less than or equal to x

[top](#)

## char

```
(char c)
```

Converts a number or s single char string to a char.

```
(char 65)
=> #\A
```

```
(char "A")
=> #\A
```

```
(long (char "A"))
=> 65
```

```
(str/join (map char [65 66 67 68]))
=> "ABCD"
```

```
(map #(- (long %) (long (char "0")))) (str/chars "123456")
=> (1 2 3 4 5 6)
```

## SEE ALSO

[char?](#)

Returns true if s is a char.

[top](#)

## char-escaped

```
(char-escaped c)
```

Returns the ASCII escaped character for c.

- `\'` single quote
- `\"` double quote
- `\\` backslash
- `\n` new line
- `\r` carriage return
- `\t` tab
- `\b` backspace
- `\f` form feed
- `\0` null character
- in all other cases returns the character c

```
(char-escaped #\n)
=> #\newline
```

```
(char-escaped #\a)
=> #\a
```

SEE ALSO

[char](#)  
Converts a number or s single char string to a char.

[char?](#)  
Returns true if s is a char.

[top](#)

# char-literals

(char-literals)

Returns all defined char literals.

## SEE ALSO

[char](#)

Converts a number or s single char string to a char.

[char?](#)

Returns true if s is a char.

top

## char?

```
(char? s)
```

Returns true if s is a char.

```
(char? #\a)
```

```
=> true
```

## SEE ALSO

[char](#)

Converts a number or s single char string to a char.

top

## charset-default-encoding

```
(charset-default-encoding)
```

Returns the default charset of this Java virtual machine.

```
(charset-default-encoding)
```

```
=> :UTF-8
```

top

## cidr/end-inet-addr

```
(cidr/end-inet-addr cidr)
```

Returns the end inet address of a CIDR IP block.

```
(cidr/end-inet-addr "222.192.0.0/11")
```

```
=> /222.223.255.255
```

```
(cidr/end-inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")
```

```
=> /2001:db8:85a3:8d3:ffff:ffff:ffff:ffff
```

```
(cidr/end-inet-addr (cidr/parse "222.192.0.0/11"))
```

```
=> /222.223.255.255
```

## cidr/in-range?

```
(cidr/in-range? ip cidr)
```

Returns true if the ip adress is within the ip range of the cidr else false. ip may be a string or a :java.net.InetAddress, cidr may be a string or a CIDR Java object obtained from 'cidr/parse'.

```
(cidr/in-range? "222.220.0.0" "222.220.0.0/11")
=> true
```

```
(cidr/in-range? (inet/inet-addr "222.220.0.0") "222.220.0.0/11")
=> true
```

```
(cidr/in-range? "222.220.0.0" (cidr/parse "222.220.0.0/11"))
=> true
```

## cidr/insert

```
(cidr/insert trie cidr value)
```

Insert a new CIDR / value relation into trie. Works with IPv4 and IPv6. Please keep IPv4 and IPv6 CIDRs in different tries.

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/lookup trie "192.16.10.15")))
=> "Germany"
```

## cidr/lookup

```
(cidr/lookup trie ip)
```

Lookup the associated value of a CIDR in the trie. A cidr "192.16.10.0/24" or an inet address "192.16.10.15" can be passed as ip.

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/lookup trie "192.16.10.15")))
=> "Germany"
```

## cidr/lookup-reverse

```
(cidr/lookup-reverse trie ip)
```

Reverse lookup a CIDR in the trie given an IP address

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/lookup-reverse trie "192.16.10.15")))
=> 192.16.10.0/24: [/192.16.10.0 .. /192.16.10.255]
```

[top](#)

## cidr/parse

```
(cidr/parse cidr)
```

Parses CIDR IP blocks to an IP address range. Supports both IPv4 and IPv6.

```
(cidr/parse "222.192.0.0/11")
=> 222.192.0.0/11: [/222.192.0.0 .. /222.223.255.255]

(cidr/parse "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")
=> 2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64: [/2001:db8:85a3:8d3:0:0:0:0 .. /2001:db8:85a3:8d3:ffff:ffff:ffff:ffff]
```

[top](#)

## cidr/size

```
(cidr/size trie)
```

Returns the size of the trie.

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/size trie)))
=> 1
```

[top](#)

## cidr/start-inet-addr

```
(cidr/start-inet-addr cidr)
```

Returns the start inet address of a CIDR IP block.

```
(cidr/start-inet-addr "222.192.0.0/11")  
=> /222.192.0.0
```

```
(cidr/start-inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")  
=> /2001:db8:85a3:8d3:0:0:0:0
```

```
(cidr/start-inet-addr (cidr/parse "222.192.0.0/11"))  
=> /222.192.0.0
```

[top](#)

## cidr/trie

(cidr/trie)

Create a new mutable concurrent CIDR trie.

```
(do  
  (let [trie (cidr/trie)]  
    (cidr/insert trie  
                 (cidr/parse "192.16.10.0/24")  
                 "Germany")  
    (cidr/lookup trie "192.16.10.15")))  
=> "Germany"
```

[top](#)

## class

(class name)

Returns the Java class for the given name. Throws an exception if the class is not found.

```
(class :java.util.ArrayList)  
=> class java.util.ArrayList
```

### SEE ALSO

#### [class-of](#)

Returns the Java class of a value.

#### [class-name](#)

Returns the Java class name of a class.

#### [class-version](#)

Returns the major version of a Java class.

#### [cast](#)

Casts a Java object

#### [formal-type](#)

Returns the formal type of a Java object

#### [remove-formal-type](#)

Removes the formal type from a Java object

## class-name

```
(class-name class)
```

Returns the Java class name of a class.

```
(class-name (class :java.util.ArrayList))  
=> "java.util.ArrayList"
```

### SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-of](#)

Returns the Java class of a value.

[class-version](#)

Returns the major version of a Java class.

## class-of

```
(class-of x)
```

Returns the Java class of a value.

```
(class-of 100)  
=> class com.github.jlangch.venice.impl.types.VncLong
```

```
(class-of (. :java.awt.Point :new 10 10))  
=> class java.awt.Point
```

### SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-name](#)

Returns the Java class name of a class.

[class-version](#)

Returns the major version of a Java class.

## class-version

```
(class-version class)
```

Returns the major version of a Java class.

Java major versions:

- Java 8 uses major version 52
- Java 9 uses major version 53
- Java 10 uses major version 54
- Java 11 uses major version 55
- Java 12 uses major version 56
- Java 13 uses major version 57
- Java 14 uses major version 58
- Java 15 uses major version 59

```
(class-version :com.github.jlangch.venice.Venice)
=> 52
```

## SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-of](#)

Returns the Java class of a value.

[class-name](#)

Returns the Java class name of a class.

top

# classloader

```
(classloader)
(classloader type)
```

Returns the classloader.

```
;; Returns the current classloader
(classloader)
=> class sun.misc.Launcher$AppClassLoader

;; Returns the system classloader
(classloader :system)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the classloader which loaded the Venice classes
(classloader :application)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the thread-context classloader
(classloader :thread-context)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

## SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[classloader-of](#)

Returns the classloader of a value or a Java class.

top

## classloader-of

(classloader-of x)

Returns the classloader of a value or a Java class.

Note:

Some Java VM implementations may use 'null' to represent the bootstrap class loader. This method will return 'nil' in such implementations if this class was loaded by the bootstrap class loader.

```
(classloader-of (class :java.awt.Point))  
=> nil
```

```
(classloader-of (. :java.awt.Point :new 10 10))  
=> nil
```

```
(classloader-of (class-of "abcdef"))  
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

```
(classloader-of "abcdef")  
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

### SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[classloader](#)

Returns the classloader.

[top](#)

## coalesce

(coalesce args\*)

Returns nil if all of its arguments are nil, otherwise it returns the first non nil argument. The arguments are evaluated lazy.

```
(coalesce)  
=> nil
```

```
(coalesce 2)  
=> 2
```

```
(coalesce nil 1 2)  
=> 1
```

[top](#)

## coll?

(coll? coll)

Returns true if coll is a collection

```
(coll? {:a 1})  
=> true
```

```
(coll? [1 2])  
=> true
```

[top](#)

## combinations

(combinations coll n)

All the unique ways of taking n different elements from the items in the collection

```
(combinations [0 1 2 3] 1)  
=> ([0] [1] [2] [3])
```

```
(combinations [0 1 2 3] 2)  
=> ([0 1] [0 2] [0 3] [1 2] [1 3] [2 3])
```

```
(combinations [0 1 2 3] 3)  
=> ([0 1 2] [0 1 3] [1 2 3])
```

```
(combinations [0 1 2 3] 4)  
=> ([0 1 2 3])
```

### SEE ALSO

[cartesian-product](#)

Returns the cartesian product of two or more collections.

[top](#)

## comment

(comment & body)

Ignores body, yields nil

```
(comment  
  (println 1)  
  (println 5))  
=> nil
```

[top](#)

## comp

(comp f\*)

Takes a set of functions and returns a fn that is the composition of those fns. The returned fn takes a variable number of args, applies the rightmost of fns to the args, the next fn (right-to-left) to the result, etc.

```
((comp str +) 8 8 8)
=> "24"

(map (comp - (partial + 3) (partial * 2)) [1 2 3 4])
=> (-5 -7 -9 -11)

((reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100)
=> 207

(filter (comp not zero?) [0 1 0 2 0 3 0 4])
=> (1 2 3 4)

(do
  (def fifth (comp first rest rest rest rest))
  (fifth [1 2 3 4 5]))
=> 5
```

[top](#)

## compare

```
(compare x y)
```

Comparator. Returns -1, 0, or 1 when x is logically 'less than', 'equal to', or 'greater than' y. For list and vectors the longer sequence is always 'greater' regardless of its contents. For sets and maps only the size of the collection is compared.

```
(compare nil 0)
=> -1

(compare 0 nil)
=> 1

(compare 1 0)
=> 1

(compare 1 1)
=> 0

(compare 1M 2M)
=> -1

(compare 1 nil)
=> 1

(compare nil 1)
=> -1

(compare "aaa" "bbb")
=> -1

(compare [0 1 2] [0 1 2])
=> 0
```

```
(compare [0 1 2] [0 9 2])
=> -1

(compare [0 9 2] [0 1 2])
=> 1

(compare [1 2 3] [0 1 2 3])
=> -1

(compare [0 1 2] [3 4])
=> 1
```

[top](#)

## compare-and-set!

```
(compare-and-set! atom oldval newval)
```

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set happened, else false.

```
(do
  (def counter (atom 2))
  (compare-and-set! counter 2 4)
  @counter)
=> 4
```

### SEE ALSO

[atom](#)

Creates an atom with the initial value x.

[top](#)

## complement

```
(complement f)
```

Takes a fn f and returns a fn that takes the same arguments as f, has the same effects, if any, and returns the opposite truth value.

```
(complement even?)
=> anonymous-de643d6f-6d59-4023-b8b7-494a48938a49

(filter (complement even?) '(1 2 3 4))
=> (1 3)
```

[top](#)

## complete-on-timeout

```
(complete-on-timeout p value time time-unit)
```

Completes the promise with the given value if not otherwise completed before the given timeout.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
      (complete-on-timeout "The fox did not jump" 500 :milliseconds)
      (deref))
=> "The quick brown fox"

(-> (promise (fn [] (sleep 500) "The quick brown fox"))
      (complete-on-timeout "The fox did not jump" 100 :milliseconds)
      (deref))
=> "The fox did not jump"

(-> (promise (fn [] (sleep 500) "The quick brown fox"))
      (complete-on-timeout "The fox did not jump" 100 :milliseconds)
      (then-apply str/upper-case)
      (deref))
=> "THE FOX DID NOT JUMP"

(-> (promise (fn [] (sleep 50) 100))
      (complete-on-timeout 888 100 :milliseconds)
      (then-apply #(do (sleep 200) (* % 3)))
      (complete-on-timeout 999 220 :milliseconds)
      (deref))
=> 999
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

### [then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

### [then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

### [then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

### [when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

### [accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

[top](#)

## component/Component

Defines a protocol for components.

Definition:

```
(defprotocol Component
  (start [component] component)
  (stop [component] component))
```

Function `start` :

Begins operation of this component. Synchronous, does not return until the component is started. Returns an updated version of this component.

Function `stop` :

Ceases operation of this component. Synchronous, does not return until the component is stopped. Returns an updated version of this component.

[top](#)

## component/dep

```
(dep c k)
```

Returns a dependency given by its key 'k' from the component 'c' dependencies.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server []
    c/Component
    (start [this] (println "Store: " (c/dep this :store)) this)
    (stop [this] this))

  (deftype :database []
    c/Component
    (start [this] this)
    (stop [this] this))

  (defn create-system []
    (-> (c/system-map
        "test"
        :server (server. )
        :store (database. ))
      (c/system-using {:server [:store]})))

  (-> (create-system)
    (c/start)
    (c/stop))

  nil)
Store: {:custom-type* :user/database}
=> nil
```

### SEE ALSO

[component/deps](#)

Returns the dependencies of the component 'c' or nil if there aren't any dependencies.

[component/id](#)

Returns id of the component 'c'.

[top](#)

## component/deps

(deps c)

Returns the dependencies of the component 'c' or `nil` if there aren't any dependencies.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server []
    c/Component
    (start [this] (println "Dependencies: " (c/deps this)) this)
    (stop [this] this))

  (deftype :database []
    c/Component
    (start [this] this)
    (stop [this] this))

  (defn create-system []
    (-> (c/system-map
        "test"
        :server (server. )
        :store (database. ))
      (c/system-using {:server [:store]})))

  (-> (create-system)
    (c/start)
    (c/stop))

  nil)
Dependencies: {:store {:custom-type* :user/database} :component-info {:custom-type* :component/component-info :
id :server :system-name test :components {}}}
=> nil
```

### SEE ALSO

[component/dep](#)

Returns a dependency given by its key 'k' from the component 'c' dependencies.

[component/id](#)

Returns id of the component 'c'.

[top](#)

## component/id

(id c)

Returns id of the component 'c'.

```
(do
  (load-module :component ['component :as 'c])

## SEE ALSO

### [component/dep](#)

Returns a dependency given by its key 'k' from the component 'c' dependencies.

### [component/deps](#)

Returns the dependencies of the component 'c' or nil if there aren't any dependencies.

[top](#)

## component/system-map

```
(system-map name keyval*)
```

Returns a system constructed of components given as key/value pairs. The 'key' is a `keyword` (the component's id) referencing the component given as 'value'.

The system has default implementations of the Lifecycle 'start' and 'stop' methods which recursively starts/stops all components in the system.

Note:

`system-map` just creates a raw system without any dependencies between the components. Use `system-using` after creating the system map to establish the dependencies.

```

(do
  (load-module :component ['component :as 'c])

  (deftype :server [port :long]
    c/Component
    (start [this] (println "server started") this)
    (stop [this] (println "server stopped") this))

  (deftype :database [user      :string
                     password :string]
    c/Component
    (start [this] (println "database started") this)
    (stop [this] (println "database stopped") this))

  (c/system-map
    "test"
    :server (server. 4600)
    :store (database. "foo" "123"))

  nil)

```

## SEE ALSO

### [component/system-using](#)

Associates a component dependency graph with the 'system' that has been created through a call to system-map. 'dependency-map' is a ...

top

## component/system-using

```
(system-using system dependency-map)
```

Associates a component dependency graph with the 'system' that has been created through a call to `system-map`. 'dependency-map' is a map of keys to maps or vectors specifying the dependencies of the component at that key in the system.

Throws an exception if a component dependency circle is detected.

The system is started and stopped calling the lifecycle `start` or `stop` method on the system component.

Upon successfully starting a component the flag `{:started true}` is added to the component's meta data. It's up to the components lifecycle `start` method to decide what to do with multiple start requests. The lifecycle `start` method can for instance simply return the unaltered component if it has already been started.

Upon successfully stopping a component the flag `{:started false}` is added to the component's meta data. It's up to the components lifecycle `stop` method to decide what to do with multiple stop requests. The lifecycle `stop` method can for instance simply return the unaltered component if it has not been started or has already been stopped.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server [port :long]
    c/Component
    (start [this]
      (let [store1 (-> (c/dep this :store1) :name)
            store2 (-> (c/dep this :store2) :name)]
        (println "server started. using the stores" store1 "," store2))
      this)
    (stop [this]

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

top

## cond

(cond & clauses)

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the value of the corresponding expr and doesn't evaluate any of the other tests or exprs. (cond) returns nil.

```
(let [n 5]
  (cond
    (< n 0) "negative"
    (> n 0) "positive"
    :else "zero"))
=> "positive"
```

### SEE ALSO

[condp](#)

Takes a binary predicate, an expression, and a set of clauses.

[case](#)

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

top

## cond->

(cond-> expr & clauses)

Takes an expression and a set of test/form pairs. Threads expr (via -> ) through each form for which the corresponding test expression is true. Note that, unlike cond branching, cond-> threading does not short circuit after the first true test expression.

It is useful in situations where you want selectively assoc, update, or dissoc something from a map.

```
(cond-> m
  (some-pred? q) (assoc :key :value))
```

```
(cond-> 1 ; we start with 1
  true inc ; the condition is true so (inc 1) => 2
  false (* 42) ; the condition is false so the operation is skipped
  (= 2 2) (* 3)) ; (= 2 2) is true so (* 2 3) => 6
=> 6
```

### SEE ALSO

top

## cond->>

(cond->> expr & clauses)

Takes an expression and a set of test/form pairs. Threads expr (via ->>) through each form for which the corresponding test expression is true. Note that, unlike cond branching, cond->> threading does not short circuit after the first true test expression.

```
(cond->> 1      ; we start with 1
  true inc      ; the condition is true so (inc 1) => 2
  false (* 42)   ; the condition is false so the operation is skipped
  (= 2 2) (* 3)) ; (= 2 2) is true so (* 3 2) => 6
=> 6
```

## SEE ALSO

[cond->](#)

Takes an expression and a set of test/form pairs. Threads expr (via ->) through each form for which the corresponding test expression ...

[top](#)

## condp

(condp pred expr & clauses)

Takes a binary predicate, an expression, and a set of clauses.

Each clause can take the form of either:

```
test-expr result-expr
test-expr :>> result-fn
```

Note :>> is an ordinary keyword.

For each clause, (pred test-expr expr) is evaluated. If it returns logical true, the clause is a match. If a binary clause matches, the result-expr is returned, if a ternary clause matches, its result-fn, which must be a unary function, is called with the result of the predicate as its argument, the result of that call being the return value of condp. A single default expression can follow the clauses, and its value will be returned if no clause matches. If no default expression is provided and no clause matches, a VncException is thrown.

```
(condp some [1 2 3 4]
  #{0 6 7} :>> inc
  #{4 5 9} :>> dec
  #{1 2 3} :>> #(* % 10))
=> 3
```

```
(condp some [-10 -20 0 10]
  pos? 1
  neg? -1
  (constantly true) 0)
=> 1
```

## SEE ALSO

[case](#)

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

[top](#)

## config/build

(build & parts)

Merges given configuration parts and returns it as a map.

Configuration parts:

- JSON classpath resource file
- JSON file
- Environment variables
- System properties

Example:

```
(do
  (load-module :config)

  (def cfg (config/build
    (config/env "java")
    (config/env-var "SERVER_PORT" [:http :port] "8080")))

  (println "home:" (-> cfg :11 :zulu :home))
  ; => home: /Library/Java/JavaVirtualMachines/zulu-11.jdk/Contents/Home

  (println "port:" (-> cfg :http :port))
  ; => port: 8080
```

```
;; -----
;; Example I) Configuration builder
(do
  (load-module :config ['config :as 'cfg])

  (cfg/build
    (cfg/resource "config-defaults.json" :key-fn keyword)
    (cfg/file "./config-local.json" :key-fn keyword)
    (cfg/env-var "SERVER_PORT" [:http :port])
    (cfg/env-var "SERVER_THREADS" [:http :threads])
    (cfg/property-var "MASTER_PWD" [:app :master-pwd])))

;; -----
;; Example II) Using configurations with the component module
(do
  (load-module :config ['config :as 'cfg])
  (load-module :component ['component :as 'cmp])

  ;; define the server component
  (deftype :server []
    cmp/Component
    (start [this]
      (let [config (cmp/dep this :config)
            port (get-in config [:server :port])]
        (println (cmp/id this) "started at port" port)
        this))
    (stop [this]
      (println (cmp/id this) "stopped")
      this))

  ;; note that the configuration is a plain vanilla Venice map and
  ;; does not implement the protocol 'Component'
  (defn create-system []
    (-> (cmp/system-map
      "test"
      :config (cfg/build
        (cfg/env-var "SERVER_PORT" [:server :port] "8800"))
```

```

      :server (server. ))
    (cmp/system-using
      {:server [:config]})))

(-> (create-system)
    (cmp/start)
    (cmp/stop))

nil)

```

## SEE ALSO

### [config/file](#)

Reads a JSON configuration part from given file f.

### [config/resource](#)

Reads a JSON configuration part from given path in classpath.

### [config/env-var](#)

Reads a configuration value from an environment variable and associates it to the given path in a map.

### [config/property-var](#)

Reads a configuration value from a system property and associates it to the given path in a map.

### [config/env](#)

Reads configuration part from environment variables, filtered by a prefix. nil may be passed as prefix to get env vars.

### [config/properties](#)

Reads configuration part from system properties, filtered by a prefix. nil may be passed as prefix to get property vars.

[top](#)

## config/env

(env prefix)

Reads configuration part from environment variables, filtered by a prefix. `nil` may be passed as prefix to get env vars.

The reader splits the environment variable names on the underscores to build a map.

```

(base) $ env | grep JAVA_
JAVA_11_OPENJDK_HOME=/Library/Java/JavaVirtualMachines/adoptopenjdk-11.jdk/Contents/Home

    :home "/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home"
  }
}

```

```
:home "/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home"  
}
```

```
(config/env "DATABASE_")
```

## SEE ALSO

[config/env-var](#)

Reads a configuration value from an environment variable and associates it to the given path in a map.

[config/properties](#)

Reads configuration part from system properties, filtered by a prefix. nil may passed as prefix to get property vars.

[config/build](#)

Merges given configuration parts and returns it as a map.

[top](#)

## config/env-var

```
(env-var name path)  
(env-var name path default-val)
```

Reads a configuration value from an environment variable and associates it to the given path in a map.

```
(config/env-var "JAVA_HOME" [:java-home])  
=> {:java-home "/Library/Java/JavaVirtualMachines/temurin-8.jdk/Contents/Home"}
```

```
(config/env-var "SERVER_PORT" [:http :port])  
=> nil
```

```
(config/env-var "SERVER_PORT" [:http :port] "8080")  
=> {:http {:port "8080"}}
```

## SEE ALSO

[config/property-var](#)

Reads a configuration value from an system property and associates it to the given path in a map.

[config/env](#)

Reads configuration part from environment variables, filtered by a prefix. nil may passed as prefix to get env vars.

[config/build](#)

Merges given configuration parts and returns it as a map.

[top](#)

## config/file

```
(file f)  
(file f reader-opts)
```

Reads a JSON configuration part from given file f.

f may be a:

- string file path, e.g: "/temp/foo.json"
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

- `java.io.InputStream`
- `java.io.Reader`
- `java.net.URL`
- `java.net.URI`

The optional 'reader-opts' are defined by `json/read-str`.

E.g.: `:key-fn keyword` will convert all config keys to keywords

```
(config/file "/foo/app/config-production.json" :key-fn keyword)
```

```
(do
  (def cfg-json """
    { "db" : {
      "classname" : "com.mysql.jdbc.Driver",
      "subprotocol" : "mysql",
      "subname" : "//127.0.0.1:3306/test",
      "user" : "test",
      "password" : "123"
    }
  }
  """)
  (-> (io/buffered-reader cfg-json)
    (config/file :key-fn keyword)))
```

## SEE ALSO

[config/resource](#)

Reads a JSON configuration part from given path in classpath.

[config/build](#)

Merges given configuration parts and returns it as a map.

[json/read-str](#)

Reads a JSON string and returns it as a Venice datatype.

[top](#)

## config/properties

```
(properties prefix)
```

Reads configuration part from system properties, filtered by a prefix. `nil` may passed as prefix to get property vars.

The reader splits the property names on the underscores to build a map.

```
(config/properties "DATABASE_")
```

## SEE ALSO

[config/property-var](#)

Reads a configuration value from an system property and associates it to the given path in a map.

[config/build](#)

Merges given configuration parts and returns it as a map.

[top](#)

## config/property-var

```
(property-var name path)
(property-var name path default-val)
```

Reads a configuration value from an system property and associates it to the given path in a map.

```
(config/property-var "java.vendor" [:java :vendor])
=> {:java {:vendor "Temurin"}}

(config/property-var "java.version" [:java :version])
=> {:java {:version "1.8.0_322"}}

(config/property-var "SERVER_PORT" [:http :port])
=> nil

(config/property-var "SERVER_PORT" [:http :port] "8080")
=> {:http {:port "8080"}}
```

#### SEE ALSO

[config/env-var](#)

Reads a configuration value from an environment variable and associates it to the given path in a map.

[config/properties](#)

Reads configuration part from system properties, filtered by a prefix. nil may passed as prefix to get property vars.

[config/build](#)

Merges given configuration parts and returns it as a map.

[top](#)

## config/resource

```
(resource path)
(resource path reader-opts)
```

Reads a JSON configuration part from given path in classpath.

The optional 'reader-opts' are defined by `json/read-str`.

E.g.: `:key-fn keyword` will convert all config keys to keywords

```
(config/resource "com/github/jlanch/venice/examples/database-config.json"
  :key-fn keyword)
=> {:db {:classname "com.mysql.jdbc.Driver" :subname "//127.0.0.1:3306/test" :user "test" :subprotocol "mysql" :
password "123"}}
```

#### SEE ALSO

[config/file](#)

Reads a JSON configuration part from given file f.

[config/build](#)

Merges given configuration parts and returns it as a map.

[json/read-str](#)

Reads a JSON string and returns it as a Venice datatype.

[top](#)

# conj

```
(conj)
(conj x)
(conj coll x)
(conj coll x & xs)
```

Returns a new collection with the x, xs 'added'. `(conj nil item)` returns (item). For list, vectors and ordered maps the values are added at the end. For all other sets and maps the position is undefined.

```
(conj [1 2 3] 4)
=> [1 2 3 4]

(conj [1 2 3] 4 5)
=> [1 2 3 4 5]

(conj [1 2 3] [4 5])
=> [1 2 3 [4 5]]

(conj '(1 2 3) 4)
=> (1 2 3 4)

(conj '(1 2 3) 4 5)
=> (1 2 3 4 5)

(conj '(1 2 3) '(4 5))
=> (1 2 3 (4 5))

(conj (set 1 2 3) 4)
=> #{1 2 3 4}

(conj {:a 1 :b 2} [:c 3])
=> {:a 1 :b 2 :c 3}

(conj {:a 1 :b 2} {:c 3})
=> {:a 1 :b 2 :c 3}

(conj {:a 1 :b 2} (map-entry :c 3))
=> {:a 1 :b 2 :c 3}

(conj)
=> []

(conj 4)
=> 4
```

## SEE ALSO

### [cons](#)

Returns a new collection where x is the first element and coll is the rest

### [into](#)

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

### [concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

### [list\\*](#)

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

**vector\***

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

## conj!

```
(conj!)  
(conj! x)  
(conj! coll x)  
(conj! coll x & xs)
```

Returns a new mutable collection with the x, xs 'added'. `(conj! nil item)` returns `(item)`. For mutable list the values are added at the end. For all mutable sets and maps the position is undefined.

```
(conj! (mutable-list 1 2 3) 4)  
=> (1 2 3 4)  
  
(conj! (mutable-list 1 2 3) 4 5)  
=> (1 2 3 4 5)  
  
(conj! (mutable-list 1 2 3) '(4 5))  
=> (1 2 3 (4 5))  
  
(conj! (mutable-set 1 2 3) 4)  
=> #{1 2 3 4}  
  
(conj! (mutable-map :a 1 :b 2) [:c 3])  
=> {:a 1 :b 2 :c 3}  
  
(conj! (mutable-map :a 1 :b 2) {:c 3})  
=> {:a 1 :b 2 :c 3}  
  
(conj! (mutable-map :a 1 :b 2) (map-entry :c 3))  
=> {:a 1 :b 2 :c 3}  
  
(conj! (stack) 1 2 3))  
=> (3 2 1)  
  
(conj! (queue) 1 2 3))  
=> (1 2 3)  
  
(conj!)  
=> ()  
  
(conj! 4)  
=> 4
```

[top](#)

## cons

```
(cons x coll)
```

Returns a new collection where x is the first element and coll is the rest

```
(cons 1 '(2 3 4 5 6))
=> (1 2 3 4 5 6)

(cons 1 nil)
=> (1)

(cons [1 2] [4 5 6])
=> [[1 2] 4 5 6]

(cons 3 (set 1 2))
=> #{1 2 3}

(cons {:c 3} {:a 1 :b 2})
=> {:a 1 :b 2 :c 3}

(cons (map-entry :c 3) {:a 1 :b 2})
=> {:a 1 :b 2 :c 3}

; cons a value to a lazy sequence
(->> (cons -1 (lazy-seq 0 #(+ % 1)))
      (take 5)
      (doall))
=> (-1 0 1 2 3)

; recursive lazy sequence (fibonacci example)
(do
  (defn fib
    ([ ] (fib 1 1))
    ([a b] (cons a (fn [] (fib b (+ a b))))))

    (doall (take 6 (fib))))
=> (1 1 2 3 5 8)
```

## SEE ALSO

### [conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item). For list, vectors and ordered maps the values are ...

### [list\\*](#)

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

### [vector\\*](#)

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

## cons!

```
(cons! x coll)
```

Adds x to the mutable coll

```
(cons! 1 (mutable-list 2 3))
=> (1 2 3)
```

```
(cons! 3 (mutable-set 1 2))
=> #{1 2 3}

(cons! {:c 3} (mutable-map :a 1 :b 2))
=> {:a 1 :b 2 :c 3}

(cons! (map-entry :c 3) (mutable-map :a 1 :b 2))
=> {:a 1 :b 2 :c 3}
```

[top](#)

## constantly

```
(constantly x)
```

Returns a function that takes any number of arguments and returns always the value x.

```
(do
  (def fix (constantly 10))
  (fix 1 2 3)
  (fix 1)
  (fix ))
=> 10
```

### SEE ALSO

#### [repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

#### [repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

#### [dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[top](#)

## contains?

```
(contains? coll key)
```

Returns true if key is present in the given collection, otherwise returns false.

Note: To test if a value is in a vector or list use `any?`

```
(contains? #{:a :b} :a)
=> true

(contains? {:a 1 :b 2} :a)
=> true

(contains? [10 11 12] 1)
=> true

(contains? [10 11 12] 5)
=> false
```

```
(contains? "abc" 1)
=> true
```

```
(contains? "abc" 5)
=> false
```

## SEE ALSO

### [not-contains?](#)

Returns true if key is not present in the given collection, otherwise returns false.

### [any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[top](#)

## count

```
(count coll)
```

Returns the number of items in the collection. `(count nil)` returns 0. Also works on strings, and Java Collections

```
(count {:a 1 :b 2})
=> 2
```

```
(count [1 2])
=> 2
```

```
(count "abc")
=> 3
```

[top](#)

## cpus

```
(cpus)
```

Returns the number of available processors or number of hyperthreads if the CPU supports hyperthreads.

```
(cpus)
=> 8
```

[top](#)

## crypt/decrypt

```
(crypt/decrypt algorithm passphrase & options)
```

Returns a new thread safe function to decrypt a string or a bytebuf given the algorithm and passphrase. If a string is passed it is base64 decoded, decrypted, and returned as string. If a bytebuf is passed the decrypted bytebuf is returned.

Supported algorithms: "DES", "3DES", "AES256"

Options:

`:url-safe {true/false}`

The boolean option directs the base64 decoder to decode standard or URL safe base64 encoded strings. If enabled (true) the base64 decoder will convert '-' and '\_' characters back to '+' and '/' before decoding.

Defaults to false.

```
(do
  (load-module :crypt)
  (def decrypt (crypt/decrypt "3DES" "secret" :url-safe true))
  (decrypt "ndmW1NLsDHA") ; => "hello"
  (decrypt "KPYjndkZ8vM") ; => "world"
  (decrypt (bytebuf [128 216 205 163 62 43 52 82]))) ; => [1 2 3 4]
=> [1 2 3 4]
```

[top](#)

## crypt/encrypt

(crypt/encrypt algorithm passphrase & options)

Returns a new thread safe function to encrypt a string or a bytebuf given the algorithm and passphrase. If a string is passed it is encrypted and returned as a base64 encoded string. If a bytebuf is passed the encrypted bytebuf is returned.

Supported algorithms: "DES", "3DES", "AES256"

Options:

`:url-safe {true/false}`

The boolean option directs the base64 encoder to emit standard or URL safe base64 encoded strings. If `true` the base64 encoder will emit '-' and '\_' instead of the usual '+' and '/' characters.

Defaults to false.

Note: no padding is added when encoding using the URL-safe alphabet.

```
(do
  (load-module :crypt)
  (def encrypt (crypt/encrypt "3DES" "secret" :url-safe true))
  (encrypt "hello") ; => "ndmW1NLsDHA"
  (encrypt "world") ; => "KPYjndkZ8vM"
  (encrypt (bytebuf [1 2 3 4]))) ; => [128 216 205 163 62 43 52 82]
=> [128 216 205 163 62 43 52 82]
```

[top](#)

## crypt/md5-hash

(crypt/md5-hash data)  
(crypt/md5-hash data salt)

Hashes a string or a bytebuf using MD5 with an optional salt.

Note: MD5 is not safe any more use PBKDF2 instead!

```
(-> (crypt/md5-hash "hello world")
    (str/bytebuf-to-hex :upper))
=> "5EB63BBBE01EEED093CB22BB8F5ACDC3"
```

```
(-> (crypt/md5-hash "hello world" "-salt-")
    (str/bytebuf-to-hex :upper))
=> "C40C4EAC3C1B87B6877E21FEBA087D0A"
```

[top](#)

## crypt/pbkdf2-hash

```
(crypt/pbkdf2-hash data salt)
(crypt/pbkdf2-hash data salt iterations key-length)
```

Hashes a string using PBKDF2. iterations defaults to 1000, key-length defaults to 256.

```
(-> (crypt/pbkdf2-hash "hello world" "-salt-")
    (str/bytebuf-to-hex :upper))
=> "54F2B4411E8817C2A0743B2A7DD7EAE5AA3F748D1DDCE00766380914AFFE995"
```

```
(-> (crypt/pbkdf2-hash "hello world" "-salt-" 1000 256)
    (str/bytebuf-to-hex :upper))
=> "54F2B4411E8817C2A0743B2A7DD7EAE5AA3F748D1DDCE00766380914AFFE995"
```

[top](#)

## crypt/sha1-hash

```
(crypt/sha1-hash data)
(crypt/sha1-hash data salt)
```

Hashes a string or a bytebuf using SHA1 with an optional salt.

```
(-> (crypt/sha1-hash "hello world")
    (str/bytebuf-to-hex :upper))
=> "2AAE6C35C94FCFB415DBE95F408B9CE91EE846ED"
```

```
(-> (crypt/sha1-hash "hello world" "-salt-")
    (str/bytebuf-to-hex :upper))
=> "90AECEDB9423CC9BC5BB7CBAFB88380BE5745B3D"
```

[top](#)

## crypt/sha512-hash

```
(crypt/sha512-hash data)
(crypt/sha512-hash data salt)
```

Hashes a string or a bytebuf using SHA512 with an optional salt.

```
(let [s (-> (crypt/sha512-hash "hello world")
             (str/bytebuf-to-hex :upper))]
      (str (str/nfirst s 32) "... " (str/nlast s 32)))
=> "309ECC489C12D6EB4CC40F50C902F2B4...D830E81F605DCF7DC5542E93AE9CD76F"
```

```
(let [s (-> (crypt/sha512-hash "hello world" "-salt-")
            (str/bytebuf-to-hex :upper))]
  (str (str/nfirst s 32) "... " (str/nlast s 32)))

```

[top](#)

## csv/read

(csv/read source & options)

Reads CSV-data from a source.

The source may be a:

- `string`
- `bytebuf`
- `java.io.File`, e.g. `(io/file "/temp/foo.json")`
- `java.nio.Path`, `
- `java.io.InputStream`
- `java.io.Reader`

Options:

:encoding enc      used when reading from a binary data source e.g :encoding :utf-8, defaults to :utf-8

:separator val     e.g. ",", defaults to a comma

:quote val        e.g. "\"", defaults to a double quote

```
(csv/read "1,\"ab\",false")
=> (("1" "ab" "false"))

(csv/read "1:::'ab':false" :separator ":" :quote "'")
=> (("1" nil nil "ab" "false"))
```

[top](#)

## csv/write

(csv/write sink records & options)

Spits data to a sink in CSV format.

The sink may be a:

- `java.io.File`, e.g. `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.OutputStream`
- `java.io.Writer`

Options:

:separator val     e.g. ",", defaults to a comma

:quote val        e.g. "\"", defaults to a double quote

:newline val      :lf (default) or :cr+lf

:encoding enc      used when writing to a binary data sink. e.g :encoding :utf-8, defaults to :utf-8

```
(csv/write (io/file "test.csv") [[1 "AC" false] [2 "WS" true]])
```

top

## csv/write-str

(csv/write-str records & options)

Writes data to a string in CSV format.

Options:

:separator val    e.g. ",", defaults to a comma  
:quote val        e.g. "", defaults to a double quote  
:newline val      :lf (default) or :cr+lf

```
(csv/write-str [[1 "AC" false] [2 "WS" true]])  
=> "1,AC,false\n2,WS,true"
```

```
(csv/write-str [[1 "AC" false] [2 "WS, '-1'" true]]  
              :quote ""  
              :separator ", "  
              :newline :cr+lf)  
=> "1,AC,false\r\n2,'WS, '-1'',true"
```

top

## current-time-millis

(current-time-millis)

Returns the current time in milliseconds.

```
(current-time-millis)  
=> 1688999644192
```

### SEE ALSO

[nano-time](#)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

top

## cycle

(cycle coll)

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

```
(doall (take 5 (cycle [1 2])))  
=> (1 2 1 2 1)
```

## SEE ALSO

### [repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

### [repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

### [dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

### [constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

## dag/add-edges

```
(add-edges edges*)
```

Add edges to a DAG. Returns a new DAG with added edges.

An edge is a vector of two nodes forming a parent/child relationship. Any *Venice* value can be used for a node.

Note: The graph is reconstructed after adding edges. To have best performance pass the edges with a single `add-edges` call to the DAG.

```
(dag/add-edges (dag/dag) ["A" "B"] ["B" "C"])
=> (["A" "B"] ["B" "C"])
```

## SEE ALSO

### [dag/dag](#)

Creates a new DAG (directed acyclic graph) built from edges

### [dag/topological-sort](#)

Topological sort of a DAG using Kahn's algorithm ([https://en.wikipedia.org/wiki/Topological\\_sorting](https://en.wikipedia.org/wiki/Topological_sorting))

[top](#)

## dag/add-nodes

```
(add-nodes nodes*)
```

Add nodes to a DAG. Returns a new DAG with added nodes.

Any *Venice* value can be used for a node.

Note: The graph is reconstructed after adding nodes. To have best performance pass the nodes with a single `add-nodes` call to the DAG.

```
(dag/add-nodes (dag/dag) "A")
=> ("A")
```

```
(-> (dag/dag)
    (dag/add-nodes "A")
    (dag/add-edges ["A" "B"])))
=> (["A" "B"])
```

```
(-> (dag/dag)
    (dag/add-nodes "A"))
```

```
(dag/add-edges ["B" "C"]))  
=> ("A" ["B" "C"])
```

## SEE ALSO

Topological sort of a DAG using Kahn's algorithm ([https://en.wikipedia.org/wiki/Topological\\_sorting](https://en.wikipedia.org/wiki/Topological_sorting))

[top](#)

## dag/child-of?

```
(child-of? dag c v)
```

Returns `true` if `c` is a transitive child of `v`

```
(-> (dag/dag ["A", "B"] ; A E  
           ["B", "C"] ; | |  
           ["C", "D"] ; B F  
           ["E", "F"] ; | / \  
           ["F", "C"] ; C G  
           ["F", "G"] ; \ /  
           ["G", "D"] ; D  
    (dag/child-of? "G" "E"))  
=> true
```

## SEE ALSO

[dag/dag](#)

Creates a new DAG (directed acyclic graph) built from edges

[dag/children](#)

Returns the transitive child nodes

[dag/parent-of?](#)

Returns true if `p` is a transitive parent of `v`

[top](#)

## dag/children

```
(children dag node)
```

Returns the transitive child nodes

```
(dag/children (dag/dag ["A" "B"] ["B" "C"]) "A")  
=> ("B" "C")
```

```
(-> (dag/dag ["A", "B"] ; A E  
           ["B", "C"] ; | |  
           ["C", "D"] ; B F  
           ["E", "F"] ; | / \  
           ["F", "C"] ; C G  
           ["F", "G"] ; \ /
```

```
      ["G", "D"]) ;      D
    (dag/children "F"))
=> ("C" "G" "D")
```

Returns the direct parent nodes

### [dag/roots](#)

Returns the root nodes of a DAG

[top](#)

## [dag/compare-fn](#)

```
(compare-fn dag)
```

Returns a comparator fn which produces a topological sort based on the dependencies in the graph. Nodes not present in the graph will sort after nodes in the graph.

```
(let [g (dag/dag ["A", "B"] ; A E
                 ["B", "C"] ; | |
                 ["C", "D"] ; B F
                 ["E", "F"] ; | / \
                 ["F", "C"] ; C G
                 ["F", "G"] ; \ /
                 ["G", "D"])] ; D
      (sort (dag/compare-fn g) ["D" "F" "A" "Z"]))
=> ["F" "A" "D" "Z"]
```

Divides x by y and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

#### [dec/scale](#)

Scales a decimal. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

[top](#)

## decimal

(decimal x) (decimal x scale rounding-mode)

Converts to decimal. rounding-mode is one of (:CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, :UP)

```
(decimal 2)
=> 2M
```

```
(decimal 2 3 :HALF_UP)
=> 2.000M
```

```
(decimal 2.5787 3 :HALF_UP)
=> 2.579M
```

```
(decimal 2.5787M 3 :HALF_UP)
=> 2.579M
```

```
(decimal "2.5787" 3 :HALF_UP)
=> 2.579M
```

```
(decimal nil)
=> 0M
```

[top](#)

## decimal?

```
(decimal? n)
```

Returns true if n is a decimal

```
(decimal? 4.0M)
=> true
```

```
(decimal? 4.0)
=> false
```

```
(decimal? 3)
=> false
```

```
(decimal? 3I)
=> false
```

[top](#)

## dedupe

```
(dedupe coll)
```

Returns a collection with all consecutive duplicates removed.  
Returns a stateful transducer when no collection is provided.

```
(dedupe [1 2 2 2 3 4 4 2 3])
=> [1 2 3 4 2 3]
```

```
(dedupe '(1 2 2 2 3 4 4 2 3))
=> (1 2 3 4 2 3)
```

### SEE ALSO

[distinct](#)

Returns a collection with all duplicates removed.

[top](#)

## def

```
(def name expr)
```

Creates a global variable.

```
(def x 5)
=> user/x

(def sum (fn [x y] (+ x y)))
=> user/sum

(def ^{:private true} x 100)
=> user/x
```

## SEE ALSO

[def](#)

Creates a global variable.

[def-](#)

Same as `def`, yielding non-public `def`

[defonce](#)

Creates a global variable that can not be overwritten

[def-dynamic](#)

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[set!](#)

Sets a global or thread-local variable to the value of the expression.

[top](#)

## def-

```
(def- name expr)
```

Same as `def`, yielding non-public `def`

```
(def- x 100)

(do
  (ns foo)
  (def- x 100)
  (ns bar)
  foo/x) ; Illegal access of private symbol
```

## SEE ALSO

[def](#)

Creates a global variable.

[top](#)

## def-dynamic

```
(def-dynamic name expr)
```

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

```
(do
  (def-dynamic x 100)
  (println x)
  (binding [x 200]
    (println x))
  (println x)))
100
200
100
=> nil

(def-dynamic ^{:private true} x 100)
=> user/x
```

## SEE ALSO

### [binding](#)

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

### [def](#)

Creates a global variable.

### [defonce](#)

Creates a global variable that can not be overwritten

### [set!](#)

Sets a global or thread-local variable to the value of the expression.

[top](#)

## defmacro

```
(defmacro name [params*] body)
```

Macro definition

```
(defmacro unless [pred a b]
  `(if (not ~pred) ~a ~b))
=> user/unless
```

## SEE ALSO

### [macroexpand](#)

If form represents a macro form, returns its expansion, else returns form.

### [macroexpand-all](#)

Recursively expands all macros in the form.

[top](#)

## defmethod

```
(defmethod multifn-name dispatch-val & fn-tail)
```

Creates a new method for a multimethod associated with a dispatch-value.

```
(do
  ;;defmulti with dispatch function
  (defmulti salary (fn [amount] (amount :t)))

  ;;defmethod provides a function implementation for a particular value
  (defmethod salary "com" [amount] (+ (:b amount) (/ (:b amount) 2)))
  (defmethod salary "bon" [amount] (+ (:b amount) 99))
  (defmethod salary :default [amount] (:b amount))

  [(salary {:t "com" :b 1000})
   (salary {:t "bon" :b 1000})
   (salary {:t "xxx" :b 1000})]
)
=> [1500 1099 1000]
```

## SEE ALSO

### [defmulti](#)

Creates a new multimethod with the associated dispatch function.

top

## defmulti

```
(defmulti name dispatch-fn)
```

Creates a new multimethod with the associated dispatch function.

```
(do
  ;;defmulti with dispatch function
  (defmulti salary (fn [amount] (amount :t)))

  ;;defmethod provides a function implementation for a particular value
  (defmethod salary "com" [amount] (+ (:b amount) (/ (:b amount) 2)))
  (defmethod salary "bon" [amount] (+ (:b amount) 99))
  (defmethod salary :default [amount] (:b amount))

  [(salary {:t "com" :b 1000})
   (salary {:t "bon" :b 1000})
   (salary {:t "xxx" :b 1000})]
)
=> [1500 1099 1000]
```

```
(do
  ;;dispatch on type
  (defmulti test (fn [x] (type x)))

  (defmethod test :core/number [x] [x :number])
  (defmethod test :core/string [x] [x :string])
  (defmethod test :core/boolean [x] [x :boolean])
  (defmethod test :default [x] [x :default])

  [(test 1)
   (test 1.0)
   (test 1.0M)
   (test "abc")
   (test [1])]
)
=> [[1 :number] [1.0 :number] [1.0M :number] ["abc" :string] [[1] :default]]
```

## SEE ALSO

### [defmethod](#)

Creates a new method for a multimethod associated with a dispatch-value.

[top](#)

## defn

```
(defn name [args*] condition-map? expr*)  
(defn name ([args*] condition-map? expr*)+)
```

Same as `(def name (fn name [args*] condition-map? expr*))` or `(def name (fn name ([args*] condition-map? expr*)+))`

```
(defn sum [x y] (+ x y))  
=> user/sum
```

```
(defn sum [x y] { :pre [(> x 0)] } (+ x y))  
=> user/sum
```

```
(defn sum  
  ([] 0)  
  ([x] x)  
  ([x y] (+ x y)))  
=> user/sum
```

## SEE ALSO

### [defn-](#)

Same as `defn`, yielding non-public `def`

### [fn](#)

Defines an anonymous function.

### [def](#)

Creates a global variable.

[top](#)

## defn-

```
(defn- name [args*] condition-map? expr*)  
(defn- name ([args*] condition-map? expr*)+)
```

Same as `defn`, yielding non-public `def`

```
(defn- sum [x y] (+ x y))  
=> user/sum
```

## SEE ALSO

### [defn](#)

Same as `(def name (fn name [args*] condition-map? expr*))` or `(def name (fn name ([args*] condition-map? expr*)+))`

### [fn](#)

Defines an anonymous function.

## def

Creates a global variable.

top

## defonce

(defonce name expr)

Creates a global variable that can not be overwritten

```
(defonce x 5)
=> user/x
```

```
(defonce ^{:private true} x 5)
=> user/x
```

### SEE ALSO

#### def

Creates a global variable.

#### def-dynamic

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

top

## defprotocol

(defprotocol protocol fn-spec\*)

Defines a new protocol with the supplied function specs.

