Primitives

Literals

Nil	nil
Boolean	true, false
Integer	150I, 1_000_000I, 0x1FFI
Long	1500, 1_000_000, 0x00A055FF
Double	3.569, 2.0E+10
BigDecimal	6.897M, 2.345E+10M
BigInteger	1000N, 1_000_000N
Char	#\A, #\π, #\u03C0
	#\space, #\newline, #\return, #\tab, #\formfeed, #\backspace, #\lparen, #\rparen, #\quote

Collections

Collections

Generic	count	compare	empty-to-nil	empty
	into	into!	cons	conj
	remove	repeat	repeatedly	conj!
	replace	range	group-by	cycle
	sort-by	frequencies	get-in	sort
	reverse	shuffle	seq	
Tests	empty?	not-empty?	distinct?	coll?
	sequential?	list?	vector?	set?
	sorted-set?	mutable-set?	map?	
	sequential?	hash-map?	ordered-map?	
	sorted-map?	mutable-map?	bytebuf?	
Process	map	map-indexed	filter	reduce
	group-by	sort	sort-by	keep
	flatten	docoll	mapv	run!

String	"abcd", "ab\"cd", "PI: \u03C0"
	""{ "age": 42 }""
String interpolation	"~{x}", ""~{x}""
	"~(inc x)", ""~(inc x)""

Numbers

Arithmetic	+ - * /
Convert	int long double decimal bigint
Compare	== = not= < > <= >= compare
Test	zero? pos? neg? even? odd? number? int? long? double? decimal?
NaN/Infinite	nan? infinite?
BigDecimal	dec/add dec/sub dec/mul dec/div dec/scale

Strings

Create	str
Use	count compare empty-to-nil first last nth nfirst nlast seq rest butlast reverse shuffle str/subs str/nfirst str/nlast str/rest str/nrest str/butlast str/butnlast str/chars str/pos str/repeat str/reverse str/lorem-ipsum
Index	str/index-of str/index-of-char str/index-of-not-char str/last-index-of
Split/Join	str/split str/split-at str/split-lines str/split-columns str/join
Replace	str/replace-first str/replace-last str/replace-all
Strip	str/strip-start str/strip-end str/strip-indent str/strip-margin
Conversion	str/lower-case str/upper-case str/cr-lf
Regex	match? not-match?
Trim	str/trim str/trim-to-nil str/trim-left str/trim-right
Format	str/format str/quote str/double-quote

Lists

Create	() list list* mutable-list
Access	first second third fourth nth last peek rest butlast nfirst nlast sublist some
Modify	cons conj conj! rest pop into into! concat distinct dedupe partition partition-all partition-by interpose interleave cartesian-product combinations mapcat flatten sort sort-by take take-while take-last drop drop-while drop-last split-at split-with
Test	list? mutable-list? coll? sequential? every? not-every? any? not-any?

Vectors

Create	[] vector vector* mutable-vector mapv
Access	first second third nth last peek butlast rest nfirst nlast subvec some
Modify	cons conj conj! rest pop into into! concatv distinct dedupe partition partition-by interpose interleave cartesian-product combinations mapcat flatten sort sort-by take take-while take-last drop drop-while drop-last update update! assoc assoc! split-with
Nested	get-in assoc-in update-in dissoc-in
Test	vector? mutable-vector? coll? sequential? contains? not-contains? every? not-every? any? not-any?

Sets

Create	#{} set sorted-set mutable-set
Modify	into into! cons cons! conj conj! disj
Algebra	difference union intersection subset? superset?
Test	set? sorted-set? mutable-set? coll? contains? not-contains? every? not-every? any? not-any?

Maps

Create	{ } hash-map ordered-map sorted-map mutable-map zipmap
--------	---

	str/double-unquote str/align str/wrap str/expand str/truncate
Hex	str/hex-to-bytebuf str/bytebuf-to-hex str/format-bytebuf
Bytebuf	bytebuf-from-string bytebuf-to-string
Encode/Decode	str/encode-base64 str/decode-base64 str/encode-url str/decode-url str/escape-html str/escape-xml
Test	string? empty? not-empty? str/blank? str/not-blank? str/starts-with? str/ends-with? str/contains? str>equals-ignore-case? str/quoted? str/double-quoted?
Test char	str/char? str/digit? str/hexdigit? str/letter? str/whitespace? str/linefeed? str/lower-case? str/upper-case?
UTF	str/normalize-utf
Validation	str/valid-email-addr?
Other	str/levenshtein

Chars

Use	char char? char-escaped char-literals
Conversion	str str/lower-case str/upper-case
Test char	str/char? str/digit? str/letter? str/whitespace? str/linefeed? str/lower-case? str/upper-case?

Booleans

Boolean	true false boolean not boolean? true? false?
---------	--

Keywords

Keyword	:a :blue keyword? keyword
---------	--

Symbols

Symbol	'a 'blue symbol? qualified-symbol? symbol
--------	--

Nil

Nil	nil nil? some?
-----	---

Access	find get keys vals
Modify	cons conj conj! assoc assoc! update update! dissoc dissoc! into into! concat flatten filter-k filter-kv reduce-kv merge merge-with merge-deep map-invert map-keys map-val select-keys
Entries	map-entry key val entries map-entry?
Nested	get-in assoc-in update-in dissoc-in
Test	map? hash-map? ordered-map? sorted-map? mutable-map? coll? contains? not-contains?

Stack

Create	stack
Access	peek pop! push! into! conj! count
Test	empty? stack?

Queue

Create	queue
Access	peek into! conj! count
Sync	put! take!
Async	offer! poll!
Process	docoll transduce reduce
Test	empty? queue?

DelayQueue

Create	delay-queue
Access	peek count
Sync	put! take!
Async	poll!
Test	empty? delay-queue?

DAG (directed acyclic graph)

Create	dag/dag dag/add-edges dag/add-nodes
Access	dag/nodes dag/edges dag/roots count
Children	dag/children dag/direct-children
Parents	dag/parents dag/direct-parents
Sort	dag/topological-sort dag/compare-fn

Just

Just	just	just?
------	------	-------

Test

dag/dag?	dag/node?	dag/edge?
dag/parent-of?	dag/child-of?	
empty?		

Byte Buffer

Create	bytebuf	bytebuf-allocate	bytebuf-allocate-random	bytebuf-byte-order!	bytebuf-byte-order	bytebuf-merge
Capacity	bytebuf-capacity	bytebuf-remaining	bytebuf-limit	bytebuf-ensure-free-capacity!	bytebuf-limit!	count
Search	bytebuf-index-of					
String	bytebuf-from-string	bytebuf-to-string				
Test	empty?	not-empty?	bytebuf?			
Use	bytebuf-to-list	bytebuf-sub	bytebuf-pos	bytebuf-pos!		
Read	bytebuf-get-byte	bytebuf-get-int	bytebuf-get-long	bytebuf-get-float	bytebuf-get-double	
Write	bytebuf-put-byte!	bytebuf-put-int!	bytebuf-put-long!	bytebuf-put-float!	bytebuf-put-double!	bytebuf-put-buf!
Base64	str/encode-base64	str/decode-base64				
Hex	str/hex-to-bytebuf	str/bytebuf-to-hex	str/format-bytebuf			

Regex

General	regex/pattern	regex/matcher	regex/reset	regex/matches?	regex/matches-not?	regex/matches	regex/group	regex/groups	regex/count	regex/find?	regex/find	regex/find-all	regex/find+	regex/find-all+
---------	---------------	---------------	-------------	----------------	--------------------	---------------	-------------	--------------	-------------	-------------	------------	----------------	-------------	-----------------

Math

Arithmetic	inc	dec	min	max	clamp	mod	mod-floor	abs	sgn	negate	floor	ceil	sqrt	square	pow	exp	log	log2	log10
Util	digits																		
Random	rand-long	rand-double	rand-bigint	rand-gaussian															

Lazy Sequences

Create	lazy-seq
Realize	doall
Test	lazy-seq?

Arrays

Create	make-array	object-array	string-array	int-array	long-array	float-array	double-array
Use	aget	aset	alength	asub	acopy	amap	

Concurrency

Atoms	atom	atom?	deref	deref?	reset!	swap!	swap-vals!	compare-and-set!	add-watch	remove-watch												
Locks	lock	lock?	acquire	try-acquire	release	locked?																
Locking	locking																					
Futures	future	future-task	future?	futures-fork	futures-wait	futures-thread-pool-info	done?	cancel	cancelled?	deref	deref?	realized?										
Promises	promise	promise?	deliver	deliver-ex	realized?	then-accept	then-accept-both	then-apply	then-combine	then-compose	when-complete	accept-either	apply-to-either	all-of	any-of	or-timeout	complete-on-timeout	timeout-after	done?	cancel	cancelled?	
Delay	delay	delay?	deref	deref?	force	realized?																
Agents	agent	send	send-off	restart-agent	set-error-handler!	agent-error	await	await-for	shutdown-agents	shutdown-agents?	await-termination-agents	await-termination-agents?	agent-send-thread-pool-info	agent-send-off-thread-pool-info								

Trigonometry	math/to-radians math/to-degrees math/sin math/cos math/tan math/asin math/acos math/atan
Statistics	math/mean math/median math/quartiles math/quantile math/standard-deviation
Algorithms	math/softmax
Constants	
E	math/E
PI	math/PI

Transducers

Use	transduce
Functions	map map-indexed filter drop drop-while drop-last take take-while take-last keep remove dedupe distinct sorted reverse flatten halt-when
Reductions	rf-first rf-last rf-every? rf-any?
Early	reduced reduced? deref deref?

Functions

Create	fn defn defn- identity comp partial memoize juxt fn!l trampoline complement constantly every-pred any-pred
Call	apply -> ->>
Test	fn?

Embedding in Java

Eval

```
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        final Venice venice = new Venice();

        final Long result = (Long)venice.eval("(+ 1 2)");
    }
}
```

Passing parameters

```
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        final Long result = (Long)venice.eval(
            "(+ x y 3)",
            Parameters.of("x", 6, "y", 3L));
    }
}
```

Dealing with Java objects

```
import java.awt.Point;
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        // returns a string: "Point=(x: 100.0, y: 200.0)"
        String ret = (String)venice.eval(
            "(let [x (:x point)                \n" +
            "      y (:y point)]                \n" +
            "  (str \"Point=(x: \" x \"\", y: \" y \"\")\"))",
            Parameters.of("point", new Point(100, 200)));

        // returns a java.awt.Point: [x=110,y=220]
        Point point = (Point)venice.eval(
            "(. :java.awt.Point :new (+ x 10) (+ y 20))",
            Parameters.of("x", 100, "y", 200));
    }
}
```

Precompiling

```
import com.github.jlangch.venice.IPreCompiled;
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
```

```

public static void main(String[] args) {
    Venice venice = new Venice();

    IPreCompiled precompiled = venice.precompile("example", "(+ 1 x)");

    for(int ii=0; ii<100; ii++) {
        venice.eval(precompiled, Parameters.of("x", ii));
    }
}
}

```

Java Interop

```

import java.time.ZonedDateTime;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        Long val = (Long)venice.eval("( . :java.lang.Math :min 20 30)");

        ZonedDateTime ts = (ZonedDateTime)venice.eval(
            "(. (. :java.time.ZonedDateTime :now) :plusDays 5)");
    }
}

```

Sandbox

```

import com.github.jlangch.venice.SecurityException;
import com.github.jlangch.venice.Venice;
import com.github.jlangch.venice.javainterop.SandboxInterceptor;
import com.github.jlangch.venice.javainterop.SandboxRules;

public class SandboxExample {
    public static void main(final String[] args) {
        final SandboxInterceptor sandbox =
            new SandboxRules()
                // Venice functions: blacklist all unsafe functions
                .rejectAllUnsafeFunctions()

                // Venice functions: whitelist rules for print functions to offset
                // blacklist rules by individual functions
                .whitelistVeniceFunctions("*print*")

                .sandbox();

        final Venice venice = new Venice(sandbox);

        // => OK, 'println' is part of the unsafe functions, but enabled by the 2nd rule
        venice.eval("(println 100)");

        // => FAIL, 'read-line' is part of the unsafe functions
        try {
            venice.eval("(read-line)");
        }
        catch(SecurityException ex) {
            System.out.println("REJECTED: (read-line)");
        }
    }
}

```

Recursion

Recursion

Functional languages support **Tail Call Optimization (TCO)** to provide memory efficient recursion. Venice supports *automatic Tail Call Optimization* and *Self Recursion* through the `loop..recur` syntax. Self recursion is a way to mimic TCO.