Formats:

- (defprotocol P (foo [x]))
- (defprotocol P (foo [x] [x y]))
- (defprotocol P (foo [x] [x y] nil))
- (defprotocol P (foo [x] [x y] 100))
- (defprotocol P (foo [x]) (bar [x] [x y]))

```
(do
  (ns foo)
  (deftype :complex [re :long, im :long])
  (defprotocol XMath (+ [x y])
                    (- [x y]))
  (extend :foo/complex XMath
    (+ [x y] (complex. (core/+ (:re x) (:re y))
                       (core/+ (:im x) (:im y)))))
    (- [x y] (complex. (core/- (:re x) (:re y))
                       (core/- (:im x) (:im y)))))
  (extend :core/long XMath
    (+ [x y] (core/+ x y))
    (- [x y] (core/- x y)))
  (foo/+ (complex. 1 1) (complex. 4 5)))
=> {:custom-type* :foo/complex :re 5 :im 6}
```

```

(do
  (ns foo)
  (defprotocol Lifecycle (start [c]) (stop [c]))
  (deftype :component [name :string]
    Lifecycle (start [c] (println "'~(:name c)' started"))
              (stop [c] (println "'~(:name c)' stopped")))
  (let [c (component. "test")
        lifecycle? (extends? (type c) Lifecycle)]
    (println "'~(:name c)' extends Lifecycle protocol: ~{lifecycle?}")
    (start c)
    (stop c)))
'test' extends Lifecycle protocol: true
'test' started
'test' stopped
=> nil

```

## SEE ALSO

### [extend](#)

Extends protocol for type with the supplied functions.

### [extends?](#)

Returns true if the type extends the protocol.

### [defmulti](#)

Creates a new multimethod with the associated dispatch function.

top

## deftype

```

(deftype name fields)
(deftype name fields validator)

```

Defines a new custom *record* type for the name with the fields.

Venice implicitly creates a builder and a type check function suffixed with a dot and a question mark:

```

(deftype :point [x :long, y :long])

(point. 200 300)           ; builder
(point? (point. 200 300)) ; type check

```

The builder accepts values of any subtype of the field's type.

```

(do
  (ns foo)
  (deftype :point [x :long, y :long])
  ; explicitly creating a custom type value
  (def x (. :point 100 200))
  ; Venice implicitly creates a builder function
  ; suffixed with a '.'
  (def y (point. 200 300))
  ; ... and a type check function
  (point? y)
  y)
=> {:custom-type* :foo/point :x 200 :y 300}

```

```

(do
  (ns foo)
  (deftype :point [x :long, y :long])

```

```

(def x (point. 100 200))
(type x)
=> :foo/point

(do
  (ns foo)
  (deftype :point [x :long, y :long]
    (fn [p]
      (assert (pos? (:x p)) "x must be positive")
      (assert (pos? (:y p)) "y must be positive"))))
  (def p (point. 100 200))
  [(:x p) (:y p)])
=> [100 200]

(do
  (ns foo)
  (deftype :named [name :string, value :any])
  (def x (named. "count" 200))
  (def y (named. "seq" [1 2]))
  [x y])
=> [{:custom-type* :foo/named :name "count" :value 200} {:custom-type* :foo/named :name "seq" :value [1 2]}]

;; modifying a custom type field
(do
  (deftype :point [x :long, y :long])
  (def p (point. 0 0))
  (def q (assoc p :x 1 :y 2)) ; q is a 'point'
  (pr-str q))
=> "{:custom-type* :user/point :x 1 :y 2}"

;; removing a custom type field
(do
  (deftype :point [x :long, y :long])
  (def p (point. 100 200))
  (def q (dissoc p :x)) ; q is just a map now
  (pr-str q))
=> "{:y 200}"

```

## SEE ALSO

### [deftype?](#)

Returns true if type is a custom type else false.

### [deftype-of](#)

Defines a new custom wrapper type based on a base type.

### [deftype-or](#)

Defines a new custom choice type.

### [..](#)

Instantiates a custom type.

### [deftype-describe](#)

Describes a custom type.

### [Object](#)

Defines a protocol to customize the toString and/or the compareTo function of custom datatypes.

### [assoc](#)

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, ...

### [dissoc](#)

Returns a new coll of the same type, that does not contain a mapping for key(s)

## deftype-describe

```
(deftype-describe type)
```

Describes a custom type.

```
(do
  (ns foo)
  (deftype :complex [real :long, imaginary :long])
  (deftype-describe :complex))

=> {:type :foo/complex :custom-type :record :field-defs ({:name :real :type :core/long :index 0I :nillable
false} {:name :imaginary :type :core/long :index 1I :nillable false}) :validation-fn nil}

(do
  (ns foo)
  (deftype-of :port :long)
  (deftype-describe :port))

=> {:custom-type :wrapping :base-type :core/long :type :foo/port :validation-fn nil}

(do
  (ns foo)
  (deftype-or :digit 0 1 2 3 4 5 6 7 8 9)
  (deftype-describe :digit))
=> {:type :foo/digit :custom-type :choice :values #{0 1 2 3 4 5 6 7 8 9}}
```

### SEE ALSO

Describes a custom type.

[top](#)

## delay

(delay & body)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with `force` or `deref` / `@`), and will cache the result and return it on all subsequent force calls.

```
(do
  (def x (delay (println "working...") 100))
  (deref x))
working...
=> 100
```

## SEE ALSO

### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [force](#)

If x is a delay, returns its value, else returns x

### [realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

### [delay?](#)

Returns true if x is a Delay created with delay

### [memoize](#)

Returns a memoized version of a referentially transparent function.

[top](#)

## delay-queue

(delay-queue)

Creates a new delay queue.

A delay-queue is an unbounded blocking queue of delayed elements, in which an element can only be taken when its delay has expired. The head of the queue is that delayed element whose delay expired furthest in the past. If no delay has expired there is no head and `poll!` will return `nil`. Unexpired elements cannot be removed using `take!` or `poll!`, they are otherwise treated as normal elements. For example, the `count` method returns the count of both expired and unexpired elements. This queue does not permit `nil` elements.

Example rate limiter:

```
(do
  (defprotocol RateLimiter (init [x]) (acquire [x]))

  (deftype :rate-limiter [queue                :core/delay-queue
                        limit-for-period      :long
                        limit-refresh-period :long]
    RateLimiter
    (init [this] (let [q (:queue this)
                      n (:limit-for-period this)]
                  (empty q)
                  (repeatedly n #(put! q :token 0))
                  this))
    (acquire [this] (let [q (:queue this)
                        p (:limit-refresh-period this)]
                     (take! q)
                     (put! q :token p))))

  ;; create a limiter with a limit of 5 actions within a 2s period
  (def limiter (init (rate-limiter. (delay-queue) 5 2000)))

  ;; test the limiter
  (doseq [x (range 1 26)]
    (acquire limiter)
    (printf "%s: run %2d%n" (time/local-date-time) x)))

(let [q (delay-queue)]
  (put! q 1 100)
  (put! q 1 200)
  (take! q))
=> 1
```

## SEE ALSO

### [peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

### [put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

### [take!](#)

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

### [poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

### [empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

### [empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

### [count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

### [delay-queue?](#)

Returns true if coll is a delay-queue

top

## delay-queue?

```
(delay-queue? coll)
```

Returns true if coll is a delay-queue

```
(delay-queue? (delay-queue))  
=> true
```

top

## delay?

```
(delay? x)
```

Returns true if x is a Delay created with delay

```
(do  
  (def x (delay (println "working...") 100))  
  (delay? x))  
=> true
```

## SEE ALSO

### [delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

## deliver

```
(deliver ref value)
```

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

```
(do
  (def p (promise))
  (deliver p 10)
  (deliver p 20) ; no effect
  @p)
=> 10
```

### SEE ALSO

[deliver-ex](#)

Delivers the supplied exception to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

## deliver-ex

```
(deliver-ex ref ex)
```

Delivers the supplied exception to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

```
(do
  (def p (promise))
  (deliver-ex p (ex :VncException "error"))
  (deliver p 20) ; no effect
  (try
    @p
    (catch :VncException e (ex-message e))))
=> "error"
```

### SEE ALSO

[deliver](#)

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

## deref

```
(deref x)
(deref x timeout-ms timeout-val)
```

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will block if computation is not complete. The variant taking a timeout can be used for futures and will return `timeout-val` if the timeout (in milliseconds) is reached before a value is available. If a future is deref'd and the waiting thread is interrupted the futures are cancelled.

```
(do
  (def counter (atom 10))
  (deref counter))
=> 10

(do
  (def counter (atom 10))
  @counter)
=> 10

(do
  (defn task [] 100)
  (let [f (future task)]
    (deref f)))
=> 100

(do
  (defn task [] 100)
  (let [f (future task)]
    @f))
=> 100

(do
  (defn task [] 100)
  (let [f (future task)]
    (deref f 300 :timeout)))
=> 100

(do
  (def x (delay (println "working...") 100))
  @x)
working...
=> 100

(do
  (def p (promise))
  (deliver p 10)
  @p)
=> 10

(do
  (def x (agent 100))
  @x)
=> 100

(do
  (def counter (volatile 10))
  @counter)
=> 10
```

## deref?

```
(deref? x)
```

Returns true if x is dereferencable.

```
(deref? (atom 10))  
=> true
```

```
(deref? (delay 100))  
=> true
```

```
(deref? (promise))  
=> true
```

```
(deref? (future (fn [] 10)))  
=> true
```

```
(deref? (volatile 100))  
=> true
```

```
(deref? (agent 100))  
=> true
```

```
(deref? (just 100))  
=> true
```

## difference

```
(difference s1)  
(difference s1 s2)  
(difference s1 s2 & sets)
```

Return a set that is the first set without elements of the remaining sets

```
(difference (set 1 2 3))  
=> #{1 2 3}
```

```
(difference (set 1 2) (set 2 3))  
=> #{1}
```

```
(difference (set 1 2) (set 1) (set 1 4) (set 3))  
=> #{2}
```

### SEE ALSO

[union](#)

Return a set that is the union of the input sets

[intersection](#)

Return a set that is the intersection of the input sets

`cons`

Returns a new collection where x is the first element and coll is the rest

`conj`

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item). For list, vectors and ordered maps the values are ...

`disj`

Returns a new set with the x, xs removed.

[top](#)

## digits

`(digits x)`

Returns the number of digits of x. The number x must be of type integer, long, or bigint

```
(digits 124)
=> 3
```

```
(digits -10)
=> 2
```

```
(digits 11111111111111111111111111111111N)
=> 32
```

[top](#)

## disj

`(disj set x)`  
`(disj set x & xs)`

Returns a new set with the x, xs removed.

```
(disj (set 1 2 3) 3)
=> #{1 2}
```

[top](#)

## dissoc

`(dissoc coll key)`  
`(dissoc coll key & ks)`

Returns a new coll of the same type, that does not contain a mapping for key(s)

```
(dissoc {:a 1 :b 2 :c 3} :b)
=> {:a 1 :c 3}
```

```

(dissoc {:a 1 :b 2 :c 3} :c :b)
=> {:a 1}

(dissoc [1 2 3] 0)
=> [2 3]

(do
  (deftype :complex [real :long, imaginary :long])
  (def x (complex. 100 200))
  (def y (dissoc x :real))
  (pr-str y))
=> "{:imaginary 200}"

```

## SEE ALSO

[assoc](#)

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, ...

[update](#)

Updates a value in an associative structure, where k is a key and f is a function that will take the old value and any supplied fargs ...

[top](#)

## dissoc!

```

(dissoc! coll key)
(dissoc! coll key & ks)

```

Dissociates keys from a mutable map, returns the map

```

(dissoc! (mutable-map :a 1 :b 2 :c 3) :b)
=> {:a 1 :c 3}

(dissoc! (mutable-map :a 1 :b 2 :c 3) :c :b)
=> {:a 1}

(dissoc! (mutable-vector 1 2 3) 0)
=> [2 3]

```

## SEE ALSO

[assoc!](#)

Associates key/vals with a mutable map, returns the map

[update!](#)

Updates a value in a mutable associative structure, where k is a key and f is a function that will take the old value and any supplied ...

[top](#)

## dissoc-in

```

(dissoc-in m ks)

```

Dissociates an entry in a nested associative structure, where ks is a sequence of keys and returns a new nested structure.

```
(do
  (def users [ {:name "James" :age 26}
                {:name "John" :age 43} ])
  (dissoc-in users [1]))
=> [{:name "James" :age 26}]

(do
  (def users [ {:name "James" :age 26}
                {:name "John" :age 43} ])
  (dissoc-in users [1 :age]))
=> [{:name "James" :age 26} {:name "John"}]
```

[top](#)

## distinct

```
(distinct coll)
```

Returns a collection with all duplicates removed.  
Returns a stateful transducer when no collection is provided.

```
(distinct [1 2 3 4 2 3 4])
=> [1 2 3 4]
```

```
(distinct '(1 2 3 4 2 3 4))
=> (1 2 3 4)
```

### SEE ALSO

[dedupe](#)

Returns a collection with all consecutive duplicates removed.

[distinct?](#)

Returns true if no two of the arguments are equal

[top](#)

## distinct?

```
(distinct? x) (distinct? x y) (distinct? x y & more)
```

Returns true if no two of the arguments are equal

```
(distinct? 1 2 3)
=> true
```

```
(distinct? 1 2 3 3)
=> false
```

```
(distinct? 1 2 3 1)
=> false
```

### SEE ALSO

[distinct](#)

Returns a collection with all duplicates removed.

## do

```
(do exprs)
```

Evaluates the expressions in order and returns the value of the last.

```
(do (println "Test...") (+ 1 1))
Test...
=> 2
```

## doall

```
(doall coll)
(doall n coll)
```

When lazy sequences are produced doall can be used to force any effects and realize the lazy sequence.

```
(->> (lazy-seq #(rand-long 100))
      (take 4)
      (doall))
=> (10 99 64 13)

(->> (lazy-seq #(rand-long 100))
      (doall 4))
=> (84 89 4 23)
```

### SEE ALSO

[lazy-seq](#)

Creates a new lazy sequence.

## dobench

```
(dobench iterations expr)
(dobench warm-up-iterations gc-runs iterations expr)
```

Runs the expr iterations times in the most effective way and returns a list of elapsed nanoseconds for each invocation. It's main purpose is supporting benchmark tests.

*Note:* For best performance enable `macroexpand-on-load` !

```
(dobench 100 (+ 1 1))
=> (19853 3463 384 242 215 169 235 164 140 168 141 206 144 166 254 173 144 213 173 149 146 184 163 185 168 181
188 183 170 203 176 154 164 221 198 143 150 177 187 145 179 170 179 174 153 211 181 156 152 174 209 192 178 175
176 144 172 188 198 146 176 187 190 157 176 175 170 145 150 168 165 182 149 174 184 166 154 185 183 166 174 207

```

[top](#)

## doc

```
(doc x)
```

Prints documentation for a var or special form given `x` as its name. Prints the definition of custom types.

Displays the source of a module if `x` is a module: `(doc :ansi)`

If the var could not be found, searches for a similiar var with the **Levenshtein distance** 1.

E.g:

```
> (doc dac)
Symbol 'dac' not found!

Did you mean?
  dag/dag
  dec
```

```
(doc +)
```

```
(doc def)
```

```
(do
  (deftype :complex [real :long, imaginary :long])
  (doc :complex))
```

### SEE ALSO

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[modules](#)

Lists the available Venice modules

[top](#)

## docoll

```
(docoll f coll)
```

Applies f to the items of the collection presumably for side effects. Returns nil.

```
(docoll #(println %) [1 2 3 4])
1
2
3
4
=> nil
```

```

(docoll
  (fn [[k v]] (println (pr-str k v))))
{:a 1 :b 2 :c 3 :d 4})
;a 1
;b 2
;c 3
;d 4
=> nil

;; docoll all elements of a queue. calls (take! queue) to get the
;; elements of the queue.
;; note: use nil to mark the end of the queue otherwise docoll will
;;       block forever!
(let [q (conj! (queue) 1 2 3 nil)]
  (docoll println q))
1
2
3
=> nil

```

## SEE ALSO

[mapv](#)

Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of ...

top

## done?

```
(done? f)
```

Returns true if the future or promise is done otherwise false

```

(do
  (def wait (fn [] (sleep 200) 100))
  (let [f (future wait)]
    (sleep 50)
    (printf "After 50ms: done=%b\n" (done? f))
    (sleep 300)
    (printf "After 300ms: done=%b\n" (done? f)))))
After 50ms: done=false
After 300ms: done=true
=> nil

```

## SEE ALSO

[future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[cancel](#)

Cancels a future or a promise

[cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

## dorun

```
(dorun count expr)
```

Runs the `expr` `count` times in the most effective way. It's main purpose is supporting benchmark tests. Returns the expression result of the last invocation.

*Note:*

For best performance enable `macroexpand-on-load` ! The expression is evaluated for every run. Alternatively a zero or one arg function referenced by a symbol can be passed:

```
(let [f (fn [] (+ 1 1))]
  (dorun 10 f))
```

When passing a one arg function `dorun` passes the incrementing counter value (0..N) to the function:

```
(let [f (fn [x] (+ x 1))]
  (dorun 10 f))
```

```
(dorun 10 (+ 1 1))
=> 2
```

## doseq

```
(doseq seq-exprs & body)
```

Repeatedly executes `body` (presumably for side-effects) with bindings and filtering as provided by `list-comp`. Does not retain the head of the sequence. Returns `nil`.

Supported modifiers are: `:when` predicate

```
(doseq [x (range 10)] (print x))
0123456789
=> nil
```

```
(doseq [x (range 10)] (print x) (print "-"))
0-1-2-3-4-5-6-7-8-9-
=> nil
```

```
(doseq [x (range 5)] (print (* x 2)))
02468
=> nil
```

```
(doseq [x (range 10) :when (odd? x)] (print x))
13579
=> nil
```

```
(doseq [x (range 10) :when (odd? x)] (print (* x 2)))
26101418
=> nil
```

```
(doseq [x [1 2 3] y [1 2 3]] (println [x y]))
[1 1]
[1 2]
```

```
[1 3]
[2 1]
[2 2]
[2 3]
[3 1]
[3 2]
[3 3]
=> nil
```

```
(doseq [[x y] [[0 1] [1 2]]] (println [x y]))
[0 1]
[1 2]
=> nil
```

```
(doseq [[c vals] (group-by count ["a" "as" "asd" "aa" "asdf" "qwer"])]
  (println c vals))
1 [a]
2 [as aa]
3 [asd]
4 [asdf qwer]
=> nil
```

## SEE ALSO

### [list-comp](#)

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and ...

### [dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[top](#)

## dotimes

```
(dotimes bindings & body)
```

Repeatedly executes body with name bound to integers from 0 through n-1.

```
(dotimes [n 3] (println (str "n is " n)))
n is 0
n is 1
n is 2
=> nil
```

## SEE ALSO

### [repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

### [repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

### [doseq](#)

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

### [list-comp](#)

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and ...

[top](#)

## doto

```
(doto x & forms)
```

Evaluates x then calls all of the methods and functions with the value of x supplied at the front of the given arguments. The forms are evaluated in order. Returns x.

```
(doto (. :java.util.HashMap :new)
      (. :put :a 1)
      (. :put :b 2))
=> {"a" 1 "b" 2}
```

[top](#)

## double

```
(double x)
```

Converts to double

```
(double 1)
=> 1.0

(double nil)
=> 0.0

(double false)
=> 0.0

(double true)
=> 1.0

(double 1.2)
=> 1.2

(double 1.2M)
=> 1.2

(double "1.2")
=> 1.2
```

[top](#)

## double-array

```
(double-array coll)
(double-array len)
(double-array len init-val)
```

Returns an array of Java primitive doubles containing the contents of coll or returns an array with the given length and optional init value

```
(double-array '(1.0 2.0 3.0))
=> [1.0, 2.0, 3.0]

(double-array '(1I 2 3.2 3.56M))
=> [1.0, 2.0, 3.2, 3.56]

(double-array 10)
=> [0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0]

(double-array 10 42.0)
=> [42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0]
```

[top](#)

## double?

```
(double? n)
```

Returns true if n is a double

```
(double? 4.0)
=> true
```

```
(double? 3)
=> false
```

```
(double? 3I)
=> false
```

```
(double? 3.0M)
=> false
```

```
(double? true)
=> false
```

```
(double? nil)
=> false
```

```
(double? {})
=> false
```

[top](#)

## drop

```
(drop n coll)
```

Returns a collection of all but the first n items in coll.  
Returns a stateful transducer when no collection is provided.

```
(drop 3 [1 2 3 4 5])
=> [4 5]
```

```
(drop 10 [1 2 3 4 5])  
=> []
```

[top](#)

## drop-last

```
(drop-last n coll)
```

Return a sequence of all but the last n items in coll.  
Returns a stateful transducer when no collection is provided.

```
(drop-last 3 [1 2 3 4 5])  
=> [1 2]
```

```
(drop-last 10 [1 2 3 4 5])  
=> []
```

[top](#)

## drop-while

```
(drop-while predicate coll)
```

Returns a list of the items in coll starting from the first item for which `(predicate item)` returns logical false.  
Returns a stateful transducer when no collection is provided.

```
(drop-while neg? [-2 -1 0 1 2 3])  
=> [0 1 2 3]
```

[top](#)

## empty

```
(empty coll)
```

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection and returns the emptied collection.

```
(empty {:a 1})  
=> {}
```

```
(empty [1 2])  
=> []
```

```
(empty '(1 2))  
=> ()
```

[top](#)

## empty-to-nil

```
(empty-to-nil x)
```

Returns nil if x is empty

```
(empty-to-nil "")  
=> nil
```

```
(empty-to-nil [])  
=> nil
```

```
(empty-to-nil '())  
=> nil
```

```
(empty-to-nil {})  
=> nil
```

[top](#)

## empty?

```
(empty? x)
```

Returns true if x is empty. Accepts strings, collections and bytebufs.

```
(empty? {})  
=> true
```

```
(empty? [])  
=> true
```

```
(empty? '())  
=> true
```

```
(empty? "")  
=> true
```

### SEE ALSO

[not-empty?](#)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

[top](#)

## entries

```
(entries m)
```

Returns a collection of the map's entries.

```

(entries {:a 1 :b 2 :c 3})
=> ([:a 1] [:b 2] [:c 3])

(let [e (entries {:a 1 :b 2 :c 3})]
  (println (map key e))
  (println (map val e)))
(:a :b :c)
(1 2 3)
=> nil

;; compare to 'into'
(let [e (into [] {:a 1 :b 2 :c 3})]
  (println (map first e))
  (println (map second e)))
(:a :b :c)
(1 2 3)
=> nil

```

## SEE ALSO

### [map](#)

Applies `f` to the set of first items of each coll, followed by applying `f` to the set of second items in each coll, until any one of the ...

### [key](#)

Returns the key of the map entry.

### [val](#)

Returns the val of the map entry.

### [keys](#)

Returns a collection of the map's keys.

### [vals](#)

Returns a collection of the map's values.

### [map-entry](#)

Creates a new map entry

[top](#)

# eval

```
(eval form)
```

Evaluates the form data structure (not text!) and returns the result.

```

(eval '(let [a 10] (+ 3 4 a)))
=> 17

```

```

(eval (list + 1 2 3))
=> 6

```

```

(let [s "(+ 2 x)" x 10]
  (eval (read-string s)))
=> 12

```

## SEE ALSO

### [read-string](#)

Reads Venice source from a string and transforms its content into a Venice data structure, following the rules of the Venice syntax.

## even?

```
(even? n)
```

Returns true if n is even, throws an exception if n is not an integer

```
(even? 4)  
=> true
```

```
(even? 3)  
=> false
```

```
(even? (int 3))  
=> false
```

### SEE ALSO

[odd?](#)

Returns true if n is odd, throws an exception if n is not an integer

## every-pred

```
(every-pred p1 & p)
```

Takes a set of predicates and returns a function f that returns true if all of its composing predicates return a logical true value against all of its arguments, else it returns false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical false result against the original predicates.

```
((every-pred number?) 1)  
=> true
```

```
((every-pred number?) 1 2)  
=> true
```

```
((every-pred number? even?) 2 4 6)  
=> true
```

## every?

```
(every? pred coll)
```

Returns true if the predicate is true for all collection items, false otherwise.

```
(every? number? nil)  
=> false
```

```
(every? number? [])
=> false

(every? number? [1 2 3 4])
=> true

(every? number? [1 2 3 :a])
=> false

(every? #(>= % 10) [10 11 12])
=> true
```

## SEE ALSO

### [any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

### [not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

### [not-every?](#)

Returns false if the predicate is true for all collection items, true otherwise

[top](#)

## ex

```
(ex class)
(ex class args*)
```

Creates an exception of type *class* with optional *args*. The *class* must be a subclass of `:java.lang.Exception`

The exception types:

- `:java.lang.Exception`
- `:java.lang.RuntimeException`
- `:com.github.jlangch.venice.VncException`
- `:com.github.jlangch.venice.ValueException`

are imported implicitly so its alias `:Exception`, `:RuntimeException`, `:VncException`, and `:ValueException` can be used.

### Checked vs unchecked exceptions

All exceptions in Venice are *unchecked*.

If *checked* exceptions are thrown in Venice they are immediately wrapped in a `:RuntimeException` before being thrown!

If Venice catches a *checked* exception from a Java Interop call it wraps it in a `:RuntimeException` before handling it by the catch block selectors.

```
(try
  (throw (ex :VncException))
  (catch :VncException e "caught :VncException"))
=> "caught :VncException"

(try
  (throw (ex :RuntimeException "#test"))
  (catch :Exception e
    "msg: ~(ex-message e)"))
=> "msg: #test"

(try
  (throw (ex :ValueException 100))
```

```

    (catch :ValueException e
      "value: ~(ex-value e)")
=> "value: 100"

(do
  (defn throw-ex-with-cause []
    (try
      (throw (ex :java.io.IOException "I/O failure"))
      (catch :Exception e
        (throw (ex :VncException "failure" (ex-cause e))))))
  (try
    (throw-ex-with-cause)
    (catch :Exception e
      "msg: ~(ex-message e), cause: ~(ex-message (ex-cause e))")))
=> "msg: failure, cause: I/O failure"

```

## SEE ALSO

### [throw](#)

Throws an exception.

### [try](#)

Exception handling: try - catch - finally

### [try-with](#)

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

### [ex?](#)

Returns true if x is a an instance of :java.lang.Throwable

### [ex-venice?](#)

Returns true if x is a an instance of :VncException

[top](#)

## ex-cause

```
(ex-cause x)
```

Returns the exception cause or nil

```

(ex-cause (ex :VncException "a message" (ex :RuntimeException "..cause..")))
=> java.lang.RuntimeException: ..cause..

```

```

(ex-cause (ex :VncException "a message"))
=> nil

```

## SEE ALSO

### [ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

### [ex-message](#)

Returns the message of the exception

### [ex-value](#)

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

[top](#)

## ex-java-stacktrace

```
(ex-java-stacktrace x)
(ex-java-stacktrace x format)
```

Returns the Java stacktrace for an exception.

The optional format (:string or :list) controls the format of the returned stacktrace. The default format is :string.

```
(println (ex-java-stacktrace (ex :RuntimeException "message")))
```

```
(println (ex-java-stacktrace (ex :VncException "message") :list))
```

### SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-venice-stacktrace](#)

Returns the Venice stacktrace for an exception or nil if the exception is not a venice exception.

[top](#)

## ex-message

```
(ex-message x)
```

Returns the message of the exception

```
(ex-message (ex :VncException "a message"))
=> "a message"
```

```
(ex-message (ex :RuntimeException))
=> nil
```

### SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-cause](#)

Returns the exception cause or nil

[ex-value](#)

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

[top](#)

## ex-value

```
(ex-value x)
```

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

```
(ex-value (ex :ValueException [10 20]))  
=> (10 20)
```

```
(ex-value (ex :RuntimeException))  
=> nil
```

## SEE ALSO

Adds a sheet with optional attributes to an Excel.

Options:

:no-header-row b	without header row, e.g. true, false
:default-column-width n	default column width in points, e.g. 100
:default-header-style s	default header style, e.g. :header
:default-body-style s	default body style, e.g. :body
:default-footer-style s	default footer style, e.g. :footer
:merged-region r	merged region [row-from row-to col-from col-to], e.g. [1 1 4 10]
:display-zeros b	display zeros, e.g. true, false. Defines if a cell should show 0 (zero) when containing zero value. When false, cells with zero value appear blank instead of showing the number zero.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :age 28 }
                {:first "Sue" :last "Ford" :age 26 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-items sheet data)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))

    (excel/cell-formula sheet 2 3 (sum (addr 2 1) (addr 2 2)))
    (excel/cell-formula sheet 3 3 (sum (addr 3 1) (addr 3 2)))
    (excel/evaluate-formulas wbook)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

## SEE ALSO

[excel/col->string](#)

Returns an Excel A-style column number string representation for a column number

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

## excel/area-data-series

```
(area-data-series title data-address-range)
```

Build an area chart data series

Arguments:

title	The series title
data-address-range	The series data in the Excel

```
(excel/area-data-series "Countries" (excel/cell-address-range 2 2 1 5))
```

### SEE ALSO

[excel/cell-address-range](#)

Build a cell address range

## excel/auto-size-column

```
(auto-size-column sheet col)
```

Auto size the width of column col (1..n) in the sheet.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :age 28 }
                {:first "Sue" :last "Ford" :age 26 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-items sheet data)
    (excel/auto-size-column sheet 1)
    (excel/auto-size-column sheet 2)
    (excel/auto-size-column sheet 3)
    (excel/write->file wbook "sample.xlsx")))
```

### SEE ALSO

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/write-value](#)

Writes a value to a specific cell given by its row and col.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

## [excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

## excel/auto-size-columns

(auto-size-columns sheet)

Auto size the width of all columns in the sheet.

```
(do
  (load-module :excel)
  (let [data [ { :first "John" :last "Doe" :age 28 }
                { :first "Sue" :last "Ford" :age 26 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-items sheet data)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

### SEE ALSO

#### [excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

#### [excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

#### [excel/write-item](#)

Render a single data item to the sheet

#### [excel/write-value](#)

Writes a value to a specific cell given by its row and col.

#### [excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

#### [excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

## excel/bar-data-series

(bar-data-series title data-address-range)

Build a bar chart data series

Arguments:

title	The series title
data-address-range	The series data in the Excel

```
(excel/bar-data-series "Countries" (excel/cell-address-range 2 2 1 5))
```

## SEE ALSO

[excel/cell-address-range](#)

Build a cell address range

                               [500 501 503]
                               [600 601 603]])
      (excel/bg-color sheet 1 6 1 3 "#a9cafc" "#d9e7fc")
      (excel/write->file wbook "sample.xlsx")))
```

## SEE ALSO

[excel/add-style](#)

Add a style with optional attributes to an Excel.

[excel/add-font](#)

Add font with optional attributes to an Excel.

[excel/cell-style](#)

Apply a defined cell style to a cell

[top](#)

## excel/cell-address-range

(cell-address-range row-first row-last col-first col-last)

Build a cell address range

([excel/cell-address-range](#) 1 2 1 10)

### SEE ALSO

[excel/cell-address](#)

Returns the cell address in A1 style for a cell at row/col in a sheet

[top](#)

## excel/cell-empty?

(cell-empty? sheet row col)

Returns true if the sheet cell given by row/col is empty.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 101 102] [200 201 202]])
      (excel/write->bytebuf wbook)))

  (let [wbook (excel/open (test-xls))
        sheet (excel/sheet wbook "Data")]
    [(excel/cell-empty? sheet 1 1)
     (excel/cell-empty? sheet 2 1)
     (excel/cell-empty? sheet 3 1)]))
```

### SEE ALSO

[excel/cell-type](#)

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

[excel/read-string-val](#)

Returns the sheet cell value as string.

[excel/read-boolean-val](#)

Returns the sheet cell value as boolean.

[excel/read-long-val](#)

Returns the sheet cell value as long.

[excel/read-double-val](#)

Returns the sheet cell value as double.

[excel/read-date-val](#)

Returns the sheet cell value as a date (:java.time.LocalDate).

[excel/read-datetime-val](#)

Returns the sheet cell value as a datetime (:java.time.LocalDateTime).

## excel/cell-formula

(cell-formula sheet row col formula)

Set a formula for a specific cell given by its row and col.

```
(do
  (load-module :excel)
  (let [data [ {:a 100 :b 200 }
                {:a 101 :b 201 }
                {:a 102 :b 202 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1" { :no-header-row true })]
    (excel/add-column sheet "A" { :field :a })
    (excel/add-column sheet "B" { :field :b })
    (excel/add-column sheet "C" { :field :c })
    (excel/write-items sheet data)
    (excel/cell-formula sheet 1 3 "SUM(A1,B1)")
    (excel/cell-formula sheet 2 3 "SUM(A2,B2)")
    (excel/cell-formula sheet 3 3 "SUM(A3,B3)")
    (excel/evaluate-formulas wbook)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

```
(do
  (load-module :excel)
  (let [data [ {:a 100 :b 200 }
                {:a 101 :b 201 }
                {:a 102 :b 202 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1" { :no-header-row true })]

    (excel/add-column sheet "A" { :field :a })
    (excel/add-column sheet "B" { :field :b })
    (excel/add-column sheet "C" { :field :c })
    (excel/write-items sheet data)
    (excel/cell-formula sheet 1 3 "SUM(A1,B1)" :bold)
    (excel/cell-formula sheet 2 3 "SUM(A2,B2)" :bold)
    (excel/cell-formula sheet 3 3 "SUM(A3,B3)" :bold)
    (excel/evaluate-formulas wbook)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

### SEE ALSO

#### [excel/addr->string](#)

Returns an Excel A1-style cell address string representation for a row and column address

#### [excel/sum-formula](#)

Returns a sum formula for the given cell area

#### [excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

#### [excel/write-item](#)

Render a single data item to the sheet

#### [excel/write-value](#)

Writes a value to a specific cell given by its row and col.

#### [excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

#### [excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

#### [excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

## excel/cell-formula-result-type

```
(cell-formula-result-type sheet row col)
```

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown } after formula cell evaluation. For non formula cells this function is the same as the `cell-type` function.

```
(do
  (load-module :excel)

  (defn create-excel []
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[10 20.123 {:formula "SUM(A1,B1)"}]])
      (excel/write->bytebuf wbook)))

  (let [wbook (excel/open (create-excel))
        sheet (excel/sheet wbook "Data")]
    (excel/evaluate-formulas wbook)

    (printf "Cell (1,3): %s (formula result type)\n"
      (excel/cell-formula-result-type sheet 1 3))))
```

### SEE ALSO

#### [excel/cell-type](#)

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

#### [excel/cell-empty?](#)

Returns true if the sheet cell given by row/col is empty.

#### [excel/read-string-val](#)

Returns the sheet cell value as string.

#### [excel/read-boolean-val](#)

Returns the sheet cell value as boolean.

#### [excel/read-long-val](#)

Returns the sheet cell value as long.

#### [excel/read-double-val](#)

Returns the sheet cell value as double.

#### [excel/read-date-val](#)

Returns the sheet cell value as a date (:java.time.LocalDate).

#### [excel/read-datetime-val](#)

Returns the sheet cell value as a datetime (:java.time.LocalDateTime).

[top](#)

## excel/cell-style

(cell-style sheet row col style-id)  
(cell-style sheet row-from row-to col-from col-to style-id)

Apply a defined cell style to a cell

```
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1" { :no-header-row false })]
    (excel/add-font wbook :bold { :bold true

```

### SEE ALSO

[excel/add-style](#)

Add a style with optional attributes to an Excel.

[excel/add-font](#)

Add font with optional attributes to an Excel.

#### [excel/write-value](#)

Writes a value to a specific cell given by its row and col.

[top](#)

## excel/cell-type

```
(cell-type sheet row col)
```

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

Note:

1. Excel returns cells containing long, double, date or datetime values as `:numeric` . The reader decides how to read a numeric cell using either of `excel/read-long-val` , `excel/read-double-val` , or `excel/read-date-val` .
2. To evaluate formulas to values call `excel/evaluate-formulas` on the workbook the right after opening the excel document.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 "101" 102.0]])
      (excel/write->bytebuf wbook)))

  (let [wbook (excel/open (test-xls))
        sheet (excel/sheet wbook "Data")]
    [(excel/cell-type sheet 1 1)
     (excel/cell-type sheet 1 2)
     (excel/cell-type sheet 1 3)
     (excel/cell-type sheet 1 4)]))
```

### SEE ALSO

#### [excel/cell-formula-result-type](#)

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown } after formula ...

#### [excel/cell-empty?](#)

Returns true if the sheet cell given by row/col is empty.

#### [excel/read-string-val](#)

Returns the sheet cell value as string.

#### [excel/read-boolean-val](#)

Returns the sheet cell value as boolean.

#### [excel/read-long-val](#)

Returns the sheet cell value as long.

#### [excel/read-double-val](#)

Returns the sheet cell value as double.

#### [excel/read-date-val](#)

Returns the sheet cell value as a date (:java.time.LocalDate).

#### [excel/read-datetime-val](#)

Returns the sheet cell value as a datetime (:java.time.LocalDateTime).

[top](#)

## excel/col->string

```
(col->string col)
```

Returns an Excel A-style column number string representation for a column number

```
(excel/col->string 1)
```

```
(excel/col->string 56)
```

### SEE ALSO

    (excel/col-width sheet 3 60)
    (excel/write->file wbook "sample.xlsx")))
```

### SEE ALSO

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/write-value](#)

Writes a value to a specific cell given by its row and col.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

## excel/auto-size-column

Auto size the width of column col (1..n) in the sheet.

[top](#)

## excel/convert->reader

(convert->reader builder)

Converts an excel or sheet builder to the corresponding reader.

```
(do
  (load-module :excel)
  (let [data [ {:a 100 :b 200 }
                {:a 101 :b 201 }
                {:a 102 :b 202 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1"
                                { :no-header-row true })]
    (excel/add-column sheet "A" { :field :a })
    (excel/add-column sheet "B" { :field :b })
    (excel/add-column sheet "C" { :field :c })
    (excel/write-items sheet data)
    (excel/cell-formula sheet 1 3 "SUM(A1,B1)")
    (excel/cell-formula sheet 2 3 "SUM(A2,B2)")
    (excel/cell-formula sheet 3 3 "SUM(A3,B3)")
    (let [reader (excel/convert->reader sheet)]
      (excel/evaluate-formulas reader)
      (excel/read-long-val reader 1 3))))
```

[top](#)

## excel/convert->writer

(convert->writer reader)

Converts an excel or sheet reader to the corresponding writer.

```
(do
  (load-module :excel)

  (let [wbook-rd (excel/open "sample.xlsx")
        wbook-wr (excel/convert->writer wbook-rd)
        sheet-wr (excel/sheet wbook-wr 1) ]
    (excel/write-value sheet-wr 1 1 "foo")
    (excel/auto-size-columns sheet-wr)
    (excel/write->file wbook-wr "sample.xlsx")))
```

[top](#)

## excel/evaluate-formulas

(evaluate-formulas it)

Evaluate all formulas in the Excel.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 101 102] [200 201 202]])
      (excel/write->bytebuf wbook)))

  (let [wbook (excel/open (test-xls))]
    (excel/evaluate-formulas wbook)))
```

## SEE ALSO

[excel/writer](#)

Creates a new Excel builder for the given type :xls or :xlsx.

[top](#)

## excel/freeze-pane

```
(freeze-pane sheet rows cols)
```

Creates a split (freezepane). Any existing freezepane or split pane is overwritten.

If both rows and cols are 0 then the existing freeze pane is removed.

rows: the number of rows to freeze (starting from the first row) cols: the number of columns to freeze (starting from the first column)

```
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1" { :no-header-row false })]
    (excel/write-data sheet [(map #(str "Col " %) (range 1 11))])
    (excel/write-data sheet (partition 10 (range 100 500)) 2 1)
    (excel/freeze-pane sheet 1 0)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

## SEE ALSO

[excel/add-merge-region](#)

Add a merge region to the sheet.

[top](#)

## excel/line-data-series

```
(line-data-series title smooth? marker data-address-range)
```

Build a line chart data series

Arguments:

title	The series title
smooth?	Smooth rendering (splines): <code>true</code> or <code>false</code>

marker	The marker type: <code>:CIRCLE</code> , <code>:DASH</code> , <code>:DIAMOND</code> , <code>:DOT</code> , <code>:NONE</code> , <code>:PLUS</code> , <code>:SQUARE</code> , <code>:STAR</code> , <code>:TRIANGLE</code>
data-address-range	The series data in the Excel

```
(excel/line-data-series "Countries"
  false
  :SQUARE
  (excel/cell-address-range 2 2 1 5))
```

#### SEE ALSO

[excel/cell-address-range](#)  
Build a cell address range

[top](#)

## excel/open

(open source)

Opens an Excel from a source and returns an Excel reader.

Supported sources are string file path, bytebuf, `:java.io.File` , or `:java.io.InputStream` .

```
(do
  (load-module :excel)

  (let [wbook (excel/open "sample.xlsx")]
    (println "Sheet count: " (excel/sheet-count wbook))))
```

#### SEE ALSO

[excel/sheet-count](#)  
Returns the number of sheets in the Excel.

[excel/sheet](#)  
Returns a sheet from the Excel reader referenced by its name or sheet index.

[excel/evaluate-formulas](#)  
Evaluate all formulas in the Excel.

[top](#)

## excel/pie-data-series

(pie-data-series data-address-range)

Build a pie chart data series

Arguments:

data-address-range	The series data in the Excel
--------------------	------------------------------

```
(excel/pie-data-series (excel/cell-address-range 2 2 1 5))
```

#### SEE ALSO

[excel/cell-address-range](#)

## excel/read-boolean-val

```
(read-boolean-val sheet row col)
```

Returns the sheet cell value as boolean.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 true 102]])
      (excel/write->bytebuf wbook)))

  (let [wbook (excel/open (test-xls))
        sheet (excel/sheet wbook "Data")]
    (excel/read-boolean-val sheet 1 2)))
```

### SEE ALSO

#### [excel/cell-empty?](#)

Returns true if the sheet cell given by row/col is empty.

#### [excel/cell-type](#)

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

#### [excel/read-string-val](#)

Returns the sheet cell value as string.

#### [excel/read-long-val](#)

Returns the sheet cell value as long.

#### [excel/read-double-val](#)

Returns the sheet cell value as double.

#### [excel/read-date-val](#)

Returns the sheet cell value as a date (:java.time.LocalDate).

#### [excel/read-datetime-val](#)

Returns the sheet cell value as a datetime (:java.time.LocalDateTime).

#### [excel/read-val](#)

Returns the sheet cell value.

## excel/read-date-val

```
(read-date-val sheet row col)
```

Returns the sheet cell value as a date (:java.time.LocalDate).

```
(do
  (load-module :excel)
```

```

(defn test-xls []
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Data")
        dt1   (time/local-date 2021 1 1)
        dt2   (time/local-date 2022 4 15)]
    (excel/write-data sheet [[100 dt1 dt2 102]])
    (excel/write->bytebuf wbook)))

(let [wbook (excel/open (test-xls))
      sheet (excel/sheet wbook "Data")]
  [(excel/read-date-val sheet 1 2)
   (excel/read-date-val sheet 1 3)]))

```

## SEE ALSO

### [excel/cell-empty?](#)

Returns true if the sheet cell given by row/col is empty.

### [excel/cell-type](#)

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

### [excel/read-string-val](#)

Returns the sheet cell value as string.

### [excel/read-boolean-val](#)

Returns the sheet cell value as boolean.

### [excel/read-long-val](#)

Returns the sheet cell value as long.

    (excel/sheet-name sheet)))
```

[top](#)

## excel/sheet-row-range

```
(sheet-row-range sheet)
```

Returns the first and the last row with data in a sheet as vector. Returns -1 values if no row exists.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 101 102] [200 201 202]])
      (excel/write->bytebuf wbook)))

  (let [wbook (excel/open (test-xls))
        sheet (excel/sheet wbook "Data")]
    (excel/sheet-row-range sheet)))
```

#### SEE ALSO

[excel/sheet-col-range](#)

Returns the first and the last col with data in a sheet row as vector. Returns -1 values if the row does not exist or the row does ...

[top](#)

## excel/sum-formula

```
(sum-formula sheet row-from row-to col-from col-to)
```

Returns a sum formula for the given cell area

```
(do
  (load-module :excel)
  (let [data [ { :a 100 :b 200 }
                { :a 101 :b 201 }
                { :a 102 :b 202 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1" { :no-header-row true })]

    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

## SEE ALSO

### [excel/write->stream](#)

Writes the excel to a Java :OutputStream.

### [excel/write->bytebuf](#)

Writes the excel to a bytebuf. Returns the bytebuf.

[top](#)

## excel/write-item

```
(write-item sheet item)
```

Render a single data item to the sheet

```
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-item sheet {:first "John" :last "Doe" :age 28 })
    (excel/write-item sheet {:first "Sue" :last "Ford" :age 26 })
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

### SEE ALSO

#### [excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

#### [excel/write-value](#)

Writes a value to a specific cell given by its row and col.

#### [excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

#### [excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

#### [excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

#### [excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

## excel/write-items

```
(write-items sheet items)
```

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :age 28 }
               {:first "Sue" :last "Ford" :age 26 } ]

Set the height of a row (1..n) in the sheet.

[top](#)

## excel/writer

(writer type)

Creates a new Excel builder for the given type :xls or :xlsx.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :age 28 }
                {:first "Sue" :last "Ford" :age 26 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-items sheet data)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

## SEE ALSO

### [excel/add-sheet](#)

Adds a sheet with optional attributes to an Excel.

### [excel/add-font](#)

Add font with optional attributes to an Excel.

### [excel/add-style](#)

Add a style with optional attributes to an Excel.

### [excel/write->file](#)

Writes the excel to a file.

[excel/write->stream](#)

Writes the excel to a Java :OutputStream.

[excel/write->bytebuf](#)

Writes the excel to a bytebuf. Returns the bytebuf.

[excel/evaluate-formulas](#)

Evaluate all formulas in the Excel.

top

## exists-class?

(exists-class? name)

Returns true the Java class for the given name exists otherwise returns false.

```
(exists-class? :java.util.ArrayList)
=> true
```

top

## exp

(exp x)

Returns Euler's number e raised to the power of a value.

```
(exp 10)
=> 22026.465794806718
```

```
(exp 10.23)
=> 27722.51006805505
```

```
(exp 10.23M)
=> 27722.51006805505
```

### SEE ALSO

[exp](#)

Returns Euler's number e raised to the power of a value.

top

## extend

(extend type protocol fns\*)

Extends protocol for type with the supplied functions.

Formats:

- (extend :core/long P (foo [x] x))

- `(extend :core/long P (foo [x] x) (foo [x y] x))`
- `(extend :core/long P (foo [x] x) (bar [x] x))`

```
(do
  (ns foo)
  (deftype :complex [re :long, im :long])
  (defprotocol XMath (+ [x y])
                    (- [x y]))
  (extend :foo/complex XMath
    (+ [x y] (complex. (core/+ (:re x) (:re y))
                      (core/+ (:im x) (:im y)))))
    (- [x y] (complex. (core/- (:re x) (:re y))
                      (core/- (:im x) (:im y)))))

  (extend :core/long XMath
    (+ [x y] (core/+ x y))
    (- [x y] (core/- x y)))
  (foo/+ (complex. 1 1) (complex. 4 5)))
=> {:custom-type* :foo/complex :re 5 :im 6}
```

## SEE ALSO

### [defprotocol](#)

Defines a new protocol with the supplied function specs.

### [extends?](#)

Returns true if the type extends the protocol.

top

## extends?

```
(extends? type protocol)
```

Returns true if the type extends the protocol.

```
(do
  (ns foo)
  (deftype :complex [re :long, im :long])
  (defprotocol XMath (+ [x y])
                    (- [x y]))
  (extend :foo/complex XMath
    (+ [x y] (complex. (core/+ (:re x) (:re y))
                      (core/+ (:im x) (:im y)))))
    (- [x y] (complex. (core/- (:re x) (:re y))
                      (core/- (:im x) (:im y)))))

  (extend :core/long XMath
    (+ [x y] (core/+ x y))
    (- [x y] (core/- x y)))
  (extends? :foo/complex XMath))
=> true
```

## SEE ALSO

### [defprotocol](#)

Defines a new protocol with the supplied function specs.

### [extend](#)

Extends protocol for type with the supplied functions.

## false?

```
(false? x)
```

Returns true if x is false, false otherwise

```
(false? true)
=> false
```

```
(false? false)
=> true
```

```
(false? nil)
=> false
```

```
(false? 0)
=> false
```

```
(false? (== 1 2))
=> true
```

### SEE ALSO

#### true?

Returns true if x is true, false otherwise

#### not

Returns true if x is logical false, false otherwise.

## filter

```
(filter predicate coll)
```

Returns a collection of the items in coll for which `(predicate item)` returns logical true.  
Returns a transducer when no collection is provided.

```
(filter even? [1 2 3 4 5 6 7])
=> (2 4 6)
```

```
(filter #(even? (val %)) {:a 1 :b 2})
=> ([:b 2])
```

```
(filter even? #{1 2 3})
=> (2)
```

### SEE ALSO

#### map

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

#### reduce

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

## filter-k

```
(filter-k f map)
```

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

```
(filter-k #(= % :a) {:a 1 :b 2 :c 3})  
=> {:a 1}
```

### SEE ALSO

[filter-kv](#)

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

## filter-kv

```
(filter-kv f map)
```

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

```
(filter-kv (fn [k v] (= k :a)) {:a 1 :b 2 :c 3})  
=> {:a 1}
```

```
(filter-kv (fn [k v] (= v 2)) {:a 1 :b 2 :c 3})  
=> {:b 2}
```

### SEE ALSO

[filter-k](#)

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

## find

```
(find map key)
```

Returns the map entry for key, or nil if key not present.

```
(find {:a 1 :b 2} :b)  
=> [:b 2]
```

```
(find {:a 1 :b 2} :z)  
=> nil
```

## first

```
(first coll)
```

Returns the first element of coll or nil if coll is nil or empty.

```
(first nil)
=> nil
```

```
(first [])
=> nil
```

```
(first [1 2 3])
=> 1
```

```
(first '())
=> nil
```

```
(first '(1 2 3))
=> 1
```

```
(first "abc")
=> #\a
```

[top](#)

## flatten

```
(flatten coll)
```

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. `(flatten nil)` returns an empty list.  
Returns a transducer when no collection is provided.

```
(flatten [])
=> []
```

```
(flatten [[1 2 3] [4 [5 6]] [7 [8 [9]]]])
=> [1 2 3 4 5 6 7 8 9]
```

```
(flatten [1 2 {:a 3 :b [4 5 6]}])
=> [1 2 {:a 3 :b [4 5 6]}]
```

```
(flatten (seq {:a 1 :b 2}))
=> (:a 1 :b 2)
```

### SEE ALSO

[mapcat](#)

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

[top](#)

## float-array

```
(float-array coll)
(float-array len)
(float-array len init-val)
```

Returns an array of Java primitive floats containing the contents of coll or returns an array with the given length and optional init value

```
(float-array '(1.0 2.0 3.0))
=> [1.0, 2.0, 3.0]

(float-array '(1I 2 3.2 3.56M))
=> [1.0, 2.0, 3.200000047683716, 3.559999942779541]

(float-array 10)
=> [0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0]

(float-array 10 42.0)
=> [42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0]
```

[top](#)

## floor

```
(floor x)
```

Returns the largest integer that is less than or equal to x

```
(floor 1.4)
=> 1.0

(floor -1.4)
=> -2.0

(floor 1.23M)
=> 1.00M

(floor -1.23M)
=> -2.00M
```

### SEE ALSO

[ceil](#)

Returns the largest integer that is greater than or equal to x

[top](#)

## flush

```
(flush)
(flush os)
```

Without arg flushes the output stream that is the current value of `*out*`. With arg flushes the passed stream that must be a subclass of either `:java.io.OutputStream` or `:java.io.Writer`.

Returns `nil`.

```
(flush)
=> nil
```

```
(flush *out*)
=> nil
```

```
(flush *err*)
=> nil
```

## SEE ALSO

[io/flush](#)

Flushes a `:java.io.OutputStream` or a `:java.io.Writer`.

[io/close](#)

Closes a `:java.io.InputStream`, `:java.io.OutputStream`, `:java.io.Reader`, or a `:java.io.Writer`.

[top](#)

## fn

```
(fn name? [params*] condition-map? expr*)
```

Defines an anonymous function.

```
(do
  (def sum (fn [x y] (+ x y)))
  (sum 2 3))
=> 5
```

```
;; multi-arity anonymous function
(let [f (fn ([x] x) ([x y] (+ x y)))]
  [(f 1) (f 4 6)])
=> [1 10]
```

```
(map (fn double [x] (* 2 x)) (range 1 5))
=> (2 4 6 8)
```

```
(map #(* 2 %) (range 1 5))
=> (2 4 6 8)
```

```
(map #(* 2 %1) (range 1 5))
=> (2 4 6 8)
```

```
;; anonymous function with two params, the second is destructured
(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})
=> {1 :a 2 :b 3 :c}
```

```
;; defining a pre-condition
```

```
(do
  (def square-root
    (fn [x]
      { :pre [(>= x 0)] }
```

```

        (. :java.lang.Math :sqrt x)))
    (square-root 4))
=> 2.0

;; closures
(do
  (defn pow [n]
    (fn [x] (apply * (repeat n x))))) ; closes over n

;; n is provided here as 2 and 3, then n goes out of scope
(def square (pow 2))
(def cubic (pow 3))
(square 4))
=> 16

;; higher-order function
(do
  (def discount
    (fn [percentage]
      { :pre [(and (>= percentage 0) (<= percentage 100))] }
      (fn [price] (- price (* price percentage 0.01))))))
  ((discount 50) 300))
=> 150.0

```

## SEE ALSO

### defn

Same as (def name (fn name [args\*] condition-map? expr\*)) or (def name (fn name ([args\*] condition-map? expr\*)+))

### defn-

Same as defn, yielding non-public def

### def

Creates a global variable.

top

## fn-about

```
(fn-about f)
```

Returns the meta information about a function

```
(fn-about and)
=> {:name "and" :ns "core" :type :macro :visibility :public :native false :class :VncMultiArityFunction :source
{:file "core" :line 479 :column 3}}
```

```
(fn-about println)
=> {:name "println" :ns "core" :type :function :visibility :public :native false :class :VncMultiArityFunction :
source {:file "core" :line 1472 :column 3}}
```

```
(fn-about +)
=> {:name "+" :ns "core" :type :function :visibility :public :native true :class :VncFunction :source {}}
```

## SEE ALSO

### fn-name

Returns the qualified name of a function or macro

### fn-body

Returns the body (a list of forms) of a function.

#### [fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

## fn-body

```
(fn-body fn)
(fn-body fn arity)
```

Returns the body (a list of forms) of a function.

Returns `nil` if `fn` is not a function or if `fn` is a native function.

```
(do
  (defn calc [& x]
    (->> x
      (filter even?)
      (map #(* % 10)))))
  (fn-body (var-get calc)))
=> ((->> x (filter even?) (map (fn [%] (* % 10)))))
```

### SEE ALSO

#### [fn-name](#)

Returns the qualified name of a function or macro

#### [fn-about](#)

Returns the meta information about a function

#### [fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

## fn-name

```
(fn-name f)
```

Returns the qualified name of a function or macro

```
(fn-name (fn sum [x y] (+ x y)))
=> "user/sum"
```

```
(let [f str/digit?]
  (fn-name f))
=> "str/digit?"
```

### SEE ALSO

#### [name](#)

Returns the name String of a string, symbol, keyword, or function

#### [namespace](#)

Returns the namespace string of a symbol, keyword, or function. If `x` is a registered namespace returns `x`.

### [fn-about](#)

Returns the meta information about a function

### [fn-body](#)

Returns the body (a list of forms) of a function.

### [fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

## fn-pre-conditions

```
(fn-pre-conditions fn)
(fn-pre-conditions fn arity)
```

Returns the pre-conditions (a vector of forms) of a function.

Returns `nil` if `fn` is not a function.

```
(do
  (defn sum [x y]
    { :pre [(> x 0) (> y 0)] }
    (+ x y))
  (fn-pre-conditions (var-get sum)))
=> [(> x 0) (> y 0)]
```

### SEE ALSO

#### [fn-name](#)

Returns the qualified name of a function or macro

#### [fn-about](#)

Returns the meta information about a function

#### [fn-body](#)

Returns the body (a list of forms) of a function.

[top](#)

## fn?

```
(fn? x)
```

Returns true if `x` is a function

```
(do
  (def sum (fn [x] (+ 1 x)))
  (fn? sum))
=> true
```

[top](#)

## fnil

```
(fnil f x)
```

```
(fnil f x y)
(fnil f x y z)
```

Takes a function `f`, and returns a function that calls `f`, replacing a `nil` first argument to `f` with the supplied value `x`. Higher arity versions can replace arguments in the second and third positions (`y`, `z`). Note that the function `f` can take any number of arguments, not just the one(s) being `nil`-patched.

```
;; e.g.: change the `str/lower-case` handling of nil arguments by
;; returning an empty string instead of nil.
((fnil str/lower-case "") nil)
=> ""
```

```
((fnil + 10) nil)
=> 10
```

```
((fnil + 10) nil 1)
=> 11
```

```
((fnil + 10) nil 1 2)
=> 13
```

```
((fnil + 10) 20 1 2)
=> 23
```

```
((fnil + 10) nil 1 2 3 4)
=> 20
```

```
((fnil + 1000 100) nil nil)
=> 1100
```

```
((fnil + 1000 100) 2000 nil 1)
=> 2101
```

```
((fnil + 1000 100) nil 200 1 2)
=> 1203
```

```
((fnil + 1000 100) nil nil 1 2 3 4)
=> 1110
```

[top](#)

## fonts/download-font-family

```
(download-font-family family-name options*)
```

Download a font family from the [Google fonts](#) repository

Some useful font families with name and true type font files globbing pattern to extract the files from the family zip file:

Family	TTF glob pattern
"Open Sans"	"static/OpenSans/*.ttf"
"Source Code Pro"	"static/*.ttf"
"Audiowide"	"*.ttf"
"Roboto"	"*.ttf"

Options:

:extract {true,false}    if true extract the TTF files from the font family ZIP, else just download the ZIP

:glob-pattern {pat}     an optional glob pattern to select the TTF files to be extracted. E.g.: "\*.ttf"  
:dir path                download dir, defaults to "."  
:silent {true,false}     if silent is true does not print download info, defaults to true

```
(do
  (load-module :fonts)

  (fonts/download-font-family "Open Sans"
    :dir (repl/fonts-dir)
    :extract true
    :glob-pattern "static/OpenSans/*.ttf"
    :silent false)

  (fonts/download-font-family "Source Code Pro"
    :dir (repl/fonts-dir)
    :extract true
    :glob-pattern "static/*.ttf"
    :silent false)

  (fonts/download-font-family "Roboto"
    :dir (repl/fonts-dir)
    :extract true
    :glob-pattern "*.ttf"
    :silent false))
```

[top](#)

## force

```
(force x)
```

If x is a delay, returns its value, else returns x

```
(do
  (def x (delay (println "working...") 100))
  (force x))
working...
=> 100

(force (+ 1 2))
=> 3
```

### SEE ALSO

#### [delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

#### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

#### [realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[top](#)

## formal-type

(formal-type object)

Returns the formal type of a Java object

```
(do
  (import :java.awt.image.BufferedImage)
  (import :java.awt.Graphics)

  ;; cast the graphics context to 'java.awt.Graphics' instead of the
  ;; implicit cast to 'java.awt.Graphics2D' as Venice is doing
  (let [img (. :BufferedImage :new 40 40 1)
        gd (cast :Graphics (. img :createGraphics))]
    (formal-type gd)))
=> :java.awt.Graphics
```

## SEE ALSO

[remove-formal-type](#)

Removes the formal type from a Java object

[cast](#)

Casts a Java object

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

## format-micro-time

(format-micro-time time)  
(format-micro-time time & options)

Formats a time given in microseconds as long or double.

Options:

:precision p      e.g :precision 4 (defaults to 3)

```
(format-micro-time 203)
=> "203μs"
```

```
(format-micro-time 20389.0 :precision 2)
=> "0.02ms"
```

```
(format-micro-time 20389 :precision 2)
=> "0.02ms"
```

```
(format-micro-time 20389 :precision 0)
=> "0ms"
```

```
(format-micro-time 20386766)
=> "20.387s"
```

```
(format-micro-time 20386766 :precision 2)
=> "20.39s"
```

```
(format-micro-time 20386766 :precision 6)
=> "20.386766s"
```

## SEE ALSO

### [format-milli-time](#)

Formats a time given in milliseconds as long or double.

### [format-nano-time](#)

Formats a time given in nanoseconds as long or double.

[top](#)

## format-milli-time

```
(format-milli-time time)
(format-milli-time time & options)
```

Formats a time given in milliseconds as long or double.

Options:

:precision p      e.g :precision 4 (defaults to 3)

```
(format-milli-time 203)
=> "203ms"
```

```
(format-milli-time 20389.0 :precision 2)
=> "20.39s"
```

```
(format-milli-time 20389 :precision 2)
=> "20.39s"
```

```
(format-milli-time 20389 :precision 0)
=> "20s"
```

## SEE ALSO

=> "20.386767s"
```

#### SEE ALSO

##### [format-milli-time](#)

Formats a time given in milliseconds as long or double.

##### [format-micro-time](#)

Formats a time given in microseconds as long or double.

##### [nano-time](#)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

[top](#)

## fourth

```
(fourth coll)
```

Returns the fourth element of coll.

```
(fourth nil)
=> nil
```

```
(fourth [])
=> nil
```

```
(fourth [1 2 3 4 5])
=> 4
```

```
(fourth '())
=> nil
```

```
(fourth '(1 2 3 4 5))
=> 4
```

[top](#)

## frequencies

```
(frequencies coll)
```

Returns a map from distinct items in coll to the number of times they appear.

```
(frequencies [:a :b :a :a])
=> {:a 3 :b 1}

;; Turn a frequency map back into a coll.
(mapcat (fn [[x n]] (repeat n x)) {:a 2 :b 1 :c 3})
=> (:a :a :b :c :c :c)
```

[top](#)

## future

```
(future fn)
```

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result and return it on all subsequent calls to deref. If the computation has not yet finished, calls to deref will block, unless the variant of deref with timeout is used.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
(do
  (defn wait [] (sleep 300) 100)
  (let [f (future wait)]
    (deref f)))
=> 100

(let [f (future #(do (sleep 300) 100))]
  (deref f))
=> 100

(do
  (defn wait [x] (sleep 300) (+ x 100))
  (let [f (future (partial wait 10))]
    (deref f)))
=> 110

(do
  (defn sum [x y] (+ x y))
  (let [f (future (partial sum 3 4))]
    (deref f)))
=> 7

;; demonstrates the use of thread locals with futures
(do
  ;; parent thread locals
  (binding [a 10 b 20]
    ;; future with child thread locals
    (let [f (future (fn [] (binding [b 90] {:a a :b b})))
          {:child @f :parent {:a a :b b}}])
    (deref f)))
=> {:parent {:a 10 :b 20} :child {:a 10 :b 90}}
```

### SEE ALSO

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

### [done?](#)

Returns true if the future or promise is done otherwise false

### [cancel](#)

Cancels a future or a promise

### [cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

### [future-task](#)

Takes a function *f* without arguments and yields a future object that will invoke the function in another thread.

### [promise](#)

Returns a promise object that can be read with *deref*, and *set*, once only, with *deliver*. Calls to *deref* prior to delivery will block, ...

### [futures-fork](#)

Creates a list of count futures. The worker factory is single argument function that gets the worker index (0..count-1) as argument ...

### [futures-wait](#)

Waits for all futures to get terminated. If the waiting thread is interrupted the futures are cancelled.

[top](#)

## future-task

```
(future-task f completed-fn)
(future-task f success-fn failure-fn)
```

Takes a function *f* without arguments and yields a future object that will invoke the function in another thread.

If a single completed function is passed it will be called with the future as its argument as soon as the future has completed. If a success and a failure function are passed either the success or failure function will be called as soon as the future has completed. Upon success the success function will be called with the future's result as its argument, upon failure the failure function will be called with the exception as its argument.

In combination with a queue a completion service can be built. The tasks appear in the queue in the order they have completed.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
;; building a completion service
;; CompletionService = incoming worker queue + worker threads + output data queue
(do
  (def q (queue 10))
  (defn process [s v] (sleep s) v)
  (defn failure [s m] (sleep s) (throw (ex :VncException m))))
  (future-task (partial process 200 2) #(offer! q %) #(offer! q %))
  (future-task (partial process 400 4) #(offer! q %) #(offer! q %))
  (future-task (partial process 100 1) #(offer! q %) #(offer! q %))
  (future-task (partial failure 300 "Failed 3") #(offer! q %) #(offer! q %))
  (println (poll! q 1000))
  (println (poll! q 1000))
  (println (poll! q 1000))
  (println (poll! q 1000)))
1
2
com.github.jlangch.venice.VncException: Failed 3
4
=> nil
```

```
;; building a completion service (future-task API variant)
(do
  (def q (queue 10))
```

```
(defn process [s v] (sleep s) v)
(defn failure [s m] (sleep s) (throw (ex :VncException m)))
(defn print_result [f] (try (println @f) (catch :Exception e (println e))))
(future-task (partial process 200 2) #(offer! q %))

## geoip/ip-to-city-loc-resolver

```
(geoip/ip-to-city-loc-resolver geoip-zip)
```

Returns a resolve function that resolves an IP address to its associated city and latitude/longitude location. The resolve function returns the city and the latitude/longitude or nil if no data is found.

The MindMax city geoip-zip may be a bytebuf, a file, a string (file path) or an InputStream.

The resolver loads the MindMax IPv4 and IPv6 city database and caches the data for IP address resolves.

As of July 2020 the MaxMind city database has:

2'917'097	IPv4 blocks
459'294	IPv6 blocks
118'189	cities

Note:

The MaxMind city IPv4 and IPv6 databases have 220MB of size on disk. It takes considerable time to load the data. Preprocessed and ready to work in the GEO IP modules ~3GB of memory is required.

Once the resolver has loaded the data the lookups are very fast.

```
(do
  (def rv (geoip/ip-to-city-loc-resolver "./geoip-city.zip"))

  (rv "192.241.235.46")) ;; => {:ip "192.241.235.46"
  ;;      :loc ["37.7353" "-122.3732"]}
```

```
;;      :country-name "United States"
;;      :country-iso  "US"
;;      :region "California"
;;      :city "San Francisco"}
```

## geoup/ip-to-city-loc-resolver-mem-optimized

(geoup/ip-to-city-loc-resolver-mem-optimized geoup-zip)

Returns a resolve function that resolves an IP address to its associated city and latitude/longitude location. The resolve function returns the city and the latitude/longitude or nil if no data is found.

The MindMax city geoup-zip may be a bytebuf, a file, a string (file path) or an InputStream.

The resolver loads the MindMax IPv4 and IPv6 city database and caches the data for IP address resolves.

As of July 2020 the MaxMind city database has:

2'917'097	IPv4 blocks
459'294	IPv6 blocks
118'189	cities

Note:

The MaxMind city IPv4 and IPv6 databases have 220MB of size on disk. It takes considerable time to load the data. This is a memory optimized resolver version on the cost of performance.

For best performance on the cost of memory use the resolver 'geoup/ip-to-city-loc-resolver' instead!

```
(do
  (def rv (geoup/ip-to-city-loc-resolver-mem-optimized "./geoup-city.zip"))

  (rv "192.241.235.46")) ;; => {:ip "192.241.235.46"

## get

```

(get map key)
(get map key not-found)

```

Returns the value mapped to key, not-found or nil if key not present.

Note: `(get :x foo)` is almost twice as fast as `(:x foo)`

```

(get {:a 1 :b 2} :b)
=> 2

```

```

(get [0 1 2 3] 1)
=> 1

```

```

;; keywords act like functions on maps
(:b {:a 1 :b 2})
=> 2

```

[top](#)

## get-in

```

(get-in m ks)
(get-in m ks not-found)

```

Returns the value in a nested associative structure, where ks is a sequence of keys. Returns nil if the key is not present, or the not-found value if supplied.

```
(get-in {:a 1 :b {:c 2 :d 3}} [:b :c])
=> 2

(get-in [:a :b :c] [0])
=> :a

(get-in [:a :b [:c :d :e]] [2 1])

```
(gradle/version)
```

Returns the Gradle version

```
(gradle/with-home "/Users/foo/Documents/Tools/gradle-5.6.2"
                  "/Users/foo/Documents/Projects/my-project"
  (gradle/version))
```

[top](#)

## gradle/with-home

```
(with-home gradle-dir proj-dir & forms)
```

Sets the Gradle home and the project directory for all subsequent forms.

```
(gradle/with-home "/Users/foo/Documents/Tools/gradle-5.6.2"
                  "/Users/foo/Documents/Projects/my-project"
  (gradle/version))
```

[top](#)

## grep/grep

```
(grep dir file-glob line-pattern & options)
```

Search for lines that match a regular expression in text files. The search starts from a base directory and chooses all files that match a globbing pattern.

Options:

:print b     e.g :print false, defaults to true

With the print option `:print true`, `grep` prints the matches in a human readable form, one line per match in the format `"{{filename}}:{{lineno}}:{{line}}"`.

With the print option `:print false`, `grep` prints the matches in a machine readable form. It returns a list of tuples `[[{{filename}}, {{lineno}}, {{line}}]`.

```
(do
  (load-module :grep)
  (grep/grep "/Users/foo/logs" "*.log" ".*Error.*"))
```

### SEE ALSO

[grep/grep-zip](#)

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match ...

[io/file-matches-glob?](#)

Returns true if the file `f` matches the glob pattern. `f` must be a file or a string (file path).

[top](#)

## grep/grep-zip

```
(grep/grep-zip dir zipfile-glob file-glob line-pattern & options)
```

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match a globbing pattern. The search starts from a base directory and chooses all ZIP files that match the zipfile globbing pattern.

Options:

:print b     e.g :print false, defaults to true

With the print option `:print true`, `grep-zip` prints the matches in a human readable form, one line per match in the format `"{{zipfile}}!{{filename}}:{{lineno}}:{{line}}"`.

With the print option `:print false`, `grep-zip` prints the matches in a machine readable form. It returns a list of tuples `[[{{zipname}}, {{filename}}, {{lineno}}, {{line}}]`.

```
(do
  (load-module :grep)
  (grep/grep-zip "/Users/foo/logs" "logs*.zip" "**/*.log" ".*Error.*"))
```

### SEE ALSO

## grep/grep

Search for lines that match a regular expression in text files. The search starts from a base directory and chooses all files that ...

## io/file-matches-glob?

Returns true if the file `f` matches the glob pattern. `f` must be a file or a string (file path).

top

## group-by

```
(group-by f coll)
```

Returns a map of the elements of `coll` keyed by the result of `f` on each element. The value at each key will be a vector of the corresponding elements, in the order they appeared in `coll`.

```
(group-by count ["a" "as" "asd" "aa" "asdf" "qwer"])
=> {1 ["a"] 2 ["as" "aa"] 3 ["asd"] 4 ["asdf" "qwer"]}

(group-by odd? (range 10))
=> {false [0 2 4 6 8] true [1 3 5 7 9]}

(group-by identity (seq "abracadabra"))
=> {#\a [\a \a \a \a \a \a] #\b [\b \b] #\r [\r \r] #\c [\c] #\d [d]}
```

top

## halt-when

```
(halt-when pred)
(halt-when pred retf)
```

Returns a transducer that ends transduction when `pred` returns true for an input. When `retf` is supplied it must be a fn of 2 arguments - it will be passed the (completed) result so far and the input that triggered the predicate, and its return value (if it does not throw an exception) will be the return value of the transducer. If `retf` is not supplied, the input that triggered the predicate will be returned. If the predicate never returns true the transduction is unaffected.

```
(do
  (def xf (comp (halt-when #(== % 10)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> [1 3 5 7 9]

(do
  (def xf (comp (halt-when #(> % 5)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> 6
```

top

## hash-map

```
(hash-map & keyvals)
(hash-map map)
```

Creates a new hash map containing the items.

```
(hash-map :a 1 :b 2)
=> {:a 1 :b 2}

(hash-map (sorted-map :a 1 :b 2))
=> {:a 1 :b 2}
```

[top](#)

## hash-map?

```
(hash-map? obj)
```

Returns true if obj is a hash map

```
(hash-map? (hash-map :a 1 :b 2))
=> true
```

[top](#)

## hexdump/dump

```
(dump s & opts)
```

Prints a hexdump of the given argument to `*out*`. Optionally supply byte offset (`:offset`, default: 0) and size (`:size`, default: :all) arguments. Can create hexdump from a collection of values, a bytebuf, a java.io.File, or a string representing a path to a file.

Example: `(hexdump/dump (range 100))`

```
00000000: 0001 0203 0405 0607 0809 0a0b 0c0d 0e0f .....

## import

```
(import class & classes)
(import class :as alias)
```

Imports one or multiple Java classes. Imports are bound to the current namespace.

Aliases are helpful if Java classes have the same name but different packages like `java.util.Date` and `java.sql.Date` :

```
(do
  (import :java.util.Date)
  (import :java.sql.Date :as :sql.Date)

  (println (. :Date :new))
  (println (. :sql.Date :valueOf "2022-06-24")))
```

```
(do
  (import :java.lang.Math)
  (. :Math :max 2 10))
=> 10
```

```
(do
  (import :java.awt.Point
          :java.lang.Math)
  (. :Math :max 2 10))
=> 10
```

```
(do
  (import :java.awt.Color :as :AwtColor)
  (. :AwtColor :new 200I 230I 255I 180I))
=> java.awt.Color[r=200,g=230,b=255]
```

```
(do
  (ns util)
  (defn import? [clazz ns_]
    (any? #(== % clazz) (map first (imports ns_))))

  (ns alpha)
  (import :java.lang.Math)
  (println "alpha:" (util/import? :java.lang.Math 'alpha))

  (ns beta)
  (println "beta:" (util/import? :java.lang.Math 'beta)))
```

```
(ns alpha)
(println "alpha:" (util/import? :java.lang.Math 'alpha))
)
alpha: true
beta: false
alpha: true
=> nil
```

## inet/inet-addr

```
(inet/inet-addr addr)
```

Converts a stringified IPv4 or IPv6 to a Java InetAddress.

```
(inet/inet-addr "222.192.0.0")  
=> /222.192.0.0
```

```
(inet/inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")  
=> /2001:db8:85a3:8d3:1319:8a2e:370:7347
```

[top](#)

## inet/inet-addr-from-bytes

```
(inet/inet-addr-bytes addr)
```

Converts a IPv4 or IPv6 byte address (a vector of unsigned integers) to a Java InetAddress.

```
(inet/inet-addr-from-bytes [222I 192I 12I 0I])  
=> /222.192.12.0
```

```
(inet/inet-addr-from-bytes [32I 1I 13I 184I 133I 163I 8I 211I 19I 25I 138I 46I 3I 112I 115I 71I])  
=> /2001:db8:85a3:8d3:1319:8a2e:370:7347
```

[top](#)

## inet/inet-addr-to-bytes

```
(inet/inet-addr-to-bytes addr)
```

Converts a stringified IPv4/IPv6 address or a Java InetAddress to an InetAddress byte vector.

```
(inet/inet-addr-to-bytes "222.192.12.0")  
=> [222I 192I 12I 0I]
```

```
(inet/inet-addr-to-bytes "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")  
=> [32I 1I 13I 184I 133I 163I 8I 211I 19I 25I 138I 46I 3I 112I 115I 71I]
```

```
(inet/inet-addr-to-bytes (inet/inet-addr "222.192.0.0"))  
=> [222I 192I 0I 0I]
```

[top](#)

## inet/ip4?

```
(inet/ip4? addr)
```

Returns true if addr is an IPv4 address.

```
(inet/ip4? "222.192.0.0")  
=> true
```

```
(inet/ip4? (inet/inet-addr "222.192.0.0"))  
=> true
```

[top](#)

## inet/ip6?

```
(inet/ip6? addr)
```

Returns true if addr is an IPv6 address.

```
(inet/ip6? "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")  
=> true
```

```
(inet/ip6? (inet/inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347"))  
=> true
```

[top](#)

## inet/linklocal-addr?

```
(inet/linklocal-addr? addr)
```

Returns true if addr is a link local address.

```
(inet/linklocal-addr? "169.254.0.0")  
=> true
```

```
(inet/linklocal-addr? (inet/inet-addr "169.254.0.0"))  
=> true
```

[top](#)

## inet/multicast-addr?

```
(inet/multicast-addr? addr)
```

Returns true if addr is a multicast address.

```
(inet/multicast-addr? "224.0.0.1")  
=> true
```

```
(inet/multicast-addr? (inet/inet-addr "224.0.0.1"))  
=> true
```

[top](#)

## inet/reachable?

```
(inet/reachable? addr timeout)
```

Test whether that address is reachable. Best effort is made by the implementation to try to reach the host, but firewalls and server configuration may block requests resulting in a unreachable status while some specific ports may be accessible. A typical implementation will use ICMP ECHO REQUESTs if the privilege can be obtained, otherwise it will try to establish a TCP connection on port 7 (Echo) of the destination host.

The timeout value, in milliseconds, indicates the maximum amount of time the try should take. If the operation times out before getting an answer, the host is deemed unreachable.

```
(inet/reachable? "google.com" 500)  
=> false
```

```
(inet/reachable? "74.125.193.113" 500)  
=> false
```

[top](#)

## inet/sitelocal-addr?

```
(inet/sitelocal-addr? addr)
```

Returns true if addr is a site local address.

```
(inet/sitelocal-addr? "192.168.0.0")  
=> true
```

```
(inet/sitelocal-addr? (inet/inet-addr "192.168.0.0"))  
=> true
```

[top](#)

## infinite?

```
(infinite? x)
```

Returns true if x is infinite else false. x must be a double!

```
(infinite? 1.0E300)  
=> false
```

```
(infinite? (* 1.0E300 1.0E100))  
=> true
```

```
(infinite? (/ 1.0 0))  
=> true
```

```
(pr (/ 4.1 0))  
:Infinite  
=> nil
```

### SEE ALSO

[nan?](#)

Returns true if x is a NaN else false. x must be a double!

[double](#)

Converts to double

[top](#)

## instance-of?

```
(instance-of? type x)
```

Returns true if x is an instance of the given type

```
(instance-of? :long 500)  
=> true
```

```
(instance-of? :java.math.BigInteger 500)
=> false
```

## SEE ALSO

### [type](#)

Returns the type of x.

### [supertype](#)

Returns the super type of x.

### [supertypes](#)

Returns the super types of x.

[top](#)

## int

```
(int x)
```

Converts to int

```
(int 1)
=> 1I
```

```
(int nil)
=> 0I
```

```
(int false)
=> 0I
```

```
(int true)
=> 1I
```

```
(int 1.2)
=> 1I
```

```

=> 1I
```

```
(int "1")
=> 1I
```

```
(int (char "A"))
=> 65I
```

[top](#)

## int-array

```
(int-array coll)
(int-array len)
(int-array len init-val)
```

Returns an array of Java primitive ints containing the contents of coll or returns an array with the given length and optional init value

```
(int-array '(1I 2I 3I))
=> [1I, 2I, 3I]

(int-array '(1I 2 3.2 3.56M))
=> [1I, 2I, 3I, 3I]

(int-array 10)
=> [0I, 0I, 0I, 0I, 0I, 0I, 0I, 0I, 0I, 0I]

(int-array 10 42I)
=> [42I, 42I, 42I, 42I, 42I, 42I, 42I, 42I, 42I, 42I]
```

[top](#)

## int?

```
(int? n)
```

Returns true if n is an int

```
(int? 4I)
=> true
```

```
(int? 4)
=> false
```

```
(int? 3.1)
=> false
```

```
(int? true)
=> false
```

```
(int? nil)
=> false
```

```
(int? {})
=> false
```

[top](#)

## interleave

```
(interleave c1 c2)
(interleave c1 c2 & colls)
```

Returns a collection of the first item in each coll, then the second etc.

Supports lazy sequences as long at least one collection is not a lazy sequence.

```
(interleave [:a :b :c] [1 2])
=> (:a 1 :b 2)
```

```
(interleave [:a :b :c] (lazy-seq 1 inc))
=> (:a 1 :b 2 :c 3)
```

## interpose

```
(interpose sep coll)
```

Returns a collection of the elements of coll separated by sep.

```
(interpose ", " [1 2 3])  
=> (1 ", " 2 ", " 3)
```

```
(apply str (interpose ", " [1 2 3]))  
=> "1, 2, 3"
```

## intersection

```
(intersection s1)  
(intersection s1 s2)  
(intersection s1 s2 & sets)
```

Return a set that is the intersection of the input sets

```
(intersection (set 1))  
=> #{1}
```

```
(intersection (set 1 2) (set 2 3))  
=> #{2}
```

```
(intersection (set 1 2) (set 3 4))  
=> #{} 
```

### SEE ALSO

#### [union](#)

Return a set that is the union of the input sets

#### [difference](#)

Return a set that is the first set without elements of the remaining sets

#### [cons](#)

Returns a new collection where x is the first element and coll is the rest

#### [conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item). For list, vectors and ordered maps the values are ...

#### [disj](#)

Returns a new set with the x, xs removed.

## into

```
(into)
(into to)
(into to from)
```

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

```
(into (sorted-map) [ [:a 1] [:c 3] [:b 2] ])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) [ {:a 1} {:c 3} {:b 2} ])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) [(map-entry :b 2) (map-entry :c 3) (map-entry :a 1)])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) {:b 2 :c 3 :a 1})
=> {:a 1 :b 2 :c 3}

(into [] {:a 1, :b 2})
=> [[:a 1] [:b 2]]

(into '() '(1 2 3))
=> (3 2 1)

(into [1 2 3] '(4 5 6))
=> [1 2 3 4 5 6]

(into '() (bytebuf [0 1 2]))
=> (0 1 2)

(into [] (bytebuf [0 1 2]))
=> [0 1 2]

(into '() "abc")
=> (#\a #\b #\c)

(into [] "abc")
=> [#\a #\b #\c]
```

## SEE ALSO

### [concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

### [merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[top](#)

## into!

```
(into!)
(into! to)
(into! to from)
```

Adds all of the items of 'from' conjoined to the mutable 'to' collection

```

(into! (queue) [1 2 3 4])
=> (1 2 3 4)

(into! (stack) [1 2 3 4])
=> (4 3 2 1)

(do
  (into! (. :java.util.concurrent.CopyOnWriteArrayList :new)
    (doto (. :java.util.ArrayList :new)
      (. :add 3)
      (. :add 4))))
=> (3 4)

(do
  (into! (. :java.util.concurrent.CopyOnWriteArrayList :new)
    '(3 4)))
=> (3 4)

```

## SEE ALSO

Returns a list of the concatenation of the elements in the supplied collections.

### [merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[top](#)

## io/->uri

```

(io/->uri s)
(io/->uri scheme user-info host port path)
(io/->uri scheme user-info host port path query)
(io/->uri scheme user-info host port path query fragment)

```

Converts s to an URI or builds an URI from its spec elements.

s may be:

- a string (a spec string to be parsed as a URI.)
- a `java.io.File`
- a `java.nio.file.Path`
- a `java.net.URL`

Arguments:

**scheme** Scheme name  
**userInfo** User name and authorization information  
**host** Host name  
**port** Port number  
**path** Path  
**query** Query  
**fragment** Fragment

```

(io/->uri "file:/tmp/test.txt")
=> file:/tmp/test.txt

(io/->uri (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt

```

```
(io/->uri (io/->url (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt

(str (io/->uri (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"

;; to create an URL from spec details:
(io/->uri "http" nil "foo.org" 8080 "/info.html" nil nil)
=> http://foo.org:8080/info.html
```

## SEE ALSO

### [io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

### [io/->url](#)

Converts s to an URL or builds an URL from its spec elements.

[top](#)

## io/->url

```
(io/->url s)
(io/->url protocol host port file)
```

Converts s to an URL or builds an URL from its spec elements.

s may be:

- a string (a spec string to be parsed as a URL.)
- a `java.io.File`
- a `java.nio.file.Path`
- a `java.net.URI`

Arguments:

**protocol** the name of the protocol to use.

**host** the name of the host.

**port** the port number on the host.

**file** the file on the host

```
(io/->url "file:/tmp/test.txt")
=> file:/tmp/test.txt

(io/->url (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt

(io/->url (io/->uri (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt

(str (io/->url (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"

;; to create an URL from spec details:
(io/->url "http" "foo.org" 8080 "/info.html")
=> http://foo.org:8080/info.html
```

## SEE ALSO

## [io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

## [io/->uri](#)

Converts `s` to an URI or builds an URI from its spec elements.

[top](#)

## [io/await-for](#)

```
(io/await-for timeout time-unit file & modes)
```

Blocks the current thread until the file has been created, deleted, or modified according to the passed modes `{:created, :deleted, :modified}`, or the timeout has elapsed. Returns logical false if returning due to timeout, logical true otherwise.

Supported time units are: `{:milliseconds, :seconds, :minutes, :hours, :days}`

```
(io/await-for 10 :seconds "/tmp/data.json" :created)
```

### SEE ALSO

## [io/watch-dir](#)

Watch a directory for changes, and call the function `event-fn` when it does. Calls the optional `failure-fn` if errors occur. On closing ...

[top](#)

## [io/buffered-reader](#)

```
(io/buffered-reader is encoding?)  
(io/buffered-reader rdr)
```

Creates a `java.io.BufferedReader` from a `java.io.InputStream` `is` with optional encoding (defaults to `:utf-8`), from a `java.io.Reader` `rd` or from a string.

Note: The caller is responsible for closing the reader!

```
(let [data (bytebuf [108 105 110 101 32 49 10 108 105 110 101 32 50])  
      is (io/bytebuf-in-stream data)]  
  (try-with [rd (io/buffered-reader is :utf-8)]  
    (println (read-line rd))  
    (println (read-line rd))))  
line 1  
line 2  
=> nil
```

```
(try-with [rd (io/buffered-reader "1\n2\n3\n4")]  
  (println (read-line rd))  
  (println (read-line rd)))  
1  
2  
=> nil
```

### SEE ALSO

## [io/buffered-writer](#)

Creates a `java.io.BufferedWriter` from a `java.io.OutputStream` `os` with optional encoding (defaults to `:utf-8`) or from a `java.io.Writer`.

## io/buffered-writer

```
(io/buffered-writer os encoding?)
(io/buffered-writer wr)
```

Creates a `java.io.BufferedWriter` from a `java.io.OutputStream` `os` with optional encoding (defaults to `:utf-8`) or from a `java.io.Writer` .

Note: The caller is responsible for closing the writer!

### SEE ALSO

[io/buffered-reader](#)

Creates a `java.io.BufferedReader` from a `java.io.InputStream` `is` with optional encoding (defaults to `:utf-8`), from a `java.io.Reader` or ...

## io/bytebuf-in-stream

```
(io/bytebuf-in-stream buf)
```

Returns a `java.io.InputStream` from a `bytebuf`.

Note: The caller is responsible for closing the stream!

```
(try-with [is (io/bytebuf-in-stream (bytebuf [97 98 99]))])
  ; do something with is
)
```

### SEE ALSO

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For ...

[io/file-in-stream](#)

Returns a `java.io.InputStream` for the file `f`.

[io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

## io/bytebuf-out-stream

```
(io/bytebuf-out-stream)
```

Returns a new `java.io.ByteArrayOutputStream` .

Dereferencing a `:ByteArrayOutputStream` returns the captured `bytebuf`.

Note: The caller is responsible for closing the stream!

```
(try-with [os (io/bytebuf-out-stream)]
  (io/spit-stream os (bytebuf [97 98 99]) :flush true)
  (str/format-bytebuf @os ", " :prefix0x))
=> "0x61, 0x62, 0x63"
```

## SEE ALSO

### [io/slurp-stream](#)

Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...

### [io/file-in-stream](#)

Returns a java.io.InputStream for the file f.

### [io/string-in-stream](#)

Returns a java.io.InputStream for the string s.

top

## io/capturing-print-stream

```
(io/capturing-print-stream)
```

Creates a new capturing print stream.

Dereferencing a capturing print stream returns the captured string.

Note: The caller is responsible for closing the stream!

```
(try-with [ps (io/capturing-print-stream)]
  (binding [*out* ps]
    (println 100)
    (println 200)
    (flush)
    @ps))
=> "100\n200\n"
```

```
(try-with [ps (io/capturing-print-stream)]
  (println ps 100)
  (println ps 200)
  (flush ps)
  @ps)
=> "100\n200\n"
```

top

## io/classpath-resource?

```
(io/classpath-resource? name)
```

Returns true if the classpath resource exists otherwise false.

```
(io/classpath-resource? "com/github/jlangch/venice/images/venice.png")
=> true
```

## SEE ALSO

### [io/load-classpath-resource](#)

Loads a classpath resource. Returns a bytebuf

## io/close

```
(io/close s)
```

Closes a `:java.io.InputStream`, `:java.io.OutputStream`, `:java.io.Reader`, or a `:java.io.Writer`.

Often it is more elegant to use `try-with` to let Venice implicitly close the stream when its leaves the scope:

```
(let [file (io/file "foo.txt")]
  (try-with [is (io/file-in-stream file)]
    (io/slurp-stream is :binary false)))
```

### SEE ALSO

[io/flush](#)

Flushes a `:java.io.OutputStream` or a `:java.io.Writer`.

## io/close-watcher

```
(io/close-watcher watcher)
```

Closes a watcher created from 'io/watch-dir'.

### SEE ALSO

[io/watch-dir](#)

Watch a directory for changes, and call the function `event-fn` when it does. Calls the optional `failure-fn` if errors occur. On closing ...

## io/copy-file

```
(io/copy-file source dest & options)
```

Copies `source` to `dest`. Returns `nil` or throws a `VncException`. `Source` must be a file or a string (file path), `dest` must be a file, a string (file path), or an `java.io.OutputStream`.

Options:

`:replace true/false`     e.g.: if `true` replace an existing file, defaults to `false`

### SEE ALSO

[io/move-file](#)

Moves `source` to `target`. Returns `nil` or throws a `VncException`. `Source` and `target` must be a file or a string (file path).

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If `f` is a directory the directory must be empty. `f ...`

[io/touch-file](#)

Updates the lastModifiedTime of the file to the current time, or creates a new empty file if the file doesn't already exist. File must ...

[io/copy-stream](#)

Copies the input stream to the output stream. Returns nil on success or throws a VncException on failure. Input and output must be a ...

top

## io/copy-stream

```
(io/copy-stream in-stream out-stream)
```

Copies the input stream to the output stream. Returns `nil` on success or throws a VncException on failure. Input and output must be a `java.io.InputStream` and `java.io.OutputStream`.

### SEE ALSO

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

top

## io/default-charset

```
(io/default-charset)
```

Returns the default charset.

top

## io/delete-file

```
(io/delete-file f & files)
```

Deletes one or multiple files. Silently skips delete if the file does not exist. If `f` is a directory the directory must be empty. `f` must be a file or a string (file path).

### SEE ALSO

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. `dir` must be a file or a string (file path).

[io/delete-file-tree](#)

Deletes a file or a directory with all its content. Silently skips delete if the file or directory does not exist. `f` must be a file ...

[io/delete-file-on-exit](#)

Requests that the file or directory be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse ...

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

[io/move-file](#)

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

top

## io/delete-file-on-exit

```
(io/delete-file-on-exit f)
```

Requests that the file or directory be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse order that they are registered. Invoking this method to delete a file or directory that is already registered for deletion has no effect. Deletion will be attempted only for normal termination of the virtual machine, as defined by the Java Language Specification.

f must be a file or a string (file path).

### SEE ALSO

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

[io/delete-file-tree](#)

Deletes a file or a directory with all its content. Silently skips delete if the file or directory does not exist. f must be a file ...

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

[top](#)

## io/delete-file-tree

```
(io/delete-file-tree f & files)
```

Deletes a file or a directory with all its content. Silently skips delete if the file or directory does not exist. f must be a file or a string (file path)

### SEE ALSO

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

[io/delete-file-on-exit](#)

Requests that the file or directory be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse ...

[top](#)

## io/delete-files-glob

```
(io/delete-files-glob dir glob)
```

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

### Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in .txt
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with .txt or .xml
<code>foo.?[xy]</code>	Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character

<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:\\*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

### Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

### Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/delete-files-glob "." "/*.log")
=> ()
```

## SEE ALSO

### [io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If `f` is a directory the directory must be empty. `f ...`

### [io/delete-file-tree](#)

Deletes a file or a directory with all its content. Silently skips delete if the file or directory does not exist. `f` must be a file ...

### [io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

[top](#)

## io/download

```
(io/download uri & options)
```

Downloads the content from the uri and reads it as text (string) or binary (bytebuf). Supports http and https protocols!

Options:

<code>:binary true/false</code>	e.g.: <code>:binary true</code> , defaults to false
<code>:user-agent agent</code>	e.g.: <code>:user-agent "Mozilla"</code> , defaults to nil
<code>:encoding enc</code>	e.g.: <code>:encoding :utf-8</code> , defaults to :utf-8
<code>:conn-timeout val</code>	e.g.: <code>:conn-timeout 10000</code> , connection timeout in milliseconds. 0 is interpreted as an infinite timeout.
<code>:read-timeout val</code>	e.g.: <code>:read-timeout 10000</code> , read timeout in milliseconds. 0 is interpreted as an infinite timeout.
<code>:progress-fn fn</code>	a progress function that takes 2 args [1] progress (0..100%) [2] status {start :progress :end :failed}

Note:

If the server returns the HTTP response status code 403 (*Access Denied*) sending a user agent like "Mozilla" may fool the website and solve the problem.

```
(-<> "https://live.staticflickr.com/65535/51007202541_ea453871d8_o_d.jpg"
  (io/download <> :binary true :user-agent "Mozilla")
  (io/spit "space-x.jpg" <>))

(do
  (load-module :ansi)
  (-<> "https://live.staticflickr.com/65535/51007202541_ea453871d8_o_d.jpg"
    (io/download <> :binary true
      :user-agent "Mozilla"
      :progress-fn (ansi/progress :caption "Download:"))
    (io/spit "space-x.jpg" <>)))
```

[top](#)

## io/exists-dir?

```
(io/exists-dir? f)
```

Returns true if the file `f` exists and is a directory. `f` must be a file or a string (file path).

```
(io/exists-dir? (io/file "/temp"))
=> false
```

### SEE ALSO

[io/exists-file?](#)

Returns true if the file `f` exists and is a file. `f` must be a file or a string (file path).

[io/file-symbolic-link?](#)

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

[top](#)

## io/exists-file?

```
(io/exists-file? f)
```

Returns true if the file `f` exists and is a file. `f` must be a file or a string (file path).

```
(io/exists-file? "/tmp/test.txt")
=> false
```

### SEE ALSO

[io/exists-dir?](#)

Returns true if the file `f` exists and is a directory. `f` must be a file or a string (file path).

[io/file-symbolic-link?](#)

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

[top](#)

## io/file

```
(io/file path)
(io/file parent child)
(io/file parent child & children)
```

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string (file path), child and children must be strings.

```
(io/file "/tmp/test.txt")
=> /tmp/test.txt

(io/file "/temp" "test.txt")
=> /temp/test.txt

(io/file "/temp" "test" "test.txt")
=> /temp/test/test.txt

(io/file (io/file "/temp") "test" "test.txt")
=> /temp/test/test.txt

(io/file (. :java.io.File :new "/tmp/test.txt"))
=> /tmp/test.txt
```

## SEE ALSO

### [io/file-name](#)

Returns the name of the file f as a string. f must be a file or a string (file path).

### [io/file-parent](#)

Returns the parent file of the file f. f must be a file or a string (file path).

### [io/file-path](#)

Returns the path of the file f as a string. f must be a file or a string (file path).

### [io/file-absolute](#)

Returns the absolute path of the file f. f must be a file or a string (file path).

### [io/file-canonical](#)

Returns the canonical path of the file f. f must be a file or a string (file path).

[top](#)

## io/file-absolute

```
(io/file-absolute f)
```

Returns the absolute path of the file f. f must be a file or a string (file path).

```
(io/file-absolute (io/file "/tmp/test/x.txt"))
=> /tmp/test/x.txt
```

## SEE ALSO

### [io/file-path](#)

Returns the path of the file f as a string. f must be a file or a string (file path).

### [io/file-canonical](#)

Returns the canonical path of the file f. f must be a file or a string (file path).

### [io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

#### [io/file-absolute?](#)

Returns true if file `f` has an absolute path else false. `f` must be a file or a string (file path).

[top](#)

Returns the absolute path of the file `f`. `f` must be a file or a string (file path).

[top](#)

## io/file-basename

```
(io/file-basename f)
```

Returns the base name (file name without file extension) of the file `f` as a string. `f` must be a file or a string (file path).

```
(io/file-basename (io/file "/tmp/test/x.txt"))  
=> "x"
```

### SEE ALSO

#### [io/file-name](#)

Returns the name of the file `f` as a string. `f` must be a file or a string (file path).

#### [io/file-parent](#)

Returns the parent file of the file `f`. `f` must be a file or a string (file path).

#### [io/file-ext](#)

Returns the file extension of a file. `f` must be a file or a string (file path).

#### [io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

## io/file-can-execute?

```
(io/file-can-execute? f)
```

Returns true if the file or directory *f* exists and can be executed. *f* must be a file or a string (file path).

```
(io/file-can-execute? "/tmp/test.txt")
```

### SEE ALSO

[io/file-can-read?](#)

Returns true if the file or directory *f* exists and can be read. *f* must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory *f* exists and can be written. *f* must be a file or a string (file path).

[io/file-hidden?](#)

Returns true if the file or directory *f* exists and is hidden. *f* must be a file or a string (file path).

[io/file-symbolic-link?](#)

Returns true if the file *f* exists and is a symbolic link. *f* must be a file or a string (file path).

[top](#)

## io/file-can-read?

```
(io/file-can-read? f)
```

Returns true if the file or directory *f* exists and can be read. *f* must be a file or a string (file path).