In addition Venice provides the *trampoline* function for mutual recursion for more involved forms of recursion.

Self-Recursive Calls (loop - recur)

Venice self-recursive calls do not consume a new stack frame for every new recursion iteration and have a constant memory usage. It's the only non-stack-consuming looping construct in Venice. To make it work the `recur` expression must be in *tail position*. This way Venice can turn the recursive `loop..recur` construct behind the scene into a plain loop.

Definition: The tail position is a position which an expression would return a value from. There are no more forms evaluated after the form in the tail position is evaluated.

Remember: Venice offers various alternative solutions to recursion to solve loops like `(+ 1 2 3 4 5 6)` to sum up a list of numbers or the powerful `reduce` function: `(reduce + [1 2 3 4 5])`. Many Venice functions accept an arbitrary number of arguments to prevent you from writing loops.

Example 1: Recursively sum up the numbers 0..n:

```
;; Definition:
;; sum 0 -> 0
;; sum n -> n + sum (n - 1)
(do
  (defn sum [n]
    ;; the transformed recursion uses an accumulator for intermediate results
    (loop [cnt n, acc 0]
      (if (zero? cnt)
        acc
        (recur (dec cnt) (+ acc cnt))))))

(sum 100000) ; => 5000050000
```

Example 2: Recursively compute the factorial of a number:

```
;; Definition:
;; factorial 1 -> 1
;; factorial n -> n * factorial (n - 1)
(do
  (defn factorial [x]
    ;; the transformed recursion uses an accumulator for intermediate results
    (loop [n x, acc 1N]
      (if (== n 1)
        acc
        (recur (dec n) (* acc n))))))

(factorial 5) ; => 120N
(factorial 10000) ; => 284625968091...00000N (35661 digits)
```

Example 3: Recursively compute the Fibonacci numbers (0 1 1 2 3 5 8 ...):

```
;; Definition:
;; fib 0 -> 0
;; fib 1 -> 1
;; fib n -> fib (n - 2) + fib (n - 1)
(do
  (defn fib [x]
    (loop [n x, a 0N, b 1N]
      (case n
        0 a
        1 b
        (recur (dec n) b (+ a b)))))

  (fib 6) ; => 8N
  (fib 100000) ; => 259740693472217...28746875N (20901 digits)
```

Recursion with lazy sequences

Example 1: Lazy Fibonacci number sequence computed by a recursive function:

```
(do
  (defn fib
    ([ ] (fib 0N 1N))
    ([a b] (cons a #(fib b (+ a b)))))

  (doall (take 7 (fib)))) ; => (0 1 1 2 3 5 8)
```

Example 2: Factorial numbers:

```
(do
  (defn factorial
    ([ ] (factorial 1 1N))
    ([x] (first (drop (dec x) (factorial))))
    ([n acc] (cons acc #(factorial (inc n) (* acc (inc n))))))

  (factorial 5) ; => 120N
  (factorial 10000) ; => 284625968091...00000N (35661 digits)
```

Mutually recursive calls (trampoline)

`trampoline` can be used to convert algorithms requiring mutual recursion without stack consumption. Calls `f`, if `f` returns a function, calls that function with no arguments, and continues to repeat, until the return value is not a function, then returns that non-function value.

The function `trampoline` is defined simplified as

```
(defn trampoline [f]
  (loop [f f]
    (let [ret (f)]
      (if (fn? ret) (recur ret) ret)))))
```

Examples:

```
(do
  (defn is-odd? [n]
    (if (zero? n) false #(is-even? (dec n))))

  (defn is-even? [n]
    (if (zero? n) true #(is-odd? (dec n))))

  (trampoline (is-odd? 10000)))
```

```
(do
  (defn factorial
    ([n] #(factorial n 1N))
    ([n acc] (if (< n 2)
                 acc
                 #(factorial (dec n) (* acc n)))))

  (trampoline (factorial 10000)))
```

Tail Call Optimization (TCO)

Venice has support for automatic *tail call optimization*. The recursive call must be in tail position.

```
(do
  (defn factorial
    ([n]      (factorial n 1N))
    ([n acc] (if (== n 1)
                 acc
                 (factorial (dec n) (* acc n)))))

  (factorial 5)      ; => 120N
  (factorial 10000) ; => 284625968091...00000N (35661 digits)
```

Recursion vs Folding

Tail call recursive functions, can always be written in terms of a reducing (folding) function. E.g.:

```
(do
  (defn factorial [n]
    ;; reducing factorial
    (reduce * 1N (range 1 (inc n))))

  (factorial 5)      ; => 120N
  (factorial 10000) ; => 284625968091...00000N (35661 digits)
```

But not all recursive functions can be transformed into a tail recursive function and translated into a loop. The [Ackermann's function](#) is such an example of a non [primitive recursive function](#) that can not be de-recursed into loops.

Recursion and Memoization

For some recursive algorithms *memoization* can speed up computation dramatically:

```
(do
  (def fibonacci
```

```

(memoize (fn [n]
           (if (< n 2)
               (max n 0)
               (+ (fibonacci (- n 1)) (fibonacci (- n 2)))))))

(fibonacci 30))

```

Please note that this naive memoization approach with recursive functions does **not** work as expected:

```

(do
  (defn fib-simple [n]
    (if (< n 2)
        (max n 0)
        (+ (fib-simple (- n 1)) (fib-simple (- n 2)))))

  (def fib-memoize (memoize fib-simple))

  (fib-memoize 30))

```

memoization is doing a good job in computing fibonacci numbers using simple recursion. It eliminates the recurring computation of the predecessors values.

Nevertheless there are recursive algorithms like the *Ackermann* function where memoization has to raise its arms.

Compare recursion efficiency

To see how efficient tail call optimization for recursion is we compare simple recursion with self recursion applied to computing Fibonacci numbers.

Note: all examples run with upfront macro expansion enabled.

```

(do
  (load-module :benchmark ['benchmark :as 'b])

  (defn fib-simple [n]
    (if (< n 2)
        n
        (+ (fib-simple (- n 1)) (fib-simple (- n 2)))))

  (defn fib-tco
    ([n]
     (fib-tco n 0N 1N))
    ([n a b]
     (case n
         0 a
         1 b
         (fib-tco (dec n) b (+ a b)))))

  (defn fib-loop-recur [x]
    (loop [n x, a 0N, b 1N]
      (case n
          0 a
          1 b
          (recur (dec n) b (+ a b)))))

  (def fib-memoize
    (memoize
     (fn [n]
       (if (< n 2)
           n
           (+ (fib-memoize (- n 1)) (fib-memoize (- n 2)))))))

```

```
;; (b/benchmark (fib-simple 30) 5 5)
;; (b/benchmark (fib-tco 30) 5000 1000)
;; (b/benchmark (fib-loop-recur 30) 5000 1000)
;; (time (fib-memoize 30)) ;; memoized functions can not be benchmarked
```

```
;; run on MacBook Air M2, with 'macroexpand' enabled
```

```
;; +-----+-----+
;; | (fib-simple 30)      | 1.171s |
;; | (fib-tco 30)        | 31.286μs |
;; | (fib-loop-recur 30) | 27.946μs |
;; | (fib-memoize 30)    | 2.540ms |
;; +-----+-----+
```

Destructuring

Destructuring

Sequential Destructuring

Sequential destructuring breaks up a sequential data structure as a Venice list or vector within a let binding

```
(do
  (let [[x y z] [1 2 3]]
    (println x y z))
  ;=> 1 2 3

  ;; for strings, the elements are destructured by character.
  (let [[x y z] "abc"]
    (println x y z))) ;; => a b c
```

or within function parameters

```
(do
  (defn position [[x y]]
    (println "x:" x "y:" y))

  (position [1 2])) ;; => x: 1 y: 2
```

The destructured collection must not be of same size as the number of binding names

```
(do
  (let [[a b c d e f] '(1 2 3)]
    (println a b c d e f)) ;=> 1 2 3 nil nil nil

  (let [[a b c] '(1 2 3 4 5 6 7 8 9)]
    (println a b c))) ;; => 1 2 3
```

Working with tail elements '&' and ignoring bindings '_'

```
(do
  (let [[a b c & z] '(1 2 3 4 5 6 7 8 9)]
    (println a b c z)) ;; => 1 2 3 (4 5 6 7 8 9)

  (let [[a _ b _ c & z] '(1 2 3 4 5 6 7 8 9)]
    (println a b c z))) ;; => 1 3 5 (6 7 8 9)
```

Binding the entire collection with ':as'

```
(do
  (let [[a b c & z :as all] '(1 2 3 4 5 6 7 8 9)]
    (println a b c z all))
  ;; => 1 2 3 (4 5 6 7 8 9) (1 2 3 4 5 6 7 8 9)
)
```

Nested bindings

```
(do
  (def line [[5 10] [10 20]])
  (let [[[x1 y1][x2 y2]] line]
    (printf "Line from (%d,%d) to (%d,%d)%n" x1 y1 x2 y2))
  ;; => "Line from (5,10) to (10,20)"
)
```

`:as` or `&` can be used at any level

```
(do
  (def line [[5 10] [10 20]])
  (let [[[a b :as group1] [c d :as group2]] line]
    (println a b group1)      ;; => 5 10 [5 10]
    (println c d group2)))   ;; => 10 20 [10 20]
```

Associative Destructuring

Associative destructuring breaks up an associative (key/value) data structure as a Venice map within a let binding.

```
(do
  (let [{a :a, b :b, c :c} {:a "A" :b "B" :d "D"}]
    (println a b c)))  ;; => A B nil
```

```
(do
  (def map_keyword {:a "A" :b "B" :c 3 :d 4})
  (def map_strings {"a" "A" "b" "B" "c" 3 "d" 4})

  (let [{:keys [a b c]} map_keyword]
    (println a b c))  ;; => A B 3

  (let [{:strs [a b c]} map_strings]
    (println a b c)))  ;; => A B 3
```

Binding the entire collection with `:as`

```
(do
  (def map_keyword {:a "A" :b "B" :c 3 :d 4})

  (let [{:keys [a b c] :as all} map_keyword]
    (println a b c all))
  ;; => A B 3 {:a A :b B :c 3 :d 4}
```

Binding with defaults `:or`

```
(do
  (defn configure [options]
    (let [{:keys [port debug verbose] :or {port 8000, debug false, verbose false}} options]
      (println "port =" port " debug =" debug " verbose =" verbose)))
    ;; => port 8000, debug false, verbose false

  (configure {:debug true}))
```

Nested destructuring

Associative destructuring can be nested and combined with sequential destructuring

```
(do
  (def users
    {:peter {:role "clerk"
              :branch "Zurich"
              :age 40}

     :magda {:role "head of HR"
              :branch "Bern"
              :age 45}

     :kurt  {:role "assistant"
              :branch "Lucerne"
              :age 32}})

  (let [{[:keys [role branch]] :peter} users]
    (println "Peter is a" role "located at" branch)))
;; => Peter is a clerk located at Zurich
```

VeniceDoc

VeniceDoc is a documentation generator for the *Venice* language for generating API documentation in HTML format from *Venice* source code. It is used internally for generating the PDF and HTML cheatsheets. The function `doc` makes use of it to display the documentation for functions.

Example

Define a function `add` with documentation:

```
(defn
  ^{ :arglists '(
      "(add)", "(add x)", "(add x y)", "(add x y & more)"
    :doc
      """
      Returns the sum of the numbers.
      `(add)` returns 0.
      """
    :examples '(
      "(add)",
      "(add 1)",
      "(add 1 2)",
      "(add 1 2 3 4)"
    :see-also '(
      "+", "-", "x", "/" ) }

  add

  ([] 0)
  ([x] x)
  ([x y] (+ x y))
  ([x y & xs] (+ x y xs)))
```

Show its documentation from the REPL:

```
venice> (doc add)
```

REPL Output:

```
(add), (add x), (add x y), (add x y & more)

Returns the sum of the numbers. (add) returns 0.

EXAMPLES:
  (add)

  (add 1)

  (add 1 2)

  (add 1 2 3 4)
```

SEE ALSO:

[+](#), [-](#), [*](#), [/](#)

VeniceDoc Format

The documentation is defined as a Venice metadata `map`:

```
{ :arglists '("add)", "(add x)")
  :doc "Returns the sum of the numbers."
  :examples '("add 1)", "(add 1 2)")
  :see-also '("+", "-", "*", "/") }
```

key	description
:arglist	the optional arglist, a list of variadic arg specs
:doc	the documentation in Venice markdown format
:examples	optional examples, a list of Venice scripts. Use triple quotes for multi-line scripts
:see-also	an optional list of cross referenced functions

Markdown

Venice Markdown

Headings

To create a heading, add one to four `#` symbols before the heading text. The number of `#` will determine the size of the heading.

```
# The largest heading
## The second largest heading
### The third largest heading
#### The fourth largest heading
```

Paragraphs and Line Breaks

```
A paragraph is simply one or more consecutive lines of text, separated by
one or more blank lines (a line containing nothing but spaces or tabs).
```

```
Within a paragraph line breaks can be added by placing a `pilcrow`
```

```
Line 1|Line 2|
Line 3
```

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines (a line containing nothing but spaces or tabs).

Within a paragraph line breaks can be added by placing a `pilcrow`

Line 1
Line 2
Line 3

Styling

Venice markdown supports *italic*, **bold**, and ***bold-italic*** styling

```
This is *italic*, **bold**, and ***bold-italic*** styled text.
```

This is *italic*, **bold**, and ***bold-italic*** styled text.

Lists

Unordered List

```
* item 1
* item 2
* item 3
```

- item 1
- item 2

- item 3

Ordered List

```
1. item 1
2. item 2
3. item 3
```

1. item 1
2. item 2
3. item 3

Multiline list items with explicit line breaks:

```
* item 1
* item 2
  next line
  next line
* item 3
```

- item 1
- item 2
next line
next line
- item 3

Multiline list items with auto line breaks:

```
* item 1
* Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod
  tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim
  veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex
  ea commodo consequat. Duis aute irure dolor in reprehenderit in
  voluptate velit esse cillum dolore eu fugiat nulla pariatur.
* item 3
```

- item 1
- Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur.
- item 3

Links

Links are created by wrapping link text in brackets `[]`, and then wrapping the URL in parentheses `()`.

```
[Venice](https://github.com/jlangch/venice)
```

[Venice](https://github.com/jlangch/venice)

Tables

A simple table

JAN	1
FEB	20
MAR	300

JAN	1
FEB	20
MAR	300

Column alignment

:---	:---:	---:
1	1	1
200	200	200
30000	30000	30000

1	1	1
200	200	200
30000	30000	30000

Width header

Col 1	Col 2	Col 3
:---	:---:	---:
1	1	1
200	200	200
30000	30000	30000

Col 1	Col 2	Col 3
1	1	1
200	200	200
30000	30000	30000

PDF rendered tables have always a width of 100%. In some use cases an additional left aligned column can trick the rendered table:

Col 1	Col 2	Col 3	
:---	:---:	---:	:---
1	1	1	
200	200	200	
30000	30000	30000	

Col 1	Col 2	Col 3
1	1	1
200	200	200
30000	30000	30000

Line breaks in cells

JAN	1 2 3
FEB	20
MAR	300

JAN	1
	2

	3
FEB	20
MAR	300

Column format using CSS styles

The Venice markdown supports a few CSS styles

Text alignment:

- `text-align: left`
- `text-align: center`
- `text-align: right`

Column width:

- `width: 15%`
- `width: 15pm`
- `width: 15em`
- `width: auto`

```
| Col 1 | Col 2 |
| [![text-align: left; width: 6em]] | [![text-align: left; width: 6em]] |
| 1 | 1 |
| 200 | 200 |
| 30000 | 30000 |
```

Col 1	Col 2
1	1
200	200
30000	30000

Code

Code can be called out within a text by enclosing it with single backticks.

```
To open a namespace use `(ns name)`.
```

To open a namespace use `(ns name)`.

Code block are enclosed with three backticks:

```
```
(defn hello []
 (println "Hello stranger"))

(hello)
```
```

producing

```
(defn hello []
  (println "Hello stranger"))

(hello)
```

Function Details

[top](#)

#{ }

Creates a set.

```
#{10 20 30}  
=> #{10 20 30}
```

[top](#)

()

Creates a list.

```
'(10 20 30)  
=> (10 20 30)
```

[top](#)

*

```
(*)  
(* x)  
(* x y)  
(* x y & more)
```

Returns the product of numbers. (*) returns 1

```
(*)  
=> 1
```

```
(* 4)  
=> 4
```

```
(* 4 3)  
=> 12
```

```
(* 4 3 2)  
=> 24
```

```
(* 4I 3I)  
=> 12I
```

```
(* 6.0 2)  
=> 12.0
```

```
( * 6 1.5M )  
=> 9.0M
```

SEE ALSO

[+](#)

Returns the sum of the numbers. (+) returns 0.

[-](#)

If one number is supplied, returns the negation, else subtracts the numbers from x and returns the result.

[/](#)

If no denominators are supplied, returns 1/numerator, else returns numerator divided by all of the denominators.

[dec/add](#)

Adds two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

[dec/sub](#)

Subtract y from x and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

[dec/mul](#)

Multiplies two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, ...

[dec/div](#)

Divides x by y and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

[dec/scale](#)

Scales a decimal. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

[top](#)

ARGV

A list of the supplied command line arguments, or `nil` if the instantiator of the Venice instance decided not to make the command line arguments available.

ARGV

```
=> nil
```

[top](#)

ansi-term

`true` if Venice runs in an ANSI terminal, otherwise `false`

ansi-term

```
=> false
```

[top](#)

err

A `:java.io.PrintStream` object representing standard error for print operations.

Defaults to `System.err`, wrapped in an `PrintStream`.

`*err*` is a dynamic var. Any `:java.io.PrintStream` can be dynamically bound to it:

```
(binding [*err* print-stream]
 (println "text"))
```

SEE ALSO

[with-err-str](#)

Evaluates `exprs` in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[*out*](#)

A `:java.io.PrintStream` object representing standard output for print operations.

[*in*](#)

A `:java.io.Reader` object representing standard input for read operations.

[top](#)

`*in*`

A `:java.io.Reader` object representing standard input for read operations.

Defaults to `System.in`, wrapped in an `InputStreamReader`.

`*in*` is a dynamic var. Any `:java.io.Reader` can be dynamically bound to it:

```
(binding [*in* reader]
 (read-line))
```

SEE ALSO

[read-line](#)

Without `arg` reads the next line from the stream that is the current value of `*in*`. With `arg` reads the next line from the passed stream ...

[read-char](#)

Without `arg` reads the next char from the stream that is the current value of `*in*`. With `arg` reads the next char from the passed stream ...

[*out*](#)

A `:java.io.PrintStream` object representing standard output for print operations.

[*err*](#)

A `:java.io.PrintStream` object representing standard error for print operations.

[top](#)

`*loaded-files*`

The loaded files

```
*loaded-files*
=> #{} 
```

[top](#)

`*loaded-modules*`

The loaded modules

```
*loaded-modules*
=> #{:tomcat :ring :csv :jsonl :xchart :ascii-table :java :xml :semver :cargo :app :gradlew :http-client-legacy
:hexdump :test :inet :maven :io :timing :benchmark :str :core :regex :installer :parsifal :shell :multipart :

SEE ALSO

[import](#)

Imports one or multiple Java classes. Imports are bound to the current namespace.

[proxify](#)

Proxies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

[java/as-runnable](#)

Wraps the function `f` in a `java.lang.Runnable` (<https://docs.oracle.com/javase/8/docs/api/java/lang/Runnable.html>)

[java/as-callable](#)

Wraps the function `f` in a `java.util.concurrent.Callable` (<https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/Callable.html>)

[top](#)

```
::
```

```
(.: type-name args*)
```

Instantiates a custom type.

Note: Venice implicitly creates a builder function suffixed with a dot:

```
(deftype :complex [real :long, imaginary :long])
(complex. 200 300)
```

For readability prefer `(complex. 200 300)` over `(.: :complex 100 200)`.

```
(do
  (ns foo)
  (deftype :complex [real :long, imaginary :long])
  (def x (.: :complex 100 200))
  [(:real x) (:imaginary x)])
=> [100 200]
```

SEE ALSO

[deftype](#)

Defines a new custom record type for the name with the fields.

[deftype?](#)

Returns true if type is a custom type else false.

[deftype-of](#)

Defines a new custom wrapper type based on a base type.

[deftype-or](#)

Defines a new custom choice type.

[deftype-describe](#)

Describes a custom type.

Object

Defines a protocol to customize the `toString` and/or the `compareTo` function of custom datatypes.

Definition:

```
(defprotocol Object
  (toString [this] (to-str false this))
  (compareTo [this other] (compare this other)))
```

`compareTo` returns a negative integer, zero, or a positive integer as *this* value is less than, equal to, or greater than the *other* value.

```
(do
  (deftype :point [x :long, y :long]
    Object
    (toString [this] (str/format "[%s %s]" (:x this) (:y this)))
    (compareTo [self other] (. (:x self) :compareTo (:x other))))

  ; custom `toString`
  (println "toString:" (point. 1 2))

  ; custom `compareTo`: sort by 'x' ascending
  (println "compareTo:"
    (sort [(point. 2 100) (point. 3 101) (point. 1 102)])))
toString: [1 2]
compareTo: [[1 102] [2 100] [3 101]]
=> nil
```

SEE ALSO

[defprotocol](#)

Defines a new protocol with the supplied function specs.

[deftype](#)

Defines a new custom record type for the name with the fields.

top

`[]`

Creates a vector.

```
[10 20 30]  
=> [10 20 30]
```

top

abs

`(abs x)`

Returns the absolute value of the number

```
(abs 10)  
=> 10
```

```
(abs -10)  
=> 10
```

```
(abs -10I)  
=> 10I
```

```
(abs -10.1)  
=> 10.1
```

```
(abs -10.12M)  
=> 10.12M
```

SEE ALSO

[sgn](#)
sgn function for a number.

[negate](#)
Negates x

top

accept-either

`(accept-either p p-other f)`

Returns a new promise that, when either this or the other given promise completeness normally, is executed with the corresponding result as argument to the supplied function f.