```
(io/file-can-read? "/tmp/test.txt")
```

### SEE ALSO

[io/file-can-write?](#)

Returns true if the file or directory *f* exists and can be written. *f* must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory *f* exists and can be executed. *f* must be a file or a string (file path).

[io/file-hidden?](#)

Returns true if the file or directory *f* exists and is hidden. *f* must be a file or a string (file path).

Returns true if the file or directory `f` exists and can be executed. `f` must be a file or a string (file path).

#### [io/file-symbolic-link?](#)

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

[top](#)

## [io/file-in-stream](#)

```
(io/file-in-stream f)
```

Returns a `java.io.InputStream` for the file `f`.

f may be a:

- string file path, e.g: `"/temp/foo.json"`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

`io/file-in-stream` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the stream!

## SEE ALSO

### [io/slurp](#)

Reads the content of file f as text (string) or binary (bytebuf).

### [io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` is. Supports the option `:binary` to either slurp binary or string data. For ...

### [io/string-in-stream](#)

Returns a `java.io.InputStream` for the string s.

### [io/bytebuf-in-stream](#)

Returns a `java.io.InputStream` from a bytebuf.

### [loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

top

## io/file-last-modified

`(io/file-last-modified f)`

Returns the last modification time (a Java `LocalDateTime`) of f or nil if f does not exist. f must be a file or a string (file path).

`(io/file-last-modified "/tmp/test.txt")`

## SEE ALSO

### [io/file-can-read?](#)

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

### [io/file-can-write?](#)

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

### [io/file-can-execute?](#)

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

top

## io/file-matches-glob?

`(io/file-matches-glob? glob f)`

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

### Globbing patterns

- |                    |  |
|--------------------|--|
| <code>*.txt</code> | Matches a path that represents a file name ending in <code>.txt</code> |
| <code>*.*</code>   | Matches file names containing a dot                                    |

<code>*.{txt,xml}</code>	Matches file names ending with <code>.txt</code> or <code>.xml</code>
<code>foo.?[xy]</code>	Matches file names starting with <code>foo.</code> and a single character extension followed by a <code>'x'</code> or <code>'y'</code> character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:\\*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

### Ranges

The pattern `[A-E]` would match any character that included `ABCDE`. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

### Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches `Cat`, `Bat`, or `Rat` the negated pattern `[!CBR]at` matches anything like `Kat`, `Pat`, or `Vat`.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/file-matches-glob? "*.log" "file.log")
=> true

(io/file-matches-glob? "**/*.log" "x/y/file.log")
=> true

(io/file-matches-glob? "**/*.log" "file.log") ; take care, doesn't match!
=> false

(io/file-matches-glob? (io/glob-path-matcher "*.log") (io/file "file.log"))
=> true

(io/file-matches-glob? (io/glob-path-matcher "**/*.log") (io/file "x/y/file.log"))
=> true
```

### SEE ALSO

[io/glob-path-matcher](#)

Returns a file matcher for glob file patterns.

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

[top](#)

## io/file-name

```
(io/file-name f)
```

Returns the name of the file `f` as a string. `f` must be a file or a string (file path).

```
(io/file-name (io/file "/tmp/test/x.txt"))
=> "x.txt"
```

## SEE ALSO

### [io/file-basename](#)

Returns the base name (file name without file extension) of the file `f` as a string. `f` must be a file or a string (file path).

### [io/file-parent](#)

Returns the parent file of the file `f`. `f` must be a file or a string (file path).

### [io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

## io/file-out-stream

```
(io/file-out-stream f options)
```

Returns a `java.io.OutputStream` for the file `f`.

`f` may be a:

- string file path, e.g: `"/temp/foo.json"`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

Options:

:append true/false      e.g.: `:append true`, defaults to false

:encoding enc            e.g.: `:encoding :utf-8`, defaults to :utf-8

`io/file-out-stream` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the stream!

## SEE ALSO

### [io/slurp](#)

Reads the content of file `f` as text (string) or binary (bytebuf).

### [io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For ...

### [io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

### [io/bytebuf-in-stream](#)

Returns a `java.io.InputStream` from a bytebuf.

### [loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

## io/file-parent

```
(io/file-parent f)
```

Returns the parent file of the file `f`. `f` must be a file or a string (file path).

```
(io/file-path (io/file-parent (io/file "/tmp/test/x.txt")))
=> "/tmp/test"
```

#### SEE ALSO

[io/file-name](#)

Returns the name of the file *f* as a string. *f* must be a file or a string (file path).

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

## io/file-path

```
(io/file-path f)
```

Returns the path of the file *f* as a string. *f* must be a file or a string (file path).

```
(io/file-path (io/file "/tmp/test/x.txt"))
=> "/tmp/test/x.txt"
```

#### SEE ALSO

[io/file-absolute](#)

Returns the absolute path of the file *f*. *f* must be a file or a string (file path).

[io/file-canonical](#)

Returns the canonical path of the file *f*. *f* must be a file or a string (file path).

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

## io/file-size

```
(io/file-size f)
```

Returns the size of the file *f*. *f* must be a file or a string (file path).

```
(io/file-size "/tmp/test.txt")
```

#### SEE ALSO

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

## io/file-symbolic-link?

```
(io/file-symbolic-link? f)
```

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

```
(io/file-symbolic-link? "/tmp/test.txt")
```

## SEE ALSO

[io/file-hidden?](#)

Returns true if the file or directory `f` exists and is hidden. `f` must be a file or a string (file path).

[io/file-can-read?](#)

Returns true if the file or directory `f` exists and can be read. `f` must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory `f` exists and can be written. `f` must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory `f` exists and can be executed. `f` must be a file or a string (file path).

[top](#)

## io/file-within-dir?

```
(io/file-within-dir? dir file)
```

Returns true if the file is within the `dir` else false.

The file and `dir` args must be absolute paths.

```
(io/file-within-dir? (io/file "/temp/foo")
                     (io/file "/temp/foo/img.png"))
=> true

(io/file-within-dir? (io/file "/temp/foo")
                     (io/file "/temp/foo/../bar/img.png"))
=> false
```

## SEE ALSO

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

## io/file?

```
(io/file? f)
```

Returns true if `x` is a `java.io.File`.

```
(io/file? (io/file "/tmp/test.txt"))
=> true
```

[top](#)

## io/filesystem-total-space

```
(io/filesystem-total-space)
(io/filesystem-total-space file)
```

Returns the total disk space in bytes. With no args returns the total disk space of the current working directory's file store. With a file argument returns the total disk space of the file store the file is located.

([io/filesystem-total-space](#))

#### SEE ALSO

[io/filesystem-usable-space](#)

Returns the usable disk space in bytes. With no args returns the usable disk space of the current working directory's file store. With ...

[top](#)

## io/filesystem-usable-space

```
(io/filesystem-usable-space)
(io/filesystem-usable-space file)
```

Returns the usable disk space in bytes. With no args returns the usable disk space of the current working directory's file store. With a file argument returns the usable disk space of the file store the file is located.

([io/filesystem-usable-space](#))

#### SEE ALSO

[io/filesystem-total-space](#)

Returns the total disk space in bytes. With no args returns the total disk space of the current working directory's file store. With ...

[top](#)

## io/flush

```
(io/flush s)
```

Flushes a `:java.io.OutputStream` or a `:java.io.Writer`.

#### SEE ALSO

[io/close](#)

Closes a `:java.io.InputStream`, `:java.io.OutputStream`, `:java.io.Reader`, or a `:java.io.Writer`.

[top](#)

## io/glob-path-matcher

```
(io/glob-path-matcher pattern)
```

Returns a file matcher for glob file patterns.

## Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in <code>.txt</code>
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with <code>.txt</code> or <code>.xml</code>
<code>foo.?[xy]</code>	Matches file names starting with <code>foo.</code> and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:\\*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

## Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

## Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/glob-path-matcher "*.log")
```

```
(io/glob-path-matcher "**/*.log")
```

## SEE ALSO

[io/file-matches-glob?](#)

Returns true if the file `f` matches the glob pattern. `f` must be a file or a string (file path).

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

[top](#)

## io/zip

```
(io/zip f)
```

`gzips f`. `f` may be a file, a string (file path), a `bytebuf` or an `InputStream`. Returns a `bytebuf`.

```
(->> (io/zip "a.txt")  
      (io/spit "a.gz"))
```

```
(io/zip (bytebuf-from-string "abcdef" :utf-8))
```

## SEE ALSO

[io/zip?](#)

Returns true if `f` is a gzipped file. `f` may be a file, a string (file path), a `bytebuf`, or an `InputStream`

### [io/ungzip](#)

ungzips f. f may be a file, a string (file path), a bytebuf, or an InputStream. Returns a bytebuf.

### [io/zip](#)

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

### [io/spit](#)

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

[top](#)

## io/gzip-to-stream

```
(io/gzip f os)
```

gzips f to the OutputStream os. f may be a file, a string (file path), a bytebuf, or an InputStream.

```
(do
  (import :java.io.ByteArrayOutputStream)
  (try-with [os (. :ByteArrayOutputStream :new)]
    (-> (bytebuf-from-string "abcdef" :utf-8)
      (io/gzip-to-stream os))
    (-> (. os :toByteArray)
      (io/ungzip)
      (bytebuf-to-string :utf-8))))
=> "abcdef"
```

### SEE ALSO

#### [io/gzip](#)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[top](#)

## io/gzip?

```
(io/gzip? f)
```

Returns true if f is a gzipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

```
(> (io/gzip (bytebuf-from-string "abc" :utf-8))
  (io/gzip?))
=> true
```

### SEE ALSO

#### [io/gzip](#)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[top](#)

## io/internet-avail?

```
(io/internet-avail?)
```

```
(io/internet-avail? url)
```

Checks if an internet connection is present for a given url. Defaults to URL *http://www.google.com*.

```
(io/internet-avail?)
```

```
(io/internet-avail? "http://www.google.com")
```

top

## io/list-file-tree

```
(io/list-file-tree dir)
(io/list-file-tree dir filter-fn)
```

Lists all files in a directory tree. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found. The filter gets a `java.io.File` as argument. Returns files as `java.io.File`

```
(io/list-file-tree "/tmp")
```

```
(io/list-file-tree "/tmp" #(io/file-ext? % ".log"))
```

### SEE ALSO

[io/list-files](#)

Lists files in a directory. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found.

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

top

## io/list-files

```
(io/list-files dir)
(io/list-files dir filter-fn)
```

Lists files in a directory. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found. The filter gets a `java.io.File` as argument. Returns files as `java.io.File`

```
(io/list-files "/tmp")
```

```
(io/list-files "/tmp" #(io/file-ext? % ".log"))
```

### SEE ALSO

[io/list-file-tree](#)

Lists all files in a directory tree. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files ...

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

top

## io/list-files-glob

```
(io/list-files-glob dir glob)
```

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

### Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in <code>.txt</code>
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with <code>.txt</code> or <code>.xml</code>
<code>foo.?[xy]</code>	Matches file names starting with <code>foo.</code> and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:\\*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

### Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z

```

## SEE ALSO

[io/classpath-resource?](#)

Returns true if the classpath resource exists otherwise false.

[top](#)

## io/mime-type

```
(io/mime-type file)
```

Returns the mime-type for the file if available else nil.

```
(io/mime-type "document.pdf")
```

```
=> "application/pdf"
```

```
(io/mime-type (io/file "document.pdf"))
```

```
=> "application/pdf"
```

[top](#)

## io/mkdir

```
(io/mkdir dir)
```

Creates the directory. dir must be a file or a string (file path).

## SEE ALSO

[io/mkdirs](#)

Creates the directory including any necessary but nonexistent parent directories. dir must be a file or a string (file path).

[top](#)

## io/mkdirs

```
(io/mkdirs dir)
```

Creates the directory including any necessary but nonexistent parent directories. dir must be a file or a string (file path).

## SEE ALSO

[io/mkdir](#)

Creates the directory. dir must be a file or a string (file path).

[top](#)

## io/move-file

(io/move-file source target)

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

#### SEE ALSO

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

[io/touch-file](#)

Updates the lastModifiedTime of the file to the current time, or creates a new empty file if the file doesn't already exist. File must ...

top

## io/print

(io/print os s)

Prints a string s to an output stream. The output stream may be a `:java.io.Writer` or a `:java.io.PrintStream`!

top

## io/read-char

(io/read-char is)

With arg reads the next char from the passed stream that must be a subclass of `:java.io.Reader`.

Returns `nil` if the end of the stream is reached.

#### SEE ALSO

[io/read-line](#)

Reads the next line from the passed stream that must be a subclass of `:java.io.BufferedReader`.

top

## io/read-line

(io/read-line is)

Reads the next line from the passed stream that must be a subclass of `:java.io.BufferedReader`.

Returns `nil` if the end of the stream is reached.

#### SEE ALSO

[io/read-char](#)

With arg reads the next char from the passed stream that must be a subclass of `:java.io.Reader`.

## io/slurp

(io/slurp f & options)

Reads the content of file f as text (string) or binary (bytebuf).

f may be a:

- string file path, e.g: "/temp/foo.json"
- bytebuffer
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`
- `java.io.Reader`
- `java.nio.file.Path`
- `java.net.URL`
- `java.net.URI`

Options:

:binary true/false    e.g.: `:binary true`, defaults to false

:encoding enc        e.g.: `:encoding :utf-8`, defaults to :utf-8

`io/slurp` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: For HTTP and HTTPS downloads prefer to use `io/download`.

### SEE ALSO

[io/slurp-lines](#)

Read all lines from f.

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` is. Supports the option `:binary` to either slurp binary or string data. For ...

[io/slurp-reader](#)

Slurps string data from a `java.io.Reader` rd.Note:

[io/spit](#)

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

[io/download](#)

Downloads the content from the uri and reads it as text (string) or binary (bytebuf). Supports http and https protocols!

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

## io/slurp-lines

(io/slurp-lines f & options)

Read all lines from f.

f may be a:

- string file path, e.g: "/temp/foo.json"

- `bytebuffer`
- `java.io.File`, e.g.: `(io/file "/temp/foo.json")`
- `java.io.InputStream`
- `java.io.Reader`
- `java.nio.file.Path`
- `java.net.URL`
- `java.net.URI`

Options:

`:encoding enc` e.g.: `:encoding :utf-8`, defaults to `:utf-8`

`io/slurp-lines` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(->> "1\n2\n3"
      io/string-in-stream
      io/slurp-lines)
=> ("1" "2" "3")
```

## SEE ALSO

[str/split-lines](#)

Splits `s` into lines.

[io/slurp](#)

Reads the content of file `f` as text (string) or binary (bytebuf).

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For ...

[io/spit](#)

Opens file `f`, writes content, and then closes `f`. `f` may be a file or a string (file path). The content may be a string or a bytebuf.

[io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

## io/slurp-reader

```
(io/slurp-reader rd)
```

Slurps string data from a `java.io.Reader` `rd`. Note:

`io/slurp-reader` offers the same functionality as `io/slurp` but it opens more flexibility with sandbox configuration. `io/slurp` can be blacklisted to prevent reading data from the filesystem and still having `io/slurp-reader` for readers input available!

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/delete-file-on-exit file)
    (io/spit file "123456789" :append true)
    (try-with [rd (io/buffered-reader (io/file-in-stream file) :utf-8)]
      (io/slurp-reader rd)))
  )
=> "123456789"
```

## SEE ALSO

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For ...

### [io/slurp](#)

Reads the content of file `f` as text (string) or binary (bytebuf).

### [io/slurp-lines](#)

Read all lines from `f`.

### [io/spit](#)

Opens file `f`, writes content, and then closes `f`. `f` may be a file or a string (file path). The content may be a string or a bytebuf.

### [io/uri-stream](#)

Returns a `java.io.InputStream` from the `uri`.

### [io/file-in-stream](#)

Returns a `java.io.InputStream` for the file `f`.

### [io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

### [io/bytebuf-in-stream](#)

Returns a `java.io.InputStream` from a bytebuf.

[top](#)

## io/slurp-stream

(`io/slurp-stream is & options`)

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For string data an optional encoding can be specified.

Options:

`:binary true/false`     e.g.: `:binary true`, defaults to `false`

`:encoding enc`         e.g.: `:encoding :utf-8`, defaults to `:utf-8`

Note:

`io/slurp-stream` offers the same functionality as `io/slurp` but it opens more flexibility with sandbox configuration. `io/slurp` can be blacklisted to prevent reading data from the filesystem and still having `io/slurp-stream` for stream input available!

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/delete-file-on-exit file)
    (io/spit file "123456789" :append true)
    (try-with [is (io/file-in-stream file)]
      (io/slurp-stream is :binary false)))
  )
=> "123456789"
```

### SEE ALSO

#### [io/slurp-reader](#)

Slurps string data from a `java.io.Reader` `rd`. Note:

#### [io/slurp](#)

Reads the content of file `f` as text (string) or binary (bytebuf).

#### [io/slurp-lines](#)

Read all lines from `f`.

#### [io/spit](#)

Opens file `f`, writes content, and then closes `f`. `f` may be a file or a string (file path). The content may be a string or a bytebuf.

### [io/uri-stream](#)

Returns a `java.io.InputStream` from the uri.

### [io/file-in-stream](#)

Returns a `java.io.InputStream` for the file `f`.

### [io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

### [io/bytebuf-in-stream](#)

Returns a `java.io.InputStream` from a `bytebuf`.

[top](#)

## io/spit

`(io/spit f content & options)`

Opens file `f`, writes content, and then closes `f`. `f` may be a file or a string (file path). The content may be a string or a `bytebuf`.

Options:

`:append true/false`      e.g.: `:append true`, defaults to `false`

`:encoding enc`          e.g.: `:encoding :utf-8`, defaults to `:utf-8`

`io/spit` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

### SEE ALSO

#### [io/spit-stream](#)

Writes content (string or `bytebuf`) to the `java.io.OutputStream` `os`. If content is of type string an optional encoding (defaults to UTF-8) ...

#### [io/spit-writer](#)

Writes text to the `java.io.Writer` `wr`. The writer can optionally be flushed after the operation.

#### [io/slurp](#)

Reads the content of file `f` as text (string) or binary (`bytebuf`).

#### [io/slurp-lines](#)

Read all lines from `f`.

#### [loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

## io/spit-stream

`(io/spit-stream os content & options)`

Writes content (string or `bytebuf`) to the `java.io.OutputStream` `os`. If content is of type string an optional encoding (defaults to UTF-8) is supported. The stream can optionally be flushed after the operation.

Options:

`:flush true/false`      e.g.: `:flush true`, defaults to `false`

`:encoding enc`          e.g.: `:encoding :utf-8`, defaults to `:utf-8`

Note:

`io/spit-stream` offers the same functionality as `io/spit` but it opens more flexibility with sandbox configuration. `io/spit` can be blacklisted to prevent writing data to the filesystem and still having `io/spit-stream` for stream output available!

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/delete-file-on-exit file)
    (try-with [os (io/file-out-stream file)]
      (io/spit-stream os "123456789" :flush true))))
=> nil
```

## SEE ALSO

[io/spit-writer](#)

Writes text to the `java.io.Writer` `wr`. The writer can optionally be flushed after the operation.

[io/spit](#)

Opens file `f`, writes content, and then closes `f`. `f` may be a file or a string (file path). The content may be a string or a `bytebuf`.

[top](#)

## io/spit-writer

```
(io/spit-writer wr text)
```

Writes text to the `java.io.Writer` `wr`. The writer can optionally be flushed after the operation.

Options:

`:flush true/false`     e.g.: `:flush true`, defaults to `false`

Note:

`io/spit-writer` offers the same functionality as `io/spit` but it opens more flexibility with sandbox configuration. `io/spit` can be blacklisted to prevent writing data to the filesystem and still having `io/spit-writer` for stream output available!

```
(do
  (let [file (io/temp-file "test-", ".txt")
        os (io/file-out-stream file)]
    (io/delete-file-on-exit file)
    (try-with [wr (io/buffered-writer os :utf-8)]
      (io/spit-writer wr "123456789" :flush true))))
=> nil
```

## SEE ALSO

[io/spit-stream](#)

Writes content (string or `bytebuf`) to the `java.io.OutputStream` `os`. If content is of type string an optional encoding (defaults to UTF-8) ...

[io/spit](#)

Opens file `f`, writes content, and then closes `f`. `f` may be a file or a string (file path). The content may be a string or a `bytebuf`.

[top](#)

## io/string-in-stream

```
(io/string-in-stream s & options)
```

Returns a `java.io.InputStream` for the string `s`.

Options:

:encoding enc     e.g.: :encoding :utf-8 , defaults to :utf-8

Note: The caller is responsible for closing the stream!

```
(let [text "The quick brown fox jumped over the lazy dog"]
  (try-with [is (io/string-in-stream text)]
    ; do something with is
  ))
```

## SEE ALSO

top

## io/string-writer

(io/string-writer)

Creates a `java.io.StringWriter` .

Dereferencing a string writer returns the captured string.

Note: The caller is responsible for closing the writer!

```
(try-with [sw (io/string-writer)])  
  (print sw 100)  
  (print sw "-")  
  (print sw 200)  
  (flush sw)  
  (println @sw))  
100-200  
=> nil
```

### SEE ALSO

[str](#)

With no args, returns the empty string. With one arg x, returns `x.toString()`. `(str nil)` returns the empty string. With more than one ...

[io/string-reader](#)

Creates a `java.io.StringReader` from a string.

[top](#)

## io/temp-dir

(io/temp-dir prefix)

Creates a new temp directory with prefix. Returns a `java.io.File`.

```
(io/temp-dir "test-")  
=> /var/folders/rm/pjqr5pln3db4mxh5qq1j5yh80000gn/T/test-244000258880655023
```

### SEE ALSO

[io/tmp-dir](#)

Returns the tmp dir as a `java.io.File`.

[io/temp-file](#)

Creates an empty temp file with the given prefix and suffix. Returns a `java.io.File`.

[top](#)

## io/temp-file

(io/temp-file prefix suffix)

Creates an empty temp file with the given prefix and suffix. Returns a `java.io.File`.

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/spit file "123456789" :append true)
    (io/slurp file :binary false :remove true))
  )
=> "123456789"
```

#### SEE ALSO

[io/temp-dir](#)

Creates a new temp directory with prefix. Returns a `:java.io.File`.

top

## io/tmp-dir

(io/tmp-dir)

Returns the tmp dir as a `java.io.File`.

```
(io/tmp-dir)
=> /var/folders/rm/pjqr5p1n3db4mxh5qq1j5yh80000gn/T
```

#### SEE ALSO

[io/user-dir](#)

Returns the user dir (current working dir) as a `java.io.File`.

[io/user-home-dir](#)

Returns the user's home dir as a `java.io.File`.

[io/temp-dir](#)

Creates a new temp directory with prefix. Returns a `:java.io.File`.

top

## io/touch-file

(io/touch-file file)

Updates the *lastModifiedTime* of the file to the current time, or creates a new empty file if the file doesn't already exist. File must be a file or a string (file path). Returns the file

#### SEE ALSO

[io/move-file](#)

Moves source to target. Returns nil or throws a `VncException`. Source and target must be a file or a string (file path).

[io/copy-file](#)

Copies source to dest. Returns nil or throws a `VncException`. Source must be a file or a string (file path), dest must be a file, a ...

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

top

## io/ungzip

(io/ungzip f)

ungzips f. f may be a file, a string (file path), a bytebuf, or an InputStream. Returns a bytebuf.

```
(-> (bytebuf-from-string "abcdef" :utf-8)
    (io/gzip)
    (io/ungzip))
=> [97 98 99 100 101 102]
```

### SEE ALSO

[io/gzip](#)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[io/gzip?](#)

Returns true if f is a gzipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

[io/ungzip-to-stream](#)

ungzips a bytebuf returning an InputStream to read the deflated data from.

[top](#)

## io/ungzip-to-stream

(io/ungzip-to-stream buf)

ungzips a bytebuf returning an InputStream to read the deflated data from.

```
(-> (bytebuf-from-string "abcdef" :utf-8)
    (io/gzip)
    (io/ungzip-to-stream)
    (io/slurp-stream :binary false :encoding :utf-8))
=> "abcdef"
```

### SEE ALSO

[io/gzip](#)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[top](#)

## io/unzip

(io/unzip f entry-name)

Unzips an entry from zip f the entry's data as a bytebuf. f may be a bytebuf, a file, a string (file path) or an InputStream.

```
(-> (io/zip "a.txt" (bytebuf-from-string "abcdef" :utf-8))
    (io/unzip "a.txt"))
=> [97 98 99 100 101 102]
```

### SEE ALSO

## [io/zip](#)

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

## [io/zip?](#)

Returns true if f is a zipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

[top](#)

# io/unzip-all

```
(io/unzip-all f)
(io/unzip-all glob f)
```

Unzips all entries of the zip f returning a map with the entry names as key and the entry data as bytebuf values. f may be a bytebuf, a file, a string (file path) or an InputStream.

An optional globbing pattern can be passed to filter the files to be unzipped.

Note: globbing patterns with unzip are always relative. E.g. `static/**/*.png`

Globbing patterns:

<code>*.txt</code>	Matches a path that represents a file name ending in .txt
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with .txt or .xml
<code>foo.?</code>	Matches file names starting with foo. and a single character extension
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:\\*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

```
(-> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
           "b.txt" (bytebuf-from-string "def" :utf-8)
           "c.txt" (bytebuf-from-string "ghi" :utf-8))
  (io/unzip-all))
=> {"a.txt" [97 98 99] "b.txt" [100 101 102] "c.txt" [103 104 105]}
```

```
(->> (io/zip "foo/a.txt" (bytebuf-from-string "abc" :utf-8)
           "bar/b.txt" (bytebuf-from-string "def" :utf-8)
           "bar/c.log" (bytebuf-from-string "ghi" :utf-8))
  (io/unzip-all "bar/*.txt"))
=> {"bar/b.txt" [100 101 102]}
```

## SEE ALSO

## [io/unzip-to-dir](#)

Unzips the zip f to a directory. f may be a file, a string (file path), a bytebuf, or an InputStream.

## [io/unzip-nth](#)

Unzips the nth (zero.based) entry of the zip f returning its data as a bytebuf. f may be a bytebuf, a file, a string (file path) or ...

## [io/unzip-first](#)

Unzips the first entry of the zip f returning its data as a bytebuf. f may be a bytebuf, a file, a string (file path) or an InputStream.

## [io/zip](#)

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

## [io/zip?](#)

Returns true if f is a zipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

[top](#)

## io/unzip-first

```
(io/unzip-first zip)
```

Unzips the first entry of the zip *f* returning its data as a bytebuf. *f* may be a bytebuf, a file, a string (file path) or an InputStream.

```
(-> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
           "b.txt" (bytebuf-from-string "def" :utf-8))
    (io/unzip-first))
=> [97 98 99]
```

## io/watch-dir

```
(io/watch-dir dir event-fn)
(io/watch-dir dir event-fn failure-fn)
(io/watch-dir dir event-fn failure-fn termination-fn)
```

Watch a directory for changes, and call the function `event-fn` when it does. Calls the optional `failure-fn` if errors occur. On closing the watcher `termination-fn` is called.

`event-fn` is a two argument function that receives the path and mode `{:created, :deleted, :modified}` of the changed file.

`failure-fn` is a two argument function that receives the watch dir and the failure exception.

`termination-fn` is a one argument function that receives the watch dir.

Returns a *watcher* that is actively watching a directory. The *watcher* is a resource which should be closed with `(io/close-watcher w)` .

```
(do
  (defn log [msg] (locking log (println msg)))

  (let [w (io/watch-dir "/tmp"
                        #(log (str %1 " " " %2))
                        (sleep 30 :seconds)
                        (io/close-watcher w))])
```

## io/zip

```
(io/zip & entries)
```

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be `nil`, a `bytebuf`, a file, a string (file path), or an `InputStream`.

An entry name with a trailing `'/'` creates a directory. Returns the zip as `bytebuf`.

```
; single entry
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8))
      (io/spit "test.zip"))

; multiple entries
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
          "b.txt" (bytebuf-from-string "def" :utf-8)
          "c.txt" (bytebuf-from-string "ghi" :utf-8))
      (io/spit "test.zip"))

; multiple entries with subdirectories
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
```

```
    "x/b.txt" (bytebuf-from-string "def" :utf-8)
    "x/y/c.txt" (bytebuf-from-string "ghi" :utf-8))
(io/spit "test.zip"))
```

```
; empty directory z/
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
            "z/" nil)
      (io/spit "test.zip"))
```

## SEE ALSO

### [io/zip-file](#)

Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file may be a file, a ...

## io/zip-append

```
(io/zip-append f & entries)
```

Appends entries to an existing zip file f. Overwrites existing entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string (file path), or an InputStream.

An entry name with a trailing '/' creates a directory.

```
(let [data (bytebuf-from-string "abc" :utf-8)]
; create the zip with a first file
(->> (io/zip "a.txt" data)
      (io/spit "test.zip"))
; add text files
(io/zip-append "test.zip" "b.txt" data "x/c.txt" data)
; add an empty directory
(io/zip-append "test.zip" "x/y/" nil))
```

## SEE ALSO

### [io/zip-file](#)

Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file may be a file, a ...

### [io/zip-remove](#)

Remove entries from a zip file f.

## io/zip-file

```
(io/zip-file options* zip-file & files)
```

Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file may be a file, a string (file path) or an OutputStream.

Options:

:filter-fn fn      a predicate function that filters the files to be added to the zip.  
 :mapper-fn fn     a mapper function that can map the file content of a file before it gets zipped. Returns nil or a :java.io.InputStream. The real file is used when nil is returned.  
 :silent b          if false prints the added entries to *out*, defaults to false

Example:

```
venice> (io/zip-file :silent false "test.zip" "dirA" "dirB")
```

Output:

```
adding: dirA/
adding: dirA/a1.png
adding: dirA/a2.png
adding: dirB/
adding: dirB/b1.png
```

```
; zip files
(io/zip-file "test.zip" "a.txt" "x/b.txt")

; zip all files from a directory
(io/zip-file "test.zip" "dir")

; zip all files in from two directories
(io/zip-file "test.zip" "dirA" "dirB")

; zip all files in from two directories and print the added entries
(io/zip-file :silent false "test.zip" "dirA" "dirB")

; zip all *.txt files from a directory
(io/zip-file :filter-fn (fn [dir name] (str/ends-with? name ".txt"))
  "test.zip"
  "dir")
```

### SEE ALSO

[io/zip](#)

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

[io/zip-list](#)

List the content of a the zip f and prints it to the current value of out. f may be a bytebuf, a file, a string (file path), or an ...

## io/zip-list

```
(io/zip-list options* f)
```

List the content of a the zip *f* and prints it to the current value of *out*. *f* may be a bytebuf, a file, a string (file path), or an InputStream. Returns nil in print mode otherwise returns a list with attributes for each zip file entry.

Options:

:verbose b if true print verbose output, defaults to false  
:print b if true print the entries to *out*, defaults to true

Example:

```
venice> (io/zip-list "test.zip")
Length      Date/Time Name
-----
      0  2021-01-05 10:32 dirA/

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

[io/unzip](#)

Unzips an entry from zip f the entry's data as a bytebuf. f may be a bytebuf, a file, a string (file path) or an InputStream.

[top](#)

## io/zip-remove

```
(io/zip-remove f & entry-names)
```

Remove entries from a zip file f.

```
; remove files from zip
(io/zip-remove "test.zip" "x/a.txt" "x/b.txt")

; remove directory from zip
(io/zip-remove "test.zip" "x/y/")
```

## SEE ALSO

[io/zip-file](#)

Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file my be a file, a ...

[io/zip-append](#)

Appends entries to an existing zip file f. Overwrites existing entries. An entry is given by a name and data. The entry data may be ...

[top](#)

## io/zip?

```
(io/zip? f)
```

Returns true if f is a zipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

```
(-> (io/zip "a" (bytebuf-from-string "abc" :utf-8))
  (io/zip?))
=> true
```

[top](#)

## ip-private?

```
(ip-private? addr)
```

Returns true if the IP address is private.

IPv4 addresses reserved for private networks:

- 192.168.0.0 - 192.168.255.255
- 172.16.0.0 - 172.31.255.255
- 10.0.0.0 - 10.255.255.255

```
(ip-private? "192.168.170.181")  
=> true
```

[top](#)

## jar-maven-manifest-version

```
(jar-maven-manifest-version group-id artefact-id)
```

Returns the Maven version for a loaded JAR's manifest or nil if there is no Maven manifest.

Reads the version from the JAR's Maven 'pom.properties' file at:  
/META-INF/maven/{group-id}/{artefact-id}/pom.properties

A 'pom.properties' may look like:

- artifactId=xchart
- groupId=org.knowm.xchart
- version=3.8.0

```
(jar-maven-manifest-version :com.github.librepdf :openpdf)  
=> "1.3.28"
```

### SEE ALSO

[java-package-version](#)

Returns version information for a Java package or nil if the package does not exist or is not visible.

[top](#)

## java-enumeration-to-list

```
(java-enumeration-to-list e)
```

Converts a Java enumeration to a list

[top](#)

## java-iterator-to-list

```
(java-iterator-to-list e)
```

Converts a Java iterator to a list

[top](#)

## java-major-version

```
(java-major-version)
```

Returns the Java major version (8, 9, 11, ...).

```
(java-major-version)
=> 8
```

### SEE ALSO

[java-version](#)

Returns the Java VM version (1.8.0\_252, 11.0.7, ...)

[java-version-info](#)

Returns the Java VM version info.

[top](#)

## java-obj?

```
(java-obj? obj)
```

Returns true if obj is a Java object

```
(java-obj? (. :java.math.BigInteger :new "0"))
=> true
```

[top](#)

## java-package-version

```
(java-package-version class)
```

Returns version information for a Java package or nil if the package does not exist or is not visible.

```
(java-package-version :java.lang.String)
=> {:implementation-title "Java Runtime Environment" :implementation-vendor "Temurin" :implementation-version
"1.8.0_322" :specification-title "Java Platform API Specification" :specification-vendor "Oracle Corporation" :
specification-version "1.8"}
```

```
(java-package-version (class :java.lang.String))
=> {:implementation-title "Java Runtime Environment" :implementation-vendor "Temurin" :implementation-version
"1.8.0_322" :specification-title "Java Platform API Specification" :specification-vendor "Oracle Corporation" :
specification-version "1.8"}
```

## SEE ALSO

### [jar-maven-manifest-version](#)

Returns the Maven version for a loaded JAR's manifest or nil if there is no Maven manifest.

### [class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

## java-source-location

(java-source-location class)

Returns the path of the source location of a class (fully qualified class name).

([java-source-location](#) :com.github.jlangch.venice.Venice)

## java/javadoc

`(javadoc class-or-object)`

Opens a browser window displaying the javadoc for argument.

([java/javadoc](#) :[java.lang.String](#))

[top](#)

## json/pretty-print

([json/pretty-print](#) s & options)

Pretty prints a JSON string

Options:

:indent s     The indent for indented output. Must contain spaces or tabs only. Defaults to two spaces.

```
(-> (json/write-str {:a 100 :b 100 :c [1 2 3]}))
(json/pretty-print)
(println)

{
  "a": 100,
  "b": 100,
  "c": [1,2,3]
}
=> nil

(-> (json/write-str {:a 100 :b 100 :c [1 2 {:x 7 :y 8}] :d {:z 9}})
(json/pretty-print :indent "  ")
(println))

{
  "a": 100,
  "b": 100,
  "c": [1,2,{
    "x": 7,
    "y": 8
  }],
  "d": {
    "z": 9
  }
}
=> nil
```

### SEE ALSO

[json/write-str](#)

Writes the val to a JSON string.

[json/read-str](#)

Reads a JSON string and returns it as a Venice datatype.

[json/spit](#)

Spits the JSON converted val to the output.

[json/slurp](#)

Slurps a JSON data from a source and returns it as a Venice data.

[top](#)

## json/read-str

([json/read-str](#) s & options)

Reads a JSON string and returns it as a Venice datatype.

Options:

- :key-fn fn** Single argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.
- :value-fn fn** Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.
- :decimal b** If true use BigDecimal for decimal numbers instead of Double. Default is false.

```
(json/read-str (json/write-str {:a 100 :b 100}))  
=> {"a" 100 "b" 100}
```

```
(json/read-str (json/write-str {:a 100 :b 100}) :key-fn keyword)  
=> {:a 100 :b 100}
```

```
(json/read-str (json/write-str {:a 100 :b 100})  
               :value-fn (fn [k v] (if (== "a" k) (inc v) v)))  
=> {"a" 101 "b" 100}
```

[top](#)

## json/slurp

(json/slurp source & options)

Slurps a JSON data from a source and returns it as a Venice data.

The source may be a:

- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.InputStream`
- `java.io.Reader`

Options:

- :key-fn fn** Single-argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.
- :value-fn fn** Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.
- :decimal b** If true use BigDecimal for decimal numbers instead of Double. Default is false.
- :encoding e** e.g: encoding :utf-8, defaults to :utf-8

```
(let [json (json/write-str {:a 100 :b 100 :c 1.233})]
  (try-with [in (io/string-reader json)]
    (pr-str (json/slurp in))))
=> "{\"a\" 100 \"b\" 100 \"c\" 1.233}"

(let [json (json/write-str {:a 100 :b 100 :c 1.233})]
  (try-with [in (io/string-reader json)]
    (pr-str (json/slurp in :decimal true :key-fn keyword)))))
=> "{:a 100 :b 100 :c 1.233M}"
```

top

## json/spit

(json/spit out val & options)

Spits the JSON converted val to the output.

The out may be a:

- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.OutputStream`
- `java.io.Writer`

Options:

:pretty b	Enables/disables pretty printing. Defaults to false.
:decimal-as-double b	If true emit a decimal as double else as string. Defaults to false.
:encoding e	e.g :encoding :utf-8, defaults to :utf-8

```
(try-with [out (io/bytebuf-out-stream)]
  (json/spit out {:a 100 :b 100 :c [10 20 30]}))
(flush out)
(bytebuf-to-string @out :utf-8))
=> "{\"a\":100,\"b\":100,\"c\":[10,20,30]}"

[top](#)

## just

([just](#) x)

Creates a wrapped x, that is dereferenceable

```
(just 10)  
=> (just 10)
```

```
(just "10")  
=> (just "10")
```

```
(deref (just 10))  
=> 10
```

[top](#)

## just?

```
(just? x)
```

Returns true if x is of type just

```
(just? (just 1))  
=> true
```

[top](#)

## juxt

```
(juxt f)  
(juxt f g)  
(juxt f g h)  
(juxt f g h & fs)
```

Takes a set of functions and returns a fn that is the juxtaposition of those fns. The returned fn takes a variable number of args, and returns a vector containing the result of applying each fn to the args (left-to-right).

```
((juxt a b c) x) => [(a x) (b x) (c x)]
```

```
((juxt first last) '(1 2 3 4))  
=> [1 4]
```

```
(do  
  (defn index-by [coll key-fn]  
    (into {} (map (juxt key-fn identity) coll)))  
  
  (index-by [{:id 1 :name "foo"}  
             {:id 2 :name "bar"}  
             {:id 3 :name "baz"}]  
            :id))  
=> {1 {:name "foo" :id 1} 2 {:name "bar" :id 2} 3 {:name "baz" :id 3}}
```

[top](#)

## keep

```
(keep f coll)
```

Returns a sequence of the non-nil results of `(f item)`. Note, this means false return values will be included. `f` must be free of side-effects. Returns a transducer when no collection is provided.

```
(keep even? (range 1 4))  
=> (false true false)
```

```
(keep (fn [x] (if (odd? x) x)) (range 4))  
=> (1 3)
```

```
(keep #{3 5 7} '(1 3 5 7 9))  
=> (3 5 7)
```

## key

```
(key e)
```

Returns the key of the map entry.

```
(key (find {:a 1 :b 2} :b))  
=> :b
```

```
(key (first (entries {:a 1 :b 2 :c 3})))  
=> :a
```

### SEE ALSO

#### [map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

#### [entries](#)

Returns a collection of the map's entries.

#### [val](#)

Returns the val of the map entry.

#### [keys](#)

Returns a collection of the map's keys.

## keys

```
(keys map)
```

Returns a collection of the map's keys.

Please note that the functions 'keys' and 'vals' applied to the same map are not guaranteed not return the keys and vals in the same order!

To achieve this, keys and vals can be calculated based on the map's entry list:

```
(let [e (entries {:a 1 :b 2 :c 3})]  
  (println (map key e))  
  (println (map val e)))
```

```
(keys {:a 1 :b 2 :c 3})  
=> (:a :b :c)
```

### SEE ALSO

#### [vals](#)

Returns a collection of the map's values.

#### [entries](#)

Returns a collection of the map's entries.

#### [map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

## keyword

```
(keyword name)
```

Returns a keyword from the given name

```
(keyword "a")  
=> :a
```

```
(keyword :a)  
=> :a
```

## keyword?

```
(keyword? x)
```

Returns true if x is a keyword

```
(keyword? (keyword "a"))  
=> true
```

```
(keyword? :a)  
=> true
```

```
(keyword? nil)  
=> false
```

```
(keyword? 'a)  
=> false
```

## kira/escape-html

```
(kira/escape-html val)  
(kira/escape-html val f)
```

Returns a HTML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

An optional function f transforms the value before being converted to a string and HTML escaped.

```
(do  
  (ns test)  
  (load-module :kira)  
  
  (println (kira/eval "<div><%= (kira/escape-html formula) %></div>"  
                     { :formula "x > 100" })))  
  
  (defn format [t] (time/format t "yyyy-MM-dd"))
```

```
(println (kira/eval "<div><%= (kira/escape-html date test/format) %></div>"
                   { :date (time/local-date 2000 8 1) })))
<div>x &gt; 100</div>
<div>2000-08-01</div>
=> nil
```

## SEE ALSO

[kira/escape-xml](#)

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

top

## kira/escape-xml

```
(kira/escape-xml val)
(kira/escape-xml val f)
```

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

An optional function f transforms the value before being converted to a string and XML escaped.

```
(do
  (ns test)
  (load-module :kira)

  (println (kira/eval "<formula><%= (kira/escape-xml formula) %></formula>"
                     { :formula "x > 100" })))

  (defn format [t] (time/format t "yyyy-MM-dd"))
  (println (kira/eval "<date><%= (kira/escape-xml date test/format) %></date>"
                     { :date (time/local-date 2000 8 1) })))
<formula>x &gt; 100</formula>
<date>2000-08-01</date>
=> nil
```

## SEE ALSO

## lazy-seq

```
(lazy-seq)
(lazy-seq f)
(lazy-seq seed f)
(lazy-seq head tail-lazy-seq)
```

Creates a new lazy sequence.

```
(lazy-seq)
empty lazy sequence
```

```
(lazy-seq f)
```

(theoretically) infinitely lazy sequence using a repeatedly invoked supplier function for each next value. The supplier function f is a no arg function. The sequence ends if the supplier function returns nil.

```
(lazy-seq seed f)
```

(theoretically) infinitely lazy sequence with a seed value and a supplier function to calculate the next value based on the previous. f is a single arg function. The sequence ends if the supplier function returns nil.

```
(lazy-seq head tail-lazy-seq)
```

Constructs a lazy sequence of a head element and a lazy sequence tail supplier.

```
; empty lazy sequence
```

```
(->> (lazy-seq)
      (doall))

bindings is a vector with 2 elements: binding-form test.

### [binding](#)

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

[top](#)

## letfn

```
(letfn [fnspec*] exprs*)
```

Takes a vector of function specs and a body, and generates a set of bindings of functions to their names. All of the names are available in all of the definitions of the functions, as well as the body.

fnspec ==> (fname [params\*] exprs) or (fname ([params\*] exprs)+)

```
(letfn [(foo [] "abc")] (foo))
```

is equivalent to

```
(let [foo (fn [] "abc")] (foo))
```

```
(letfn [(foo [] "abc")
        (bar [] (str (foo) "def"))]
  (bar))
=> "abcdef"
```

## SEE ALSO

## let

Evaluates the expressions and binds the values to symbols in the new local context.

top

## list

```
(list & items)
```

Creates a new list containing the items.

```
(list)
```

```
=> ()
```

```
(list 1 2 3)
```

```
=> (1 2 3)
```

```
(list 1 2 3 [:a :b])
```

```
=> (1 2 3 [:a :b])
```

top

## list\*

```
(list* args)
```

```
(list* a args)
```

```
(list* a b args)
```

```
(list* a b c args)
```

```
(list* a b c d & more)
```

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

```
(list* 1 '(2 3))
```

```
=> (1 2 3)
```

```
(list* 1 2 3 [4])
```

```
=> (1 2 3 4)
```

```
(list* 1 2 3 '(4 5))
```

```
=> (1 2 3 4 5)
```

```
(list* '(1 2) 3 [4])
```

```
=> ((1 2) 3 4)
```

```
(list* nil)
```

```
=> nil
```

```
(list* nil [2 3])
```

```
=> (nil 2 3)
```

```
(list* 1 2 nil)
```

```
=> (1 2)
```

SEE ALSO

### [cons](#)

Returns a new collection where x is the first element and coll is the rest

### [conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item). For list, vectors and ordered maps the values are ...

### [concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

### [vector\\*](#)

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

## list-comp

```
(list-comp seq-exprs body-expr)
```

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and yields a collection of evaluations of expr.

Supported modifiers are: `:when` predicate

```
(list-comp [x (range 10)] x)
=> (0 1 2 3 4 5 6 7 8 9)
```

```
(list-comp [x (range 5)] (* x 2))
=> (0 2 4 6 8)
```

```
(list-comp [x (range 10) :when (odd? x)] x)
=> (1 3 5 7 9)
```

```
(list-comp [x (range 10) :when (odd? x)] (* x 2))
=> (2 6 10 14 18)
```

```
(list-comp [x (seq "abc") y [0 1 2]] [x y])
=> ([#\a 0] [#\a 1] [#\a 2] [#\b 0] [#\b 1] [#\b 2] [#\c 0] [#\c 1] [#\c 2])
```

### SEE ALSO

#### [doseq](#)

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

#### [dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[top](#)

## list?

```
(list? obj)
```

Returns true if obj is a list

```
(list? (list 1 2))
=> true
```

```
(list? '(1 2))
=> true
```

[top](#)

## load-classpath-file

```
(load-classpath-file f)
(load-classpath-file f force)
(load-classpath-file f nsalias)
(load-classpath-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the classpath file. The function is restricted to classpath files with the extension '.venice'.

Returns a tuple with the file's name and the keyword `:loaded` if the file has been successfully loaded or `:already-loaded` if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

Loaded files are cached by Venice and subsequent loads are just skipped. To enforce a reload call the file load with the force flag set to true:

```
(load-classpath-file "com/github/jlangch/venice/test.venice" true)
```

An optional namespace alias can be passed: `(load-classpath-file "com/github/jlangch/venice/test.venice" ['test :as 't])`

`load-classpath-file` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice")
  (test-support/test-fn "hello"))
=> "test: hello"

(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice")
  (test-support/test-fn "hello")
  ; reload the classpath file
  (ns-remove 'test-support)
  (load-classpath-file "com/github/jlangch/venice/test-support.venice" true)
  (test-support/test-fn "hello"))
=> "test: hello"

;; namespace aliases
(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice" ['test-support :as 't])
  (t/test-fn "hello"))
=> "test: hello"
```

### SEE ALSO

#### [load-file](#)

Sequentially read and evaluate the set of forms contained in the file.

#### [load-string](#)

Sequentially read and evaluate the set of forms contained in the string.

#### [load-module](#)

Loads a Venice predefined extension module.

#### [loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

## load-file

```
(load-file f)
(load-file f force)
(load-file f nsalias)
(load-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the file.

If the file is found on one of the defined load paths it is read and the forms it contains are evaluated. If the file is not found an exception is raised.

Returns a tuple with the file's name and the keyword `:loaded` if the file has been successfully loaded or `:already-loaded` if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

The function is restricted to load files with the extension '.venice'. If the file extension is missing '.venice' will be implicitly added.

An optional namespace alias can be passed: `(load-file "coffee.venice" ['coffee :as 'c])`

`load-file` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
;; With load-paths: [/users/foo/scripts]
;;      -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee")

;; With load-paths: [/users/foo/scripts]
;;      -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee.venice")

;; With load-paths: [/users/foo/scripts]
;;      -> loads: /users/foo/scripts/beverages/coffee.venice
(load-file "beverages/coffee")

;; With load-paths: [/users/foo/resources.zip]
;;      -> loads: /users/foo/resources.zip!beverages/coffee.venice
(load-file "beverages/coffee")
```

## load-module

```
(load-module m)
```

```
(load-module m force)
(load-module m nsalias)
(load-module m force nsalias)
```

Loads a Venice predefined extension module.