```
(-> (promise (fn [] (sleep 200) 200))  
    (accept-either (promise (fn [] (sleep 100) 100))
```

```
(fn [v] (println (+ v 1))))  
(deref))  
101  
=> nil
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

[then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

[then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

[then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

top

acopy

```
(acopy src src-pos dest dest-pos dest-len)
```

Copies an array from the `src` array, beginning at the specified position, to the specified position of the `dest` array. Returns the modified destination array

```
(acopy (long-array '(1 2 3 4 5)) 2 (long-array 20) 10 3)  
=> [0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 3, 4, 5, 0, 0, 0, 0, 0, 0, 0]
```

top

acquire

```
(acquire lock)
```

Acquires a lock, blocking until the lock is available.

```
(let [l (lock)]  
  (acquire l)  
  ;; do something
```

```
(release l))  
=> nil
```

SEE ALSO

[lock](#)

Creates a new lock object.

[try-acquire](#)

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

[release](#)

Releases a lock.

[locked?](#)

Returns true if the lock is in use else false.

[top](#)

add-tap

```
(add-tap f)
```

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via `tap>` .

This function may (briefly) block, and will never impede calls to `tap>` , but blocking indefinitely may cause tap values to be dropped.

Remember f in order to `remove-tap`

```
(add-tap println)  
=> nil
```

SEE ALSO

[remove-tap](#)

Remove f from the tap set.

[clear-taps](#)

Removes all tap sets.

[tap>](#)

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

[top](#)

add-watch

```
(add-watch ref key fn)
```

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

```
(do  
  (def x (agent 10))  
  (defn watcher [key ref old new]  
    (println "watcher: " key))  
  (add-watch x :test watcher))  
=> nil
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

agent

(agent state & options)

Creates and returns an agent with an initial value of state and zero or more options.

Options:

:error-handler handler-fn
:error-mode mode-keyword
:validator validate-fn

The `handler-fn` is called if an action throws an exception. It's a function taking two args the agent and the exception. The mode-keyword may be either `:continue` (the default) or `:fail`. The `validate-fn` must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the `validate-fn` should return false or throw an exception.

```
(do
  (def x (agent 100))
  (send x + 5)
  (sleep 100)
  (deref x))
=> 105
```

SEE ALSO

[send](#)

Dispatch an action to an agent. Returns the agent immediately.

[send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

[await](#)

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

[await-for](#)

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout ...

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[set-error-handler!](#)

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

[agent-error](#)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

[top](#)

agent-error

(agent-error agent)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns `nil` if the agent is not failed.

```
(do
  (def x (agent 100 :error-mode :fail))
  (send x (fn [n] (/ n 0)))
  (sleep 500)
  (agent-error x))
=> com.github.jlangch.venice.VncException: / by zero
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[set-error-handler!](#)

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

[agent-error-mode](#)

Returns the agent's error mode

[top](#)

agent-send-off-thread-pool-info

```
(agent-send-off-thread-pool-info)
```

Returns the thread pool info of the ThreadPoolExecutor serving agent send-off.

<i>core-pool-size</i>	the number of threads to keep in the pool, even if they are idle
<i>maximum-pool-size</i>	the maximum allowed number of threads
<i>current-pool-size</i>	the current number of threads in the pool
<i>largest-pool-size</i>	the largest number of threads that have ever simultaneously been in the pool
<i>active-thread-count</i>	the approximate number of threads that are actively executing tasks
<i>scheduled-task-count</i>	the approximate total number of tasks that have ever been scheduled for execution
<i>completed-task-count</i>	the approximate total number of tasks that have completed execution

```
(agent-send-off-thread-pool-info)
```

```
=> {:core-pool-size 0 :maximum-pool-size 2147483647 :current-pool-size 2 :largest-pool-size 2 :active-thread-count 0 :scheduled-task-count 10 :completed-task-count 10}
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

[top](#)

agent-send-thread-pool-info

```
(agent-send-thread-pool-info)
```

Returns the thread pool info of the ThreadPoolExecutor serving agent send.

<i>core-pool-size</i>	the number of threads to keep in the pool, even if they are idle
<i>maximum-pool-size</i>	the maximum allowed number of threads

<i>current-pool-size</i>	the current number of threads in the pool
<i>largest-pool-size</i>	the largest number of threads that have ever simultaneously been in the pool
<i>active-thread-count</i>	the approximate number of threads that are actively executing tasks
<i>scheduled-task-count</i>	the approximate total number of tasks that have ever been scheduled for execution
<i>completed-task-count</i>	the approximate total number of tasks that have completed execution

([agent-send-thread-pool-info](#))

```
=> {:core-pool-size 10 :maximum-pool-size 10 :current-pool-size 9 :largest-pool-size 9 :active-thread-count 0 :
scheduled-task-count 9 :completed-task-count 9}
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send](#)

Dispatch an action to an agent. Returns the agent immediately.

[top](#)

aget

([aget](#) array idx)

Returns the value at the index of an array of Java Objects

```
(aget (long-array '(1 2 3 4 5)) 1)
=> 2
```

[top](#)

alength

([alength](#) array)

Returns the length of an array

```
(alength (long-array '(1 2 3 4 5)))
=> 5
```

[top](#)

all-of

([all-of](#) p & ps)

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, then the returned promise also does so. Otherwise, the results, if any, of the given promises are not reflected in the returned promise, but may be obtained by inspecting them individually.

```
(-> (all-of (promise (fn [] (sleep 100) 1))
           (promise (fn [] (sleep 100) 2))
           (promise (fn [] (sleep 500) 3)))
    (deref))
=> nil
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[any-of](#)

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

[top](#)

alter-ns-meta!

```
(alter-ns-meta! n f & args)
```

Alters the metadata for a namespace. `f` must be free of side-effects.

```
(do
  (ns foo)
  (alter-ns-meta! foo assoc :a 1))
=> {:a 1}

(do
  (ns foo)
  (def n 'foo)
  (alter-ns-meta! (var-get n) assoc :a 1)
  (pr-str (ns-meta (var-get n))))
=> "{:a 1}"
```

SEE ALSO

[ns-meta](#)

Returns the meta data of the namespace `n` or `nil` if `n` is not an existing namespace

[reset-ns-meta!](#)

Resets the metadata for a namespace

[ns](#)

Opens a namespace.

[top](#)

amap

```
(amap f arr)
```

Applies `f` to each item in the array `arr`. Returns a new array with the mapped values.

```
(str (amap (fn [x] (+ 1 x)) (long-array 6 0)))
=> "[1, 1, 1, 1, 1, 1]"
```

and

```
(and x)
(and x & next)
```

Ands the predicate forms

```
(and true true)
=> true
```

```
(and true false)
=> false
```

```
(and)
=> true
```

SEE ALSO

[or](#)

Ors the predicate forms

[not](#)

Returns true if x is logical false, false otherwise.

ansi/ansi

```
(ansi style)
```

Output an ANSI escape code using a style key.

If `*use-ansi*` is bound to false, outputs an empty string instead of an ANSI code.

```
(println (str (ansi/ansi :blue) "foo"))
```

```
(println (str (ansi/ansi :underline) "foo"))
```

```
(println (str (ansi/ansi (ansi/fg-color 33)) "foo"))
```

ansi/bg-color

```
(bg-color code)
(fg-color r g b)
```

Defines an extended background color from the 256-color extended color set. The code ranges from 0 to 255.

```
(ansi/bg-color 197)
```

SEE ALSO

[ansi/fg-color](#)

Defines an extended foreground color from the 256-color extended color set. The code ranges from 0 to 255.

[top](#)

ansi/fg-color

```
(fg-color code)
(fg-color r g b)
```

Defines an extended foreground color from the 256-color extended color set. The code ranges from 0 to 255.

The color range of a 256 color terminal consists of 4 parts in which case you actually get 258 colors:

- Color numbers 0 to 7 are the default terminal colors, the actual RGB value of which is not standardized and can often be configured.
- Color numbers 8 to 15 are the *bright* colors. Most of the time these are a lighter shade of the color with index - 8. They are also not standardized and can often be configured. Depending on terminal and shell, they are often used instead of or in conjunction with bold font faces.
- Color numbers 16 to 231 are RGB colors. These 216 colors are defined by 6 values on each of the three RGB axes. That is, instead of values 0 - 255, each color only ranges from 0 - 5.

The color number is then calculated like this

```
number = 16 + 36 * r + 6 * g + b
```

with `r`, `g` and `b` in the range 0 - 5.

- The color numbers 232 to 255 are grayscale with 24 shades of gray from dark to light.

```
(ansi/fg-color 197)
```

SEE ALSO

[ansi/bg-color](#)

Defines an extended background color from the 256-color extended color set. The code ranges from 0 to 255.

[top](#)

ansi/progress

```
(progress & options)
```

Returns a progress handler that renders the progress as a percentage string.

The returned progress handler takes two args:

- progress, a value 0..100 in :percent mode otherwise any value
- status, one of {start :progress :end :failed}

E.g: Download: 54%

Progress options:

:caption txt	A caption text. Defaults to empty.
:start-msg msg	A start message. Defaults to "{caption} started".
:end-msg msg	An end message. Defaults to "{caption} ok".
:end-col col	An end message ansi color code.

:failed-msg msg	A failed message. Defaults to "{caption} failed".
:failed-col col	A failed message ansi color code.
:mode m	A mode {;percent, :custom}. Defaults to :percent.

```
(let [pb (ansi/progress :caption "Test:")]
  (pb 0 :progress)
  (sleep 1 :seconds)
  (pb 50 :progress)
  (sleep 1 :seconds)
  (pb 100 :progress)
  (sleep 1 :seconds)
  (pb 100 :end))

(io/download "https://foo.org/image.png"
  :binary true
  :user-agent "Mozilla"
  :progress-fn (ansi/progress :caption "Download:"))
```

[top](#)

ansi/progress-bar

(progress-bar & options)

Returns a progress handler that renders a progress bar.

The returned progress handler takes two args:

- progress (0..100%)
- status {;start :progress :end :failed}

E.g:

- Download: [#####]
- Download: [#####] 70%

Progress bar options:

:caption txt	A caption text. Defaults to empty.
:width val	The width of the bar in chars. Defaults to 25.
:start-msg msg	A start message. Defaults to "{caption} started".
:end-msg msg	An end message. Defaults to "{caption} ok".
:end-col col	An end message ansi color code.
:failed-msg msg	A failed message. Defaults to "{caption} failed".
:failed-col col	A failed message ansi color code.
:show-percent bool	If true shows the percentage. Defaults to 'false'.

```
(let [pb (ansi/progress-bar
  :caption "Test:"
  :width 25
  :show-percent true)]
  (pb 0 :progress)
  (sleep 1 :seconds)
  (pb 50 :progress)
  (sleep 1 :seconds)
  (pb 100 :progress)
  (sleep 1 :seconds)
  (pb 100 :end))
```

```
(io/download "https://foo.org/image.png"
  :binary true
  :user-agent "Mozilla"
  :progress-fn (ansi/progress-bar
    :caption "Download:"
    :width 25
    :show-percent true))
```

[top](#)

ansi/style

```
(style text styles)
```

Applies ANSI color and style to a text string.

```
(println (ansi/style "foo" :green))

(println (ansi/style "foo" :green :underline))

(println (ansi/style "foo" :green :bg-yellow :underline))

(println (ansi/style "foo" (ansi/fg-color 21) (ansi/bg-color 221) :underline))

(println (ansi/style "foo" nil))
```

[top](#)

ansi/with-ansi

```
(with-ansi & forms)
```

Runs the given forms with the *use-ansi* variable temporarily bound to true, to enable the production of any ANSI color codes specified in the forms.