Returns a tuple with the module's name and the keyword `:loaded` if the module has been successfully loaded or `:already-loaded` if the module has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the module is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

Loaded modules are cached by Venice and subsequent loads are just skipped. To enforce a reload call the module load with the force flag set to true: `(load-module :hexdump true)`

An optional namespace alias can be passed: `(load-module :hexdump ['hexdump :as 'h])`

`load-module` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(load-module :trace)

;; loading the :trace modul and define a ns alias 't for namespace
;; 'trace used in the module
(load-module :trace ['trace :as 't])

;; reloading a module
(do
  (load-module :trace)
  ; reload the module
  (ns-remove 'trace)
  (load-module :trace true))

;; namespace aliases
(do
  (load-module :hexdump ['hexdump :as 'h])
  (h/dump (range 32 64)))
```

## loadpath/normalize

```
(loadpath/normalize f)
```

Normalize a relative file regarding the load paths.

With the load paths: `["/Users/foo/img.png", "/Users/foo/resources"]`

- `(loadpath/normalize "img.png") -> "/Users/foo/img.png"`
- `(loadpath/normalize "test.json") -> "/Users/foo/resources/test.json"`
- `(loadpath/normalize "/tmp/data.json") -> "/tmp/data.json"`

## SEE ALSO

### [loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

### [loadpath/unrestricted?](#)

Returns true if the load paths are unrestricted.

[top](#)

## loadpath/paths

(loadpath/paths)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the application level. They are passed as part of the sandbox to the Venice evaluator.

The functions that support load paths try sequentially every load path to access files. If a load path is a ZIP file, files can be read from within that ZIP file.

Example:

```
/Users/foo/demo
|
+--- resources.zip
|
+--- /data
    |
    +--- config.json
    |
    +--- /scripts
        |
        +--- script1.venice
```

With a load path configuration of `["/Users/foo/demo/resources.zip", "/Users/foo/demo/data"]`

- `(io/slurp "config.json")` -> slurps `/Users/foo/demo/data/config.json`
- `(io/slurp "scripts/script1.venice")` -> slurps `/Users/foo/demo/data/scripts/script1.venice`
- `(io/slurp "img1.png")` -> slurps `/Users/foo/demo/resources.ziplimg1.png`

I/O functions with support for load paths:

- `load-file`
- `io/slurp`
- `io/slurp-lines`
- `io/spit`
- `io/file-in-stream`
- `io/file-out-stream`
- `io/delete-file`

To enforce a Venice script to read/write files on the load paths only:

- Define a custom sandbox
- Disable all I/O functions
- Enable the I/O functions that support load paths

## SEE ALSO

[loadpath/unrestricted?](#)

Returns true if the load paths are unrestricted.

[loadpath/normalize](#)

Normalize a relative file regarding the load paths.

## locking

(locking x & exprs)

Executes 'exprs' in an implicit do, while holding the monitor of 'x'. Will release the monitor of 'x' in all circumstances. Locking operates like the synchronized keyword in Java.

```
(do
  (def x 1)
  (locking x
    (println 100)
    (println 200)))
100
200
=> nil

;; Locks are reentrant
(do
  (def x 1)
  (locking x
    (locking x
      (println "in"))
    (println "out")))
in
out
=> nil

(defn log [msg] (locking log (println msg)))
(log "message")
message
=> nil
```

[top](#)

## log

(log x)

Returns the natural logarithm (base e) of a value

```
(log 10)
=> 2.302585092994046
```

```
(log 10.23)
=> 2.325324579963535
```

```
(log 10.23M)
=> 2.325324579963535
```

## SEE ALSO

[log10](#)

Returns the base 10 logarithm of a value

[top](#)

# log10

```
(log10 x)
```

Returns the base 10 logarithm of a value

```
(log10 10)
=> 1.0
```

```
(log10 10.23)
=> 1.0098756337121602
```

```
(log10 10.23M)
=> 1.0098756337121602
```

```
;; the number of digits
(long (+ (floor (log10 235)) 1))
=> 3
```

## SEE ALSO

[log](#)

Returns the natural logarithm (base e) of a value

[top](#)

# long

```
(long x)
```

Converts to long

```
(long 1)
=> 1
```

```
(long nil)
=> 0
```

```
(long false)
=> 0
```

```
(long true)
=> 1

(long 1.2)
=> 1

(long 1.2M)
=> 1

(long "1")
=> 1

(long (char "A"))
=> 65
```

[top](#)

## long-array

```
(long-array coll)
(long-array len)
(long-array len init-val)
```

Returns an array of Java primitive longs containing the contents of coll or returns an array with the given length and optional init value

```
(long-array '(1 2 3))
=> [1, 2, 3]

(long-array '(1I 2 3.2 3.56M))
=> [1, 2, 3, 3]

(long-array 10)
=> [0, 0, 0, 0, 0, 0, 0, 0, 0, 0]

(long-array 10 42)
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

[top](#)

## long?

```
(long? n)
```

Returns true if n is a long

```
(long? 4)
=> true

(long? 4I)
=> false

(long? 3.1)
=> false
```

```
(long? true)
=> false

(long? nil)
=> false

(long? {})
=> false
```

[top](#)

## loop

```
(loop [bindings*] exprs*)
```

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

```
;; tail recursion
(loop [x 10]
  (when (> x 1)
    (println x)
    (recur (- x 2)))))

10
8
6
4
2
=> nil
```

```
;; tail recursion
(do
  (defn sum [n]
    (loop [cnt n acc 0]
      (if (zero? cnt)
        acc
        (recur (dec cnt) (+ acc cnt)))))
    (sum 10000)))

=> 50005000
```

### SEE ALSO

[recur](#)

Evaluates the exprs and rebinds the bindings of the recursion point to the values of the exprs. The recur expression must be at the ...

[top](#)

## macro?

```
(macro? x)
```

Returns true if x is a macro

```
(macro? and)
=> true
```

## macroexpand

```
(macroexpand form)
```

If form represents a macro form, returns its expansion, else returns form.

To recursively expand all macros in a form use `(macroexpand-all form)`.

```
(macroexpand '(> c (+ 3) (* 2)))  
=> (* (+ c 3) 2)
```

### SEE ALSO

[defmacro](#)

Macro definition

[macroexpand-all](#)

Recursively expands all macros in the form.

## macroexpand-all

```
(macroexpand-all form)
```

Recursively expands all macros in the form.

```
(macroexpand-all '(and true true))  
=> (let [cond__21014__auto true] (if cond__21014__auto true cond__21014__auto))
```

```
(macroexpand-all '(and true (or true false) true))  
=> (let [cond__21037__auto true] (if cond__21037__auto (let [cond__21037__auto (let [cond__21038__auto true]  
(if cond__21038__auto cond__21038__auto false))] (if cond__21037__auto true cond__21037__auto))  
cond__21037__auto))
```

```
(macroexpand-all '(let [n 5] (cond (< n 0) -1 (> n 0) 1 :else 0)))  
=> (let [n 5] (if (< n 0) -1 (if (> n 0) 1 (if :else 0 nil))))
```

### SEE ALSO

[macroexpand](#)

If form represents a macro form, returns its expansion, else returns form.

[defmacro](#)

Macro definition

## macroexpand-on-load?

```
(macroexpand-on-load?)
```

Returns true if `macroexpand-on-load` feature is enabled else false.

The activation of `macroexpand-on-load` (upfront macro expansion) results in 3x to 15x better performance. Upfront macro expansion can be activated through the `!macroexpand` command in the REPL.

```
(macroexpand-on-load?)  
=> false
```

[top](#)

## make-array

```
(make-array type len)  
(make-array type dim &more-dims)
```

Returns an array of the given type and length

```
(str (make-array :long 5))  
=> "[0, 0, 0, 0, 0]"  
  
(str (make-array :java.lang.Long 5))  
=> "[nil, nil, nil, nil, nil]"  
  
(str (make-array :long 2 3))  
=> "[[0 0 0], [0 0 0]]"  
  
(aset (make-array :java.lang.Long 5) 3 9999)  
=> [nil, nil, nil, 9999, nil]
```

[top](#)

## map

```
(map f coll colls*)
```

Applies `f` to the set of first items of each `coll`, followed by applying `f` to the set of second items in each `coll`, until any one of the `colls` is exhausted. Any remaining items in other `colls` are ignored.

Returns a transducer when no collection is provided.

Note: if Java collections are used the mapper converts all mapped items back to Java data types to keep Java compatibility as much as possible! To avoid this just convert the Java collection to a Venice collection. E.g.: `(into [] ...)`.

```
(map inc [1 2 3 4])  
=> (2 3 4 5)  
  
(map + [1 2 3 4] [10 20 30 40])  
=> (11 22 33 44)  
  
(map list '(1 2 3 4) '(10 20 30 40))  
=> ((1 10) (2 20) (3 30) (4 40))  
  
(map vector (lazy-seq 1 inc) [10 20 30 40])  
=> ([1 10] [2 20] [3 30] [4 40])
```

```

(map (fn [e] [(key e) (inc (val e))]) {:a 1 :b 2})
=> ([:a 2] [:b 3])

(map inc #{1 2 3})
=> (2 3 4)

;; Venice enforces Java types when using java collections instead
;; of Venice collections!
;; -> The returned element type is a 'java.util.ArrayList'
;; and not a 'core/vector'
(->> (doto (. :java.util.ArrayList :new) (. :add 1) (. :add 2))
      (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
      (first)
      (type))
=> :java.util.ArrayList

;; Same example with a Venice collection!
;; -> The returned element type is a 'core/vector'
(->> [1 2]
      (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
      (first)
      (type))
=> :core/vector

```

## SEE ALSO

## map-invert

```
(map-invert m)
```

Returns the map with the vals mapped to the keys.

```
(map-invert {:a 1 :b 2 :c 3})
=> {1 :a 2 :b 3 :c}
```

[top](#)

## map-keys

```
(map-keys f m)
```

Applies function *f* to the keys of the map *m*.

```
(map-keys name {:a 1 :b 2 :c 3})
=> {"a" 1 "b" 2 "c" 3}
```

## SEE ALSO

[map-vals](#)

Applies function *f* to the values of the map *m*.

[map-invert](#)

Returns the map with the vals mapped to the keys.

[top](#)

## map-vals

```
(map-vals f m)
```

Applies function *f* to the values of the map *m*.

```
(map-vals inc {:a 1 :b 2 :c 3})
=> {:a 2 :b 3 :c 4}
```

```
(map-vals :len {:a {:col 1 :len 10} :b {:col 2 :len 20} :c {:col 3 :len 30}})
=> {:a 10 :b 20 :c 30}
```

## SEE ALSO

### [map-keys](#)

Applies function *f* to the keys of the map *m*.

### [map-invert](#)

Returns the map with the vals mapped to the keys.

[top](#)

## map?

```
(map? obj)
```

Returns true if *obj* is a map

```
(map? {:a 1 :b 2})
=> true
```

[top](#)

## mapcat

```
(mapcat fn & colls)
```

Returns the result of applying *concat* to the result of applying *map* to *fn* and *colls*. Thus function *fn* should return a collection.

```
(mapcat identity [[1 2 3] [4 5 6] [7 8 9]])
=> (1 2 3 4 5 6 7 8 9)
```

```
(mapcat identity [[1 2 [3 4]] [5 6 [7 8]]])
=> (1 2 [3 4] 5 6 [7 8])
```

```
(mapcat reverse [[3 2 1] [6 5 4] [9 8 7]])
=> (1 2 3 4 5 6 7 8 9)
```

```
(mapcat list [:a :b :c] [1 2 3])
=> (:a 1 :b 2 :c 3)
```

```
(mapcat #(remove even? %) [[1 2] [2 2] [2 3]])
=> (1 3)
```

```
(mapcat #(repeat 2 %) [1 2])
=> (1 1 2 2)
```

```
(mapcat (juxt inc dec) [1 2 3 4])
=> (2 0 3 1 4 2 5 3)
```

```
;; Turn a frequency map back into a coll.
(mapcat (fn [[x n]] (repeat n x)) {:a 2 :b 1 :c 3})
=> (:a :a :b :c :c :c)
```

## SEE ALSO

### [map](#)

Applies `f` to the set of first items of each coll, followed by applying `f` to the set of second items in each coll, until any one of the ...

### [flatten](#)

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. (flatten ...

[top](#)

## mapv

```
(mapv f coll colls*)
```

Returns a vector consisting of the result of applying `f` to the set of first items of each coll, followed by applying `f` to the set of second items in each coll, until any one of the colls is exhausted. Any remaining items in other colls are ignored.

```
(mapv inc [1 2 3 4])
=> [2 3 4 5]
```

```
(mapv + [1 2 3 4] [10 20 30 40])
=> [11 22 33 44]
```

```
(mapv vector [1 2 3 4] [10 20 30 40])
=> [[1 10] [2 20] [3 30] [4 40]]
```

## SEE ALSO

### [docoll](#)

Applies `f` to the items of the collection presumably for side effects. Returns nil.

[top](#)

## match?

```
(match? s regex)
```

Returns true if the string `s` matches the regular expression `regex`.

The argument 'regex' may be a string representing a regular expression or a `:java.util.regex.Pattern`.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. `regex/matches?` performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"[0-9]+" "")]
  (filter #(regex/matches? m %) ["100" "1a1" "200"])))
```

```
(match? "1234" "[0-9]+")
=> true
```

```
(match? "1234ss" "[0-9]+")
=> false
```

```
(match? "1234" #"[0-9]+")
=> true
```

## SEE ALSO

### [not-match?](#)

Returns true if the string `s` does not match the regular expression `regex`.

### [regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

### [regex/matches-not?](#)

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

### [regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

### [regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

### [regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

### [regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[top](#)

## math/acos

```
(math/acos x)
```

Returns the arc cosine of a value; the returned angle is in the range `0.0` through `pi`

```
(math/acos 0.5)

## maven/download

(maven/download artefact options\*)

Downloads an artefact in the format 'group-id:artefact-id:version' from a Maven repository. Can download any combination of the jar, sources, or pom artefacts to a directory.

Options:

:jar {true,false}	download the jar, defaults to true
:sources {true,false}	download the sources, defaults to false
:pom {true,false}	download the pom, defaults to false
:dir path	download dir, defaults to "."
:repo maven-repo	a maven repo, defaults to "https://repo1.maven.org/maven2"
:silent {true,false}	if silent is true does not show a progress bar, defaults to true

```
(maven/download "org.knowm.xchart:xchart:3.8.1")
```

```
(maven/download "org.knowm.xchart:xchart:3.8.1" :sources true :pom true)
```

```
(maven/download "org.knowm.xchart:xchart:3.8.1" :dir "." :jar false :sources true)
```

```
(maven/download "org.knowm.xchart:xchart:3.8.1" :dir "." :sources true)
```

```
(maven/download "org.knowm.xchart:xchart:3.8.1" :dir "." :sources true :repo "https://repo1.maven.org/maven2")
```

```
(maven/download "org.knowm.xchart:xchart:3.8.1" :dir "." :silent false)
```

### SEE ALSO

[maven/get](#)

```

```
(max 1.0M 2)
=> 2
```

## SEE ALSO

[min](#)

Returns the smallest of the values

[top](#)

## memoize

```
(memoize f)
```

Returns a memoized version of a referentially transparent function.

Note:

Use memoization for expensive calculations. If used with fast calculations it has the opposite effect and can slow it down actually!

```
(do
  (def fibonacci
    (memoize
      (fn [n]
        (cond
          (<= n 0) 0
```

```

      (< n 2) 1
      :else (+ (fibonacci (- n 1)) (fibonacci (- n 2)))))))))

(time (fibonacci 25))
Elapsed time: 2.42ms
=> 75025

(do
  (defn test [a b]
    (println (str "calculating a=" a ", b=" b))
    (+ a b))

  (def test-memo (memoize test))

  (test-memo 1 1)
  (test-memo 1 2)
  (test-memo 1 1)
  (test-memo 1 2)
  (test-memo 1 1))
calculating a=1, b=1
calculating a=1, b=2
=> 2

```

## SEE ALSO

### [delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

[top](#)

## merge

```
(merge & maps)
```

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from the latter (left-to-right) will be the mapping in the result.

```

(merge {:a 1 :b 2 :c 3} {:b 9 :d 4})
=> {:a 1 :b 9 :c 3 :d 4}

```

```

(merge {:a 1} nil)
=> {:a 1}

```

(merge nil nil)
=> nil

```

## SEE ALSO

### [merge-with](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from ...

### [merge-deep](#)

Recursively merges maps.

### [into](#)

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

## concat

Returns a list of the concatenation of the elements in the supplied collections.

[top](#)

## merge-deep

```
(merge-deep values)
(merge-deep strategy & values)
```

Recursively merges maps.

If the first parameter is a keyword it defines the strategy to use when merging non-map collections. Options are:

1. *:replace*, the default, the last value is used
2. *:into*, if the value in every map is a collection they are concatenated using `into`. Thus the type of (first) value is maintained.

```
(merge-deep {:a {:c 2}} {:a {:b 1}})
=> {:a {:b 1 :c 2}}
```

```
(merge-deep :replace {:a [1]} {:a [2]})
=> {:a [2]}
```

```
(merge-deep :into {:a [1]} {:a [2]})
=> {:a [1 2]}
```

```
(merge-deep {:a 1} nil)
=> nil
```

### `merge-deep`

Recursively merges maps.

[top](#)

## meta

`(meta obj)`

Returns the metadata of obj, returns nil if there is no metadata.

```
(meta (vary-meta [1 2] assoc :a 1))  
=> {:a 1 :line 25 :column 28 :file "example"}
```

[top](#)

## min

`(min x)`  
`(min x y)`  
`(min x y & more)`

Returns the smallest of the values

```
(min 1)  
=> 1  
  
(min 1 2)  
=> 1  
  
(min 4 3 2 1)  
=> 1  
  
(min 1I 2I)  
=> 1I  
  
(min 1.0)  
=> 1.0  
  
(min 1.0 2.0)  
=> 1.0  
  
(min 4.0 3.0 2.0 1.0)  
=> 1.0  
  
(min 1.0M)  
=> 1.0M  
  
(min 1.0M 2.0M)  
=> 1.0M
```

```
(min 4.0M 3.0M 2.0M 1.0M)
=> 1.0M
```

```
(min 1.0M 2)
=> 1.0M
```

## SEE ALSO

[max](#)

Returns the greatest of the values

[top](#)

## mod

```
(mod n d)
```

Modulus of n and d.

```
(mod 10 4)
=> 2
```

```
(mod -1 5)
=> 4
```

```
(mod 10I 4I)
=> 2I
```

## SEE ALSO

[mod-floor](#)

floor a number towards 0 to the nearest multiple of a number

[top](#)

## mod-floor

```
(mod-floor n m)
```

floor a number towards 0 to the nearest multiple of a number

```
(mod-floor 9 3)
=> 9
```

```
(mod-floor 10 3)
=> 9
```

```
(mod-floor 11 3)
=> 9
```

```
(mod-floor -11 3)
=> -9
```

SEE ALSO

[mod](#)

Modulus of n and d.

[top](#)

# module-name

(module-name class)

Returns the Java module name of a class.

([module-name](#) ([class](#) :[java.util.ArrayList](#)))

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-name](#)

Returns the Java class name of a class.

[top](#)

# modules

(modules)

Lists the available Venice modules

SEE ALSO

[doc](#)

Prints documentation for a var or special form given x as its name. Prints the definition of custom types.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[top](#)

# mutable-list

(mutable-list & items)

Creates a new mutable list containing the items.

The list is backed by `java.util.ArrayList` and is not thread-safe.

([mutable-list](#))

=> ()

```
(mutable-list 1 2 3)
=> (1 2 3)

(mutable-list 1 2 3 [:a :b])
=> (1 2 3 [:a :b])
```

[top](#)

## mutable-list?

```
(mutable-list? obj)
```

Returns true if obj is a mutable list

```
(mutable-list? (mutable-list 1 2))
=> true
```

[top](#)

## mutable-map

```
(mutable-map & keyvals)
(mutable-map map)
```

Creates a new mutable threadsafe map containing the items.

```
(mutable-map :a 1 :b 2)
=> {:a 1 :b 2}

(mutable-map {:a 1 :b 2})
=> {:a 1 :b 2}
```

[top](#)

## mutable-map?

```
(mutable-map? obj)
```

Returns true if obj is a mutable map

```
(mutable-map? (mutable-map :a 1 :b 2))
=> true
```

[top](#)

## mutable-set

```
(mutable-set & items)
```

Creates a new mutable set containing the items.

```
(mutable-set)
=> #{}

(mutable-set nil)
=> #{nil}

(mutable-set 1)
=> #{1}

(mutable-set 1 2 3)
=> #{1 2 3}

(mutable-set [1 2] 3)
=> #{3 [1 2]}
```

[top](#)

## mutable-set?

```
(mutable-set? obj)
```

Returns true if obj is a mutable-set

```
(mutable-set? (mutable-set 1))
=> true
```

[top](#)

## mutable-vector

```
(mutable-vector & items)
```

Creates a new mutable threadsafe vector containing the items.

```
(mutable-vector)
=> []

(mutable-vector 1 2 3)
=> [1 2 3]

(mutable-vector 1 2 3 [:a :b])
=> [1 2 3 [:a :b]]
```

[top](#)

## mutable-vector?

```
(mutable-vector? obj)
```

Returns true if obj is a mutable vector

```
(mutable-vector? (mutable-vector 1 2))  
=> true
```

[top](#)

## name

(name x)

Returns the name String of a string, symbol, keyword, or function

```
(name :user/x)  
=> "x"
```

```
(name 'x)  
=> "x"
```

```
(name "x")  
=> "x"
```

```
(name str/digit?)  
=> "digit?"
```

### SEE ALSO

[qualified-name](#)

Returns the qualified name String of a string, symbol, keyword, or function

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[fn-name](#)

Returns the qualified name of a function or macro

[top](#)

## namespace

(namespace x)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

Throws an exception if x does not support namespaces like (namespace 2) .

```
(namespace 'user/foo)  
=> "user"
```

```
(namespace :user/foo)  
=> "user"
```

```
(namespace str/digit?)  
=> "str"
```

```
(namespace *ns*)  
=> "user"
```

## SEE ALSO

### [name](#)

Returns the name String of a string, symbol, keyword, or function

### [fn-name](#)

Returns the qualified name of a function or macro

### [ns](#)

Opens a namespace.

### [\\*ns\\*](#)

The current namespace

### [var-ns](#)

Returns the namespace of the var's symbol

[top](#)

## nan?

```
(nan? x)
```

Returns true if x is a NaN else false. x must be a double!

```
(nan? 0.0)  
=> false
```

```
(nan? (/ 0.0 0))  
=> true
```

```
(nan? (sqrt -1))  
=> true
```

```
(pr (sqrt -1))  
:NaN  
=> nil
```

## SEE ALSO

### [infinite?](#)

Returns true if x is infinite else false. x must be a double!

### [double](#)

Converts to double

[top](#)

## nano-time

```
(nano-time)
```

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

```
(nano-time)
=> 41770000872893
```

```
(let [t (nano-time)
      _ (sleep 100)
      e (nano-time)]
  (format-nano-time (- e t) :precision 2))
=> "101.79ms"
```

## SEE ALSO

[current-time-millis](#)

Returns the current time in milliseconds.

[format-nano-time](#)

Formats a time given in nanoseconds as long or double.

[top](#)

## neg?

```
(neg? x)
```

Returns true if x smaller than zero else false

```
(neg? -3)
=> true
```

```
(neg? 3)
=> false
```

```
(neg? (int -3))
=> true
```

```
(neg? -3.2)
=> true
```

```
(neg? -3.2M)
=> true
```

## SEE ALSO

[zero?](#)

Returns true if x zero else false

[pos?](#)

Returns true if x greater than zero else false

[negate](#)

Negates x

[top](#)

## negate

```
(negate x)
```

Negates x

```
(negate 10)  
=> -10
```

```
(negate 10I)  
=> -10I
```

```
(negate 1.23)  
=> -1.23
```

```
(negate 1.23M)  
=> -1.23M
```

## SEE ALSO

[abs](#)

Returns the absolute value of the number

[sgn](#)

sgn function for a number.

[top](#)

## newline

```
(newline)  
(newline os)
```

Without arg writes a platform-specific newline to the output channel that is the current value of `*out*`. With arg writes a newline to the passed stream that must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Returns `nil`.

```
(newline)  
=> nil
```

```
(newline *out*)  
=> nil
```

```
(newline *err*)  
=> nil
```

## SEE ALSO

[print](#)

Prints the values xs to the stream that is the current value of `*out*` or to the passed stream os that must be a subclass of either ...

[println](#)

Prints the values xs to the stream that is the current value of `*out*` or to the passed output stream os if given followed by a (newline).

[printf](#)

Without output stream prints formatted output as per format to the stream that is the current value of `*out*`. With a stream prints ...

[top](#)

## nfirst

```
(nfirst coll n)
```

Returns a collection of the first n items

```
(nfirst nil 2)
=> ()
```

```
(nfirst [] 2)
=> []
```

```
(nfirst [1] 2)
=> [1]
```

```
(nfirst [1 2 3] 2)
=> [1 2]
```

```
(nfirst '() 2)
=> ()
```

```
(nfirst '(1) 2)
=> (1)
```

```
(nfirst '(1 2 3) 2)
=> (1 2)
```

```
(nfirst "abcdef" 2)
=> (#\a #\b)
```

```
(nfirst (lazy-seq 1 #(+ % 1)) 4)
=> (...)
```

## SEE ALSO

[str/nfirst](#)

Returns a string of the n first characters of s.

[top](#)

## nil?

```
(nil? x)
```

Returns true if x is nil, false otherwise

```
(nil? nil)
=> true
```

```
(nil? 0)
=> false
```

```
(nil? false)
=> false
```

## SEE ALSO

## [some?](#)

Returns true if x is not nil, false otherwise

[top](#)

## nlast

```
(nlast coll n)
```

Returns a collection of the last n items

```
(nlast nil 2)
=> ()
```

```
(nlast [] 2)
=> []
```

```
(nlast [1] 2)
=> [1]
```

```
(nlast [1 2 3] 2)
=> [2 3]
```

```
(nlast '() 2)
=> ()
```

```
(nlast '(1) 2)
=> (1)
```

```
(nlast '(1 2 3) 2)
=> (2 3)
```

```
(nlast "abcdef" 2)
=> (#\e #\f)
```

### SEE ALSO

#### [str/nlast](#)

Returns a string of the n last characters of s.

[top](#)

## not

```
(not x)
```

Returns true if x is logical false, false otherwise.

```
(not true)
=> false
```

```
(not (== 1 2))
=> true
```

## SEE ALSO

[and](#)

Ands the predicate forms

[or](#)

Ors the predicate forms

[top](#)

## not-any?

```
(not-any? pred coll)
```

Returns false if the predicate is true for at least one collection item, true otherwise

```
(not-any? number? nil)
=> true
```

```
(not-any? number? [])
=> true
```

```
(not-any? number? [1 :a :b])
=> false
```

```
(not-any? number? [1 2 3])
=> false
```

```
(not-any? #(>= % 10) [1 5 10])
=> false
```

## SEE ALSO

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[every?](#)

Returns true if the predicate is true for all collection items, false otherwise.

[not-every?](#)

Returns false if the predicate is true for all collection items, true otherwise

[top](#)

## not-contains?

```
(not-contains? coll key)
```

Returns true if key is not present in the given collection, otherwise returns false.

```
(not-contains? #{:a :b} :c)
=> true
```

```
(not-contains? {:a 1 :b 2} :c)
=> true
```

```
(not-contains? [10 11 12] 1)
=> false

(not-contains? [10 11 12] 5)
=> true

(not-contains? "abc" 1)
=> false

(not-contains? "abc" 5)
=> true
```

## SEE ALSO

### [contains?](#)

Returns true if key is present in the given collection, otherwise returns false.

[top](#)

## not-empty?

```
(not-empty? x)
```

Returns true if x is not empty. Accepts strings, collections and bytebufs.

```
(not-empty? {:a 1})
=> true

(not-empty? [1 2])
=> true

(not-empty? '(1 2))
=> true

(not-empty? "abc")
=> true
```

## SEE ALSO

### [empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[top](#)

## not-every?

```
(not-every? pred coll)
```

Returns false if the predicate is true for all collection items, true otherwise

```
(not-every? number? nil)
=> true
```

```
(not-every? number? [])  
=> true  
  
(not-every? number? [1 2 3 4])  
=> false  
  
(not-every? number? [1 2 3 :a])  
=> true  
  
(not-every? #(>= % 10) [10 11 12])  
=> false
```

## SEE ALSO

### [every?](#)

Returns true if the predicate is true for all collection items, false otherwise.

### [any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

### [not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

[top](#)

## not-match?

```
(not-match? s regex)
```

Returns true if the string `s` does not match the regular expression `regex`.

The argument 'regex' may be a string representing a regular expression or a `:java.util.regex.Pattern`.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. `regex/matches-not?` performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"[0-9]+" "")]  
  (filter #(regex/matches-not? m %) ["100" "1a1" "200"])))
```

```
(not-match? "S1000" "[0-9]+")  
=> true
```

```
(not-match? "S1000" #"[0-9]+")  
=> true
```

```
(not-match? "1000" "[0-9]+")  
=> false
```

## SEE ALSO

### [match?](#)

Returns true if the string `s` matches the regular expression `regex`.

### [regex/matches-not?](#)

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

### [regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

#### [regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

#### [regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

#### [regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

#### [regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[top](#)

## not=

```
(not= x)
(not= x y)
(not= x y & more)
```

Same as `(not (= x y))`

```
(not= "abc" "abc")
=> false
```

```
(not= 0 0)
=> false
```

```
(not= 0 1)
=> true
```

```
(not= 0 0.0)
=> true
```

```
(not= 0 0.0M)
=> true
```

```
(not= "0" 0)
=> true
```

```
(not= 4)
=> false
```

```
(not= 1 2 3)
=> true
```

### SEE ALSO

[=](#)

Returns true if both operands have equivalent type and value

[==](#)

Returns true if both operands have equivalent value.

[top](#)

## ns

```
(ns sym)
```

Opens a namespace.

```
(do
  (ns xxx)
  (def foo 1)
  (ns yyy)
  (def foo 5)
  (println xxx/foo foo yyy/foo))
1 5 5
=> nil
```

### SEE ALSO

[\\*ns\\*](#)

The current namespace

[ns?](#)

Returns true if n is an existing namespace that has been defined with (ns n) else false.

[ns-unmap](#)

Removes the mappings for the symbol from the namespace.

[ns-remove](#)

Removes the mappings for all symbols from the namespace.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[ns-alias](#)

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name ...

[ns-meta](#)

Returns the meta data of the namespace n or nil if n is not an existing namespace

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[var-ns](#)

Returns the namespace of the var's symbol

[top](#)

## ns-alias

```
(ns-alias alias namespace-sym)
```

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name of the target namespace.

```
(ns-alias 'p 'parsatron)
=> nil
```

```
(do
  (load-module :hexdump)
  (ns-alias 'h 'hexdump)
  (h/dump [0 1 2 3]))
```

```
00000000: 0001 0203          ....  
=> nil
```

## SEE ALSO

[ns-unalias](#)

Removes a namespace alias in the current namespace.

[ns-aliases](#)

Returns a map of the aliases defined in the current namespace.

[\\*ns\\*](#)

The current namespace

[ns](#)

Opens a namespace.

[top](#)

## ns-aliases

```
(ns-aliases)
```

Returns a map of the aliases defined in the current namespace.

```
(ns-aliases)  
=> {}
```

```
(do  
  (ns-alias 'h 'hexdump)  
  (ns-alias 'p 'parsatron)  
  (ns-aliases))  
=> {h hexdump p parsatron}
```

## SEE ALSO

[ns-alias](#)

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name ...

[ns-unalias](#)

Removes a namespace alias in the current namespace.

[\\*ns\\*](#)

The current namespace

[ns](#)

Opens a namespace.

[top](#)

## ns-list

```
(ns-list)  
(ns-list ns)
```

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

```
(ns-list 'regex)
=> (regex/count regex/find regex/find+ regex/find-all regex/find-all+ regex/find? regex/group regex/groups regex/matcher regex/matches regex/matches-not? regex/matches? regex/pattern regex/reset)
```

```
(ns-list)
=> ("ansi" "app" "benchmark" "cidr" "component" "config" "crypt" "csv" "dag" "dec" "excel" "fonts" "geoip"
"gradle" "grep" "hexdump" "inet" "io" "java" "json" "kira" "loadpath" "math" "maven" "parsifal" "pdf" "qrref"
"regex" "sandbox" "semver" "sh" "shell" "str" "test" "time" "trace" "xchart" "xml")
```

## SEE ALSO

[ns](#)

Opens a namespace.

[\\*ns\\*](#)

The current namespace

[ns-unmap](#)

Removes the mappings for the symbol from the namespace.

[ns-remove](#)

Removes the mappings for all symbols from the namespace.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[var-ns](#)

Returns the namespace of the var's symbol

[top](#)

## ns-meta

```
(ns-meta n)
```

Returns the meta data of the namespace n or `nil` if n is not an existing namespace

```
(do
  (ns foo)
  (ns-meta foo))
=> {}

(do
  (ns foo)
  (ns-meta 'foo))
=> {}

(do
  (ns foo)
  (def n 'foo)
  (ns-meta (var-get n)))
=> {}
```

## SEE ALSO

[alter-ns-meta!](#)

Alters the metadata for a namespace. f must be free of side-effects.

[reset-ns-meta!](#)

Resets the metadata for a namespace

[ns](#)

Opens a namespace.

[top](#)

## ns-remove

```
(ns-remove ns)
```

Removes the mappings for all symbols from the namespace.

```
(do
  (ns foo)
  (def x 1)
  (ns bar)
  (def y 1)
  (ns-remove 'foo)
  (println "ns foo:" (ns-list 'foo))
  (println "ns bar:" (ns-list 'bar)))
ns foo: ()
ns bar: (bar/y)
=> nil
```

### SEE ALSO

[ns](#)

Opens a namespace.

[ns-unmap](#)

Removes the mappings for the symbol from the namespace.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[var-ns](#)

Returns the namespace of the var's symbol

[top](#)

## ns-unalias

```
(ns-unalias alias)
```

Removes a namespace alias in the current namespace.

```
(do
  (ns-alias 'h 'hexdump)
  (ns-unalias 'h))
=> nil
```

### SEE ALSO

[ns-alias](#)

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name ...

[ns-aliases](#)

Returns a map of the aliases defined in the current namespace.

[\\*ns\\*](#)

The current namespace

[ns](#)

Opens a namespace.

[top](#)

## ns-unmap

```
(ns-unmap ns sym)
```

Removes the mappings for the symbol from the namespace.

```
(do
  (ns foo)
  (def x 1)
  (ns-unmap 'foo 'x)
  (ns-unmap *ns* 'x))
=> nil
```

### SEE ALSO

[ns](#)

Opens a namespace.

[\\*ns\\*](#)

The current namespace

[ns-remove](#)

Removes the mappings for all symbols from the namespace.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[var-ns](#)

Returns the namespace of the var's symbol

[top](#)

## ns?

```
(ns? n)
```

Returns true if n is an existing namespace that has been defined with `(ns n)` else false.

```
(do
  (ns foo)
  (ns? foo))
=> true
```

### SEE ALSO

[ns](#)

Opens a namespace.

[top](#)

## nth

```
(nth coll idx)
```

Returns the nth element of coll.

```
(nth nil 1)
=> nil
```

```
(nth [1 2 3] 1)
=> 2
```

```
(nth '(1 2 3) 1)
=> 2
```

```
(nth "abc" 2)
=> #\c
```

[top](#)

## number?

```
(number? n)
```

Returns true if n is a number (int, long, double, or decimal)

```
(number? 4I))
=> true
```

```
(number? 4)
=> true
```

```
(number? 4.0M)
=> true
```

```
(number? 4.0)
=> true
```

```
(number? true)
=> false
```

```
(number? "a")
=> false
```

[top](#)

## object-array

```
(object-array coll)
(object-array len)
(object-array len init-val)
```

Returns an array of Java Objects containing the contents of coll or returns an array with the given length and optional init value

```
(object-array '(1 2 3 4 5))
=> [1, 2, 3, 4, 5]
```

```
(object-array '(1 2.0 3.45M "4" true))
=> [1, 2.0, 3.45M, 4, true]
```

```
(object-array 10)
=> [nil, nil, nil, nil, nil, nil, nil, nil, nil, nil]
```

```
(object-array 10 42)
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

[top](#)

## odd?

```
(odd? n)
```

Returns true if n is odd, throws an exception if n is not an integer

```
(odd? 3)
=> true
```

```
(odd? 4)
=> false
```

```
(odd? (int 4))
=> false
```

### SEE ALSO

[even?](#)

Returns true if n is even, throws an exception if n is not an integer

[top](#)

## offer!

```
(offer! queue v)
(offer! queue timeout v)
```

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary for space to become available. For an indefinite timeout pass the timeout value :indefinite. If no timeout is given returns immediately false if the queue does not have any more capacity. Returns true if the element was added to this queue, else false.

```
(let [q (queue)]
  (offer! q 1)
  (offer! q 1000 2))
```

```
(offer! q :indefinite 3)
(offer! q 3)
(poll! q)
q)
=> (2 3 3)
```

## SEE ALSO

### [queue](#)

Creates a new mutable threadsafe bounded or unbounded queue.

### [put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

### [take!](#)

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

### [poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

### [peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

### [empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

### [count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

## or

```
(or x)
(or x & next)
```

Ors the predicate forms

```
(or true false)
=> true
```

```
(or false false)
=> false
```

```
(or nil 100)
=> 100
```

```
(or)
=> false
```

## SEE ALSO

### [and](#)

Ands the predicate forms

### [not](#)

Returns true if x is logical false, false otherwise.

[top](#)

## or-timeout

```
(or-timeout p time time-unit)
```

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
    (or-timeout 500 :milliseconds)
    (then-apply str/upper-case)
    (deref))
=> "THE QUICK BROWN FOX"

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
    (or-timeout 200 :milliseconds)
    (then-apply str/upper-case)
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
    (then-apply str/upper-case)
    (or-timeout 200 :milliseconds)
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException
```

### SEE ALSO

#### [promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

#### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

#### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

#### [then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

#### [then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

#### [then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

#### [when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

#### [accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

#### [apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

#### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

## ordered-map

```
(ordered-map & keyvals)
(ordered-map map)
```

Creates a new ordered map containing the items.

```
(ordered-map :a 1 :b 2)
=> {:a 1 :b 2}
```

```
(ordered-map (hash-map :a 1 :b 2))
=> {:a 1 :b 2}
```

[top](#)

## ordered-map?

```
(ordered-map? obj)
```

Returns true if obj is an ordered map

```
(ordered-map? (ordered-map :a 1 :b 2))
=> true
```

[top](#)

## os-arch

```
(os-arch)
```

Returns the OS architecture. E.g: "x86\_64"

```
(os-arch)
=> "x86_64"
```

### SEE ALSO

#### [os-type](#)

Returns the OS type. Type is one of :windows, :mac-osx, :linux, :unix, or :unknown

#### [os-type?](#)

Returns true if the OS id of the type otherwise false. Type is one of :windows, :mac-osx, :linux, or :unix

#### [os-name](#)

Returns the OS name. E.g.: "Mac OS X"

#### [os-version](#)

Returns the OS version

[top](#)

## os-name

[top](#)

## parsifal/>>

```
(>> p)
```

```
(>> p q)
```

```
(>> p q & ps)
```

Returns a new parser that parses a list of parsers. Returns the value of the last parser if all parsers succeed, else the parser fails.

**Note:** *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parser `>>` does not rewind the input state if any of the sub parsers fails. `>>*` is the backtracking version of `>>` that wraps the parsers within a call to `attempt`. See the backtracking example below.

```
(do
```

```
  (load-module :parsifal ['parsifal :as 'p])
```

```
  (p/run (p/>> (p/char #\lparen) (p/digit) (p/char #\rparen)) "(1)"))
```

```

; => #\)

; Using bindings
(p/run (p/let->> [l (p/char #\lparen)
                  d (p/digit)
                  r (p/char #\rparen)]
          (p/always (str l d r)))
      "(1)")
; => "(1)"
)

; Backtracking demo
(do
  (load-module :parsifal ['parsifal :as 'p])

  ; No backtracking with `>>` parser
  (p/run (p/either (p/>> (p/letter) (p/digit))
              (p/letter))
      "abc")
; => ParseError: Unexpected token 'b' at line: 1 column: 2

; Backtracking with `>>*` parser
(p/run (p/either (p/>>* (p/letter) (p/digit))
              (p/letter))
      "abc")
; => #\a
)

```

[top](#)

## parsifal/SourcePosition

Defines a protocol to add line and column information for custom tokens.

Definition:

```

(defprotocol SourcePosition
  (line [p])
  (column [p]))

```

```

(do
  (load-module :parsifal ['parsifal :as 'p])

  (deftype :Token [type :keyword, val :string, line :long, column :long]
    Object
      (toString [this] (str/format "[%s %s (%d,%d)]"
                                   (pr-str (:type this))
                                   (pr-str (:val this))
                                   (:line this)
                                   (:column this))))

    p/SourcePosition
      (line [this] (:line this))
      (column [this] (:column this)))

  (p/defparser lbracket []
    (p/let->> [[l c] (p/pos)
              t      (p/char #\[)]
              (p/always (Token. :lbracket (str t) l c))))

  (p/run (lbracket) "[1,2,3]")
  ; => [:lbracket "[" (1,1)]
)

```

## SEE ALSO

### [defprotocol](#)

Defines a new protocol with the supplied function specs.

### [deftype](#)

Defines a new custom record type for the name with the fields.

[top](#)

## parsifal/always

```
(always x)
```

A parser that always succeeds with the value given and consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [t (p/many1 (p/digit))]
      (p/always (long (apply str t)))))

  (p/run (integer) "400")
  ; => 400
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser optional [p default-value]
    (p/either (p/attempt p)
      (p/always default-value)))

  (p/run (optional (p/char #\X) #\?) "X400")
  ; => #\X

  (p/run (optional (p/char #\X) #\?) "400")
  ; => #\?
)
```

[top](#)

## parsifal/any

```
(any)
```

Consume any single item from the head of the input. This parser will fail to consume if the input is empty.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any) "Cats")
  ; => #\C

  (p/run (p/any) [#\C #\a #\t #\s])
```

```
; => #\C
)
```

[top](#)

## parsifal/any-char

(any-char)

Consume any character.

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any-char) "Cats")
  ; => #\C

  (p/run (p/any-char) [#\C #\a #\t #\s])
  ; => #\C
)
```

[top](#)

## parsifal/any-char-of

(any-char-of s)

Consume any of the characters given in the string. E.g.: (any-char-of "{[}") .

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any-char-of "HXYZ") "Hello, world!")
  ; => #\H
)
```

[top](#)

## parsifal/attempt

(attempt p)

A parser that will attempt to parse `p` , and upon failure never consume any input.

**Note:** *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt` .

The parsers `>>` and `let->>` do not rewind the input state if any of the sub parsers fails. To add backtracking parsers can be wrapped with `attempt!`

```

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser optional [p default-value]
    (p/either (p/attempt p)
      (p/always default-value)))

  (p/run (optional (p/char #\X) #\?) "400")
  ; => #\?
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  ; Backtracking

  ; No implicit backtracking with `>>` parser!
  (p/run (p/either (p/>> (p/letter) (p/digit))
    (p/letter))
    "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Explicit backtracking with `>>>` parser using `attempt`!
  (p/run (p/either (p/attempt (p/>> (p/letter) (p/digit)))
    (p/letter))
    "abc")
  ; => #\a
)

```

[top](#)

## parsifal/between

(between open close p)

Returns a new parser that parses `open`, `p`, and `close` returning the value of `p` and discarding the values of `open` and `close`. Does not consume any input on failure.

```

(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/run (p/between (p/char #\lparen)
    (p/char #\rparen)
    (p/many1 (p/digit)))
    "(123)")
  ; => [#\1 #\2 #\3]
)

```

[top](#)

## parsifal/char

(char)

Consume the given character.

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/char #\H) "Hello")
  ; => #\H

  (p/run (p/char #\H) [#\H #\e #\l #\l #\o])
  ; => #\H
)
```

[top](#)

## parsifal/choice

```
(choice & p)
```

Returns a new parser that tries each given parsers in turn, returning the value of the first one that succeeds.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "Hello")
  ; => [#\H #\e #\l #\l #\o]

  (p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
  ; => [#\4 #\2]
)
```

[top](#)

## parsifal/defparser

```
(defparser name args & body)
```

The `defparser` macro defines `_functions_` that create parsers.

**Note:** *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parsers created by this macro do not rewind the input state if one of the sub parsers fails. To allow backtracking `attempt` can be used!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser sample []
    (p/string "Hello")
    (p/always 42))

  (p/run (sample) "Hello, world!")
  ; => 42
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  ; Backtracking
```

```
(p/defparser letter-and-digit []
  (p/letter)
  (p/digit))

; No implicit backtracking!
(p/run (p/either (letter-and-digit) (p/letter)) "abc")
; => ParseError: Unexpected token 'b' at line: 1 column: 2

; Explicit backtracking with `attempt`!
(p/run (p/either (p/attempt (letter-and-digit)) (p/letter)) "abc")
; => #\a
)
```

[top](#)

## parsifal/digit

(digit)

Consume a digit [0-9] character.

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/digit) "123")
  ; => #\1

  (p/run (p/any-char) [#\1 #\2 #\3])
  ; => #\1
)
```

[top](#)

## parsifal/either

(either p q)

Returns a new parser that tries `p`, upon success, returning its value, and upon failure (if no input was consumed) tries to parse `q`

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter))) "Hello")
  ; => [#\H #\e #\l #\l #\o]

  (p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
  ; => [#\4 #\2]
)
```

[top](#)

## parsifal/eof

```
(eof)
(eof err-msg)
```

A parser to detect the end of input. If there is nothing more to consume from the underlying input, this parser succeeds with a `nil` value, otherwise it fails.

A custom error message can be provided for the case the parser fails.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/eof) "")
  ; => nil

  (p/run (p/eof) "a")
  ; => ParseError: Expected end of input at line: 1 column: 1
)
```

[top](#)

## parsifal/hexdigit

```
(hexdigit)
```

Consume a hex digit [0-9a-fA-F] character.

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/hexdigit) "A00")
  ; => #\A

  (p/run (p/hexdigit) [#\A #\0 #\0])
  ; => #\A
)
```

[top](#)

## parsifal/let->>

```
(let->> [[& bindings_] & body])
```

Binds parser results to names for further processing input.

**Note:** *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parser `let->>` does not rewind the input state if one of the sub parsers fails. `let->>*` is the backtracking version of `let->>` that wraps the parsers within a call to `attempt`. See the backtracking example below.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser float []
    (p/let->> [i (p/many1 (p/digit))
```

```

        d (p/char #\.)
        f (p/many1 (p/digit))]]
    (p/always (apply str (flatten (list i d f))))))

(p/run (float) "10.56")
; => "10.56"
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser int []
    (p/let->> [i (p/many1 (p/digit))]
      (let [n (long (apply str i))]
        (if (even? n)
          (p/always (str n " is even"))
          (p/always (str n " is odd"))))))))

  (p/run (int) "500")
  ; => "500 is even"
)

; Backtracking demo
(do
  (load-module :parsifal ['parsifal :as 'p])

  ; No backtracking with `let->>` parser!
  (p/run (p/either (p/let->> [c (p/letter)
                             d (p/digit)]
                          (p/always (list c d)))
    (p/letter))
    "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Backtracking with `let->>*` parser
  (p/run (p/either (p/let->>* [c (p/letter)
                             d (p/digit)]
                          (p/always (list c d)))
    (p/letter))
    "abc")
  ; => #\a
)

```

[top](#)

## parsifal/letter

(letter)

Consume a letter character defined by Java `Character.isLetter(ch)` .

*Note:* Works with char items only!

```

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/letter) "Cats")
  ; => #\C

  (p/run (p/letter) [#\C #\a #\t #\s])

```

```
; => #\C
)
```

[top](#)

## parsifal/letter-or-digit

(letter-or-digit)

Consume a letter or digit character defined by Java `Character.isLetterOrDigit(ch)` .

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/letter-or-digit) "Cats")
  ; => #\C

  (p/run (p/letter-or-digit) "5Cats")
  ; => #\5

  (p/run (p/letter-or-digit) [#\C #\a #\t #\s])
  ; => #\C
)
```

[top](#)

## parsifal/lineno

(lineno)

A parser that returns the current line number. It consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [l (p/lineno)
               t (p/many1 (p/digit))]
      (p/always [:int (apply str t) l])))

  (p/run (integer) "400")
  ; => [:int "400" 1]
)
```

[top](#)

## parsifal/lookahead

(lookahead p)

A parser that upon success consumes no input, but returns what was parsed.

**Note:** *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser block-string-tok []
    (p/between (p/times 3 (p/char #\quote))
      (p/times 3 (p/char #\quote))
      (p/many (p/let->> [cs (p/lookahead (p/times 3 (p/any-char)))]
        (if (= cs [#\quote #\quote #\quote])
          (p/never)
          (p/any-char)))))))

  (p/defparser block-string []
    (p/let->> [s (block-string-tok)]
      (p/always (apply str s))))

  (p/run (block-string) "\"\"A \"string\" with quotes!\"\"\"")
  ; => "A \"string\" with quotes!"
)
```

[top](#)

## parsifal/many

```
(many p)
```

Returns a new parser that will parse zero or more items that match the given parser `p`. The matched items are concatenated into a sequence.

*Note:* A `ParseError` will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/many (p/digit)) "1234-0000")
  ; => [#\1 #\2 #\3 #\4]

  (p/run (p/many (p/digit)) "ABC-12345")
  ; => []
)
```

[top](#)

## parsifal/many1

```
(many1 p)
```

Returns a new parser that will parse one or more items that match the given parser `p`. The matched items are concatenated into a sequence.

*Note:* A `ParseError` will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```
(do
  (load-module :parsifal ['parsifal :as 'p])
```

```
(p/run (p/many1 (p/digit)) "1234-0000")
; => [#\1 #\2 #\3 #\4]

(p/run (p/many1 (p/digit)) "ABC-12345")
; => ParseError: Unexpected token 'A' at line: 1 column: 1
)
```

[top](#)

## parsifal/never

```
(never)
(never err-msg)
(never err-msg line column)
```

A parser that always fails, consuming no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  ;; parse a string with a single integer
  (p/defparser single-integer []
    (p/let->> [i (p/many1 (p/digit))
               t (p/either (p/eof) (p/any))])
    (if (nil? t)
        (p/always (apply str i))
        (p/never (str "Unexpected token '" t "'")))))

  (p/run (single-integer) "400")
  ; => "400"

  (p/run (single-integer) "400-")
  ; => ParseError: Unexpected token '-' at line: 1 column: 5
)
```

[top](#)

## parsifal/none-char-of

```
(none-char-of s)
```

Consume all but of the characters given in the string. E.g.: `(none-char-of "([{"` .

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/none-char-of "()[]{}") "Hello, world!")
  ; => #\H
)
```

[top](#)

## parsifal/not-char

(not-char)

Consume all but the given character

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/not-char #\x) "Cats")
  ; => #\C

  (p/run (p/not-char #\x) [#\C #\a #\t #\s])
  ; => #\C
)
```

top

## parsifal/pos

(pos)

A parser that returns the current line/column number as tuple of `[line col]`. It consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [[l c] (p/pos)
               t      (p/many1 (p/digit))])
    (p/always [:int (apply str t) (list l c)])))

  (p/run (integer) "400")
  ; => [:int "400" (1,1)]
)
```

top

## parsifal/run

(run p input)

Run a parser `p` over some input. The input can be a string or a seq of tokens, if the parser produces an error, its message is wrapped in a *ParseError* and thrown, and if the parser succeeds, its value is returned.

*Parsifal* is port of Nate Young's Clojure Parsatron [parser combinators](#) project.

*Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

A simple parser example:

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/char #\H) "Hello")
  ; => #\H
)
```

```
(p/run (p/char #\H) [#\H #\e #\l #\l #\o])
; => #\H
)
```

[top](#)

## parsifal/string

(string s)

Consume the given string and returns a string. Does not consume any input upon failure.

*Note:* Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/string "Hello") "Hello, world!")
  ; => "Hello"

  (p/run (p/string "Hello") (seq "Hello, world!"))
  ; => "Hello"
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
  ; => "Hello"

  (p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
  ; => #\H
)
```

[top](#)

## parsifal/times

(times n p)

Returns a new parser that consumes exactly `n` times what the parser `p` matches. The matched items are concatenated into a sequence. Does not consume any input if not all of the repetitions match.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/times 5 (p/letter)) "Hello, world!")
  ; => [#\H #\e #\l #\l #\o]

  ;; Note: `p/times` is different from parsing letters explicitly
  (p/run (p/>> (p/letter)
               (p/letter)
               (p/letter)
               (p/letter)
               (p/letter))
         "Hello, world!")
)
```

```
; => [#\o]
)
```

[top](#)

## parsifal/token

(token)

Consume a single item from the head of the input if (consume? item) predicate is not nil . This parser will fail to consume if either the consume? test returns false or if the input is empty.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/token #(< % 5)) [3 5 7])
  ; => 3

  (p/run (p/token str/upper-case) "Hello")
  ; => #\H
)
```

[top](#)

## partial

(partial f args\*)

Takes a function f and fewer than the normal arguments to f, and returns a fn that takes a variable number of additional args. When called, the returned function calls f with args + additional args.

```
((partial * 2) 3)
=> 6

(map (partial * 2) [1 2 3 4])
=> (2 4 6 8)

(map (partial reduce +) [[1 2 3 4] [5 6 7 8]])
=> (10 26)

(do
  (def hundred-times (partial * 100))
  (hundred-times 5))
=> 500
```

[top](#)

## partition

```
(partition n coll)
(partition n step coll)
(partition n step padcoll coll)
```

Returns a collection of lists of n items each, at offsets step apart. If step is not supplied, defaults to n, i.e. the partitions do not overlap. If a padcoll collection is supplied, use its elements as necessary to complete last partition upto n items. In case there are not enough padding elements, return a partition with less than n items. padcoll may be a lazy sequence

```
(partition 3 [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5])

(partition 3 3 (repeat 99) [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6 99 99])

(partition 3 3 [] [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6])

(partition 2 3 [0 1 2 3 4 5 6])
=> ([0 1] [3 4])

(partition 3 1 [0 1 2 3 4 5 6])
=> ([0 1 2] [1 2 3] [2 3 4] [3 4 5] [4 5 6])

(partition 3 6 ["a"] (range 20))
=> ((0 1 2) (6 7 8) (12 13 14) (18 19 "a"))

(partition 4 6 ["a" "b" "c" "d"] (range 20))
=> ((0 1 2 3) (6 7 8 9) (12 13 14 15) (18 19 "a" "b"))
```

## SEE ALSO

Reduces a collection using a parallel reduce-combine strategy. The collection is partitioned into groups of approximately *n* items, ...

### [cpus](#)

Returns the number of available processors or number of hyperthreads if the CPU supports hyperthreads.

## pdf/available?

(pdf/available?)

Checks if the 3rd party libraries required for generating PDFs are available.

(pdf/available?)

## pdf/check-required-libs

(pdf/check-required-libs)

Checks if the 3rd party libraries required for generating PDFs are available. Throws an exception if not.

(pdf/check-required-libs)

## pdf/copy

(pdf/copy pdf & page-nr)

Copies pages from a PDF to a new PDF. The PDF is passed as bytebuf. Returns the new PDF as a bytebuf.

```
; copy the first and second page
(pdf/copy pdf :1 :2)
```

```
; copy the last and second last page
(pdf/copy pdf :-1 :-2)
```

```
; copy the pages 1, 2, 6-10, and 12
(pdf/copy pdf :1 :2 :6-10 :12)
```

## peek

```
(peek coll)
```

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the head element (or nil if the queue is empty).

```
(peek '(1 2 3 4))  
=> 1
```

```
(peek [1 2 3 4])  
=> 4
```

```
(let [s (conj! (stack) 1 2 3 4)]  
      (peek s))  
=> 4
```

```
(let [q (conj! (queue) 1 2 3 4)]  
      (peek q))  
=> 1
```

[top](#)

## perf

```
(perf expr warmup-iterations test-iterations)
```

Performance test with the given expression.

Runs the test in 3 phases:

1. Runs the expr in a warmup phase to allow the HotSpot compiler to do optimizations.
2. Runs the garbage collector.
3. Runs the expression under profiling. Returns nil.

After a test run metrics data can be obtained with (prof :data-formatted)

```
(do  
  (perf (+ 120 200) 12000 1000)  
  (println (prof :data-formatted)))
```

### SEE ALSO

[time](#)

Evaluates expr and prints the time it took. Returns the value of expr.

[prof](#)

Controls the code profiling. See the companion functions/macros 'dorun' and 'perf'. The perf macro is built on prof and dorun and provides ...

[top](#)

## pid

```
(pid)
```

Returns the PID of this process.

```
(pid)
=> "18086"
```

[top](#)

## pmap

```
(pmap f coll)
(pmap f coll & colls)
```

Like `map`, except `f` is applied in parallel. Only useful for computationally intensive functions where the time of `f` dominates the coordination overhead.

The result collection is sorted in the same way as for `map`, i.e. it preserves the items' order in the *coll* (or *colls*) parameter(s) of `pmap`. In other words: calculation is done parallel, but the result is delivered in the order the input came (in *coll/colls*). In contrast, side effects of `f` (if any) are coming in random order!

`pmap` is implemented using Venice futures and processes `(+ 2 (cpus))` items in parallel.

;; With ``pmap``, the total elapsed time is just over 2 seconds:

```
(do
  (defn long-running-job [n]
    (sleep 2000) ; wait for 2 seconds
    (+ n 10))
  (time (pmap long-running-job (range 4))))
Elapsed time: 2.00s
=> (10 11 12 13)
```

;; With ``map``, the total elapsed time is roughly 4 \* 2 seconds:

```
(do
  (defn long-running-job [n]
    (sleep 2000) ; wait for 2 seconds
    (+ n 10))
  (time (map long-running-job (range 4))))
Elapsed time: 8.01s
=> (10 11 12 13)
```

[top](#)

## poll!

```
(poll! queue)
(poll! queue timeout)
```

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value `:indefinite`. If no timeout is given returns the item if one is available else returns `nil`. With a timeout returns the item if one is available within the given timeout else returns `nil`.

```
(let [q (conj! (queue) 1 2 3 4)]
  (poll! q)
  (poll! q 1000)
  q)
=> (3 4)
```

## SEE ALSO

### [queue](#)

Creates a new mutable threadsafe bounded or unbounded queue.

### [put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always `nil`.

### [take!](#)

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

### [offer!](#)

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

### [peek](#)

For a list, same as `first`, for a vector, same as `last`, for a stack the top element (or `nil` if the stack is empty), for a queue the ...

### [empty?](#)

Returns true if `x` is empty. Accepts strings, collections and bytebufs.

### [count](#)

Returns the number of items in the collection. (`count nil`) returns 0. Also works on strings, and Java Collections

top

## pop

```
(pop coll)
```

For a list, returns a new list without the first item, for a vector, returns a new vector without the last item.

```
(pop '(1 2 3 4))
=> (2 3 4)
```

```
(pop [1 2 3 4])
=> [1 2 3]
```

top

## pop!

```
(pop! stack)
```

Pops an item from a stack.

```
(let [s (stack)]
  (push! s 1)
  (push! s 2))
```

```
(push! s 3)
(pop! s))
=> 3

Returns true if x zero else false

### [neg?](#)

Returns true if x smaller than zero else false

[top](#)

## postwalk

```
(postwalk f form)
```

Performs a depth-first, post-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

```
(postwalk (fn [x] (println "Walked:" (pr-str x)) x)
          '(1 2 {:a 1 :b 2}))
Walked: 1
Walked: 2
Walked: :a
Walked: 1
Walked: [:a 1]
Walked: :b
Walked: 2
Walked: [:b 2]
Walked: {:a 1 :b 2}
Walked: (1 2 {:a 1 :b 2})
=> (1 2 {:a 1 :b 2})
```

#### SEE ALSO

[prewalk](#)

Performs a depth-last, pre-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

[top](#)

## postwalk-replace

(postwalk-replace smap form)

Recursively transforms form by replacing keys in smap with their values. Like `replace` but works on any data structure. Does replacement at the leaves of the tree first.

`postwalk-replace` is the equivalent of *Common Lisp's* `sublis` function.

```
(postwalk-replace {:a 1 :b 2} [:a :b])
=> [1 2]
```

```
(postwalk-replace {:a 1 :b 2} [:a :b :c])
=> [1 2 :c]
```

```
(postwalk-replace {:a 1 :b 2} [:a :b [:a :b] :c])
=> [1 2 [1 2] :c]
```

```
(postwalk-replace {'x 1 'y 2} '(+ x y))
=> (+ 1 2)
```

#### SEE ALSO

[prewalk-replace](#)

Recursively transforms form by replacing keys in smap with their values. Like `replace` but works on any data structure. Does replacement ...

[postwalk](#)

Performs a depth-first, post-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

[top](#)

## pow

```
(pow x y)
```

Returns the value of x raised to the power of y

```
(pow 10 2)
=> 100.0
```

```
(pow 10.23 2)
=> 104.6529
```

```
(pow 10.23 2.5)
=> 334.72571990233183
```

[top](#)

## pr

```
(pr & xs)
(pr os & xs)
```

Prints the values `xs` to the output stream that is the current value of `*out*` or to the passed output stream `os` if given. The passed stream must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Prints the values, separated by spaces if there is more than one. `pr` and `prn` print in a way that objects can be read by the reader.

Returns `nil`.

```
(pr "hello")
"hello"
=> nil

(pr {:foo "hello" :bar 34.5})
{:foo "hello" :bar 34.5}
=> nil

(pr ['a :b "\n" #\space "c"])
[a :b "\n" #\space "c"]
=> nil

(pr *out* [10 20 30])
[10 20 30]
=> nil

(pr *err* [10 20 30])
[10 20 30]
=> nil
```

## SEE ALSO

### [prn](#)

Prints the values `xs` to the output stream that is the current value of `*out*` or to the passed stream `os` if given followed by a (newline).

### [newline](#)

Without `arg` writes a platform-specific newline to the output channel that is the current value of `*out*`. With `arg` writes a newline ...

### [pr-str](#)

With no args, returns the empty string. With one arg `x`, returns `x.toString()`. With more than one arg, returns the concatenation of ...

## pr-str

```
(pr-str & xs)
```

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of the str values of the args with delimiter ' '.

```
(pr-str)
=> ""
```

```
(pr-str 1 2 3)
=> "1 2 3"
```

### SEE ALSO

#### [str](#)

With no args, returns the empty string. With one arg x, returns x.toString(). (str nil) returns the empty string. With more than one ...

## preduce

```
(preduce n combine-fn combine-seed reduce-fn reduce-seed coll)

```
(preduce n reduce-fn reduce-seed coll)
```

```

Reduces a collection using a parallel reduce-combine strategy. The collection is partitioned into groups of approximately n items, each of which is reduced with reduce-fn (with reduce-seed as its seed value) in parallel. The results of these reductions are then reduced with the combine-fn (with combine-seed as its seed value). Without an explicit combine-fn the reduce-fn and its seed reduce-seed will be used as combine-fn and combine-seed.

```
(preduce 3 + 0 + 0 [1 2 3 4 5])
=> 15
```

```
(preduce 3 (fn [acc x] (+ acc x)) 0 (fn [acc x] (+ acc x)) 0 [1 2 3 4 5])
=> 15
```

```
(preduce 3 + 0 [1 2 3 4 5])
=> 15
```

```
(preduce 3 (fn [acc x] (+ acc x)) 0 [1 2 3 4 5])
=> 15
```

### SEE ALSO

#### [reduce](#)

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

#### [map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

#### [filter](#)

Returns a collection of the items in coll for which (predicate item) returns logical true.

#### [pmap](#)

Like map, except f is applied in parallel. Only useful for computationally intensive functions where the time of f dominates the coordination ...

## [pcalls](#)

Executes the no-arg fns in parallel, returning a sequence of their values in the same order the functions are passed. In contrast, ...

[top](#)

## prewalk

```
(prewalk f form)
```

Performs a depth-last, pre-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

```
(prewalk (fn [x] (println "Walked:" (pr-str x)) x)
  '(1 2 {:a 1 :b 2}))
Walked: (1 2 {:a 1 :b 2})
Walked: 1
Walked: 2
Walked: {:a 1 :b 2}
Walked: [:a 1]
Walked: :a
Walked: 1
Walked: [:b 2]
Walked: :b
Walked: 2
=> (1 2 {:a 1 :b 2})
```

### SEE ALSO

#### [postwalk](#)

Performs a depth-first, post-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

[top](#)

## prewalk-replace

```
(prewalk-replace smap form)
```

Recursively transforms form by replacing keys in smap with their values. Like `replace` but works on any data structure. Does replacement at the root of the tree first.

```
(prewalk-replace {:a 1 :b 2} [:a :b])
=> [1 2]

```
(prewalk-replace {:a 1 :b 2} [:a :b :c])
=> [1 2 :c]

```
(prewalk-replace {:a 1 :b 2} [:a :b [:a :b] :c])
=> [1 2 [1 2] :c]

```
(prewalk-replace {'x 1 'y 2} '(+ x y))
=> (+ 1 2)
```

```

```

```

## prewalk

Performs a depth-last, pre-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

top

## print

```
(print & xs)
(print os & xs)
```

Prints the values `xs` to the stream that is the current value of `*out*` or to the passed stream `os` that must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Prints the values, separated by spaces if there is more than one. `print` and `println` print in a human readable form.

If the printed data needs to be read back by a Venice reader use the functions `pr` and `prn` instead.

Returns `nil`.

```
(print [10 20 30])
[10 20 30]
=> nil
```

```
(print *out* [10 20 30])
[10 20 30]
=> nil
```

```
(print *err* [10 20 30])
[10 20 30]
=> nil
```

## SEE ALSO

### println

Prints the values `xs` to the stream that is the current value of `*out*` or to the passed output stream `os` if given followed by a (newline).

### printf

Without output stream prints formatted output as per format to the stream that is the current value of `*out*`. With a stream prints ...

### newline

Without `arg` writes a platform-specific newline to the output channel that is the current value of `*out*`. With `arg` writes a newline ...

top

## printf

```
(printf fmt & args)
(printf os fmt & args)
```

Without output stream prints formatted output as per format to the stream that is the current value of `*out*`. With a stream prints to that stream that must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Prints like `print` and `println` in a human readable form.

Returns `nil`.

See: [Java Formatter](#)

```
(printf "%s: %d" "abc" 100)
abc: 100
=> nil

(printf "line 1: %s\nline 2: %s\n" "123" "456")
line 1: 123
line 2: 456
=> nil

(printf "%d%%" 42)
42%
=> nil

(printf *out* "%s: %d" "abc" 100)
abc: 100
=> nil

(printf *err* "%s: %d" "abc" 100)
abc: 100
=> nil
```

### [pr-str](#)

With no args, returns the empty string. With one arg `x`, returns `x.toString()`. With more than one arg, returns the concatenation of ...

## prof

(prof opts)

Controls the code profiling. See the companion functions/macros 'dorun' and 'perf'. The perf macro is built on prof and dorun and provides all for simple Venice profiling.

The profiler reports a function's elapsed time as "time with children"!

Profiling recursive functions:

Because the profiler reports "time with children" and accumulates the elapsed time across all recursive calls the resulting time for a particular recursive function is higher than the effective time.

```
(do
  (prof :on)    ; turn profiler on
  (prof :off)   ; turn profiler off
  (prof :status) ; returns the profiler on/off status
  (prof :clear) ; clear profiler data captured so far
  (prof :data)  ; returns the profiler data as map
  (prof :data-formatted) ; returns the profiler data as formatted text
  (prof :data-formatted "Metrics") ; returns the profiler data as formatted text with a title
  nil)
=> nil
```

### SEE ALSO

#### perf

Performance test with the given expression.

#### time

Evaluates expr and prints the time it took. Returns the value of expr.

## promise

(promise)  
(promise fn)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, unless the variant of deref with timeout is used. All subsequent derefs will return the same delivered value without blocking.

Promises are implemented on top of Java's `CompletableFuture`.

```
(do
  (def p (promise))
  (deliver p 10)
  (deliver p 20) ; no effect
  @p)
=> 10

;; deliver the promise from a future
(do
  (def p (promise))
  (defn task1 [] (sleep 500) (deliver p 10))
  (defn task2 [] (sleep 800) (deliver p 20))
  (future task1))
```

```

    (future task2)
    @p)
=> 10

;; deliver the promise from a task's return value
(do
  (defn task [] (sleep 300) 10)
  (def p (promise task))
  @p)
=> 10

(let [p (promise #(do (sleep 300) 10))])
  @p)
=> 10

```

## SEE ALSO

### [deliver](#)

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

### [promise?](#)

Returns true if f is a Promise otherwise false

### [realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [done?](#)

Returns true if the future or promise is done otherwise false

### [cancel](#)

Cancels a future or a promise

### [cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

### [all-of](#)

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

### [any-of](#)

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

### [then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

### [then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

### [then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

### [when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

### [accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

### [timeout-after](#)

Returns a promise that timeouts after the specified time. The promise throws a `TimeoutException`.

[top](#)

## promise?

`(promise? p)`

Returns true if `f` is a Promise otherwise false

```
(promise? (promise))  
=> true
```

[top](#)

## proxify

`(proxify interface method-map)`

Proxies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

The dynamic invocation handler takes care that the methods are called in the context of a Venice sandbox even if the Java method that invokes the callback methods is running in another thread.

Supports default method implementations in the proxied Java interface. These Java interface methods can be either overridden by a Venice function or just be omitted. In the latter case the return value of methods default implementation will be handed back.

In case a Java `FunctionalInterface` is required the proxy wrappers from the `:java` module are often simpler to use:

- `java/as-runnable`
- `java/as-callable`
- `java/as-predicate`
- `java/as-function`
- `java/as-consumer`
- `java/as-supplier`
- `java/as-bipredicate`
- `java/as-bifunction`
- `java/as-biconsumer`
- `java/as-binaryoperator`

```
(do  
  (import :java.io.File :java.io.FilenameFilter)  
  
  (def file-filter  
    (fn [dir name] (str/ends-with? name ".xxx")))  
  
  (let [dir (io/tmp-dir)]  
    ;; create a dynamic proxy for the interface FilenameFilter  
    ;; and implement its function 'accept' by 'file-filter'
```

```
(. dir :list (proxify :FilenameFilter {:accept file-filter}))))
=> []

;; Instead of explicit proxies, functional interface wrappers are
;; often simpler to use
(do
  (load-module :java)
  (import :java.util.stream.Collectors)

  (-> (. [1 2 3 4] :stream)
    (. :filter (java/as-predicate #(> % 2)))
    (. :map (java/as-function #(* % 10)))
    (. :collect (. :Collectors :toList))))
=> (30 40)
```

## SEE ALSO

Wraps the function f in a java.util.function.BiConsumer (<https://docs.oracle.com/javase/8/docs/api/java/util/function/BiConsumer.html>)

### [java/as-binaryoperator](#)

Wraps the function f in a java.util.function.BinaryOperator (<https://docs.oracle.com/javase/8/docs/api/java/util/function/BinaryOperator.html>)

[top](#)

## push!

```
(push! stack v)
```

Pushes an item to a stack.

```
(let [s (stack)]
  (push! s 1)
  (push! s 2)
  (push! s 3)
  (pop! s))
=> 3
```

## SEE ALSO

### stack

Creates a new mutable threadsafe stack.

### peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

### pop!

Pops an item from a stack.

### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

top

## put!

```
(put! queue val)
(put! queue val delay)
```

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

*queue:* (put! queue val)

Puts the value 'val' to the tail of the queue.

*delay-queue:* (put! queue val delay)

Puts the value 'val' with a delay of 'delay' milliseconds to a delay-queue

```
(let [q (queue)]
  (put! q 1)
  (poll! q)
  q)
=> ()

(let [q (delay-queue)]
  (put! q 1 100)
  (take! q))
=> 1
```

## SEE ALSO

### queue

Creates a new mutable threadsafe bounded or unbounded queue.

### take!

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

### offer!

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

### poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

### peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

## qrref/format

(format s)

Format a QR reference.

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/format "0000000000000000000000001234011"))
=> "00 00000 00000 00000 00012 34011"
```

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/format (qr/qr-ref 1 :bill "1234"))))
=> "00 00000 00000 00000 00012 34011"
```

### SEE ALSO

[qrref/qr-ref](#)

Creates a QR reference according to the Swiss payment standards.

[qrref/parse](#)

Parse a QR reference. The reference may be formatted.

## qrref/parse

(parse ref)

Parse a QR reference. The reference may be formatted.

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/parse (qr/qr-ref 1 :bill "1234"))))
=> {:bill-typ :bill :bill-nr "1234" :version 1}
```

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/parse "0000000000000000000000001234011"))
=> {:bill-typ :bill :bill-nr "1234" :version 1}
```

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/parse "00 00000 00000 00000 00012 34011"))
=> {:bill-typ :bill :bill-nr "1234" :version 1}
```

### SEE ALSO

[qrref/qr-ref](#)

Creates a QR reference according to the Swiss payment standards.

[qrref/format](#)

Format a QR reference.

## qrref/qr-ref

```
(qr-ref version bill-type bill-nr)
```

Creates a QR reference according to the Swiss payment standards.

- *version*, an integer [1..9]
- *bill-type*, one of {:bill, :reminder-1, :reminder-2, :reminder-3}
- *bill-nr*, a string with up to 24 digits '0'..'9'

[Swiss Payment Standards / de](#)

[Swiss Payment Standards / en](#)

```
(do

```

### SEE ALSO

[qrref/parse](#)

Parse a QR reference. The reference may be formatted.

[qrref/format](#)

Format a QR reference.

## qualified-name

```
(name x)
```

Returns the qualified name String of a string, symbol, keyword, or function

```
(qualified-name :user/x)
=> "user/x"
```

```
(qualified-name 'x)
=> "x"
```

```
(qualified-name "x")
=> "x"
```

```
(qualified-name str/digit?)
=> "str/digit?"
```

### SEE ALSO

[name](#)

Returns the name String of a string, symbol, keyword, or function

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[fn-name](#)

Returns the qualified name of a function or macro

[top](#)

## qualified-symbol?

(qualified-symbol? x)

Returns true if x is a qualified symbol

```
(qualified-symbol? 'foo/a)
=> true
```

```
(qualified-symbol? (symbol "foo/a"))
=> true
```

```
(qualified-symbol? 'a)
=> false
```

```
(qualified-symbol? nil)
=> false
```

```
(qualified-symbol? :a)
=> false
```

[top](#)

## quasiquote

(quasiquote form)

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

unquote:

It is possible to unquote part of the form that is quoted with `~`. Unquoting allows you to evaluate parts of the syntax quoted expression.

unquote-splicing:

Unquote evaluates to a collection of values and inserts the collection into the quoted form. But sometimes you want to unquote a list and insert its elements (not the list) inside the quoted form. This is where `~@` (unquote-splicing) comes to rescue.

```
(quasiquote (16 17 (inc 17)))
=> (16 17 (inc 17))
```

```
`(16 17 (inc 17))
=> (16 17 (inc 17))
```

```
`(16 17 ~(inc 17))
=> (16 17 18)
```

```
`(16 17 ~(map inc [16 17]))
=> (16 17 (17 18))
```

```
`(16 17 ~@(map inc [16 17]))
=> (16 17 17 18)
```

```
`(1 2 ~@#{1 2 3})  
=> (1 2 1 2 3)
```

```
`(1 2 ~@{:a 1 :b 2 :c 3})

## SEE ALSO

[quote](#)

There are two equivalent ways to quote a form either with `quote` or with `'`. They prevent the quoted form from being evaluated.

top

## queue

```
(queue)  
(queue capacity)
```

Creates a new mutable threadsafe bounded or unbounded queue.

The queue can be turned into a synchronous queue when using the functions `put!` and `take!`. `put!` waits until the value be added and `take!` waits until a value is available from queue thus synchronizing the producer and consumer.

```
; unbounded queue  
(let [q (queue)]  
  (offer! q 1)  
  (offer! q 2)  
  (offer! q 3)  
  (poll! q)  
  q)  
=> (2 3)
```

```
; bounded queue  
(let [q (queue 10)]  
  (offer! q 1000 1)  
  (offer! q 1000 2)  
  (offer! q 1000 3)  
  (poll! q 1000)  
  q)  
=> (2 3)
```

```
; synchronous unbounded queue  
(let [q (queue)]  
  (put! q 1)  
  (put! q 2)  
  (put! q 3)  
  (take! q)  
  q)  
=> (2 3)
```

```
; synchronous bounded queue  
(let [q (queue 10)]  
  (put! q 1)  
  (put! q 2)  
  (put! q 3)  
  (take! q)  
  q)  
=> (2 3)
```

## SEE ALSO

### [peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

### [put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

### [take!](#)

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

### [offer!](#)

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

### [poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

### [empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

### [empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

### [count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

### [queue?](#)

Returns true if coll is a queue

### [reduce](#)

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

### [transduce](#)

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be ...

### [docoll](#)

Applies f to the items of the collection presumably for side effects. Returns nil.

### [into!](#)

Adds all of the items of 'from' conjoined to the mutable 'to' collection

### [conj!](#)

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item). For mutable list the values are added at ...

## queue?

```
(queue? coll)
```

Returns true if coll is a queue

```
(queue? (queue))  
=> true
```

top

## quote

```
(quote form)
```

There are two equivalent ways to quote a form either with `quote` or with `'`. They prevent the quoted form from being evaluated.

Regular quotes work recursively with any kind of forms and types: strings, maps, lists, vectors...

```
(quote (1 2 3))
=> (1 2 3)

(quote (+ 1 2))
=> (+ 1 2)

'(1 2 3)
=> (1 2 3)

'(+ 1 2)
=> (+ 1 2)

'(a (b (c d (+ 1 2))))
=> (a (b (c d (+ 1 2))))
```

#### SEE ALSO

[quasiquote](#)

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

```

## SEE ALSO

### [future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

### [delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

### [promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[top](#)

## recur

```
(recur expr*)
```

Evaluates the exprs and rebinds the bindings of the recursion point to the values of the exprs. The recur expression must be at the tail position. The tail position is a position which an expression would return a value from.

```

;; tail recursion
(loop [x 10]
  (when (> x 1)
    (println x)
    (recur (- x 2)))))

10
8
6
4
2
=> nil

;; tail recursion
(defn sum [n]

```

```

(loop [cnt n acc 0]
  (if (zero? cnt)
    acc
    (recur (dec cnt) (+ acc cnt)))))
(sum 10000))
=> 50005000

```

## SEE ALSO

### [loop](#)

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

[top](#)

## reduce

```

(reduce f coll)
(reduce f val coll)

```

`f` should be a function of 2 arguments. If `val` is not supplied, returns the result of applying `f` to the first 2 items in `coll`, then applying `f` to that result and the 3rd item, etc. If `coll` contains no items, `f` must accept no arguments as well, and `reduce` returns the result of calling `f` with no arguments. If `coll` has only 1 item, it is returned and `f` is not called. If `val` is supplied, returns the result of applying `f` to `val` and the first item in `coll`, then applying `f` to that result and the 2nd item, etc. If `coll` contains no items, returns `val` and `f` is not called.

`reduce` can work with queues as collection, given that the end of the queue is marked by adding a `nil` element. Otherwise the reducer does not know when to stop reading elements from the queue.

```

(reduce + [1 2 3 4 5 6 7])
=> 28

```

```

(reduce + 10 [1 2 3 4 5 6 7])
=> 38

```

```

(reduce (fn [x y] (+ x y 10)) [1 2 3 4 5 6 7])
=> 88

```

```

(reduce (fn [x y] (+ x y 10)) 10 [1 2 3 4 5 6 7])
=> 108

```

```

((reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100)
=> 207

```

```

(reduce (fn [m [k v]] (assoc m k v)) {} [[:a 1] [:b 2] [:c 3]])
=> {:a 1 :b 2 :c 3}

```

```

(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})
=> {1 :a 2 :b 3 :c}

```

```

(reduce (fn [m c] (assoc m (first c) c)) {} [[:a 1] [:b 2] [:c 3]])
=> {:a [:a 1] :b [:b 2] :c [:c 3]}

```

```

;; sliding window (width 3) average
(->> (partition 3 1 (repeatedly 10 #(rand-long 30))))
    (map (fn [window] (/ (reduce + window) (count window)))))
=> (20 18 12 16 16 18 15 17)

```

```

;; reduce all elements of a queue. calls (take! queue) to get the
;; elements of the queue.

```

```
;; note: use nil to mark the end of the queue otherwise reduce will
;;      block forever!
(let [q (conj! (queue) 1 2 3 4 5 6 7 nil)]
  (reduce + q))
=> 28
```

## SEE ALSO

```

## SEE ALSO

### [match?](#)

Returns true if the string `s` matches the regular expression `regex`.

### [regex/group](#)

Returns the input subsequence captured by the given group during the previous match operation.

### [regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

### [regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

### [regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[top](#)

## regex/matcher

```
(regex/matcher pattern str)
```

Returns an instance of `java.util.regex.Matcher`.

The pattern can be either a string or a pattern created by `(regex/pattern s)`.

Matchers are mutable and are not safe for use by multiple concurrent threads!

JavaDoc: [Pattern](#)

```
(regex/matcher #"[0-9]+" "100")
=> java.util.regex.Matcher[pattern=[0-9]+ region=0,3 lastmatch=]
```

```
(regex/matcher (regex/pattern "[0-9]+") "100")
=> java.util.regex.Matcher[pattern=[0-9]+ region=0,3 lastmatch=]
```

```
(regex/matcher "[0-9]+" "100")
=> java.util.regex.Matcher[pattern=[0-9]+ region=0,3 lastmatch=]
```

## SEE ALSO

### [match?](#)

Returns true if the string `s` matches the regular expression `regex`.

### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

### [regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

### [regex/find?](#)

Attempts to find the next subsequence that matches the pattern. If the match succeeds then more information can be obtained via the ...

### [regex/reset](#)

Resets the matcher with a new string

## regex/matches

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

## regex/find

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

## regex/find-all

Returns all regex matches as list or an empty list if there are no matches.

top

# regex/matches

(regex/matches pattern str)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

If the matcher's pattern matches the entire region sequence returns a list with the entire region sequence and the matched groups otherwise returns an empty list.

Returns matching info as meta data on the region and the groups.

Region meta data:

:start            start pos of the overall group  
:end             end pos of the overall group  
:group-count    the number of matched elements groups

Group meta data:

:start    start pos of the element group  
:end      end pos of the element group

JavaDoc: [Pattern](#)

```
;; Entire region sequence matched
(regex/matches "hello, (.*)" "hello, world")
=> ("hello, world" "world")

;; Entire region sequence not matched
(regex/matches "HEllo, (.*)" "hello, world")
=> ()

;; Matching multiple groups
(regex/matches "([0-9]+)-([0-9]+)-([0-9]+)-([0-9]+)" "672-345-456-212")
=> ("672-345-456-212" "672" "345" "456" "212")

;; Matching multiple groups
(let [p (regex/pattern "([0-9]+)-([0-9]+)")]
  (regex/matches p "672-345"))
=> ("672-345" "672" "345")

;; Access matcher's region meta info
(let [pattern "([0-9]+)-([0-9]+)-([0-9]+)-([0-9]+)"
      matches (regex/matches pattern "672-345-456-212")]
  (println "meta info:" (pr-str (meta matches)))
  (println "matches: " (pr-str matches)))
meta info: {:group-count 4 :start 0 :end 15}
matches:   ("672-345-456-212" "672" "345" "456" "212")
=> nil
```

```
;; Access matcher's region meta info and the meta info of each group
(let [pattern "([0-9+)-([0-9+)-([0-9+)-([0-9+)"
      matches (regex/matches pattern "672-345-456-212")])
      (println "region info:  " (pr-str (meta matches)))
      (println "group count:  " (count matches) "(region included)")
      (println "group matches: " (pr-str (nth matches 0)) (meta (nth matches 0)))
      (println "              " (pr-str (nth matches 1)) (meta (nth matches 1)))
      (println "              " (pr-str (nth matches 2)) (meta (nth matches 2)))
      (println "              " (pr-str (nth matches 3)) (meta (nth matches 3)))
      (println "              " (pr-str (nth matches 4)) (meta (nth matches 4))))

region info:  {:group-count 4 :start 0 :end 15}
group count:  5 (region included)
group matches: "672-345-456-212" {:start 0 :end 15}
               "672"  {:start 0 :end 3}
               "345"  {:start 4 :end 7}
               "456"  {:start 8 :end 11}
               "212"  {:start 12 :end 15}

=> nil
```

## SEE ALSO

Returns true if the string `s` matches the regular expression `regex`.

### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[top](#)

## regex/matches-not?

```
(regex/matches-not? matcher)
(regex/matches-not? matcher str)
```

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

```
(let [m (regex/matcher #"[0-9]+" "10A")]
      (regex/matches-not? m))
=> true

(let [m (regex/matcher #"[0-9]+" "value: 10A")]
      (regex/matches-not? m))
=> true

(let [m (regex/matcher #"[0-9]+" "")]
      (filter #(regex/matches-not? m %) ["100" "10A" "200"]))
=> ("10A")
```

## SEE ALSO

### [match?](#)

Returns true if the string `s` matches the regular expression `regex`.

### [regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

### [regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

top

## regex/matches?

```
(regex/matches? matcher)
(regex/matches? matcher str)
```

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

```
(let [m (regex/matcher #"[0-9]+" "100")]
  (regex/matches? m))
=> true

(let [m (regex/matcher #"[0-9]+" "value: 100")]
  (regex/matches? m))
=> false

(let [m (regex/matcher #"[0-9]+" "")]
  (filter #(regex/matches? m %) ["100" "1a1" "200"]))
=> ("100" "200")
```

### SEE ALSO

#### [match?](#)

Returns true if the string `s` matches the regular expression `regex`.

#### [regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

#### [regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

#### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

top

## regex/pattern

```
(regex/pattern s)
```

Returns an instance of `java.util.regex.Pattern`.

Patterns are immutable and are safe for use by multiple concurrent threads!

Alternatively regex pattern literals can be used to define a pattern: `#"[0-9]+"`

```
"\\d" ;; regex string to match one digit
```

Notice that you have to escape the backslash to get a literal backslash in the string. However, regex pattern literals are smart. They don't need to double escape:

```
#"\\d" ;; regex pattern literal to match one digit
```

JavaDoc: [Pattern](#)

```
(regex/pattern "[0-9]+")
=> [0-9]+
```

```
(regex/pattern "\\d+")
=> \d+

#"[0-9]+"
=> [0-9]+

#"\\d+"
=> \d+
```

## SEE ALSO

### [match?](#)

Returns true if the string *s* matches the regular expression *regex*.

### [regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

### [regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

### [regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

### [regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[top](#)

## regex/reset

```
(regex/reset matcher str)
```

Resets the matcher with a new string

```
(do
  (let [m (regex/matcher #"[0-9]+" "100")]
    (println (regex/find m))
    (let [m (regex/reset m "200")]
      (println (regex/find m)))))

100
200
=> nil
```

## SEE ALSO

### [match?](#)

Returns true if the string *s* matches the regular expression *regex*.

### [regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

### [regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[top](#)

## remove

```
(remove predicate coll)
```

Returns a collection of the items in `coll` for which `(predicate item)` returns logical false.  
Returns a transducer when no collection is provided.

```
(remove nil? [1 nil nil 4 5 6])  
=> (1 4 5 6)
```

```
(remove even? [1 2 3 4 5 6 7])  
=> (1 3 5 7)
```

```
(remove #{3 5} '(1 3 5 7 9))  
=> (1 7 9)
```

```
(remove #(= 3 %) '(1 2 3 4 5 6))  
=> (1 2 4 5 6)
```

[top](#)

## remove-formal-type

```
(remove-formal-type object)
```

Removes the formal type from a Java object

```
(do  
  (let [p0 (. :java.awt.Point :new 0 0)  
        p1 (cast :java.lang.Object p0)  
        p2 (remove-formal-type p1)]  
    (println "p0:" (formal-type p0))  
    (println "p1:" (formal-type p1))  
    (println "p2:" (formal-type p2))))  
p0: :java.awt.Point  
p1: :java.lang.Object  
p2: :java.awt.Point  
=> nil
```

### SEE ALSO

[formal-type](#)

Returns the formal type of a Java object

[cast](#)

Casts a Java object

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

## remove-watch

```
(remove-watch ref key)
```

Removes a watch function from an agent/atom reference.

```
(do
  (def x (agent 10))
  (defn watcher [key ref old new]
    (println "watcher: " key))
  (add-watch x :test watcher)
  (remove-watch x :test))
=> nil
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

top

## repeat

```
(repeat x)
(repeat n x)
```

Returns a lazy sequence of x values or a collection with the value x repeated n times.

```
(repeat 3 "hello")
=> ("hello" "hello" "hello")

(repeat 5 [1 2])
=> ([1 2] [1 2] [1 2] [1 2] [1 2])

(repeat ":")
=> (...)

(interleave [:a :b :c] (repeat 100))
=> (:a 100 :b 100 :c 100)
```

## SEE ALSO

### [repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

### [dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

### [constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

top

## repeatedly

```
(repeatedly n fn)
```

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

```
(repeatedly 5 #(rand-long 11))
=> (6 3 6 8 5)
```

```
;; compare with repeat, which only calls the 'rand-long'  
;; function once, repeating the value five times.  
(repeat 5 (rand-long 11))  
=> (8 8 8 8 8)
```

## SEE ALSO

### [repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

### [dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

### [constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

## repl/fonts-dir

```
(repl/fonts-dir)
```

Returns the REPL fonts directory!

## SEE ALSO

### [repl?](#)

Returns true if running within a REPL.

### [repl/home-dir](#)

Returns the REPL home directory!

### [repl/libs-dir](#)

Returns the REPL libs directory!

[top](#)

## repl/home-dir

```
(repl/home-dir)
```

Returns the REPL home directory!

## SEE ALSO

### [repl?](#)

Returns true if running within a REPL.

### [repl/libs-dir](#)

Returns the REPL libs directory!

### [repl/fonts-dir](#)

Returns the REPL fonts directory!

[top](#)

## repl/info

(repl/info)

Returns information on the REPL.

Note: This function is only available when called from within a REPL!

E.g.:

```
{ :term-name "JLine terminal"
  :term-type "xterm-256color"
  :term-cols 80
  :term-rows 24
  :term-colors 256
  :term-class :org.repackage.org.jline.terminal.impl.PosixSysTerminal
  :color-mode :light }
```

### SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-rows](#)

Returns number of rows in the REPL terminal.

[repl/term-cols](#)

Returns number of columns in the REPL terminal.

[top](#)

## repl/libs-dir

(repl/libs-dir)

Returns the REPL libs directory!

### SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/home-dir](#)

Returns the REPL home directory!

[repl/fonts-dir](#)

Returns the REPL fonts directory!

[top](#)

## repl/term-cols

(repl/term-cols)

Returns number of columns in the REPL terminal.

Note: This function is only available when called from within a REPL!

## SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-rows](#)

Returns number of rows in the REPL terminal.

[repl/info](#)

Returns information on the REPL.

[top](#)

## repl/term-rows

`(repl/term-rows)`

Returns number of rows in the REPL terminal.

Note: This function is only available when called from within a REPL!

## SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-cols](#)

Returns number of columns in the REPL terminal.

[repl/info](#)

Returns information on the REPL.

[top](#)

## repl?

`(repl?)`

Returns true if running within a REPL.

`(repl?)`

[top](#)

## replace

`(replace smap coll)`

Given a map of replacement pairs and a collection, returns a collection with any elements that are a key in smap replaced with the corresponding value in smap.

```
(replace {2 :two, 4 :four} [4 2 3 4 5 6 2])  
=> [:four :two 3 :four 5 6 :two]
```

```
(replace {2 :two, 4 :four} #{1 2 3 4 5})
=> #{1 3 5 :four :two}

(replace [{:a 10} [:c 30]] {:a 10 :b 20})
=> {:b 20 :c 30}
```

[top](#)

## reset!

```
(reset! box newval)
```

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

```
(do
  (def counter (atom 0))
  (reset! counter 99)
  @counter)
=> 99

(do
  (def counter (atom 0))
  (reset! counter 99))
=> 99

(do
  (def counter (volatile 0))
  (reset! counter 99)
  @counter)
=> 99
```

### SEE ALSO

#### [atom](#)

Creates an atom with the initial value x.

#### [volatile](#)

Creates a volatile with the initial value x

[top](#)

## reset-ns-meta!

```
(reset-ns-meta! n datamap)
```

Resets the metadata for a namespace

```
(do
  (ns foo)
  (reset-ns-meta! foo {}))
=> {}

(do
  (ns foo)
  (def n 'foo)
  (reset-ns-meta! (var-get n) {}))
```

```
(pr-str (ns-meta (var-get n))))  
=> "{}"
```

## SEE ALSO

### [ns-meta](#)

Returns the meta data of the namespace n or nil if n is not an existing namespace

### [alter-ns-meta!](#)

Alters the metadata for a namespace. f must be free of side-effects.

### [ns](#)

Opens a namespace.

top

## resolve

```
(resolve symbol)
```

Resolves a symbol.

```
(resolve '+)  
=> +
```

```
(resolve 'y)  
=> nil
```

```
(resolve (symbol "+"))  
=> +
```

```
((-> "first" symbol resolve) [1 2 3])  
=> 1
```

top

## rest

```
(rest coll)
```

Returns a possibly empty collection of the items after the first.

```
(rest nil)  
=> nil
```

```
(rest [])  
=> []
```

```
(rest [1])  
=> []
```

```
(rest [1 2 3])  
=> [2 3]
```

```
(rest '())  
=> ()  
  
(rest '(1))  
=> ()  
  
(rest '(1 2 3))  
=> (2 3)  
  
(rest "1234")  
=> (#\2 #\3 #\4)
```

#### SEE ALSO

[str/rest](#)

Returns a possibly empty string of the characters after the first.

[top](#)

## restart-agent

```
(restart-agent agent state)
```

When an agent is failed, changes the agent state to new-state and then un-fails the agent so that sends are allowed again.

```
(do  
  (def x (agent 100))  
  (restart-agent x 200)  
  (deref x))  
=> 200
```

#### SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

## reverse

```
(reverse coll)
```

Returns a collection of the items in coll in reverse order.  
Returns a stateful transducer when no collection is provided.

```
(reverse [1 2 3 4 5 6])  
=> [6 5 4 3 2 1]  
  
(reverse "abcdef")  
=> (#\f #\e #\d #\c #\b #\a)
```

#### SEE ALSO

[str/reverse](#)

## rf-any?

```
(rf-any? pred)
```

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

```
(transduce (filter number?) (rf-any? pos?) [true -1 1 2 false])  
=> true
```

### SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

## rf-every?

```
(rf-every? pred)
```

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

```
(transduce (filter number?) (rf-every? pos?) [1 2 3])  
=> true
```

### SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

## rf-first

```
(rf-first)
```

Returns a reducing function for a transducer that returns the first item.

```
(transduce (filter number?) rf-first [false 1 2])
=> 1
```

```
(transduce identity rf-first [nil 1 2])
=> nil
```

## SEE ALSO

### [rf-last](#)

Returns a reducing function for a transducer that returns the last item.

### [rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

### [rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

## rf-last

```
(rf-last)
```

Returns a reducing function for a transducer that returns the last item.

```
(transduce (filter number?) rf-last [false 1 2])
=> 2
```

```
(transduce identity rf-last [1 2 1.2])
=> 1.2
```

## SEE ALSO

### [rf-first](#)

Returns a reducing function for a transducer that returns the first item.

### [rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

### [rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

## run!

```
(run! f coll)
```

Runs the supplied function, for purposes of side effects, on successive items in the collection. Returns `nil`

```
(run! prn [1 2 3 4])
1
2
3
4
=> nil
```

## SEE ALSO

[docoll](#)

Applies f to the items of the collection presumably for side effects. Returns nil.

[mapv](#)

Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of ...

[top](#)

## sandbox/functions

(sandbox/functions group)

Lists the sandboxed functions defined by a sandbox function group.

Groups:

- :io
- :print
- :concurrency
- :java-interop
- :system
- :special-forms
- :unsafe

([sandbox/functions](#) [:print](#))

## SEE ALSO

[sandboxed?](#)

Returns true if there is a sandbox other than :AcceptAllInterceptor otherwise false.

[top](#)

## sandbox/type

(sandbox/type)

Returns the sandbox type.

Venice sandbox types:

- `:AcceptAllInterceptor` - accepts all (no restrictions)
- `:RejectAllInterceptor` - safe sandbox, rejects access to all I/O functions, system properties, environment vars, extension modules, dynamic code loading, multi-threaded functions (futures, agents, ...), and Java calls
- `:SandboxInterceptor` - customized sandbox

([sandbox/type](#))

=> `:AcceptAllInterceptor`

## SEE ALSO

[sandboxed?](#)

Returns true if there is a sandbox other than :AcceptAllInterceptor otherwise false.

## sandboxed?

```
(sandboxed?)
```

Returns true if there is a sandbox other than `:AcceptAllInterceptor` otherwise false.

```
(sandboxed?)
=> false
```

### SEE ALSO

[sandbox/type](#)

Returns the sandbox type.

## schedule-at-fixed-rate

```
(schedule-at-fixed-rate fn initial-delay period time-unit)
```

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period. Returns a future. `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future. Time unit is one of `:milliseconds`, `:seconds`, `:minutes`, `:hours`, or `:days`.

```
(schedule-at-fixed-rate #(println "test") 1 2 :seconds)

(let [s (schedule-at-fixed-rate #(println "test") 1 2 :seconds)]
  (sleep 16 :seconds)
  (cancel s))
```

### SEE ALSO

[schedule-delay](#)

Creates and executes a one-shot action that becomes enabled after the given delay.

## schedule-delay

```
(schedule-delay fn delay time-unit)
```

Creates and executes a one-shot action that becomes enabled after the given delay. Returns a future. `(deref f)`, `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future. Time unit is one of `:milliseconds`, `:seconds`, `:minutes`, `:hours`, or `:days`.

```
(schedule-delay (fn[] (println "test")) 1 :seconds)

(deref (schedule-delay (fn [] 100) 2 :seconds))
```

## SEE ALSO

[schedule-at-fixed-rate](#)

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period.

[top](#)

## second

```
(second coll)
```

Returns the second element of coll.

```
(second nil)
=> nil
```

```
(second [])
=> nil
```

```
(second [1 2 3])
=> 2
```

```
(second '())
=> nil
```

```
(second '(1 2 3))
=> 2
```

[top](#)

## select-keys

```
(select-keys map keyseq)
```

Returns a map containing only those entries in map whose key is in keys

```
(select-keys {:a 1 :b 2} [:a])
=> {:a 1}
```

```
(select-keys {:a 1 :b 2} [:a :c])
=> {:a 1}
```

```
(select-keys {:a 1 :b 2 :c 3} [:a :c])
=> {:a 1 :c 3}
```

## SEE ALSO

[keys](#)

Returns a collection of the map's keys.

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

## semver/cmp

```
(semver/cmp a b)
```

Compares versions a and b, returning -1 if a is older than b, 0 if they're the same version, and 1 if a is newer than b.

```
(semver/cmp "1.2.3" "1.5.4")  
=> -1
```

```
(semver/cmp (semver/version "1.2.3") (semver/version "1.5.4"))  
=> -1
```

### SEE ALSO

[top](#)

## semver/parse

```
(semver/parse s)
```

Parses string 's' into a semantic version map.