```
(ansi/with-ansi (println (ansi/style "foo" :green)))
```

[top](#)

ansi/without-ansi

```
(without-ansi & forms)
```

Runs the given forms with the *use-ansi* variable temporarily bound to false, to suppress the production of any ANSI color codes specified in the forms.

```
(ansi/without-ansi (println (ansi/style "foo" :green)))
```

[top](#)

ansi/without-cursor

(without-cursor & forms)

Runs the given forms with the cursor turned off.

[top](#)

any-of

(any-of p & ps)

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, the returned promise also does so.

```
(-> (any-of (promise (fn [] (sleep 300) 1))
           (promise (fn [] (sleep 100) 2))
           (promise (fn [] (sleep 500) 3)))
    (deref))
=> 2
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[all-of](#)

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

[top](#)

any-pred

(any-pred p1 & p)

Takes a set of predicates and returns a function f that returns the first logical true value returned by one of its composing predicates against any of its arguments, else it returns logical false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical true result against the original predicates.

```
((any-pred number?) 1)
=> true

((any-pred number?) 1 "a")
=> true

((any-pred number? string?) 2 "a")
=> true
```

[top](#)

any?

```
(any? pred coll)
```

Returns true if the predicate is true for at least one collection item, false otherwise.

```
(any? number? nil)
=> false
```

```
(any? number? [])
=> false
```

```
(any? number? [1 :a :b])
=> true
```

```
(any? number? [1 2 3])
=> true
```

```
(any? #(== % 10) [10 20 30])
=> true
```

```
(any? #(>= % 10) [1 5 10])
=> true
```

SEE ALSO

[every?](#)

Returns true if the predicate is true for all collection items, false otherwise.

[not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

[not-every?](#)

Returns false if the predicate is true for all collection items, true otherwise

[top](#)

app/build

```
(app/build name main-file file-map dest-dir)
```

Creates a Venice application archive that can be distributed and executed as a single file.

The archive is stored as: {dest-dir}/{name}.zip

Returns a map with information on the created archive:

```
{ "file"    "{dest-dir}/{name}.zip",
  "name"    "{name}" }
```

Build example:

```
/staging
├─ billing.venice
├─ utils
│   ├── util.venice
│   └─ render.venice
└─ data
    ├── bill.template
    └─ logo.jpg
```

With these staged files the archive is built as:

```
(app/build
  "billing"
  "billing.venice"
  { "billing.venice"      "/staging/billing.venice"
    "utils/util.venice"   "/staging/utils/util.venice"
    "utils/render.venice" "/staging/utils/render.venice"
    "data/bill.template"  "/staging/data/bill.template"
    "data/logo.jpg"      "/staging/data/logo.jpg" }
  ".")
```

Loading Venice files works relative to the application. You can only load files that are in the app archive. If for instances "billing.venice" in the above example requires "utils/render.venice" just add `(load-file "utils/render.venice")` to "billing.venice".

The app can be run from the command line as:

```
> java -jar venice-1.12.9.jar -app billing.zip
```

Venice reads the archive and loads the archive's main file.

Or with additional Java libraries (all JARs in 'libs' dir):

```
> java -cp "libs/*" com.github.jlangch.venice.Launcher -app billing.zip
```

[top](#)

app/manifest

```
(app/manifest app)
```

Returns the manifest of a Venice application archive as a map.

[top](#)

apply

```
(apply f args* coll)
```

Applies f to all arguments composed of args and coll

```
(apply + [1 2 3])
=> 6
```

```
(apply + 1 2 [3 4 5])
=> 15
```

```
(apply str [1 2 3 4 5])
=> "12345"
```

```
(apply inc [1])
=> 2
```

[top](#)

apply-to-either

```
(apply-to-either p p-other f)
```

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result as argument to the supplied function f.

```
(-> (promise (fn [] (sleep 200) 200))
    (apply-to-either (promise (fn [] (sleep 100) 100))
                     (fn [v] (+ v 1))))
(deref))
=> 101
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

as->

```
(as-> expr name & forms)
```

Binds name to expr, evaluates the first form in the lexical context of that binding, then binds name to that result, repeating for each successive form, returning the result of the last form. This allows a value to thread into any argument position.

; allows to use arbitrary positioning of the argument

```
(as-> [:foo :bar] v
    (map name v)
    (first v)
    (str/subs v 1))
=> "oo"
```

; allows the use of if statements in the thread

```
(as-> {:a 1 :b 2} m
    (update m :a #(+ % 10))
    (if true
      (update m :b #(+ % 10))
```

```
m))  
=> {:a 11 :b 12}
```

SEE ALSO

->

Threads the x through the forms. Inserts x as the second item in the first form, making a list of it if it is not a list already.

->>

Threads the x through the forms. Inserts x as the last item in the first form, making a list of it if it is not a list already. If ...

-<>

Threads the x through the forms. Inserts x at position of the <> symbol of the first form, making a list of it if it is not a list already.

```

[top](#)

atom

```
(atom x)
(atom x & options)
```

Creates an atom with the initial value x.

Options:

- :meta metadata-map
- :validator validate-fn

If metadata-map is supplied, it will become the metadata on the atom. validate-fn must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the validate-fn should return false or throw an exception.

```
(do
  (def counter (atom 0))
  (swap! counter inc)
  (deref counter))
=> 1
```

```
(do
  (def counter (atom 0))
  (reset! counter 9)
  @counter)
=> 9
```

SEE ALSO

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

[swap!](#)

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

[compare-and-set!](#)

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

[add-watch](#)

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

[remove-watch](#)

Removes a watch function from an agent/atom reference.

[top](#)

atom?

```
(atom? x)
```

Returns true if x is an atom, otherwise false

```
(do
  (def counter (atom 0))
  (atom? counter))
=> true
```

await

```
(await agents)
```

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

```
(do
  (def x1 (agent 100))
  (def x2 (agent {}))
  (send-off x1 + 5)
  (send-off x2 (fn [state]
                 (sleep 100)
                 (assoc state :done true))))
;; blocks till the agent actions are finished
(await x1 x2))
=> true
```

SEE ALSO

Creates and returns an agent with an initial value of state and zero or more options.

[await-for](#)

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout ...

await-for

```
(await-for timeout-ms agents)
```

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout (in milliseconds) has elapsed. Returns logical false if returning due to timeout, logical true otherwise.

```
(do
  (def x1 (agent 100))
  (def x2 (agent {}))
  (send-off x1 + 5)
  (send-off x2 (fn [state]
                 (sleep 100)
                 (assoc state :done true))))
;; blocks till the agent actions are finished
(await-for 500 x1 x2))
=> true
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[await](#)

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

await-termination-agents

(shutdown-agents)

Blocks until all actions have completed execution after a shutdown request, or the timeout occurs, or the current thread is interrupted, whichever happens first.

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (await-termination-agents 1000))
```

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

await-termination-agents?

(await-termination-agents?)

Returns true if all tasks have been completed following agent shut down

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (await-termination-agents 1000)
  (sleep 300)
  (await-termination-agents?))
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

bases

(bases class)

Returns the immediate superclass and interfaces of class, if any.

```
(bases :java.util.ArrayList)
=> (:java.util.AbstractList :java.util.List :java.util.RandomAccess :java.lang.Cloneable :java.io.Serializable)
```

[top](#)

benchmark/benchmark

```
(benchmark expr warmup-iterations iterations & options)
```

Benchmarks the given expression.

Note: All macros in the expression are expanded before running the benchmark phases.

Runs the benchmark in 4 phases:

1. Run the expression in a warm-up phase to allow the JIT compiler to do optimizations
2. Run the garbage collector to isolate timings from GC state prior to testing
3. Runs the expression benchmark
4. Analyzes and prints the benchmark statistics

Options:

:chart b If true generates a chart and saves it to 'benchmark.png'. Defaults to false.
:steps n the number of steps for the quantization, defaults to 100
:median b show the median value in the chart {true/false}, defaults to false
:outlier b show the outlier range in the chart {true/false}, defaults to false
:gc n the number of GC runs

```
(do
  (load-module :benchmark ['benchmark :as 'b])

  (b/benchmark (+ 1 2) 120000 10000)

  (b/benchmark (+ 1 2) 120000 10000 :chart true :median true)

  (b/benchmark (+ 1 2) 120000 10000 :chart true :outlier true)

  (b/benchmark (+ 1 2) 120000 10000 :chart true :steps 100))
```

[top](#)

bigint

```
(bigint x)
```

Converts to big integer.

```
(bigint 2000)
=> 2000N

(bbigint 34897.65)
=> 34897N

(bbigint "5676000000000")
=> 5676000000000N

(bbigint nil)
=> 0N
```

[top](#)

binding

```
(binding [bindings*] exprs*)
```

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

```
(do
  (binding [x 100]
    (println x)
    (binding [x 200]
      (println x))
    (println x)))
100
200
100
=> nil

;; binding-introduced bindings are thread-locally mutable:
(binding [x 1]
  (set! x 2)
  x)
=> 2

;; binding can use qualified names :
(binding [user/x 1]
  user/x)
=> 1
```

SEE ALSO

[def-dynamic](#)

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[top](#)

boolean

```
(boolean x)
```

Converts to boolean. Everything except 'false' and 'nil' is true in boolean context.

```
(boolean false)
=> false

(boolean true)
=> true

(boolean nil)
=> false

(boolean 100)
=> true
```

boolean?

```
(boolean? n)
```

Returns true if n is a boolean

```
(boolean? true)  
=> true
```

```
(boolean? false)  
=> true
```

```
(boolean? nil)  
=> false
```

```
(boolean? 0)  
=> false
```

bound?

```
(bound? s)
```

Returns true if the symbol is bound to a value else false

```
(bound? 'test)  
=> false
```

```
(let [test 100]  
  (bound? 'test))  
=> true
```

```
(do  
  (def a 100)  
  (bound? 'a))  
=> true
```

SEE ALSO

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[def](#)

Creates a global variable.

[defonce](#)

Creates a global variable that can not be overwritten

butlast

```
(butlast coll)
```

Returns a collection with all but the last list element

```
(butlast nil)  
=> nil
```

```
(butlast [])  
=> []
```

```
(butlast [1])  
=> []
```

```
(butlast [1 2 3])  
=> [1 2]
```

```
(butlast '())  
=> ()
```

```
(butlast '(1))  
=> ()
```

```
(butlast '(1 2 3))  
=> (1 2)
```

```
(butlast "1234")  
=> (#\1 #\2 #\3)
```

SEE ALSO

[str/butlast](#)

Returns a possibly empty string of the characters without the last.

[top](#)

byte-order

```
(byte-order)
```

Returns the CPU's byte order.

```
(byte-order)  
=> :big-endian
```

[top](#)

bytebuf

```
(bytebuf x)
```

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, a string

```
(bytebuf [0 1 2])  
=> [0 1 2]
```

```
(bytebuf '(0 1 2))  
=> [0 1 2]
```

```
(bytebuf "abc")  
=> [97 98 99]
```

SEE ALSO

[io/bytebuf-out-stream](#)

Returns a new `java.io.ByteArrayOutputStream`.

[top](#)

bytebuf-allocate

```
(bytebuf-allocate length)  
(bytebuf-allocate length init-val)
```

Allocates a new bytebuf. The values will be all zero or preset with `init-val` if `init-val` is supplied.

```
(bytebuf-allocate 20)  
=> [0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0]
```

```
(bytebuf-allocate 20 0x55)  
=> [20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20]
```

[top](#)

bytebuf-allocate-random

```
(bytebuf-allocate-random length)
```

Allocates a new bytebuf. The values will be all preset with randombytes

```
(bytebuf-allocate-random 20)  
=> [83 50 208 37 241 235 12 210 49 166 115 144 131 133 116 128 74 227 12 120]
```

[top](#)

bytebuf-byte-order

```
(bytebuf-byte-order buf endian)
```

Returns the bytebuf's byte order.

```
(bytebuf-byte-order (bytebuf-allocate 10))  
=> :big-endian
```

SEE ALSO

[bytebuf-byte-order!](#)

Sets the bytebuf's byte order.

[top](#)

bytebuf-byte-order!

```
(bytebuf-byte-order! buf endian)
```

Sets the bytebuf's byte order.

```
(-> (bytebuf-allocate 10)
    (bytebuf-byte-order! :big-endian)
    (bytebuf-byte-order))
=> :big-endian

(-> (bytebuf-allocate 10)
    (bytebuf-byte-order! :little-endian)
    (bytebuf-byte-order))
=> :little-endian
```

SEE ALSO

[bytebuf-byte-order](#)

Returns the bytebuf's byte order.

[top](#)

bytebuf-capacity

```
(bytebuf-capacity buf)
```

Returns the capacity of a bytebuf.

```
(bytebuf-capacity (bytebuf-allocate 100))
=> 100
```

SEE ALSO

[bytebuf-remaining](#)

Returns the number of bytes between the current position and the limit.

[bytebuf-limit](#)

Returns the limit of a bytebuf.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

[bytebuf-limit!](#)

Set a new limit for the buffer. The new limit must not be larger than the capacity.

[top](#)

bytebuf-ensure-free-capacity!

```
(bytebuf-ensure-capacity! buf capacity)
```

Ensure that the bytearray has a free capacity. Returns the widened bytearray.

[illegible]

SEE ALSO

bytebuf-remaining

Returns the number of bytes between the current position and the limit.

bytebuf-capacity

Returns the capacity of a bytearray.

bytebuf-limit

Returns the limit of a bytearray.

bytebuf-pos

Returns the buffer's current position.

bytebuf-limit!

Set a new limit for the buffer. The new limit must not be larger than the capacity.

top

bytebuf-from-string

```
(bytebuf-from-string s)
(bytebuf-from-string s encoding)
(bytebuf-from-string s encoding buf-length fillbyte)
```

Converts a string to a bytearray using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-from-string "abcdef")  
=> [97 98 99 100 101 102]
```

```
(bytebuf-from-string "abcdef" :UTF-8)
=> [97 98 99 100 101 102]
```

```
(bytebuf-from-string "abcdef" :UTF-8 16 0x00)
=> [97 98 99 100 101 102 0 0 0 0 0 0 0 0 0 0]
```

SEE ALSO

bytebuf-to-string

Converts a bytearray to a string using an optional encoding. The encoding defaults to :UTF-8

top

bytebuf-get-byte

```
(bytebuf-get-byte buf)
(bytebuf-get-byte buf pos)
```

Reads a byte from the buffer. Without a pos reads from the current position and increments the position by one. With a position reads the byte from that position.

```
(-> (bytebuf-allocate 4)
    (bytebuf-put-byte! 1)
    (bytebuf-put-byte! 2)
    (bytebuf-get-byte 0))
=> 11
```

[top](#)

bytebuf-get-double

```
(bytebuf-get-double buf)
(bytebuf-get-double buf pos)
```

Reads a double from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the double from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-double! 20.0)
    (bytebuf-put-double! 40.0)
    (bytebuf-get-double 0))
=> 20.0
```

[top](#)

bytebuf-get-float

```
(bytebuf-get-float buf)
(bytebuf-get-float buf pos)
```

Reads a float from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the float from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-float! 20.0)
    (bytebuf-put-float! 40.0)
    (bytebuf-get-float 0))
=> 20.0
```

[top](#)

bytebuf-get-int

```
(bytebuf-get-int buf)
(bytebuf-get-int buf pos)
```

Reads an integer from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the integer from that position.

```
(-> (bytebuf-allocate 8)
    (bytebuf-put-int! 1I)
    (bytebuf-put-int! 2I)
    (bytebuf-get-int 0))
=> 1I
```

[top](#)

bytebuf-get-long

```
(bytebuf-get-long buf)
(bytebuf-get-long buf pos)
```

Reads a long from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the long from that position.

```
(-> (bytebuf-allocate 16)
    (bytebuf-put-long! 20)
    (bytebuf-put-long! 40)
    (bytebuf-get-long 0))
=> 20
```

[top](#)

bytebuf-index-of

```
(bytebuf-index-of buf pattern)
(bytebuf-index-of buf pattern from-index)
(bytebuf-index-of buf pattern from-index to-index)
```

Returns the index within a byte buf of the first occurrence of the specified byte pattern.

The search is based on the Knuth-Morris-Pratt (KMP) pattern matching algorithm.

The KMP algorithm is an efficient method for finding the occurrence of a substring (a pattern) within a larger string (or in this case, a sequence of bytes)

```
(bytebuf-index-of (bytebuf [1 2 3 4 5]) (bytebuf [3 4]))
=> 2
```

```
(bytebuf-index-of (bytebuf [1 2 3 4 5 3 4]) (bytebuf [3 4]) 4)
=> 5
```

SEE ALSO

[bytebuf](#)

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, a string

[top](#)

bytebuf-limit

```
(bytebuf-limit buf)
```

Returns the limit of a bytearray.

```
(bytebuf-limit (bytebuf-allocate 100))  
=> 100
```

SEE ALSO

[bytebuf-remaining](#)

Returns the number of bytes between the current position and the limit.

[bytebuf-capacity](#)

Returns the capacity of a bytearray.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytearray has a free capacity. Returns the widened bytearray.

[bytebuf-limit!](#)

Set a new limit for the buffer. The new limit must not be larger than the capacity.

[top](#)

bytebuf-limit!

```
(bytebuf-limit! buf new-limit)
```

Set a new limit for the buffer. The new limit must not be larger than the capacity.

Returns the new limit of a bytearray.

```
(bytebuf-limit! (bytebuf-allocate 100) 50)  
=> 50
```

SEE ALSO

[bytebuf-remaining](#)

Returns the number of bytes between the current position and the limit.

[bytebuf-capacity](#)

Returns the capacity of a bytearray.

[bytebuf-limit](#)

Returns the limit of a bytearray.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytearray has a free capacity. Returns the widened bytearray.

[top](#)

bytebuf-merge

```
(bytebuf-merge buffers)
```

Merges bytebufs.

```
(bytebuf-merge (bytebuf [1 2]) (bytebuf [3 4]))  
=> [1 2 3 4]
```

SEE ALSO

[bytebuf](#)

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, a string

[top](#)

bytebuf-pos

```
(bytebuf-pos buf)
```

Returns the buffer's current position.

```
(bytebuf-pos (bytebuf-allocate 10))  
=> 0
```

SEE ALSO

[bytebuf-capacity](#)

Returns the capacity of a bytebuf.

[bytebuf-remaining](#)

Returns the number of bytes between the current position and the limit.

[bytebuf-limit](#)

Returns the limit of a bytebuf.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

[bytebuf-limit!](#)

Set a new limit for the buffer. The new limit must not be larger than the capacity.

[top](#)

bytebuf-pos!

```
(bytebuf-pos! buf pos)
```

Sets the buffer's position.

```
(-> (bytebuf-allocate 10)  
    (bytebuf-pos! 4)  
    (bytebuf-put-byte! 1)  
    (bytebuf-pos! 8)  
    (bytebuf-put-byte! 2))  
=> [0 0 0 0 1 0 0 0 2 0]
```

[top](#)

bytebuf-put-buf!

```
(bytebuf-put-buf! dst src src-offset length)
```

This method transfers bytes from the src to the dst buffer at the current position, and then increments the position by length.

```
(-> (bytebuf-allocate 10)
     (bytebuf-pos! 4)
     (bytebuf-put-buf! (bytebuf [1 2 3]) 0 2))
=> [0 0 0 0 1 2 0 0 0 0]
```

[top](#)

bytebuf-put-byte!

```
(bytebuf-put-byte! buf b)
```

Writes a byte to the buffer at the current position, and then increments the position by one.

```
(-> (bytebuf-allocate 4)
     (bytebuf-put-byte! 1)
     (bytebuf-put-byte! 2))
=> [1 2 0 0]
```

[top](#)

bytebuf-put-double!

```
(bytebuf-put-double! buf d)
```

Writes a double (8 bytes) to buffer at the current position, and then increments the position by eight.

```
(-> (bytebuf-allocate 16)
     (bytebuf-put-double! 64.0)
     (bytebuf-put-double! 200.0))
=> [64 80 0 0 0 0 0 0 64 105 0 0 0 0 0 0]
```

[top](#)

bytebuf-put-float!

```
(bytebuf-put-float! buf d)
```

Writes a float (4 bytes) to buffer at the current position, and then increments the position by four.

```
(-> (bytebuf-allocate 8)
     (bytebuf-put-float! 64.0)
     (bytebuf-put-float! 200.0))
=> [66 128 0 0 67 72 0 0]
```

[top](#)

bytebuf-put-int!

```
(bytebuf-put-int! buf i)
```

Writes an integer (4 bytes) to buffer at the current position, and then increments the position by four.

```
(-> (bytebuf-allocate 8)
     (bytebuf-put-int! 4I)
     (bytebuf-put-int! 8I))
=> [0 0 0 4 0 0 0 8]
```

[top](#)

bytebuf-put-long!

```
(bytebuf-put-long! buf l)
```

Writes a long (8 bytes) to buffer at the current position, and then increments the position by eight.

```
(-> (bytebuf-allocate 16)
     (bytebuf-put-long! 4)
     (bytebuf-put-long! 8))
=> [0 0 0 0 0 0 0 4 0 0 0 0 0 0 0 8]
```

[top](#)

bytebuf-remaining

```
(bytebuf-remaining buf)
```

Returns the number of bytes between the current position and the limit.

```
(bytebuf-capacity (bytebuf-allocate 100))
=> 100
```

SEE ALSO

[bytebuf-capacity](#)

Returns the capacity of a bytebuf.

[bytebuf-limit](#)

Returns the limit of a bytebuf.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

[bytebuf-limit!](#)

Set a new limit for the buffer. The new limit must not be larger than the capacity.

[top](#)

bytebuf-sub

(bytebuf-sub x start) (bytebuf-sub x start end)

Returns a byte buffer of the items in buffer from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count bytebuffer)

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 2)
=> [3 4 5 6]
```

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 4)
=> [5 6]
```

[top](#)

bytebuf-to-list

(bytebuf-to-list buf)

Returns the bytebuf as lazy list of integers

```
(doall (bytebuf-to-list (bytebuf [97 98 99])))
=> (97I 98I 99I)
```

[top](#)

bytebuf-to-string

(bytebuf-to-string buf)
(bytebuf-to-string buf encoding)

Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-to-string (bytebuf [97 98 99]) :UTF-8)
=> "abc"
```

SEE ALSO

[bytebuf-from-string](#)

Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8

[top](#)

bytebuf?

(bytebuf? x)

Returns true if x is a bytebuf

```
(bytebuf? (bytebuf [1 2]))
=> true

(bytebuf? [1 2])
=> false

(bytebuf? nil)
=> false
```

[top](#)

callstack

```
(callstack)
```

Returns the current callstack.

```
(do
  (defn f1 [x] (f2 x))
  (defn f2 [x] (f3 x))
  (defn f3 [x] (f4 x))
  (defn f4 [x] (callstack))
  (f1 100))
=> [{:fn-name "callstack" :file "example" :line 46 :col 18} {:fn-name "user/f4" :file "example" :line 45 :col 18}
{:fn-name "user/f3" :file "example" :line 44 :col 18} {:fn-name "user/f2" :file "example" :line 43 :col 18}
{:fn-name "user/f1" :file "example" :line 47 :col 5}]
```

[top](#)

cancel

```
(cancel f)
```

Cancels a future or a promise

```
(do
  (def wait (fn [] (sleep 400) 100))
  (let [f (future wait)]
    (sleep 50)
    (printf "After 50ms: cancelled=%b\n" (cancelled? f))
    (cancel f)
    (sleep 100)
    (printf "After 150ms: cancelled=%b\n" (cancelled? f))))
After 50ms: cancelled=false
After 150ms: cancelled=true
=> nil
```

SEE ALSO

[future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[done?](#)

Returns true if the future or promise is done otherwise false

cancelled?