Semantic versioning format:

```
standard  
version: 1.0.0
```

```
pre-release: 1.0.0-beta
meta data: 1.0.0-beta+001
```

```
with revision
version: 1.0.0.0
pre-release: 1.0.0.0-beta
meta data: 1.0.0.0-beta+001
```

```
E.g.: { :major 1, :minor 3, :patch 5 }
      { :major 1, :minor 3, :patch 5 :pre-release "beta"}
      { :major 1, :minor 3, :patch 5 :pre-release "beta"}
      { :major 1, :minor 3, :patch 5 :pre-release "beta" :meta "001"}
```

```
(semver/parse "1.2.3")
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}

(semver/parse "1.2.3-beta")
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release "beta"}

(semver/parse "1.2.3-beta+001")
=> {:patch 3 :meta-data "001" :minor 2 :major 1 :revision nil :pre-release "beta"}
```

## SEE ALSO

### [semver/version](#)

If 'o' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'o' and return a version map.

### [semver/valid-format?](#)

Checks the string 's' for semantic versioning formatting

top

## semver/valid-format?

```
(semver/valid-format? s)
```

Checks the string 's' for semantic versioning formatting

```
(semver/valid-format? "1.2.3")
=> true
```

## SEE ALSO

### [semver/parse](#)

Parses string 's' into a semantic version map.

### [semver/valid?](#)

Checks if the supplied version map is valid regarding semantic versioning or not.

top

## semver/valid?

```
(semver/valid? v)
```

Checks if the supplied version map is valid regarding semantic versioning or not.

```
(semver/valid? (semver/parse "1.2.3"))  
=> true
```

## SEE ALSO

### [semver/parse](#)

Parses string 's' into a semantic version map.

### [semver/valid?](#)

Checks if the supplied version map is valid regarding semantic versioning or not.

[top](#)

## semver/version

```
(semver/version o)
```

If 'o' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'o' and return a version map.

```
(semver/version "1.2.3")  
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}
```

## SEE ALSO

### [semver/parse](#)

Parses string 's' into a semantic version map.

[top](#)

## send

```
(send agent action-fn args)
```

Dispatch an action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do  
  (def x (agent 100))  
  (send x + 5)  
  (send x (partial + 7))  
  (sleep 100)  
  (deref x))  
=> 112
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

### [send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

[top](#)

## send-off

```
(send-off agent fn args)
```

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do
  (def x (agent 100))
  (send-off x + 5)
  (send-off x (partial + 7))
  (sleep 100)
  (deref x))
=> 112
```

### SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send](#)

Dispatch an action to an agent. Returns the agent immediately.

[top](#)

## seq

```
(seq coll)
```

Returns a seq on the collection. If the collection is empty, returns nil. `(seq nil)` returns nil. seq also works on Strings and converts Java streams to lists.

```
(seq nil)
=> nil
```

```
(seq [])
=> nil
```

```
(seq [1 2 3])
=> (1 2 3)
```

```
(seq '(1 2 3))
=> (1 2 3)
```

```
(seq {:a 1 :b 2})
=> ([:a 1] [:b 2])
```

```
(seq "abcd")
=> (#\a #\b #\c #\d)
```

[top](#)

## sequential?

(sequential? coll)

Returns true if coll is a sequential collection

```
(sequential? '(1))  
=> true
```

```
(sequential? [1])  
=> true
```

```
(sequential? {:a 1})  
=> false
```

```
(sequential? nil)  
=> false
```

```
(sequential? "abc")  
=> false
```

[top](#)

## service

(service name method & args)

Calls a service with the specified name from the Venice's service registry.

Venice's service registry is used with application scripting scenarios where multiple external services must be made available to Venice. E.g.: the service registry can be used to register an application's *Spring Framework* services and make them discoverable by a Venice script.

Example:

```
Venice venice = new Venice();  
  
venice.getServiceRegistry()  
    .register("Calculator", new Calculator())  
    .registerServiceDiscovery(new TestServiceDiscovery());  
  
long r = (Long)venice.eval("(service :Calculator :multiply 10 20)");  
venice.eval("(service :Logger :log (version))");
```

while `Calculator` and `TestServiceDiscovery` are defined as:

```
public static class TestServiceDiscovery implements IServiceDiscovery {  
    @Override public Object lookup(final String name) {  
        if (name == null) {  
            throw new IllegalArgumentException("A service name must not be null");  
        }  
        else if (name.equals("Logger")) {  
            return logger;  
        }  
        else {  
            throw new VncException("Service " + name + " is not registered");  
        }  
    }  
}  
  
private final Logger logger = new Logger();  
}
```

```
public class Calculator {
  public long multiply(long v1, long v2) {
    return v1 * v2;
  }
}

public static class Logger {
  public void log(String message) {
    System.out.println(message);
  }
}
```

```
(service :UserService :find "Smith" "John")
```

## SEE ALSO

[service?](#)

Returns true if the named service exists otherwise false

top

## service?

```
(service? name)
```

Returns true if the named service exists otherwise false

```
(service? :UserService
```

## SEE ALSO

[service](#)

Calls a service with the specified name from the Venice's service registry.

top

## set

```
(set & items)
```

Creates a new set containing the items.

```
(set)
=> #{}

(set nil)
=> #{nil}
```

```
(set 1)
=> #{1}
```

```
(set 1)
=> #{1}
```

```
(set 1 2 3)
=> #{1 2 3}
```

```
(set [1 2] 3)
=> #{[1 2] 3}
```

top

## set!

```
(set! var-symbol expr)
```

Sets a global or thread-local variable to the value of the expression.

```
(do
  (def x 10)
  (set! x 20)
  x)
=> 20

(do
  (def-dynamic x 100)
  (set! x 200)
  x)
=> 200

(do
  (def-dynamic x 100)
  (without-str
    (print x)
    (binding [x 200]
      (print (str "-" x))
      (set! x (inc x))
      (print (str "-" x)))
    (print (str "-" x))))
=> "100-200-201-100"
```

### SEE ALSO

[def](#)  
Creates a global variable.

[def-dynamic](#)  
Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

top

## set-error-handler!

```
(set-error-handler! agent handler-fn)
```

Sets the error-handler of an agent to `handler-fn`. If an action being run by the agent throws an exception `handler-fn` will be called with two arguments: the agent and the exception.

```
(do
  (def x (agent 100))
  (defn err-handler-fn [ag ex]
    (println "error occured: "
      (:message ex)))
```

```
        " and we still have value"
        @ag))
(set-error-handler! x err-handler-fn)
(send x (fn [n] (/ n 0))))
=> (agent :value 100)
```

## SEE ALSO

### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

### [agent-error-mode](#)

Returns the agent's error mode

### [agent-error](#)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

[top](#)

## set?

```
(set? obj)
```

Returns true if obj is a set

```
(set? (set 1))
=> true
```

[top](#)

## sgn

```
(sgn x)
```

sgn function for a number.

```
-1 if x < 0
 0 if x = 0
 1 if x > 0
```

```
(sgn -10)
=> -1
```

```
(sgn 0)
=> 0
```

```
(sgn 10)
=> 1
```

```
(sgn -10I)
=> -1
```

```
(sgn -10.1)
=> -1
```

```
(sgn -10.12M)
=> -1
```

## SEE ALSO

[abs](#)

Returns the absolute value of the number

[negate](#)

Negates x

[top](#)

## sh

```
(sh & args)
```

Launches a new sub-process.

Options:

**:in** may be given followed by input source as `InputStream`, `Reader`, `File`, `ByteBuf`, or `String`, to be fed to the sub-process's `stdin`.

**:in-enc** option may be given followed by a `String`, used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the input string specified by the `:in` option to the sub-process's `stdin`. Defaults to "UTF-8". If the `:in` option provides a byte array, then the bytes are passed unencoded, and this option is ignored.

**:out-enc** option may be given followed by `:bytes` or a `String`. If a `String` is given, it will be used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the sub-process's `stdout` to a `String` which is returned. If `:bytes` is given, the sub-process's `stdout` will be stored in a `Bytebuf` and returned. Defaults to UTF-8.

**:out-fn** a function with a single string argument that receives line by line from the process' `stdout`. If passed the `:out` value in the return map will be empty.

**:err-fn** a function with a single string argument that receives line by line from the process' `stderr`. If passed the `:err` value in the return map will be empty.

**:env** override the process `env` with a map.

**:dir** override the process `dir` with a `String` or `java.io.File`.

**:throw-ex** If true throw an exception if the exit code is not equal to zero, if false returns the exit code. Defaults to false. It's recommended to use `(with-sh-throw (sh "ls" "-l"))` instead.

You can bind `:env`, `:dir` for multiple operations using `with-sh-env` or `with-sh-dir`. `with-sh-throw` is binds `:throw-ex` as `true`.

sh returns a map of

```
:exit => sub-process's exit code
:out  => sub-process's stdout (as Bytebuf or String)
:err  => sub-process's stderr (String via platform default encoding)
```

E.g.:

```
(sh "uname" "-r")
=> {:err "" :out "20.5.0\n" :exit 0}
```

```
(println (sh "ls" "-l"))
```

```
(println (sh "ls" "-l" "/tmp"))
```

```
(println (sh "sed" "s/[aeiou]/oo/g" :in "hello there\n"))
```

```
(println (sh "cat" :in "x\u25bax\n"))
```

```

(println (sh "echo" "x\u25bax"))

(println (sh "/bin/sh" "-c" "ls -l"))

(sh "ls" "-l" :out-fn println)

(sh "ls" "-l" :out-fn println :err-fn println)

;; background process
(println (sh "/bin/sh" "-c" "sleep 30 >/dev/null 2>&1 &"))

(println (sh "/bin/sh" "-c" "nohup sleep 30 >/dev/null 2>&1 &"))

;; reads 4 single-byte chars
(println (sh "echo" "x\u25bax" :out-enc "ISO-8859-1"))

;; reads binary file into bytes[]
(println (sh "cat" "birds.jpg" :out-enc :bytes))

;; working directory
(println (with-sh-dir "/tmp" (sh "ls" "-l") (sh "pwd"))))

(println (sh "pwd" :dir "/tmp"))

;; throw an exception if the shell's subprocess exit code is not equal to 0
(println (with-sh-throw (sh "ls" "-l"))))

(println (sh "ls" "-l" :throw-ex true))

;; windows
(println (sh "cmd" "/c dir 1>&2"))

```

## SEE ALSO

### [with-sh-throw](#)

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

### [with-sh-dir](#)

Sets the directory for use with sh, see sh for details.

### [with-sh-env](#)

Sets the environment for use with sh.

[top](#)

## sh/open

```
(sh/open f)
```

Opens a *file* or an *URL* with the associated platform specific application.

Uses the OS commands:

- *MacOS*: `/usr/bin/open f`
- *Windows*: `cmd /C start f`
- *Linux*: `/usr/bin/xdg-open f`

Note: `sh/open` can only be run from a REPL!

```
(sh/open "sample.pdf")
```

```
(sh/open "https://github.com/jlangch/venice")
```

top

## sh/pwd

```
(sh/pwd)
```

Returns the current working directory.

Note:

You can't change the current working directory of the Java VM but if you were to launch another process using `(sh & args)` you can specify the working directory for the new spawned process.

```
(sh/pwd)
```

### SEE ALSO

[sh](#)

Launches a new sub-process.

top

## shell/alive?

```
(alive? pid)
```

```
(alive? process-handle)
```

Returns true if the process represented by a PID or a process handle is alive otherwise false.

Requires Java 9+.

```
(shell/alive? 4556)
```

### SEE ALSO

[shell/pid](#)

Without argument returns the PID (type long) of this process. With a process-handle (:java.lang.ProcessHandle) returns the PID for ...

## shell/process-info

`(process-info pid)`  
`(process-info process-handle)`

Returns the process info for a process represented by a PID or a process handle.

The process info is a map with the keys:

<code>:pid</code>	the PID
<code>:alive</code>	true if the process is alive else false
<code>:arguments</code>	the list of strings of the arguments of the process
<code>:command</code>	the executable pathname of the process
<code>:command-line</code>	the command line of the process
<code>:start-time</code>	the start time of the process

:total-cpu-millis    the total cputime accumulated of the process

:user                the user of the process.

Requires Java 9+.

([shell/process-info](#) 4556)

```
;; find the PID of the ArangoDB process
;; like: pgrep -lf ArangoDB3 | cut -d ' ' -f 1
(->> (shell/processes)

[top](#)

## shell/processes-info

(processes-info)

Returns a snapshot of all processes visible to the current process. Returns a list of process infos for the processes.

The process info is a map with the keys:

:pid                the PID

:alive	true if the process is alive else false
:arguments	the list of strings of the arguments of the process
:command	the executable pathname of the process
:command-line	the command line of the process
:start-time	the start time of the process
:total-cpu-millis	the total cputime accumulated of the process
:user	the user of the process.

Requires Java 9+.

([shell/processes-info](#))

```
;; find the PID of the ArangoDB process
;; like: pgrep -lf ArangoDB3 | cut -d ' ' -f 1
(->> (shell/processes-info)
      (filter #(str/contains? (:command-line %) "ArangoDB3"))
      (map :pid))
```

## SEE ALSO

[shell/processes](#)

Returns a snapshot of all processes visible to the current process. Returns a list of `:java.lang.ProcessHandle` for the processes.

top

## shell/wait-for-process-exit

```
(wait-for-process-exit pid timeout)
(wait-for-process-exit process-handle timeout)
```

Waits until the process with the pid exits. Waits max timeout seconds. Returns nil if the process exits before reaching the timeout, else the pid is returned. Accepts a PID or a process handle (`:java.lang.ProcessHandle`).

Requires Java 9+.

([shell/wait-for-process-exit](#) 12345 20)

## SEE ALSO

[shell/pid](#)

Without argument returns the PID (type long) of this process. With a process-handle (`:java.lang.ProcessHandle`) returns the PID for ...

[shell/kill](#)

Requests the process to be killed. Returns true if the process is killed and false if the process stays alive. Returns nil if the process ...

[shell/processes](#)

Returns a snapshot of all processes visible to the current process. Returns a list of `:java.lang.ProcessHandle` for the processes.

top

## shuffle

```
(shuffle coll)
```

Returns a collection of the items in coll in random order.

```
(shuffle '(1 2 3 4 5 6))
=> (2 6 5 1 4 3)

(shuffle [1 2 3 4 5 6])
=> [6 3 5 4 1 2]

(shuffle "abcdef")
=> (#\f #\e #\d #\b #\c #\a)
```

[top](#)

## shutdown-agents

```
(shutdown-agents)
```

Initiates a shutdown of the thread pools that back the agent system. Running actions will complete, but no new actions will be accepted

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents))
```

### SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

## shutdown-agents?

```
(shutdown-agents?)
```

Returns true if the thread-pool that backs the agents is shut down

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (sleep 300)
  (shutdown-agents?))
```

### SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

## shutdown-hook

```
(shutdown-hook f)
```

Registers the function `f` as a JVM shutdown hook.

Shutdown hooks can be tested in a REPL:

- start a REPL
- run `(shutdown-hook (fn [] (println "SHUTDOWN") (sleep 3000)))`
- exit the REPL with `!exit`

The sandbox is active within the shutdown hook:

- start a REPL
- run `!sandbox customized`
- run `!sandbox add-rule blacklist:venice:func:+`
- run `(shutdown-hook (fn [] (try (+ 1 2) (catch :SecurityException ex (println ex) (sleep 3000)))))`
- exit the REPL with `!exit`

```
(shutdown-hook (fn [] (println "shutdown")))
```

[top](#)

## sleep

```
(sleep n)
(sleep n time-unit)
```

Sleep for the time `n`. The default time unit is milliseconds.

Time unit is one of `:milliseconds`, `:seconds`, `:minutes`, `:hours`, or `:days` or their abbreviations `:msec`, `:ms`, `:sec`, `:s`, `:min`, `:hr`, `:h`, `:d`.

```
(sleep 30)
=> nil

(sleep 30 :milliseconds)
=> nil

(sleep 30 :msec)
=> nil

(sleep 5 :seconds)
=> nil

(sleep 5 :sec)
=> nil
```

[top](#)

## some

```
(some pred coll)
```

Returns the first logical true value of `(pred x)` for any `x` in `coll`, else `nil`.

Stops processing the collection if the first value is found that meets the predicate.

```
(some even? '(1 2 3 4))
=> true

(some even? '(1 3 5 7))
=> nil

(some #{5} [1 2 3 4 5])
=> 5

(some #(<= 5 %) [1 2 3 4 5])
=> true

(some #(if (even? %) %) [1 2 3 4])
=> 2
```

top

## some->

(some-> expr & forms)

When expr is not nil, threads it into the first form (via -> ), and when that result is not nil, through the next etc.

```
(some-> {:y 3 :x 5}
      :y
      (- 2))
=> 1
```

```
(some-> {:y 3 :x 5}
      :z
      (- 2))
=> nil
```

### SEE ALSO

[some->>](#)

When expr is not nil, threads it into the first form (via ->> ), and when that result is not nil, through the next etc.

top

## some->>

(some->> expr & forms)

When expr is not nil, threads it into the first form (via ->> ), and when that result is not nil, through the next etc.

```
(some->> {:y 3 :x 5}
      :y
      (- 2))
=> -1
```

```
(some->> {:y 3 :x 5}
      :z
      (- 2))
=> nil
```

## SEE ALSO

[some->](#)

When `expr` is not `nil`, threads it into the first form (via `->`), and when that result is not `nil`, through the next etc.

[top](#)

## some?

```
(some? x)
```

Returns true if `x` is not `nil`, false otherwise

```
(some? nil)
=> false
```

```
(some? 0)
=> true
```

```
(some? 4.0)
=> true
```

```
(some? false)
=> true
```

```
(some? [])
=> true
```

```
(some? {})
=> true
```

## SEE ALSO

[nil?](#)

Returns true if `x` is `nil`, false otherwise

[top](#)

## sort

```
(sort coll)
(sort comparefn coll)
```

Returns a sorted list of the items in `coll`. If no compare function `comparefn` is supplied, uses the natural compare. The compare function takes two arguments and returns -1, 0, or 1

```
(sort [3 2 5 4 1 6])
=> [1 2 3 4 5 6]
```

```
(sort compare [3 2 5 4 1 6])
=> [1 2 3 4 5 6]
```

```
; reversed
(sort (comp - compare) [3 2 5 4 1 6])
=> [6 5 4 3 2 1]
```

```
(sort {:c 3 :a 1 :b 2})
=> ([:a 1] [:b 2] [:c 3])
```

## SEE ALSO

### [sort-by](#)

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, ...

[top](#)

## sort-by

```
(sort-by keyfn coll)
(sort-by keyfn compfn coll)
```

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, uses compare.

To sort by multiple values use `juxt`, see the examples below.

```
(sort-by :id [{:id 2 :name "Smith"} {:id 1 :name "Jones"} ])
=> [{:name "Jones" :id 1} {:name "Smith" :id 2}]
```

```
(sort-by count ["aaa" "bb" "c"])
=> ["c" "bb" "aaa"]
```

```
; reversed
(sort-by count (comp - compare) ["aaa" "bb" "c"])
=> ["aaa" "bb" "c"]
```

```
(sort-by first [[1 2] [3 4] [2 3]])
=> [[1 2] [2 3] [3 4]]
```

```
; sort tuples by first value, and where first value is equal,
; sort by second value
(sort-by (juxt first second) [[3 2] [1 3] [3 1] [1 2]])
=> [[1 2] [1 3] [3 1] [3 2]]
```

```
; reversed
(sort-by first (comp - compare) [[1 2] [3 4] [2 3]])
=> [[3 4] [2 3] [1 2]]
```

```
(sort-by :rank [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 1} {:rank 2} {:rank 3}]
```

```
; reversed
(sort-by :rank (comp - compare) [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 3} {:rank 2} {:rank 1}]
```

```
;sort entries in a map by value
(sort-by val {:foo 7, :bar 3, :baz 5})
=> ([:bar 3] [:baz 5] [:foo 7])
```

```

; sort by :foo, and where :foo is equal, sort by :bar
(do
  (def x [ {:foo 2 :bar 11}
            {:foo 1 :bar 99}
            {:foo 2 :bar 55}
            {:foo 1 :bar 77} ])
  (sort-by (juxt :foo :bar) x))
=> [{:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11} {:foo 2 :bar 55}]

; sort by a given key order
(do
  (def x [ {:foo 2 :bar 11}
            {:foo 1 :bar 99}
            {:foo 2 :bar 55}
            {:foo 1 :bar 77} ])
  (def order [55 77 99 11])
  (sort-by #((into {} (map-indexed (fn [i e] [e i]) order)) (:bar %))
    x))
=> [{:foo 2 :bar 55} {:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11}]

```

## SEE ALSO

### [sort](#)

Returns a sorted list of the items in coll. If no compare function comparefn is supplied, uses the natural compare. The compare function ...

[top](#)

## sorted

```
(sorted cmp coll)
```

Returns a sorted collection using the compare function cmp. The compare function takes two arguments and returns -1, 0, or 1. Returns a stateful transducer when no collection is provided.

```

(sorted compare [4 2 1 5 6 3])
=> [1 2 3 4 5 6]

(sorted (comp (partial * -1) compare) [4 2 1 5 6 3])
=> [6 5 4 3 2 1]

```

[top](#)

## sorted-map

```

(sorted-map & keyvals)
(sorted-map map)

```

Creates a new sorted map containing the items.

```

(sorted-map :a 1 :b 2)
=> {:a 1 :b 2}

(sorted-map (hash-map :a 1 :b 2))
=> {:a 1 :b 2}

```

## sorted-map?

```
(sorted-map? obj)
```

Returns true if obj is a sorted map

```
(sorted-map? (sorted-map :a 1 :b 2))  
=> true
```

## sorted-set

```
(sorted-set & items)
```

Creates a new sorted-set containing the items.

```
(sorted-set)  
=> #{} 
```

```
(sorted-set nil)  
=> #{nil} 
```

```
(sorted-set 1)  
=> #{1} 
```

```
(sorted-set 6 2 4)  
=> #{2 4 6} 
```

```
(str (sorted-set [2 3] [1 2]))  
=> "#{[1 2] [2 3]}" 
```

## sorted-set?

```
(sorted-set? obj)
```

Returns true if obj is a sorted-set

```
(sorted-set? (sorted-set 1))  
=> true
```

## split-at

```
(split-at n coll)
```

Returns a vector of [(take n coll) (drop n coll)]

```
(split-at 2 [1 2 3 4 5])  
=> [(1 2) (3 4 5)]
```

```
(split-at 3 [1 2])  
=> [(1 2) ()]
```

[top](#)

## split-with

```
(split-with pred coll)
```

Splits the collection at the first false/nil predicate result in a vector with two lists

```
(split-with odd? [1 3 5 6 7 9])  
=> [(1 3 5) (6 7 9)]
```

```
(split-with odd? [1 3 5])  
=> [(1 3 5) ()]
```

```
(split-with odd? [2 4 6])  
=> [() (2 4 6)]
```

[top](#)

## sqrt

```
(sqrt x)
```

Square root of x

```
(sqrt 10)  
=> 3.1622776601683795
```

```
(sqrt 10I)  
=> 3.1622776601683795
```

```
(sqrt 10.23)

```

```
(square 10.23M)  
=> 104.6529M
```

### SEE ALSO

[sqrt](#)

Square root of x

## stack

(stack)

Creates a new mutable threadsafe stack.

```
(let [s (stack)]  
  (push! s 1)  
  (push! s 2)  
  (push! s 3))  
=> (3 2 1)
```

### SEE ALSO

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[pop!](#)

Pops an item from a stack.

[push!](#)

Pushes an item to a stack.

[empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[into!](#)

Adds all of the items of 'from' conjoined to the mutable 'to' collection

[conj!](#)

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item). For mutable list the values are added at ...

[stack?](#)

Returns true if coll is a stack

top

## stack?

```
(stack? coll)
```

Returns true if coll is a stack

```
(stack? (stack))  
=> true
```

top

## stacktrace

```
(stacktrace ex)
```

Returns the stacktrace of a java exception

```
(println (stacktrace (. :VncException :new (str "test"))))
```

top

## str

```
(str & xs)
```

With no args, returns the empty string. With one arg x, returns x.toString(). (str nil) returns the empty string. With more than one arg, returns the concatenation of the str values of the args.

```
(str)  
=> ""
```

```
(str 1 2 3)  
=> "123"
```

```
(str +)  
=> "+"
```

```
(str [1 2 3])  
=> "[1 2 3]"
```

```
(str "total " 100)
=> "total 100"
```

```
(str #\h #\i)
=> "hi"
```

## SEE ALSO

[pr-str](#)

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of ...

[top](#)

## str/blank?

```
(str/blank? s)
```

True if s is nil, empty, or contains only whitespace.

```
(str/blank? nil)
=> true
```

```
(str/blank? "")
=> true
```

```
(str/blank? " ")
=> true
```

```
(str/blank? "abc")
=> false
```

## SEE ALSO

[str/not-blank?](#)

True if s contains at least one non whitespace char.

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[not-empty?](#)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

[nil?](#)

Returns true if x is nil, false otherwise

[top](#)

## str/butlast

```
(str/butlast s)
```

Returns a possibly empty string of the characters without the last.

```
(str/butlast "abcdef")
=> "abcde"
```

## str/butnlast

```
(str/butnlast s n)
```

Returns a possibly empty string of the characters without the `n` last characters.

```
(str/butnlast "abcdef" 3)  
=> "abc"
```

## str/bytebuf-to-hex

```
(str/bytebuf-to-hex data)  
(str/bytebuf-to-hex data :upper)
```

Converts byte data to a hex string using the hexadecimal digits: `0123456789abcdef`.  
If the `:upper` options is passed the hex digits `0123456789ABCDEF` are used.

```
(str/bytebuf-to-hex (bytebuf [0 1 2 3 4 5 6]))  
=> "00010203040506"
```

```
(str/bytebuf-to-hex (bytebuf [202 254]) :upper)  
=> "CAFE"
```

## str/char?

```
(str/char? s)
```

Returns true if `s` is a char or a single char string.

```
(str/char? "x")  
=> true
```

```
(str/char? #\x)  
=> true
```

## str/chars

```
(str/chars s)
```

Converts a string to a char list.

```
(str/chars "abcdef")  
=> (#\a #\b #\c #\d #\e #\f)
```

```
(str/join (str/chars "abcdef"))  
=> "abcdef"
```

[top](#)

## str/contains?

```
(str/contains? s substr)
```

True if s contains with substr.

```
(str/contains? "abc" "ab")  
=> true
```

```
(str/contains? "abc" #\b)  
=> true
```

[top](#)

## str/cr-lf

```
(str/cr-lf s mode)
```

Convert a text to use LF or CR-LF.

```
(str/cr-lf "line1  
line2  
line3" :cr-lf)
```

```
(str/cr-lf "line1  
line2  
line3" :lf)
```

[top](#)

## str/decode-base64

```
(str/decode-base64 s)
```

Base64 decode.

```
(str/decode-base64 (str/encode-base64 (bytebuf [0 1 2 3 4 5 6])))  
=> [0 1 2 3 4 5 6]
```

[top](#)

## str/decode-url

```
(str/decode-url s)
```

URL decode.

```
(str/decode-url "The+string+%C3%BC%40foo-bar")  
=> "The string ü@foo-bar"
```

[top](#)

## str/digit?

```
(str/digit? s)
```

True if s is a char and the char is a digit.

Defined by Java Character.isDigit(ch).

```
(str/digit? #\8)  
=> true
```

```
(str/digit? "8")  
=> false
```

### SEE ALSO

[str/letter?](#)

True if s is a char and the char is a letter.

[str/hexdigit?](#)

True if s is a char and the char is a hex digit.

[top](#)

## str/double-quote

```
(str/double-quote str)
```

Double quotes a string.

```
(str/double-quote "abc")  
=> "\"abc\""
```

```
(str/double-quote "")  
=> "\"\""
```

[top](#)

## str/double-quoted?

```
(str/double-quoted? str)
```

Returns true if the string is double quoted.

```
(str/double-quoted? "\"abc\"")  
=> true
```

[top](#)

## str/double-unquote

```
(str/double-unquote str)
```

Unquotes a double quoted string.

```
(str/double-unquote "\"abc\"")  
=> "abc"
```

```
(str/double-unquote "\"\"")  
=> ""
```

```
(str/double-unquote nil)  
=> nil
```

[top](#)

## str/encode-base64

```
(str/encode-base64 data)
```

Base64 encode.

```
(str/encode-base64 (bytebuf [0 1 2 3 4 5 6]))  
=> "AAECAwQFBg=="
```

[top](#)

## str/encode-url

```
(str/encode-url s)
```

URL encode.

```
(str/encode-url "The string ü@foo-bar")  
=> "The+string+%C3%BC%40foo-bar"
```

[top](#)

## str/ends-with?

```
(str/ends-with? s substr)
```

True if s ends with substr.

```
(str/ends-with? "abc" "bc")  
=> true
```

[top](#)

## str/equals-ignore-case?

```
(str/equals-ignore-case? s1 s2)
```

Compares two strings ignoring case. True if both are equal.

```
(str/equals-ignore-case? "abc" "abC")  
=> true
```

[top](#)

## str/escape-html

```
(str/escape-html s)
```

HTML escape. Escapes `&`, `<`, `>`, `"`, `'`, and the non blocking space `U+00A0`

```
(str/escape-html "1 2 3 & < > \" ' \u00A0")  
=> "1 2 3 &amp; &lt; &gt; &quot; &apos; "
```

[top](#)

## str/escape-xml

```
(str/escape-xml s)
```

XML escape. Escapes `&`, `<`, `>`, `"`, `'`

```
(str/escape-xml "1 2 3 & < > \" ' ")  
=> "1 2 3 &amp; &lt; &gt; &quot; &apos; "
```

[top](#)

## str/expand

```
(str/expand s len fill mode*)
```

Expands a string to the max lenght len. Fills up with the fillstring if the string needs to be expanded. The fill string is added to the start or end of the string depending on the mode :start, :end. The mode defaults to :end

```

(str/expand "abcdefghij" 8 ".")
=> "abcdefghij"

(str/expand "abcdefghij" 20 ".")
=> "abcdefghij....."

(str/expand "abcdefghij" 20 "." :start)
=> ".....abcdefghij"

(str/expand "abcdefghij" 20 "." :end)
=> "abcdefghij....."

(str/expand "abcdefghij" 30 "1234" :start)
=> "12341234123412341234abcdefghij"

(str/expand "abcdefghij" 30 "1234" :end)
=> "abcdefghij12341234123412341234"

```

top

## str/format

```

(str/format format args*)
(str/format locale format args*)

```

Returns a formatted string using the specified format string and arguments.  
 Venice uses the Java format syntax.

JavaDoc: [Format Syntax](#)

```

(str/format "value: %.4f" 1.45)
=> "value: 1.4500"

(str/format (. :java.util.Locale :new "de" "DE") "value: %.4f" 1.45)
=> "value: 1,4500"

(str/format (. :java.util.Locale :GERMANY) "value: %.4f" 1.45)
=> "value: 1,4500"

(str/format (. :java.util.Locale :new "de" "CH") "value: %,d" 2345000)
=> "value: 2'345'000"

(str/format [ "de" ] "value: %,2f" 100000.45)
=> "value: 100.000,45"

(str/format [ "de" "DE" ] "value: %,2f" 100000.45)
=> "value: 100.000,45"

(str/format [ "de" "CH" ] "value: %,2f" 100000.45)
=> "value: 100'000.45"

(str/format [ "en" "US" ] "value: %,2f" 100000.45)
=> "value: 100,000.45"

(str/format [ "de" "DE" ] "value: %,d" 2345000)
=> "value: 2.345.000"

```

## str/format-bytebuf

(str/format-bytebuf data delimiter & options)

Formats a bytebuffer.

Options

:prefix0x     prefix with 0x

```
(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) nil)
=> "002243E2FF"
```

```
(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) "")
=> "002243E2FF"
```

```
(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) ", ")
=> "00, 22, 43, E2, FF"
```

```
(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) ", " :prefix0x)
=> "0x00, 0x22, 0x43, 0xE2, 0xFF"
```

## str/hex-to-bytebuf

(str/hex-to-bytebuf hex)

Converts a hex string to a bytebuf

```
(str/hex-to-bytebuf "005E4AFF")
=> [0 94 74 255]
```

```
(str/hex-to-bytebuf "005e4aff")
=> [0 94 74 255]
```

## str/hexdigit?

(str/hexdigit? s)

True if s is a char and the char is a hex digit.

```
(str/hexdigit? #\8)
=> true
```

```
(str/hexdigit? #\a)
=> true
```

```
(str/hexdigit? #\A)
=> true
```

```
(str/hexdigit? #\Y)
=> false
```

[top](#)

## str/index-of

```
(str/index-of s value)
(str/index-of s value from-index)
```

Return index of value (string or char) in s, optionally searching forward from from-index. Return nil if value not found.

```
(str/index-of "abcdefabc" "ab")
=> 0
```

### SEE ALSO

[str/last-index-of](#)

Return last index of value (string or char) in s, optionally searching backward from from-index. Return nil if value not found.

[top](#)

## str/join

```
(str/join coll)
(str/join separator coll)
```

Joins all elements in coll separated by an optional separator.

```
(str/join [1 2 3])
=> "123"
```

```
(str/join "-" [1 2 3])
=> "1-2-3"
```

```
(str/join "-" [(char "a") 1 "xyz" 2.56M])
=> "a-1-xyz-2.56M"
```

[top](#)

## str/last-index-of

```
(str/last-index-of s value)
(str/last-index-of s value from-index)
```

Return last index of value (string or char) in s, optionally searching backward from from-index. Return nil if value not found.

```
(str/last-index-of "abcdefabc" "ab")
=> 6
```

## SEE ALSO

[str/index-of](#)

Return index of value (string or char) in *s*, optionally searching forward from *from-index*. Return nil if value not found.

[top](#)

## str/letter?

```
(str/letter? s)
```

True if *s* is a char and the char is a letter.

Defined by Java Character.isLetter(ch).

```
(str/letter? #\x)
=> true
```

[top](#)

## str/levenshtein

```
(str/levenshtein s1 s2)
```

Returns the *Levenshtein* distance of two strings.

The *Damerau-Levenshtein* algorithm is an extension to the *Levenshtein* algorithm which solves the edit distance problem between a source string and a target string with the following operations:

- Character Insertion
- Character Deletion
- Character Replacement
- Adjacent Character Swap

Note that the adjacent character swap operation is an edit that may be applied when two adjacent characters in the source string match two adjacent characters in the target string, but in reverse order, rather than a general allowance for adjacent character swaps.

This implementation allows the client to specify the costs of the various edit operations with the restriction that the cost of two swap operations must not be less than the cost of a delete operation followed by an insert operation. This restriction is required to preclude two swaps involving the same character being required for optimality which, in turn, enables a fast dynamic programming solution.

The cost of the *Damerau-Levenshtein* algorithm is  $O(n*m)$  where *n* is the length of the source string and *m* is the length of the target string. This implementation consumes  $O(n*m)$  space.

```
(str/levenshtein "Tier" "Tor")
=> 2
```

```
(str/levenshtein "Tier" "tor")
=> 3
```

[top](#)

## str/linefeed?

```
(str/linefeed? s)
```

True if s is a char and the char is a linefeed.

```
(str/linefeed? #\newline)
=> true
```

```
(str/linefeed? (first "
"))
=> true
```

[top](#)

## str/lorem-ipsum

```
(str/lorem-ipsum & options)
```

Creates an arbitrary length Lorem Ipsum text.

Options:

:chars n            returns n characters (limited to 1000000)

:paragraphs n      returns n paragraphs (limited to 100)

```
(str/lorem-ipsum :chars 250)
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis turpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat aliquet, lectus diam fringilla velit, finibus eleifend ipsum
urna at lacus. Phasellus sit am"
```

```
(str/lorem-ipsum :paragraphs 1)
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis turpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat aliquet, lectus diam fringilla velit, finibus eleifend ipsum
urna at lacus. Phasellus sit amet nisl fringilla, cursus est in, mollis lacus. Proin dignissim rhoncus dolor.
Cras tellus odio, elementum sed erat sit amet, euismod tincidunt nisl. In hac habitasse platea dictumst. Duis
aliquam sollicitudin tempor. Sed gravida tincidunt felis at fringilla. Morbi tempor enim at commodo vulputate.
Aenean et ultrices lorem, placerat pretium augue. In hac habitasse platea dictumst. Cras fringilla ligula quis
interdum hendrerit. Etiam at massa tempor, facilisis lacus placerat, congue erat."
```

[top](#)

## str/lower-case

```
(str/lower-case s)
(str/lower-case locale s)
```

Converts s to lowercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/lower-case "aBcDeF")
=> "abcdef"
```

```
(str/lower-case #\A)
=> #\a
```

```
(str/lower-case (. :java.util.Locale :new "de" "DE") "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :GERMANY) "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :new "de" "CH") "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" ] "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" "DE" ] "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" "DE" ] "aBcDeF")
=> "abcdef"
```

#### SEE ALSO

[str/upper-case](#)

Converts s to uppercase.

[top](#)

## str/lower-case?

```
(str/lower-case? s)
```

True if s is a char and the char is a lower case char.

Defined by Java Character.isLowerCase(ch).

```
(str/lower-case? #\x)
=> true
```

```
(str/lower-case? #\X)
=> false
```

```
(str/lower-case? #\8)
=> false
```

[top](#)

## str/nfirst

```
(str/nfirst s n)
```

Returns a string of the n first characters of s.

```
(str/nfirst "abcdef" 2)
=> "ab"
```

```
(str/nfirst "abcdef" 10)
=> "abcdef"
```

```
(str/nfirst "abcdef" 0)
=> ""
```

[top](#)

## str/nlast

```
(str/nlast s n)
```

Returns a string of the n last characters of s.

```
(str/nlast "abcdef" 2)
=> "ef"
```

```
(str/nlast "abcdef" 10)
=> "abcdef"
```

```
(str/nlast "abcdef" 0)
=> ""
```

[top](#)

## str/not-blank?

```
(str/not-blank? s)
```

True if s contains at least one non whitespace char.

```
(str/not-blank? "abc")
=> true
```

```
(str/not-blank? " a ")
=> true
```

```
(str/not-blank? nil)
=> false
```

```
(str/not-blank? "")
=> false
```

```
(str/not-blank? " ")
=> false
```

### SEE ALSO

[str/blank?](#)

True if s is nil, empty, or contains only whitespace.

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

### not-empty?

Returns true if x is not empty. Accepts strings, collections and bytebufs.

### nil?

Returns true if x is nil, false otherwise

[top](#)

## str/nrest

```
(str/nrest s n)
```

Returns a possibly empty string of the characters after the n first characters.

```
(str/nrest "abcdef" 3)  
=> "def"
```

[top](#)

## str/pos

```
(str/pos s pos)
```

Returns the 0 based row/column position within a string based on absolute character position. Returns a map with the keys 'row' and 'col'.

Note: CR & LF count together as one each regarding the absolute position.

```
(str/pos "abcdefghij" 4)  
=> {:col 4 :row 0}
```

```
(str/pos "ab  
cdefghij" 6)  
=> {:col 3 :row 1}
```

[top](#)

## str/quote

```
(str/quote str q)  
(str/quote str start end)
```

Quotes a string.

```
(str/quote "abc" "-")  
=> "-abc-"
```

```
(str/quote "abc" "<" ">")  
=> "<abc>"
```

[top](#)

## str/quoted?

```
(str/quoted? str q)
(str/quoted? str start end)
```

Returns true if the string is quoted.

```
(str/quoted? "-abc-" "-")
=> true

(str/quoted? "<abc>" "<" ">")
=> true
```

[top](#)

## str/repeat

```
(str/repeat s n)
(str/repeat s n sep)
```

Repeats s n times with an optional separator.

```
(str/repeat "abc" 0)
=> ""

(str/repeat "abc" 3)
=> "abcabcabc"

(str/repeat "abc" 3 "-")
=> "abc-abc-abc"
```

[top](#)

## str/replace-all

```
(str/replace-all s search replacement)
```

Replaces the all occurrences of search in s. The search arg may be a string or a regex pattern

```
(str/replace-all "abcdefabc" "ab" "__")
=> "__cdef__c"

(str/replace-all "a0b01c012d" (regex/pattern "[0-9]+") "_")
=> "a_b_c_d"

(str/replace-all "a0b01c012d" #"[0-9]+" "_")
=> "a_b_c_d"
```

### SEE ALSO

#### [str/replace-first](#)

Replaces the first occurrence of search in s. The search arg may be a string or a regex pattern. If the search arg is of type string ...

## [str/replace-last](#)

Replaces the last occurrence of search in s.

[top](#)

## str/replace-first

```
(str/replace-first s search replacement & options)
```

Replaces the first occurrence of search in s. The search arg may be astring or a regex pattern. If the search arg is of type string the options : ignore-case and :nfirst are supported.

Options:

:ignore-case b if true ignores case, defaults to false

:nfirst n e.g :nfirst 2, defaults to 1

```
(str/replace-first "ab-cd-ef-ab-cd" "ab" "XYZ")
=> "XYZ-cd-ef-ab-cd"
```

```
(str/replace-first "AB-CD-EF-AB-CD" "ab" "XYZ" :ignore-case true)
=> "XYZ-CD-EF-AB-CD"
```

```
(str/replace-first "ab-ab-cd-ab-ef-ab-cd" "ab" "XYZ" :nfirst 3)
=> "XYZ-XYZ-cd-XYZ-ef-ab-cd"
```

```
(str/replace-first "a0b01c012d" (regex/pattern "[0-9]+") "_")
=> "a_b01c012d"
```

```
(str/replace-first "a0b01c012d" #"[0-9]+" "_")
=> "a_b01c012d"
```

### SEE ALSO

Replaces the first occurrence of search in s. The search arg may be a string or a regex pattern. If the search arg is of type string ...

### [str/replace-all](#)

Replaces the all occurrences of search in s. The search arg may be a string or a regex pattern

[top](#)

## str/rest

```
(str/rest s)
```

Returns a possibly empty string of the characters after the first.

```
(str/rest "abcdef")
=> "bcdef"
```

[top](#)

## str/reverse

```
(str/reverse s)
```

Reverses a string

```
(str/reverse "abcdef")
=> "fedcba"
```

[top](#)

## str/split

```
(str/split s regex)
(str/split s regex limit)
```

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

```
(str/split "abc,def,ghi" ",")
=> ("abc" "def" "ghi")
```

```
(str/split "James Peter Robert" " " 2)
=> ("James" "Peter Robert")
```

```
(str/split "abc , def , ghi" "[ *],[ *]")
=> ("abc" "def" "ghi")
```

```
(str/split "abc,def,ghi" "((?<=,)|(?=,))")
=> ("abc" ", " "def" ", " "ghi")

(str/split "q1w2e3r4t5y6u7i8o9p0" #"\\d+")
=> ("q" "w" "e" "r" "t" "y" "u" "i" "o" "p")

(str/split "q1w2e3r4t5y6u7i8o9p0" #"\\d+" 5)
=> ("q" "w" "e" "r" "t5y6u7i8o9p0")

(str/split " q1w2 " #"")
=> (" " "q" "1" "w" "2" " ")

(str/split nil ",")
=> ()
```

#### SEE ALSO

(str/split-at "abc" 2)
=> ("ab" "c")

(str/split-at "abc" 3)
=> ("abc" " ")
```

#### SEE ALSO

[str/split-lines](#)

Splits s into lines.

[top](#)

## str/split-columns

```
(str/split-columns s cols)
```

Splits a string into columns. The columns are given by their start positions.

```
(str/split-columns "1abc 2d 3gh" [0 6 12])  
=> ("1abc" "2d" "3gh")
```

#### SEE ALSO

[str/split](#)

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

[top](#)

## str/split-lines

```
(str/split-lines s)
```

Splits s into lines.

```
(str/split-lines "line1  
line2  
line3")  
=> ("line1" "line2" "line3")
```

#### SEE ALSO

[str/split](#)

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

[io/slurp-lines](#)

Read all lines from f.

[top](#)

## str/starts-with?

```
(str/starts-with? s substr)
```

True if s starts with substr.

```
(str/starts-with? "abc" "ab")  
=> true
```

[top](#)

## str/strip-end

```
(str/strip-end s substr)
```

Removes a substr only if it is at the end of a s, otherwise returns s.

```
(str/strip-end "abcdef" "def")  
=> "abc"
```

```
(str/strip-end "abcdef" "abc")  
=> "abcdef"
```

[top](#)

## str/strip-indent

```
(str/strip-indent s)
```

Strip the indent of a multi-line string. The first line's leading whitespaces define the indent.

```
(str/strip-indent "  line1  
    line2  
    line3")  
=> "line1\n  line2\n  line3"
```

[top](#)

## str/strip-margin

```
(str/strip-margin s)
```

Strips leading whitespaces upto and including the margin '|' from each line in a multi-line string.

```
(str/strip-margin "line1  
|  line2  
|  line3")  
=> "line1\n  line2\n  line3"
```

[top](#)

## str/strip-start

```
(str/strip-start s substr)
```

Removes a substr only if it is at the beginning of a s, otherwise returns s.

```
(str/strip-start "abcdef" "abc")  
=> "def"
```

```
(str/strip-start "abcdef" "def")  
=> "abcdef"
```

[top](#)

## str/subs

```
(str/subs s start)
(str/subs s start end)
```

Returns the substring of s beginning at start inclusive, and ending at end (defaults to length of string), exclusive.

```
(str/subs "abcdef" 2)
=> "cdef"

(str/subs "abcdef" 2 5)
=> "cde"
```

[top](#)

## str/trim

```
(str/trim s)
```

Trims leading and trailing whitespaces from s.

```
(str/trim " abc ")
=> "abc"
```

### SEE ALSO

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

## str/trim-left

```
(str/trim-left s)
```

Trims leading whitespaces from s.

```
(str/trim-left " abc ")
=> "abc "
```

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

## str/truncate

```
(str/truncate s maxlen marker mode*)
```

Truncates a string to the max lenght maxlen and adds the marker if the string needs to be truncated. The marker is added to the start, middle, or end of the string depending on the mode :start, :middle, :end. The mode defaults to :end

```
(str/truncate "abcdefghij" 20 "...")  
=> "abcdefghij"
```

```
(str/truncate "abcdefghij" 9 "...")  
=> "abcdef..."
```

```
(str/truncate "abcdefghij" 4 "...")  
=> "a..."
```

```
(str/truncate "abcdefghij" 7 "...":start)  
=> "...ghij"
```

```
(str/truncate "abcdefghij" 7 "...":middle)  
=> "ab...ij"
```

```
(str/truncate "abcdefghij" 7 "...":end)  
=> "abcd..."
```

[top](#)

## str/upper-case

```
(str/upper-case s)  
(str/upper-case locale s)
```

Converts s to uppercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/upper-case "aBcDeF")  
=> "ABCDEF"
```

```
(str/upper-case #\a)  
=> #\A
```

```
(str/upper-case (. :java.util.Locale :new "de" "DE") "aBcDeF")  
=> "ABCDEF"
```

```
(str/upper-case (. :java.util.Locale :GERMANY) "aBcDeF")  
=> "ABCDEF"
```

```
(str/upper-case (. :java.util.Locale :new "de" "CH") "aBcDeF")  
=> "ABCDEF"
```

```
(str/upper-case [ "de"] "aBcDeF")  
=> "ABCDEF"
```

```
(str/upper-case [ "de" "DE"] "aBcDeF")  
=> "ABCDEF"
```

```
(str/upper-case [ "de" "DE"] "aBcDeF")
=> "ABCDEF"
```

## SEE ALSO

[str/lower-case](#)

Converts s to lowercase.

[top](#)

## str/upper-case?

```
(str/upper-case? s)
```

True if s is a char and the char is an upper case char.

Defined by Java Character.isUpperCase(ch).

```
(str/upper-case? #\x)
=> false
```

```
(str/upper-case? #\X)
=> true
```

```
(str/upper-case? #\8)
=> false
```

[top](#)

## str/valid-email-addr?

```
(str/valid-email-addr? e)
```

Returns true if e is a valid email address according to RFC5322, else returns false

```
(str/valid-email-addr? "user@domain.com")
=> true
```

```
(str/valid-email-addr? "user@domain.co.in")
=> true
```

```
(str/valid-email-addr? "user.name@domain.com")
=> true
```

```
(str/valid-email-addr? "user_name@domain.com")
=> true
```

```
(str/valid-email-addr? "username@yahoo.corporate.in")
=> true
```

[top](#)

## str/whitespace?

```
(str/whitespace? s)
```

True if s is char and the char is a whitespace.

Defined by Java Character.isWhitespace(ch).