Returns true if the future or promise is cancelled otherwise false

top

cancelled?

```
(cancelled? f)
```

Returns true if the future or promise is cancelled otherwise false

```
(cancelled? (future (fn [] 100)))  
=> false
```

SEE ALSO

future

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

done?

Returns true if the future or promise is done otherwise false

cancel

Cancels a future or a promise

top

cargo-arangodb/db-dump

```
(cargo-arangodb/db-dump cname db-name db-user db-passwd dump-name log)
```

Dumps an ArangoDB database.

The DB dump is written to container's directory `"/var/lib/arangodb3/{dump-name}"`. If the directory does not exist it is created automatically.

Example:

```
(do  
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])  
  
  ;; (cargo-arangodb/exists-db-dump? "db-test" "dump-001")  
  ;; (cargo-arangodb/remove-db-dump "db-test" "dump-001")  
  
  ;; Dump the 'people' database to 'dump-001'  
  (ca/db-dump "db-test" "people" "root" "xxx" "dump-001" nil))
```

Args:

cname	The container name
db-name	The name of the DB to dump
db-user	The DB user
db-passwd	The DB password
dump-name	The dump name. e.g "dump-001"
log	A log function, may be <i>nil</i> . E.g: <code>(fn [s] (println "ArangoDB:" s))</code>

Dumps an ArangoDB database using this commands on the container:

```
mkdir /var/lib/arangodb3/dump-001
```

```
arangodump
--output-directory /var/lib/arangodb3/dump-001
--overwrite true
--include-system-collections true
--server.database "people"
--server.endpoint tcp://127.0.0.1:8529
--server.username "root"
--server.password "xxx"
```

Open an interactive docker shell to check the dump:

```
docker exec -it {container-id} sh
```

ZIP a dump

```
docker exec -it {container-id}
zip -r
    /var/lib/arangodb3/dump-001.zip
    /var/lib/arangodb3/dump-001
```

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  (ca/db-dump "db-test" "people" "root" "xxx" "dump-001" nil))
```

SEE ALSO

[cargo-arangodb/db-restore](#)

Restores an ArangoDB database from a dump

[cargo-arangodb/exists-db-dump?](#)

Returns true if the dump with the given name exists otherwise false.

[cargo-arangodb/remove-db-dump](#)

Removes an existing DB dump.

[cargo-arangodb/download-db-dump](#)

Downloads an existing the DB dump 'dump-name' from the container to the local filesystem. The export directory in the local filesystem ...

[cargo-arangodb/upload-db-dump](#)

Uploads an existing DB dump with the name 'dump-name' from the local filesystem to the container. The import directory on local filesystem ...

[top](#)

cargo-arangodb/db-restore

```
(cargo-arangodb/db-restore cname db-name db-user db-passwd dump-name log)
```

Restores an ArangoDB database from a dump

The DB dump is read from container's directory "/var/lib/arangodb3/{dump-name}".

Example:

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  ;; (cargo-arangodb/exists-db-dump? "db-test" "dump-001")
  ;; (cargo-arangodb/remove-db-dump "db-test" "dump-001")

  ;; Restore the 'people' database from 'dump-001'
  (ca/db-restore "db-test" "people" "root" "xxx" "dump-001" nil))
```

Args:

cname	The container name
db-name	The name of the DB to dump
db-user	The DB user
db-passwd	The DB password
dump-name	The dump name. e.g "dump-001"
log	A log function, may be <i>nil</i> . E.g: <code>(fn [s] (println "ArangoDB:" s))</code>

Restores an ArangoDB database using this command on the container:

```
arangorestore
--input-directory /var/lib/arangodb3/dump-001
--force-same-database
--create-database true
--include-system-collections true
--server.database "people"
--server.endpoint tcp://127.0.0.1:8529
--server.username "root"
--server.password "xxx"
```

Open an interactive docker shell to check the dump:

```
docker exec -it {container-id} sh
```

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])
  (ca/db-restore "db-test" "people" "root" "xxx" "dump-001" nil))
```

[top](#)

cargo-arangodb/start

```
(cargo-arangodb/start cname version mapped-port root-passwd memory cores log)
(cargo-arangodb/start cname version volumes mapped-port root-passwd memory cores log)
```

Starts an ArangoDB container.

Start rules:

- If a container with another version exists for the container name remove the container and the image

- Pull the image if not yet locally available
- If the container already runs - use it
- If the container is available but does not run - start it `(docker/start ...)`
- If the container is not available - run it `(docker/run ...)`
- Finally check for a successful startup. The container log must contain the string *".is ready for business. Have fun."* on the last line.

Args:

cname	A unique container name
version	The ArangoDB version to use. E.g.: 3.11.4
mapped-port	The published (mapped) ArangoDB port on the host
root-passwd	The ArangoDB root password
memory	The detected memory ArangoDB is to use. E.g.: 8GB, 8000MB
cores	The detected number of cores ArangoDB is to use
log	A log function, may be <i>nil</i> . E.g: <code>(fn [s] (println "ArangoDB:" s))</code>

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  ;; Run an ArangoDB container labeled as "db-test"
  (ca/start "db-test" "3.11.4" 8500 "test" "8GB" 1 nil))
```

[top](#)

cargo-arangodb/upload-db-dump

```
(cargo-arangodb/upload-db-dump cname dump-name import-dir log)
```

Uploads an existing DB dump with the name 'dump-name' from the local filesystem to the container. The import directory on local filesystem must be an existing non empty directory.

Args:

cname	The container name
dump-name	The dump name
import-dir	The import dir. E.g.: <code>(io/file (io/user-home-dir) "dump")</code>
log	A log function, may be <i>nil</i> . E.g: <code>(fn [s] (println "ArangoDB:" s))</code>

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  ;; upload the dump to the container's filesystem

[top](#)

cargo-qdrant/running?

```
(cargo-qdrant/running? cname)
```

Returns true if a container with the specified name is running.

Args:

cname A unique container name

```
;; Test if Qdrant container is running
(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])
  (cq/running? "qdrant"))
```

SEE ALSO

[cargo-qdrant/logs](#)

Prints the Qdrant docker container logs

[cargo-qdrant/start](#)

Starts a Qdrant container.

[cargo-qdrant/stop](#)

Stops a Qdrant container

[top](#)

cargo-qdrant/start

```
(cargo-qdrant/start cname version storage-dir)
(cargo-qdrant/start cname version storage-dir config-file log)
(cargo-qdrant/start cname version mapped-rest-port mapped-grpc-port storage-dir config-file log)
```

Starts a Qdrant container.

Qdrant is vector database often used for LLM embeddings.

Telemetry reporting is disabled by setting the env variable QDRANT__TELEMETRY_DISABLED to `true` .

Start rules:

- If a container with another version exists for the container name remove the container and the image
- Pull the image if not yet locally available
- If the container already runs - use it
- If the container is available but does not run - start it `(docker/start ...)`
- If the container is not available - run it `(docker/run ...)`
- Finally check for a successful startup. The container log must contain the string *".is ready for business. Have fun."* on the last line.

Args:

cname	A unique container name
version	The Qdrant version to use. E.g.: 1.8.3
mapped-rest-port	The published (mapped) Qdrant REST port on the host. Defaults to 6333
mapped-grpc-port	The published (mapped) Qdrant GRPC port on the host. Defaults to 6334
storage-dir	Directory where Qdrant persists all the data.
config-file	An optional custom configuration yaml file
log	A log function, may be <i>nil</i> . E.g: <code>(fn [s] (println "Qdrant:" s))</code>

```
(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])

  ;; Run a Qdrant container labeled as "qdrant"
  (cq/start "qdrant" "1.8.3" "./qdrant-storage"))
```

SEE ALSO

[cargo-qdrant/stop](#)

[top](#)

cargo-qdrant/stop

```
(cargo-qdrant/stop cname)
(cargo-qdrant/stop cname log)
```

Stops a Qdrant container

Args:

cname A unique container name

```
(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])

  ;; Stop the Qdrant container labeled as "qdrant"
  (cq/stop "qdrant"))
```

SEE ALSO

[cargo-qdrant/start](#)

Starts a Qdrant container.

[cargo-qdrant/running?](#)

Returns true if a container with the specified name is running.

[top](#)

cargo/purge

(cargo/purge cname)

Removes a container and its image. The container must not be running.

Args:

cname A unique container name

```
;; Purge an ArangoDB container
(cargo/purge "arangodb-test")
```

SEE ALSO

[cargo/start](#)

Starts a container.

[cargo/stop](#)

Stops a container

[cargo/running?](#)

Returns true if a container with the specified name is running.

[top](#)

cargo/running?

(cargo/running? cname)

Returns true if a container with the specified name is running.

Args:

cname A unique container name

```
;; Test if ArangoDB container is running
(cargo/running? "arangodb-test")
```

SEE ALSO

[cargo/start](#)

Starts a container.

[cargo/stop](#)

Stops a container

[cargo/purge](#)

Removes a container and its image. The container must not be running.

[top](#)

cargo/start

```
(cargo/start cname repo version publish envs args ready? log)
(cargo/start cname repo version publish envs args ready? log wait-after-start-secs ready-check-max-secs)
```

Starts a container.

Start rules:

- If a container with the passed name exists or is running in another version, stop that container and remove it together with the image
- Pull the image if it is not yet locally available
- If the container runs with the requested version already - use it
- If the container is available but does not run - start it using `(docker/start ...)`
- If the container is not available - run it using `(docker/run ...)`
- Finally check for a successful startup using the supplied `ready?` function. E.g.: `ready?` may scan the container logs for a successful startup message.

Args:

<code>cname</code>	A unique container name
<code>repo</code>	The image repository
<code>version</code>	The image version
<code>publish</code>	Publish a container's ports to the host. To expose port 8080 inside the container to port 3000 outside the container, pass <code>["3000:8080"]</code>
<code>envs</code>	A vector of env variables
<code>vols</code>	A vector of volume mounts
<code>args</code>	A vector of arguments for the process run in the container
<code>ready?</code>	A function to decide if the container is ready (may be <i>nil</i>). The function takes the unique container name as its single argument. It returns true if the container is ready else false
<code>log</code>	A log function (may be <i>nil</i>). The function takes a single string argument
<code>wait-after-start-secs</code>	Wait n seconds after starting the container (may be <i>nil</i>)
<code>ready-check-max-secs</code>	Try max n seconds for ready check (defaults to 30s if <i>nil</i>)

```
;; Run an ArangoDB container
(cargo/start "arangodb-test"
  "arangodb/arangodb"
  "3.11.4"
  ["8500:8529"]
  ["ARANGO_ROOT_PASSWORD=test"
   "ARANGODB_OVERRIDE_DETECTED_TOTAL_MEMORY=8GB"
   "ARANGODB_OVERRIDE_DETECTED_NUMBER_OF_CORES=1"]
  []
  ["--server.endpoint tcp://0.0.0.0:8529"]
  (fn [cname]
    (-> (docker/container-logs cname :tail 1)
      (str/trim)
      (match? #".*is ready for business. Have fun.*"))))
  (fn [s] (println "ArangoDB:" s))
  3
  30)
```

SEE ALSO

[cargo/stop](#)

Stops a container

[cargo/running?](#)

Returns true if a container with the specified name is running.