```
(str/whitespace? #\space)
=> true
```

[top](#)

## str/wrap

```
(str/wrap text & options)
```

Wraps ascii text to lines with a length of maxlen characters .

Options:

:maxlen n      the max len of line (default 80)

:line-wrap     controls the line wrap

```
{:
 anywhere,
:break-
 word}
```

```
(-> (str/lorem-ipsum :paragraphs 1)
    (str/wrap :maxlen 80 :line-wrap :break-word))
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis\nturpis. Duis dictum id sem et

```

[top](#)

## string-array

```
(string-array coll)
(string-array len)
(string-array len init-val)
```

Returns an array of Java strings containing the contents of coll or returns an array with the given length and optional init value

```
(string-array '("1" "2" "3"))
=> [1, 2, 3]
```

```
(string-array 10)
=> [nil, nil, nil, nil, nil, nil, nil, nil, nil, nil]
```

```
(string-array 10 "42")
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

## string?

```
(string? x)
```

Returns true if x is a string

```
(string? "abc")  
=> true
```

```
(string? 1)  
=> false
```

```
(string? nil)  
=> false
```

## sublist

```
(sublist l start) (sublist l start end)
```

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

`sublist` accepts a lazy-seq if both start and end is given.

```
(sublist '(1 2 3 4 5 6) 2)  
=> (3 4 5 6)
```

```
(sublist '(1 2 3 4 5 6) 2 3)  
=> (3)
```

```
(doall (sublist (lazy-seq 1 inc) 3 7))  
=> (4 5 6 7)
```

### SEE ALSO

[subvec](#)

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

## subset?

```
(subset? set1 set2)
```

Return true if set1 is a subset of set2

```
(subset? #{2 3} #{1 2 3 4})  
=> true
```

```
(subset? #{2 5} #{1 2 3 4})  
=> false
```

## SEE ALSO

### [set](#)

Creates a new set containing the items.

### [superset?](#)

Return true if set1 is a superset of set2

### [union](#)

Return a set that is the union of the input sets

### [difference](#)

Return a set that is the first set without elements of the remaining sets

### [intersection](#)

Return a set that is the intersection of the input sets

[top](#)

## subvec

```
(subvec v start) (subvec v start end)
```

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

```
(subvec [1 2 3 4 5 6] 2)  
=> [3 4 5 6]
```

```
(subvec [1 2 3 4 5 6] 2 3)  
=> [3]
```

## SEE ALSO

### [sublist](#)

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

[top](#)

## supers

```
(supers class)
```

Returns the immediate and indirect superclasses and interfaces of class, if any.

```
(supers :java.util.ArrayList)  
=> (:java.util.AbstractList :java.util.AbstractCollection :java.util.List :java.util.Collection :java.lang.  
Iterable)
```

[top](#)

## superset?

```
(superset? set1 set2)
```

Return true if set1 is a superset of set2

```
(superset? #{1 2 3 4} #{2 3} )  
=> true
```

```
(superset? #{1 2 3 4} #{2 5})  
=> false
```

## SEE ALSO

### [set](#)

Creates a new set containing the items.

### [subset?](#)

Return true if set1 is a subset of set2

### [union](#)

Return a set that is the union of the input sets

### [difference](#)

Return a set that is the first set without elements of the remaining sets

### [intersection](#)

Return a set that is the intersection of the input sets

[top](#)

## supertype

```
(supertype x)
```

Returns the super type of x.

```
(supertype 5)  
=> :core/number
```

```
(supertype [1 2])  
=> :core/sequence
```

```
(supertype (. :java.math.BigInteger :valueOf 100))  
=> :java.lang.Number
```

## SEE ALSO

### [type](#)

Returns the type of x.

### [supertypes](#)

Returns the super types of x.

### [instance-of?](#)

Returns true if x is an instance of the given type

[top](#)

## supertypes

```
(supertypes x)
```

Returns the super types of x.

```
(supertypes 5)
```

```
=> (:core/number :core/val)
```

```
(supertypes [1 2])
```

```
=> (:core/sequence :core/collection :core/val)
```

```
(supertypes (. :java.math.BigInteger :valueOf 100))
```

```
=> (:java.lang.Number :java.lang.Object)
```

## SEE ALSO

[type](#)

Returns the type of x.

[supertype](#)

Returns the super type of x.

[instance-of?](#)

Returns true if x is an instance of the given type

[top](#)

## swap!

```
(swap! box f & args)
```

Atomically swaps the value of an atom or a volatile to be: `(apply f current-value-of-box args)` . Note that f may be called multiple times, and thus should be free of side effects. Returns the value that was swapped in.

```
(do
  (def counter (atom 0))
  (swap! counter inc))
```

```
=> 1
```

```
(do
  (def counter (atom 0))
  (swap! counter inc)
  (swap! counter + 1)
  (swap! counter #(inc %))
  (swap! counter (fn [x] (inc x)))
  @counter)
```

```
=> 4
```

```
(do
  (def fruits (atom ()))
  (swap! fruits conj :apple)
  (swap! fruits conj :mango)
  @fruits)
```

```
=> (:apple :mango)
```

```
(do
  (def counter (volatile 0))
```

```
(swap! counter (partial + 6))
@counter
=> 6
```

## SEE ALSO

### [swap-vals!](#)

Atomically swaps the value of an atom to be: (apply f current-value-of-atom args). Note that f may be called multiple times, and thus ...

### [reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

### [compare-and-set!](#)

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

### [atom](#)

Creates an atom with the initial value x.

### [volatile](#)

Creates a volatile with the initial value x

[top](#)

## swap-vals!

```
(swap-vals! atom f & args)
```

Atomically swaps the value of an atom to be: (apply f current-value-of-atom args) . Note that f may be called multiple times, and thus should be free of side effects. Returns [old new], the value of the atom before and after the swap.

```
(do
  (def queue (atom '(1 2 3)))
  (swap-vals! queue pop))
=> [(1 2 3) (2 3)]
```

## SEE ALSO

### [swap!](#)

### [reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

### [compare-and-set!](#)

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

### [atom](#)

Creates an atom with the initial value x.

### [volatile](#)

Creates a volatile with the initial value x

[top](#)

## symbol

```
(symbol name)
(symbol ns name)
```

Returns a symbol from the given name

```
(symbol "a")
=> a

(symbol "foo" "a")
=> foo/a

(symbol *ns* "a")
=> user/a

(symbol 'a)
=> a
```

[top](#)

## symbol?

```
(symbol? x)
```

Returns true if x is a symbol

```
(symbol? 'a)
=> true

(symbol? (symbol "a"))
=> true

(symbol? nil)
=> false

(symbol? :a)
=> false
```

[top](#)

## system-env

```
(system-env)
(system-env name)
(system-env name default-val)
```

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

Without arguments returns all system env variables authorized by the configured sandbox.

```
(system-env :SHELL)
=> "/bin/bash"

(system-env :FOO "test")
=> "test"

(system-env "SHELL")
=> "/bin/bash"
```

## SEE ALSO

### [system-prop](#)

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

[top](#)

## system-exit-code

```
(system-exit-code code)
```

Defines the exit code that is used if the Java VM exits. Defaults to 0.

Note:

The exit code is only used when the Venice launcher has been used to run a script file, a command line script, a Venice app archive, or the REPL.

```
(system-exit-code 0)
```

[top](#)

## system-prop

```
(system-prop)
(system-prop name)
(system-prop name default-val)
```

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

Without arguments returns all system properties authorized by the configured sandbox.

```
(system-prop :os.name)
=> "Mac OS X"

(system-prop :foo.org "abc")
=> "abc"

(system-prop "os.name")
=> "Mac OS X"
```

## SEE ALSO

### [system-env](#)

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

[top](#)

## tail-pos

```
(tail-pos)
(tail-pos name)
```

Throws a `NotInTailPositionException` if the `expr` is not in tail position otherwise returns nil.

Definition:

The tail position is a position which an expression would return a value from. There are no more forms evaluated after the form in the tail position is evaluated.

```
;; in tail position
(do 1 (tail-pos))
=> nil
```

```
;; not in tail position
(do (tail-pos) 1)
=> NotInTailPositionException: Not in tail position
```

[top](#)

## take

```
(take n coll)
```

Returns a collection of the first n items in coll, or all items if there are fewer than n.

Returns a stateful transducer when no collection is provided. Returns a lazy sequence if coll is a lazy sequence.

```
(take 3 [1 2 3 4 5])
=> [1 2 3]
```

```
(take 10 [1 2 3 4 5])
=> [1 2 3 4 5]
```

```
(doall (take 4 (repeat 3)))
=> (3 3 3 3)
```

```
(doall (take 10 (cycle (range 0 3))))
=> (0 1 2 0 1 2 0 1 2 0)
```

[top](#)

## take!

```
(take! queue)
```

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

```
(let [q (queue)]
  (put! q 1)
  (take! q)
  q)
=> ()
```

### SEE ALSO

[queue](#)

Creates a new mutable threadsafe bounded or unbounded queue.

[put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

### offer!

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

### poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

### peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

top

## take-last

```
(take-last n coll)
```

Return a sequence of the last n items in coll.

Returns a stateful transducer when no collection is provided.

```
(take-last 3 [1 2 3 4 5])  
=> [3 4 5]
```

```
(take-last 10 [1 2 3 4 5])  
=> [1 2 3 4 5]
```

top

## take-while

```
(take-while predicate coll)
```

Returns a list of successive items from coll while (predicate item) returns logical true.

Returns a transducer when no collection is provided.

```
(take-while neg? [-2 -1 0 1 2 3])  
=> [-2 -1]
```

top

## test/deftest

```
(deftest name & body)
```

Defines a test function with no arguments.

All assertion macros are available for test assertions within the test function body:

- `assert`
- `assert-false`
- `assert-eq`

- `assert-ne`
- `assert-throws`
- `assert-does-not-throw`
- `assert-throws-with-msg`

It's recommended to use dedicated test namespaces for the tests and to group tests by namespaces.

Note: Actually, the test body goes in the `:test` metadata on the var, and the real function (the value of the var) calls `test-var` on itself.

```
(do
  (load-module :test)

  (ns foo-test)

  (test/deftest add-test []
    (assert-eq 0 (+ 0 0))
    (assert-eq 3 (+ 1 2)))

  (test/deftest mul-test []
    (assert-eq 6 (* 2 3)))

  (ns bar)
  (test/run-tests 'foo-test))
```

Testing namespace 'foo-test

PASS foo-test/add-test

PASS foo-test/mul-test

Ran 2 tests with 3 assertions

0 failures, 0 errors.

=> {:assert 3 :error 0 :pass 2 :test 2 :type :summary :fail 0}

;; Explicit setup/teardown

```
(do
  (ns foo-test)
  (load-module :test)

  (test/deftest sum-test []
    (let [f (io/temp-file "test-", ".txt")]
      (try
        (io/spit f "1234" :append true)
        (assert-eq "1234" (io/slurp f :binary false))
        (finally
          (io/delete-file f))))))

  (test/run-tests *ns*))
```

Testing namespace 'foo-test

PASS foo-test/sum-test

Ran 1 tests with 1 assertions

0 failures, 0 errors.

=> {:assert 1 :error 0 :pass 1 :test 1 :type :summary :fail 0}

## SEE ALSO

[test/run-tests](#)

Runs all tests in the given namespaces; prints results. The tests are run grouped the namespace.

[test/run-test-var](#)

Runs a single test; prints results. Returns a map summarizing the test results.

#### [test/use-fixtures](#)

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different ...

#### [test/successful?](#)

Returns true if the given test summary indicates all tests were successful, false otherwise.

#### [assert](#)

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

#### [assert-false](#)

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

#### [assert-eq](#)

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

#### [assert-ne](#)

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

#### [assert-throws](#)

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

#### [assert-does-not-throw](#)

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

[top](#)

## test/run-test-var

```
(run-test-var v)
```

Runs a single test; prints results. Returns a map summarizing the test results.

```
(do
  (ns foo-test)

[top](#)

## test/use-fixtures

```
(use-fixtures ns fixture-type & fixture-fns)
```

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different namespaces have different fixtures.

A fixture of type `:each` is called before and after each test in the fixture's namespace.

A fixture of type `:once` is called before the first and after the last test in the fixture's namespace serving as an initial setup and final teardown.

To pass a value from a fixture to the tests dynamic vars can be used. See the 3rd example below.

```
;; Fixtures :each
;; Adds logic for a setup and teardown method that will be called
;; before and after each test
(do
  (load-module :test)

  (defn each-time-setup []
    (println "FIXTURE each time setup"))

  (defn each-time-teardown []
    (println "FIXTURE each time teardown"))

  (defn each-fixture [f]
    (each-time-setup)
    (try
      (f)
      (finally (each-time-teardown))))

  ;; register as an each-time callback
```

```

(test/use-fixtures *ns* :each each-fixture)

(test/deftest add-test []
  (assert-eq 3 (+ 1 2)))

(test/deftest sub-test []
  (assert-eq 3 (- 4 1)))

(test/run-tests *ns*)

Testing namespace 'user

FIXTURE each time setup
PASS user/add-test
FIXTURE each time teardown

[top](#)

## then-accept

```
(then-accept p f)
```

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

```
(-> (promise (fn [] "the quick brown fox"))
    (then-accept (fn [v] (println (pr-str v)))))
(deref))
"the quick brown fox"
=> nil

(let [result (promise)
      p      (promise)]
  (thread #(deliver p 5))
  (then-accept p (fn [v] (deliver result (+ v 2)))))
[@p @result]))
=> [5 7]
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

### [then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

### [then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

### [then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

### [when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

### [accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

## then-accept-both

```
(then-accept-both p p-other f)
```

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two results as arguments.

```
(-> (promise (fn [] (sleep 200) "The quick brown fox")))
    (then-accept-both (promise (fn [] (sleep 100) "jumps over the lazy dog")))
    (fn [u v] (println (pr-str (str u " " v)))))
(deref))
"The quick brown fox jumps over the lazy dog"
=> nil
```

### [then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

### [then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

### [when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

### [accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

## then-apply

```
(then-apply p f)
```

Applies a function `f` on the result of the previous stage of the promise `p`.

```
(-> (promise (fn [] "the quick brown fox"))
    (then-apply str/upper-case)
    (then-apply #(str % " jumps over the lazy dog")))
(deref))
=> "THE QUICK BROWN FOX jumps over the lazy dog"
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

### [then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

### [then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

#### [or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

#### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

## third

```
(third coll)
```

Returns the third element of `coll`.

```
(third nil)
=> nil
```

```
(third [])
=> nil
```

```
(third [1 2 3])
=> 3

(third '())
=> nil

(third '(1 2 3))
=> 3
```

[top](#)

## thread

```
(thread f)
(thread f name)
```

Executes the function `f` in another thread, returning immediately to the calling thread. Returns a `promise` which will receive the result of calling the function `f` when completed. Optionally a name can be assigned to the spawned thread.

*Note:* Each call to `thread` creates a new expensive system thread. Consider to use futures or promises that use an *ExecutorService* to deal efficiently with threads.

```
@(thread #(do (sleep 100) 1))
=> 1

@(thread #(do (sleep 100) (thread-name)))
=> "venice-thread-3"

@(thread #(do (sleep 100) (thread-name)) "job")
=> "job-1"

;; consumer / producer
(do
  (defn produce [q]
    (doseq [x (range 4)] (put! q x) (sleep 100))
    (put! q nil))
  (defn consume [q]
    (transduce (map println) (constantly nil) q))
  (let [q (queue 10)]
    (thread #(produce q))
    @(thread #(consume q))))

0
1
2
3
=> nil
```

### SEE ALSO

#### [future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

#### [promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

#### [agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

## thread-daemon?

```
(thread-daemon?)
```

Returns true if this Thread is a daemon thread else false.

```
(thread-daemon?)  
=> false
```

### SEE ALSO

[thread-name](#)

Returns this thread's name.

## thread-id

```
(thread-id)
```

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is unique and remains unchanged during its lifetime. When a thread is terminated, this thread ID may be reused.

```
(thread-id)  
=> 1
```

### SEE ALSO

[thread-name](#)

Returns this thread's name.

## thread-interrupted

```
(thread-interrupted)
```

Tests whether the current thread has been interrupted. The interrupted status of the thread is cleared by this method. In other words, if this method were to be called twice in succession, the second call would return false (unless the current thread were interrupted again, after the first call had cleared its interrupted status and before the second call had examined it).

Returns true if the current thread has been interrupted else false.

```
(thread-interrupted)  
=> false
```

### SEE ALSO

[thread-interrupted?](#)

Tests whether this thread has been interrupted. The interrupted status of the thread is unaffected by this method. Returns true if ...

## thread-interrupted?

```
(thread-interrupted?)
```

Tests whether this thread has been interrupted. The interrupted status of the thread is unaffected by this method. Returns true if the current thread has been interrupted else false.

```
(thread-interrupted?)  
=> false
```

### SEE ALSO

[thread-interrupted](#)

Tests whether the current thread has been interrupted. The interrupted status of the thread is cleared by this method. In other words, ...

## thread-local

```
(thread-local)
```

Creates a new thread-local accessor

```
(do  
  (assoc! (thread-local) :a 1)  
  (get (thread-local) :a))  
=> 1
```

```
(do  
  (assoc! (thread-local) :a 1)  
  (get (thread-local) :b 999))  
=> 999
```

```
(do  
  (thread-local :a 1 :b 2)  
  (get (thread-local) :a))  
=> 1
```

```
(do  
  (thread-local { :a 1 :b 2 })  
  (get (thread-local) :a))  
=> 1
```

```
(do  
  (thread-local-clear)  
  (assoc! (thread-local) :a 1 :b 2)  
  (dissoc! (thread-local) :a)  
  (get (thread-local) :a 999))  
=> 999
```

### SEE ALSO

[thread-local-clear](#)

Removes all thread local vars

### [thread-local-map](#)

Returns a snapshot of the thread local vars as a map.

### [assoc!](#)

Associates key/vals with a mutable map, returns the map

### [dissoc!](#)

Dissociates keys from a mutable map, returns the map

### [get](#)

Returns the value mapped to key, not-found or nil if key not present.

[top](#)

## thread-local-clear

```
(thread-local-clear)
```

Removes all thread local vars

```
(thread-local-clear)  
=> thread-local-clear
```

### SEE ALSO

#### [thread-local](#)

Creates a new thread-local accessor

#### [dissoc!](#)

Dissociates keys from a mutable map, returns the map

[top](#)

## thread-local-map

```
(thread-local-map)
```

Returns a snapshot of the thread local vars as a map.

Note:

The returned map is a copy of the current thread local vars. Thus modifying this map is not modifying the thread local vars! Use `assoc!` and `dissoc!` for that purpose!

```
(do  
  (thread-local-clear)  
  (thread-local :a 1 :b 2)  
  (thread-local-map))  
=> {:a 1 :b 2 :*assertions* (0)}
```

### SEE ALSO

#### [thread-local](#)

Creates a new thread-local accessor

#### [get](#)

Returns the value mapped to key, not-found or nil if key not present.

#### [assoc!](#)

Associates key/vals with a mutable map, returns the map

## disso!

Dissociates keys from a mutable map, returns the map

top

## thread-local?

```
(thread-local? x)
```

Returns true if x is a thread-local, otherwise false

```
(do
  (def x (thread-local))
  (thread-local? x))
=> true
```

### SEE ALSO

[thread-local](#)

Creates a new thread-local accessor

top

## thread-name

```
(thread-name)
```

Returns this thread's name.

```
(thread-name)
=> "main"
```

### SEE ALSO

[thread-id](#)

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is ...

top

## throw

```
(throw)
(throw val)
(throw ex)
```

Throws an exception.

```
(throw)
```

Throws a :ValueException with `nil` as its value.

```
(throw val)
```

With `val` as a Venice value throws a :ValueException with `val` as its value.

E.g: `(throw [1 2 3])`

```
(throw ex)
```

With a `ex` as an exception type throws the exception.

E.g: `(throw (ex :VncException "invalid data"))`

```
(try
  (+ 100 200)
  (catch :Exception e
    "caught ~(ex-message e)"))
=> 300
```

```
(try
  (+ 100 200)
  (throw)
  (catch :ValueException e
    "caught ~(pr-str (ex-value e))"))
=> "caught nil"
```

```
(try
  (+ 100 200)
  (throw 100)
  (catch :ValueException e
    "caught ~(ex-value e)"))
=> "caught 100"
```

;; The finally block is just for side effects, like  
;; closing resources. It never returns a value!

```
(try
  (+ 100 200)
  (throw [100 {:a 3}])
  (catch :ValueException e
    "caught ~(ex-value e)")
  (finally (println "#finally")
    :finally))
#finally
=> "caught [100 {:a 3}]"
```

```
(try
  (throw (ex :RuntimeException "#test")))
  (catch :RuntimeException e
    "caught ~(ex-message e)"))
=> "caught #test"
```

;; Venice wraps thrown checked exceptions with a RuntimeException!

```
(do
  (import :java.io.IOException)
  (try
    (throw (ex :IOException "#test"))
    (catch :RuntimeException e
      "caught ~(ex-message (ex-cause e))")))
=> "caught #test"
```

## SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of `:java.lang.Exception`

[try](#)

Exception handling: try - catch - finally

[try-with](#)

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

## time

```
(time expr)
```

Evaluates expr and prints the time it took. Returns the value of expr.

```
(time (+ 100 200))  
Elapsed time: 7.18µs  
=> 300
```

### SEE ALSO

[dorun](#)

Runs the expr count times in the most effective way. It's main purpose is supporting benchmark tests. Returns the expression result ...

## time/after?

```
(time/after? date1 date2)  
(time/after? date1 date2 & more)
```

Returns true if all dates are ordered from the latest to the earliest (same semantics as [>](#) )

```
(time/after? (time/local-date 2019 1 1)  
             (time/local-date 2018 1 1))  
=> true  
  
(time/after? (time/local-date-time "2019-01-01T10:00:00.000")  
             (time/local-date-time "2018-01-01T10:00:00.000"))  
=> true  
  
(time/after? (time/zoned-date-time "2019-01-01T10:00:00.000+01:00")  
             (time/zoned-date-time "2018-01-01T10:00:00.000+01:00"))  
=> true
```

### SEE ALSO

Returns the month of the date 1..12

[time/day-of-year](#)

Returns the day of the year (1..366)

[time/day-of-month](#)

Returns the day of the month (1..31)

[time/first-day-of-month](#)

Returns the first day of a month as a local-date.

[time/day-of-week](#)

Returns the day of the week (:MONDAY ... :SUNDAY)

[top](#)

## time/latest

([time/latest](#) coll)

Returns the latest date from a collection of dates. All dates must be of equal type. The coll may be empty or nil.

([time/latest](#) [([time/local-date](#) 2018 8 1) ([time/local-date](#) 2018 8 3)])

=> 2018-08-03

[top](#)

## time/leap-year?

```
(time/leap-year? date)
```

Checks if the year is a leap year.

```
(time/leap-year? 2000)  
=> true
```

```
(time/leap-year? (time/local-date 2000 1 1))  
=> true
```

```
(time/leap-year? (time/local-date-time))  
=> false
```

```
(time/leap-year? (time/zoned-date-time))  
=> false
```

## SEE ALSO

[time/length-of-year](#)

Returns the length of the year represented by this date.

[time/length-of-month](#)

Returns the length of the month represented by this date.

[top](#)

## time/length-of-month

```
(time/length-of-month date)
```

Returns the length of the month represented by this date.

This returns the length of the month in days. For example, a date in January would return 31.

```
(time/length-of-month (time/local-date 2000 2 1))  
=> 29
```

```
(time/length-of-month (time/local-date 2001 2 1))  
=> 28
```

```
(time/length-of-month (time/local-date-time))  
=> 31
```

```
(time/length-of-month (time/zoned-date-time))  
=> 31
```

## SEE ALSO

[time/length-of-year](#)

Returns the length of the year represented by this date.

[time/leap-year?](#)

Checks if the year is a leap year.

[top](#)

## time/length-of-year

```
(time/length-of-year date)
```

Returns the length of the year represented by this date.

This returns the length of the year in days, either 365 or 366.

```
(time/length-of-year (time/local-date 2000 1 1))  
=> 366
```

```
(time/length-of-year (time/local-date 2001 1 1))  
=> 365
```

```
(time/length-of-year (time/local-date-time))  
=> 365
```

```
(time/length-of-year (time/zoned-date-time))  
=> 365
```

### SEE ALSO

[time/length-of-month](#)

Returns the length of the month represented by this date.

[time/leap-year?](#)

Checks if the year is a leap year.

[top](#)

## time/local-date

```
(time/local-date)  
(time/local-date year month day)  
(time/local-date date)
```

Creates a new local-date. A local-date is represented by 'java.time.LocalDate'

```
(time/local-date)  
=> 2023-07-10
```

```
(time/local-date 2018 8 1)  
=> 2018-08-01
```

```
(time/local-date "2018-08-01")  
=> 2018-08-01
```

```
(time/local-date (time/local-date-time 2018 8 1 14 20 10))  
=> 2018-08-01
```

```
(time/local-date 1375315200000)  
=> 2013-08-01
```

```
(time/local-date (. :java.util.Date :new))  
=> 2023-07-10
```

## SEE ALSO

### [time/local-date-time](#)

Creates a new local-date-time. A local-date-time is represented by 'java.time.LocalDateTime'

### [time/zoned-date-time](#)

Creates a new zoned-date-time. A zoned-date-time is represented by 'java.time.ZonedDateTime'

[top](#)

## time/local-date-parse

```
(time/local-date-parse str format locale?)
```

Parses a local-date.

```
(time/local-date-parse "2018-12-01" "yyyy-MM-dd")  
=> 2018-12-01
```

```
(time/local-date-parse "2018-Dec-01" "yyyy-MMM-dd" :ENGLISH)  
=> 2018-12-01
```

[top](#)

```

```
(time/local-date-time (. :java.util.Date :new))  
=> 2023-07-10T16:34:15.549
```

## SEE ALSO

### [time/local-date](#)

Creates a new local-date. A local-date is represented by 'java.time.LocalDate'

### [time/zoned-date-time](#)

Creates a new zoned-date-time. A zoned-date-time is represented by 'java.time.ZonedDateTime'

[top](#)

## time/local-date-time-parse

```
(time/local-date-time-parse str format locale?)
```

Parses a local-date-time.

```
(time/local-date-time-parse "2018-08-01 14:20" "yyyy-MM-dd HH:mm")  
=> 2018-08-01T14:20
```

```
(time/local-date-time-parse "2018-08-01 14:20:01.000" "yyyy-MM-dd HH:mm:ss.SSS")  
=> 2018-08-01T14:20:01
```

[top](#)

## time/local-date-time?

```
(time/local-date-time? date)
```

Returns true if date is a local-date-time ('java.time.LocalDateTime') else false

```
(time/local-date-time? (time/local-date-time))  
=> true
```

[top](#)

## time/local-date?

```
(time/local-date? date)
```

Returns true if date is a locale date ('java.time.LocalDate') else false

```
(time/local-date? (time/local-date))  
=> true
```

[top](#)

## time/milli

```
(time/milli date)
```

Returns the millis of the date 0..999

```
(time/milli (time/local-date))  
=> 0
```

```
(time/milli (time/local-date-time))  
=> 564
```

```
(time/milli (time/zoned-date-time))  
=> 582
```

## SEE ALSO

[time/hour](#)

Returns the hour of the date 0..23

[time/minute](#)

Returns the minute of the date 0..59

[time/second](#)

Returns the second of the date 0..59

[top](#)

## time/minus

```
(time/minus date unit n)
```

Subtracts the n units from the date. Units: {years :months :weeks :days :hours :minutes :seconds :milliseconds}

```
(time/minus (time/local-date) :days 2)  
=> 2023-07-08
```

```
(time/minus (time/local-date-time) :days 2)  
=> 2023-07-08T16:34:17.591
```

```
(time/minus (time/zoned-date-time) :days 2)  
=> 2023-07-08T16:34:17.610+02:00[Europe/Zurich]
```

## SEE ALSO

[time/plus](#)

Adds the n units to the date. Units: {years :months :weeks :days :hours :minutes :seconds :milliseconds}

[top](#)

## time/minute

```
(time/minute date)
```

Returns the minute of the date 0..59

```
(time/minute (time/local-date))  
=> 0
```

Returns the year of the date

### [time/day-of-year](#)

Returns the day of the year (1..366)

### [time/day-of-month](#)

Returns the day of the month (1..31)

### [time/first-day-of-month](#)

Returns the first day of a month as a local-date.

### [time/last-day-of-month](#)

Returns the last day of a month as a local-date.

### [time/day-of-week](#)

Returns the day of the week (:MONDAY ... :SUNDAY)

[top](#)

## time/not-after?

```
(time/not-after? date1 date2)
```

Returns true if date1 is not-after date2 else false (same semantics as `<=` )

```
(time/not-after? (time/local-date 2018 1 1)
                 (time/local-date 2019 1 1))
=> true

(time/not-after? (time/local-date-time "2018-01-01T10:00:00.000")
                 (time/local-date-time "2019-01-01T10:00:00.000"))
=> true

(time/not-after? (time/zoned-date-time "2018-01-01T10:00:00.000+01:00")
                 (time/zoned-date-time "2019-01-01T10:00:00.000+01:00"))
=> true
```

### SEE ALSO

#### [time/after?](#)

Returns true if all dates are ordered from the latest to the earliest (same semantics as `>`)

#### [time/before?](#)

Returns true if all dates are ordered from the earliest to the latest (same semantics as `<`)

#### [time/not-before?](#)

Returns true if date1 is not-before date2 else false (same semantics as `>=`)

[top](#)

## time/not-before?

```
(time/not-before? date1 date2)
```

Returns true if date1 is not-before date2 else false (same semantics as `>=` )

```

```

### SEE ALSO

#### [time/minus](#)

Subtracts the n units from the date. Units: {years :months :weeks :days :hours :minutes :seconds :milliseconds}

[top](#)

## time/second

(time/second date)

Returns the second of the date 0..59

```
(time/second (time/local-date))  
=> 0
```

```
(time/second (time/local-date-time))  
=> 16
```

```
(time/second (time/zoned-date-time))  
=> 16
```

### SEE ALSO

[time/hour](#)

Returns the hour of the date 0..23

[time/minute](#)

Returns the minute of the date 0..59

[time/milli](#)

Returns the millis of the date 0..999

[top](#)

## time/to-millis

(time/to-millis date)

Converts the passed date to milliseconds since epoch

```
(time/to-millis (time/date))  
=> 1688999657780
```

```
(time/to-millis (time/local-date))  
=> 1688940000000
```

```
(time/to-millis (time/local-date-time))  
=> 1688999657818
```

```
(time/to-millis (time/zoned-date-time))  
=> 1688999657838
```

[top](#)

## time/with-time

```
(time/with-time date hour minute second)  
(time/with-time date hour minute second millis)
```

Sets the time of a date. Returns a new date

```
(time/with-time (time/local-date) 22 00 15 333)
=> 2023-07-10T22:00:15.333
```

```
(time/with-time (time/local-date-time) 22 00 15 333)

## time/zoned-date-time?

```
(time/zoned-date-time? date)
```

Returns true if date is a zoned-date-time ('java.time.ZonedDateTime') else false

```
(time/zoned-date-time? (time/zoned-date-time))
=> true
```

top

## timeout-after

```
(timeout-after p time time-unit)
```

Returns a promise that timeouts after the specified time. The promise throws a TimeoutException.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                  (fn [v] (println (pr-str v)))))
    (deref))
"The quick brown fox"
=> nil

(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                  (fn [v] (println (pr-str v)))))
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                  (fn [v] (println (pr-str v)))))
    (deref 2000 :timeout))
=> :timeout

(-> (promise (fn [] (sleep 200) "The quick brown fox"))
    (apply-to-either (timeout-after 100 :milliseconds)
                    identity)
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

### [then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

### [then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

### [then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

### [when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

### [accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

## total-memory

```
(total-memory)
```

Returns the total amount of memory available to the Java VM.

```
(total-memory)
=> "1037.0MB"
```

## SEE ALSO

### [used-memory](#)

Returns the currently used memory by the Java VM.

## trampoline

```
(trampoline f)
(trampoline f & args)
```

trampoline can be used to convert algorithms requiring mutual recursion without stack consumption. Calls f with supplied args, if any. If f returns a fn, calls that fn with no arguments, and continues to repeat, until the return value is not a fn, then returns that non-fn value.

Note that if you want to return a fn as a final value, you must wrap it in some data structure and unpack it after trampoline returns.

```
(do
  (defn factorial
    ([n] #(factorial n 1N))
    ([n acc] (if (< n 2)
                 acc
                 #(factorial (dec n) (* acc n)))))

  (trampoline (factorial 20)))
=> 2432902008176640000N
```

[top](#)

## transduce

```
(transduce xform f coll)
(transduce xform f init coll)
```

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be a reducing step function that accepts both 1 and 2 arguments. Returns the result of applying (the transformed) xf to init and the first item in coll, then applying xf to that result and the 2nd item, etc. If coll contains no items, returns init and f is not called.

transduce can work with queues as collection, given that the end of the queue is marked by adding a nil element. Otherwise the transducer does not know when to stop reading elements from the queue.

Transformations		Reductions	Control
-----		-----	-----
map	map-indexed	rf-first	halt-when
filter	flatten	rf-last	
drop	drop-while	rf-any?	
drop-last	remove	rf-every?	
take	take-while		
take-last	keep	conj	
dedupe	distinct	+, *	
sorted	reverse	max, min	

```

(transduce identity + [1 2 3 4])

### false?

Returns true if x is false, false otherwise

### not

Returns true if x is logical false, false otherwise.

top

## try

```
(try expr*)
(try expr* (catch selector ex-sym expr*)*)
(try expr* (catch selector ex-sym expr*)* (finally expr*))
```

Exception handling: try - catch - finally

`(try)` without any expression returns `nil`.

The exception types

- `:java.lang.Exception`
- `:java.lang.RuntimeException`
- `:com.github.jlangch.venice.VncException`
- `:com.github.jlangch.venice.ValueException`

are imported implicitly so its alias `:Exception`, `:RuntimeException`, `:VncException`, and `:ValueException` can be used as selector without an import of the class.

### Selectors

- a class: (e.g., `:RuntimeException`, `:java.text.ParseException`), matches any instance of that class
- a key-values vector: (e.g., `[key val & kvs]`), matches any instance of `:ValueException` where the exception's value meets the expression `(and (= (get ex-value key) val) ...)`
- a predicate: (a function of one argument like `map?`, `set?`), matches any instance of `:ValueException` where the predicate applied to the exception's value returns true

### Notes:

The finally block is just for side effects, like closing resources. It never returns a value!

All exceptions in Venice are *unchecked*. If *checked* exceptions are thrown in Venice they are immediately wrapped in a `:RuntimeException` before being thrown! If Venice catches a *checked* exception from a Java interop call it wraps it in a `:RuntimeException` before handling it by the catch block selectors.

```
(try
  (throw "test")
  (catch :ValueException e
    "caught ~(ex-value e)"))
=> "caught test"
```

```

(try
  (throw 100)
  (catch :Exception e -100))
=> -100

(try
  (throw 100)
  (catch :ValueException e (ex-value e))
  (finally (println "...finally")))
...finally
=> 100

(try
  (throw (ex :RuntimeException "message"))
  (catch :RuntimeException e (ex-message e)))
=> "message"

;; exception type selector:
(try
  (throw [1 2 3])
  (catch :ValueException e (ex-value e))
  (catch :RuntimeException e "runtime ex")
  (finally (println "...finally")))
...finally
=> [1 2 3]

;; key-value selector:
(try
  (throw {:a 100, :b 200})
  (catch [:a 100] e
    (println "ValueException, value: ~(ex-value e)"))
  (catch [:a 100, :b 200] e
    (println "ValueException, value: ~(ex-value e)")))
ValueException, value: {:a 100 :b 200}
=> nil

;; key-value selector (exception cause):
(try
  (throw (ex :java.io.IOException "failure"))
  (catch [:cause-type :java.io.IOException] e
    (println "IOException, msg: ~(ex-message (ex-cause e))"))
  (catch :RuntimeException e
    (println "RuntimeException, msg: ~(ex-message e)")))
IOException, msg: failure
=> nil

;; predicate selector:
(try
  (throw {:a 100, :b 200})
  (catch long? e
    (println "ValueException, value: ~(ex-value e)"))
  (catch map? e
    (println "ValueException, value: ~(ex-value e)"))
  (catch #(and (map? %) (= 100 (:a %))) e
    (println "ValueException, value: ~(ex-value e)")))
ValueException, value: {:a 100 :b 200}
=> nil

;; predicate selector with custom types:
(do
  (deftype :my-exception1 [message :string, position :long])

```

```
(deftype :my-exception2 [message :string])

(try
  (throw (my-exception1. "error" 100))
  (catch my-exception1? e
    (println (:value e)))
  (catch my-exception2? e
    (println (:value e))))

Generates a UUID.

`(uuid)`

`=> "e4094ce5-695d-48bc-a25f-ae6a6fe488d0"`

[top](#)

## val

`(val e)`

Returns the val of the map entry.

`(val (find {:a 1 :b 2} :b))`

`=> 2`

```
(val (first (entries {:a 1 :b 2 :c 3})))  
=> 1
```

## SEE ALSO

### [map](#)

Applies `f` to the set of first items of each coll, followed by applying `f` to the set of second items in each coll, until any one of the ...

### [entries](#)

Returns a collection of the map's entries.

### [key](#)

Returns the key of the map entry.

### [vals](#)

Returns a collection of the map's values.

[top](#)

## vals

```
(vals map)
```

Returns a collection of the map's values.

Please note that the functions 'keys' and 'vals' applied to the same map are not guaranteed not return the keys and vals in the same order!

To achieve this, keys and vals can be calculated based on the map's entry list:

```
(let [e (entries {:a 1 :b 2 :c 3})]  
  (println (map key e))  
  (println (map val e)))
```

```
(vals {:a 1 :b 2 :c 3})  
=> (1 2 3)
```

## SEE ALSO

### [keys](#)

Returns a collection of the map's keys.

### [entries](#)

Returns a collection of the map's entries.

### [map](#)

Applies `f` to the set of first items of each coll, followed by applying `f` to the set of second items in each coll, until any one of the ...

## var-get

```
(var-get v)
```

Returns a var's value.

```
(var-get +)  
=> +
```

```
(var-get '+)
=> +

(var-get (symbol "+"))
=> +

((var-get +) 1 2)
=> 3

(do
  (def x 10)
  (var-get 'x))
=> 10
```

## SEE ALSO

### [var-ns](#)

Returns the namespace of the var's symbol

### [var-name](#)

Returns the name of the var's symbol

### [var-local?](#)

Returns true if the var is local else false

### [var-global?](#)

Returns true if the var is global else false

### [var-thread-local?](#)

Returns true if the var is thread-local else false

[top](#)

## var-global?

```
(var-global? v)
```

Returns true if the var is global else false

```
(var-global? +)
=> true
```

```
(var-global? '+)
=> true
```

```
(var-global? (symbol "+"))
=> true
```

```
(do
  (def x 10)
  (var-global? x))
=> true
```

```
(let [x 10]
  (var-global? x))
=> false
```

## SEE ALSO

### [var-get](#)

Returns a var's value.

### [var-ns](#)

Returns the namespace of the var's symbol

### [var-name](#)

Returns the name of the var's symbol

### [var-local?](#)

Returns true if the var is local else false

### [var-thread-local?](#)

Returns true if the var is thread-local else false

[top](#)

## var-local?

```
(var-local? v)
```

Returns true if the var is local else false

```
(var-local? +)  
=> true
```

```
(var-local? '+)  
=> true
```

```
(var-local? (symbol "+"))  
=> true
```

```
(do  
  (def x 10)  
  (var-local? x))  
=> false
```

```
(let [x 10]  
  (var-local? x))  
=> true
```

### SEE ALSO

#### [var-get](#)

Returns a var's value.

```
(do
```

```
  (ns foo)
```

```
  (def add +)
```

```
  (namespace add))
```

```
=> nil
```

### SEE ALSO

#### [namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

#### [var-get](#)

Returns a var's value.

### [var-name](#)

Returns the name of the var's symbol

### [var-local?](#)

Returns true if the var is local else false

### [var-global?](#)

Returns true if the var is global else false

### [var-thread-local?](#)

Returns true if the var is thread-local else false

[top](#)

## var-thread-local?

```
(var-thread-local? v)
```

Returns true if the var is thread-local else false

```
(binding [x 100]
  (var-local? x))
=> false
```

### SEE ALSO

#### [var-get](#)

Returns a var's value.

#### [var-ns](#)

Returns the namespace of the var's symbol

#### [var-name](#)

Returns the name of the var's symbol

#### [var-local?](#)

Returns true if the var is local else false

#### [var-global?](#)

Returns true if the var is global else false

## vary-meta

```
(vary-meta obj f & args)
```

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

```
(meta (vary-meta [1 2] assoc :a 1))
=> {:a 1 :line 25 :column 28 :file "example"}
```

[top](#)

## vector

```
(vector & items)
```

Creates a new vector containing the items.

```
(vector)
```

```
=> []
```

```
(vector 1 2 3)
```

```
=> [1 2 3]
```

```
(vector 1 2 3 [:a :b])
```

```
=> [1 2 3 [:a :b]]
```

```
(vector "abc")
```

```
=> ["abc"]
```

[top](#)

## vector\*

```
(vector* args)
```

```
(vector* a args)
```

```
(vector* a b args)
```

```
(vector* a b c args)
```

```
(vector* a b c d & more)
```

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

```
(vector* 1 [2 3])
```

```
=> [1 2 3]
```

```
(vector* 1 2 3 [4])
```

```
=> [1 2 3 4]
```

```
(vector* 1 2 3 '(4 5))
```

```
=> [1 2 3 4 5]
```

```
(vector* '[1 2] 3 [4])
```

```
=> [[1 2] 3 4]
```

```
(vector* nil)
```

```
=> nil
```

```
(vector* nil [2 3])
```

```
=> [nil 2 3]
```

```
(vector* 1 2 nil)
```

```
=> (1 2)
```

## SEE ALSO

[cons](#)

Returns a new collection where x is the first element and coll is the rest

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item). For list, vectors and ordered maps the values are ...

### concat

Returns a list of the concatenation of the elements in the supplied collections.

### list\*

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

## vector?

(vector? obj)

Returns true if obj is a vector

```
(vector? (vector 1 2))  
=> true
```

```
(vector? [1 2])  
=> true
```

[top](#)

## version

(version)

Returns the Venice version.

```
(version)  
=> "0.0.0"
```

[top](#)

## volatile

(volatile x)

Creates a volatile with the initial value x

```
(do  
  (def counter (volatile 0))  
  (swap! counter inc)  
  (deref counter))  
=> 1
```

```
(do  
  (def counter (volatile 0))  
  (reset! counter 9)  
  @counter)  
=> 9
```

### SEE ALSO

### [deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### [reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

### [swap!](#)

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

[top](#)

## volatile?

```
(volatile? x)
```

Returns true if x is a volatile, otherwise false

```
(do
  (def counter (volatile 0))
  (volatile? counter))
=> true
```

[top](#)

## when

```
(when test & body)
```

Evaluates test. If logical true, evaluates body in an implicit do.

```
(when (== 1 1) true)
=> true
```

### SEE ALSO

#### [when-not](#)

Evaluates test. If logical false, evaluates body in an implicit do.

#### [when-let](#)

bindings is a vector with 2 elements: binding-form test.

#### [if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

#### [if-not](#)

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

#### [if-let](#)

bindings is a vector with 2 elements: binding-form test.

[top](#)

## when-complete

```
(when-complete p f)
```

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result value as first and a possible exception as second argument to the function. The asynchronous function f is called presumably for handling side effects.

```
(-> (promise (fn [] "The Quick Brown Fox"))
  (then-apply str/upper-case)
  (when-complete (fn [v,e] (println (pr-str {:value v :ex e}))))
  (then-apply str/lower-case)
  (deref))
{:value "THE QUICK BROWN FOX" :ex nil}
=> "the quick brown fox"
```

## SEE ALSO

### [promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### [then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

### [then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

### [then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

### [then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

### [then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

### [accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### [or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

### [complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

## when-let

```
(when-let bindings & body)
```

bindings is a vector with 2 elements: binding-form test.

If test is true, evaluates the body expressions with binding-form bound to the value of test, if not, yields nil

```
(when-let [value (* 100 2)]
  (str "The expression is true. value=" value))
=> "The expression is true. value=200"
```

## SEE ALSO

### [if-let](#)

bindings is a vector with 2 elements: binding-form test.

### [let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

## when-not

```
(when-not test & body)
```

Evaluates test. If logical false, evaluates body in an implicit do.

```
(when-not (== 1 2) true)
=> true
```

### SEE ALSO

#### [when](#)

Evaluates test. If logical true, evaluates body in an implicit do.

#### [when-let](#)

bindings is a vector with 2 elements: binding-form test.

#### [if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

#### [if-not](#)

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

#### [if-let](#)

bindings is a vector with 2 elements: binding-form test.

## while

```
(while test & body)
```

Repeatedly executes body while test expression is true. Presumes some side-effect will cause test to become false/nil. Returns nil.

```
(do
  (def a (atom 5))
  (while (pos? @a)
    (println @a)
    (swap! a dec)))
5
4
3
2
1
=> nil
```

## with-err-str

```
(with-err-str & forms)
```

Evaluates exprs in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing calls. `with-err-str` can be nested.

```
(with-err-str (println *err* "a string"))  
=> "a string\n"
```

#### SEE ALSO

[with-out-str](#)

Evaluates exprs in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[top](#)

## with-meta

```
(with-meta obj m)
```

Returns a copy of the object `obj`, with a map `m` as its metadata.

[top](#)

## with-out-str

```
(with-out-str & forms)
```

Evaluates exprs in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing calls. `with-out-str` can be nested.

```
(with-out-str (println "a string"))  
=> "a string\n"
```

#### SEE ALSO

[with-err-str](#)

Evaluates exprs in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[top](#)

## with-sh-dir

```
(with-sh-dir dir & forms)
```

Sets the directory for use with `sh`, see `sh` for details.

```
(with-sh-dir "/tmp" (sh "ls" "-l"))
```

#### SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-env](#)

Sets the environment for use with `sh`.

[with-sh-throw](#)

Shell commands executed within a `with-sh-throw` context throw an exception if the spawned shell process returns an exit code other than 0.

[top](#)

## with-sh-env

(`with-sh-env` `env` & `forms`)

Sets the environment for use with `sh`.

```
(with-sh-env {"NAME" "foo"} (sh "ls" "-l"))
```

### SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-dir](#)

Sets the directory for use with `sh`, see `sh` for details.

[with-sh-throw](#)

Shell commands executed within a `with-sh-throw` context throw an exception if the spawned shell process returns an exit code other than 0.

[top](#)

## with-sh-throw

(`with-sh-throw` `forms`)

Shell commands executed within a `with-sh-throw` context throw an exception if the spawned shell process returns an exit code other than 0.

For use with `sh`, see `sh` for details. `with-sh-throw` can be nested.

```
(with-sh-throw (sh "ls" "-l"))
```

### SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-env](#)

Sets the environment for use with `sh`.

[with-sh-dir](#)

Sets the directory for use with `sh`, see `sh` for details.

[top](#)

## xml/children

(`xml/children` `nodes`)

Returns the children of the XML nodes collection

```
(do
  (load-module :xml)
  (xml/children
    (list (xml/parse-str "<a><b>B</b></a>"))))
=> ({:content ["B"] :tag "b"})
```

[top](#)

## xml/parse

```
(xml/parse s)
(xml/parse s handler)
```

Parses and loads the XML from the source `s` with the parser XMLHandler handler. The source may be an `InputSource` or an `InputStream`. Returns a tree of XML element maps with the keys `:tag`, `:attrs`, and `:content`.

[top](#)

## xml/parse-str

```
(xml/parse-str s)
(xml/parse-str s handler)
```

Parses an XML from the string `s`. Returns a tree of XML element maps with the keys `:tag`, `:attrs`, and `:content`.

```
(do
  (load-module :xml)
  (xml/parse-str "<a><b>B</b></a>"))
=> {:content [{:content ["B"] :tag "b"]} :tag "a"}
```

[top](#)

## xml/path->

```
(xml/path-> path nodes)
```

Applies the path to a node or a collection of nodes

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b><c>C</c></b></a>")
        path [(xml/tag= "b")
              (xml/tag= "c")
              xml/text
              first]]
    (xml/path-> path nodes)))
=> "C"
```

[top](#)

## xml/text

(xml/text nodes)

Returns a list of text contents of the XML nodes collection

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b>B</b></a>")
        path [(xml/tag= "b")
              xml/text]]
    (xml/path-> path nodes)))
=> ("B")
```

[top](#)

## zero?

(zero? x)

Returns true if x zero else false

```
(zero? 0)
=> true
```

```
(zero? 2)
=> false
```

```
(zero? (int 0))
=> true
```

```
(zero? 0.0)
=> true
```

```
(zero? 0.0M)
=> true
```

### SEE ALSO

[neg?](#)

Returns true if x smaller than zero else false

[pos?](#)

Returns true if x greater than zero else false

[top](#)

## zipmap

(zipmap keys vals)

Returns a map with the keys mapped to the corresponding vals.

To create a list of tuples from two or more lists use

```
(map list '(1 2 3) '(4 5 6)) .
```

```
(zipmap [:a :b :c :d :e] [1 2 3 4 5])  
=> {:a 1 :b 2 :c 3 :d 4 :e 5}
```

```
(zipmap [:a :b :c] [1 2 3 4 5])  
=> {:a 1 :b 2 :c 3}
```

[top](#)

Creates a hash map.

```
{:a 10 :b 20}  
=> {:a 10 :b 20}
```