[cargo/purge](#)

Removes a container and its image. The container must not be running.

[top](#)

[cargo/stop](#)

```
(cargo/stop cname log)
```

Stops a container

Args:

cname A unique container name

log A log function (may be *nil*). The function takes a single string argument

```
;; Stop an ArangoDB container
(cargo/stop "arangodb-test"
  (fn [s] (println "ArangoDB:" s)))
```

SEE ALSO

[cargo/start](#)

Starts a container.

[cargo/running?](#)

Returns true if a container with the specified name is running.

[cargo/purge](#)

Removes a container and its image. The container must not be running.

[top](#)

[cartesian-product](#)

```
(cartesian-product coll1 coll2 coll*)
```

Returns the cartesian product of two or more collections.

Removes all duplicates items in the collections before computing the cartesian product.

```
(cartesian-product [1 2 3] [1 2 3])
=> ((1 1) (1 2) (1 3) (2 1) (2 2) (2 3) (3 1) (3 2) (3 3))

(cartesian-product [0 1] [0 1] [0 1])
=> ((0 0 0) (0 0 1) (0 1 0) (0 1 1) (1 0 0) (1 0 1) (1 1 0) (1 1 1))
```

SEE ALSO

[combinations](#)

All the unique ways of taking n different elements from the items in the collection

[top](#)

[case](#)

(case expr & clauses)

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

```
(case (+ 1 9)
  10 :ten
  20 :twenty
  30 :thirty
  :dont-know)
=> :ten
```

SEE ALSO

[cond](#)

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the ...

[condp](#)

Takes a binary predicate, an expression, and a set of clauses.

[top](#)

cast

(cast class object)

Casts a Java object to a specific type

Note: Casting a Java object will change the object's *formal type*. See the [formal-type](#) function for detailed information.

```
(do
  (import :java.awt.Point)
  (import :java.awt.geom.Point2D)

  ;; upcasting :java.awt.Point to :java.awt.geom.Point2D
  ;; Point2D does not define the translate method!
  (let [p1 (. :Point :new 1.0 1.0)
        p2 (cast :Point2D p1)]
    (println "p1 ->" p1)
    (println "p2 ->" p2)
    (println "Formal type p1 ->" (formal-type p1))
    (println "Formal type p2 ->" (formal-type p2))
    (println "p1' ->" (doto p1 (. :translate 2.0 2.0)))
    ;; the translate method is not defined by Point2D
    ;; and will fail with a JavaMethodInvocationException!
    ;; (doto p2 (. :translate 2.0 2.0))
  ))
p1 -> java.awt.Point[x=1,y=1]
p2 -> java.awt.Point[x=1,y=1]
Formal type p1 -> :java.awt.Point
Formal type p2 -> :java.awt.geom.Point2D
p1' -> java.awt.Point[x=3,y=3]
=> nil
```

SEE ALSO

[formal-type](#)

Returns the formal type of a Java object.

[remove-formal-type](#)

Removes the formal type from a Java object.

class

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

ceil

(ceil x)

Returns the largest integer that is greater than or equal to x

```
(ceil 1.4)
=> 2.0
```

```
(ceil -1.4)
=> -1.0
```

```
(ceil 1.23M)
=> 2.00M
```

```
(ceil -1.23M)
=> -1.00M
```

SEE ALSO

[floor](#)

Returns the largest integer that is less than or equal to x

[top](#)

char

(char c)

Converts a number or s single char string to a char.

```
(char 65)
=> #\A
```

```
(char "A")
=> #\A
```

```
(long (char "A"))
=> 65
```

```
(str/join (map char [65 66 67 68]))
=> "ABCD"
```

```
(map #(- (long %) (long (char "0")))) (str/chars "123456")
=> (1 2 3 4 5 6)
```

SEE ALSO

[char?](#)

Returns true if s is a char.

top

char-escaped

(char-escaped c)

Returns the ASCII escaped character for c.

- \ ' single quote
- \ " double quote
- \ \ backslash
- \ n new line
- \ r carriage return
- \ t tab
- \ b backspace
- \ f form feed
- \ 0 null character
- in all other cases returns the character c

(char-escaped #\n)

=> #\newline

(char-escaped #\a)

=> #\a

SEE ALSO

[char](#)

Converts a number or s single char string to a char.

[char?](#)

Returns true if s is a char.

top

char-literals

(char-literals)

Returns all defined char literals.

Char Literal	Unicode	Char
#\space	\u0020	#\space
#\newline	\u000A	#\newline

cidr/in-range?

```
(cidr/in-range? ip cidr)
```

Returns true if the ip adress is within the ip range of the cidr else false. ip may be a string or a :java.net.InetAddress, cidr may be a string or a CIDR Java object obtained from 'cidr/parse'.

```
(cidr/in-range? "222.220.0.0" "222.220.0.0/11")
```

```
=> true
```

```
(cidr/in-range? (inet/inet-addr "222.220.0.0") "222.220.0.0/11")
```

```
=> true
```

```
(cidr/in-range? "222.220.0.0" (cidr/parse "222.220.0.0/11"))
```

```
=> true
```

top

cidr/insert

```
(cidr/insert trie cidr value)
```

Insert a new CIDR / value relation into trie. Works with IPv4 and IPv6. Please keep IPv4 and IPv6 CIDRs in different tries.

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24"))
```

```
      "Germany")
    (cidr/lookup trie "192.16.10.15"))
=> "Germany"
```

[top](#)

cidr/lookup

```
(cidr/lookup trie ip)
```

Lookup the associated value of a CIDR in the trie. A cidr "192.16.10.0/24" or an inet address "192.16.10.15" can be passed as ip.

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/lookup trie "192.16.10.15")))
=> "Germany"
```

[top](#)

cidr/lookup-reverse

```
(cidr/lookup-reverse trie ip)
```

Reverse lookup a CIDR in the trie given an IP address

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/lookup-reverse trie "192.16.10.15")))
=> 192.16.10.0/24: [/192.16.10.0 .. /192.16.10.255]
```

[top](#)

cidr/parse

```
(cidr/parse cidr)
```

Parses CIDR IP blocks to an IP address range. Supports both IPv4 and IPv6.

```
(cidr/parse "222.192.0.0/11")
=> 222.192.0.0/11: [/222.192.0.0 .. /222.223.255.255]
```

```
(cidr/parse "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")
=> 2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64: [/2001:db8:85a3:8d3:0:0:0:0 .. /2001:db8:85a3:8d3:ffff:ffff:ffff:ffff]
```

[top](#)

cidr/size

```
(cidr/size trie)
```

Returns the size of the trie.

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/size trie)))
=> 1
```

[top](#)

cidr/start-inet-addr

```
(cidr/start-inet-addr cidr)
```

Returns the start inet address of a CIDR IP block.

```
(cidr/start-inet-addr "222.192.0.0/11")
=> /222.192.0.0

(cidr/start-inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")
=> /2001:db8:85a3:8d3:0:0:0:0

(cidr/start-inet-addr (cidr/parse "222.192.0.0/11"))
=> /222.192.0.0
```

[top](#)

cidr/trie

```
(cidr/trie)
```

Create a new mutable concurrent CIDR trie.

```
(do
  (let [trie (cidr/trie)]
    (cidr/insert trie
      (cidr/parse "192.16.10.0/24")
      "Germany")
    (cidr/lookup trie "192.16.10.15")))
=> "Germany"
```

[top](#)

clamp

```
(clamp x min max)
```

Restricts a given value between a lower and upper bound. In this way, it acts like a combination of the `min` and `max` functions.

```
(clamp 1 10 20)  
=> 10
```

```
(clamp 1I 10I 20I)  
=> 10I
```

```
(clamp 1.0 10.0 20.0)  
=> 10.0
```

SEE ALSO

[min](#)

Returns the smallest of the values

[max](#)

Returns the greatest of the values

[top](#)

class

```
(class name)
```

Returns the Java class for the given name. Throws an exception if the class is not found.

```
(class :java.util.ArrayList)  
=> class java.util.ArrayList
```

SEE ALSO

[class-of](#)

Returns the Java class of a value.

[class-name](#)

Returns the Java class name of a class.

[class-version](#)

Returns the major version of a Java class.

[cast](#)

Casts a Java object to a specific type

[formal-type](#)

Returns the formal type of a Java object.

[remove-formal-type](#)

Removes the formal type from a Java object.

[top](#)

class-name

```
(class-name class)
```

Returns the Java class name of a class.

```
(class-name (class :java.util.ArrayList))  
=> "java.util.ArrayList"
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-of](#)

Returns the Java class of a value.

[class-version](#)

Returns the major version of a Java class.

[top](#)

class-of

```
(class-of x)
```

Returns the Java class of a value.

```
(class-of 100)  
=> class com.github.jlangch.venice.impl.types.VncLong
```

```
(class-of (. :java.awt.Point :new 10 10))  
=> class java.awt.Point
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-name](#)

Returns the Java class name of a class.

[class-version](#)

Returns the major version of a Java class.

[top](#)

class-version

```
(class-version class)
```

Returns the major version of a Java class.

Java major versions:

- Java 8 uses major version 52
- Java 9 uses major version 53
- Java 10 uses major version 54
- Java 11 uses major version 55
- Java 12 uses major version 56

- Java 13 uses major version 57
- Java 14 uses major version 58
- Java 15 uses major version 59

```
(class-version :com.github.jlangch.venice.Venice)
=> 52
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-of](#)

Returns the Java class of a value.

[class-name](#)

Returns the Java class name of a class.

[top](#)

classloader

```
(classloader)
(classloader type)
```

Returns the classloader.

```
;; Returns the current classloader
(classloader)
=> class sun.misc.Launcher$AppClassLoader

;; Returns the system classloader
(classloader :system)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the classloader which loaded the Venice classes
(classloader :application)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the thread-context classloader
(classloader :thread-context)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[classloader-of](#)

Returns the classloader of a value or a Java class.

[top](#)

classloader-of

```
(classloader-of x)
```

Returns the classloader of a value or a Java class.

Note:

Some Java VM implementations may use 'null' to represent the bootstrap class loader. This method will return 'nil' in such implementations if this class was loaded by the bootstrap class loader.

```
(classloader-of (class :java.awt.Point))  
=> nil
```

```
(classloader-of (. :java.awt.Point :new 10 10))  
=> nil
```

```
(classloader-of (class-of "abcdef"))  
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

```
(classloader-of "abcdef")  
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[classloader](#)

Returns the classloader.

[top](#)

clear-taps

```
(clear-taps)
```

Removes all tap sets.

```
(do  
  (add-tap prn)  
  (clear-taps))  
=> nil
```

SEE ALSO

[remove-tap](#)

Remove f from the tap set.

[add-tap](#)

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via tap>.

[tap>](#)

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

[top](#)

coalesce

```
(coalesce args*)
```

Returns nil if all of its arguments are nil, otherwise it returns the first non nil argument. The arguments are evaluated lazy.

```
(coalesce)
=> nil

(coalesce 2)
=> 2

(coalesce nil 1 2)
=> 1
```

[top](#)

coll?

```
(coll? coll)
```

Returns true if coll is a collection

```
(coll? {:a 1})
=> true

(coll? [1 2])
=> true
```

[top](#)

combinations

```
(combinations coll n)
```

All the unique ways of taking n different elements from the items in the collection

```
(combinations [0 1 2 3] 1)
=> ([0] [1] [2] [3])

(combinations [0 1 2 3] 2)
=> ([0 1] [0 2] [0 3] [1 2] [1 3] [2 3])

(combinations [0 1 2 3] 3)
=> ([0 1 2] [0 1 3] [1 2 3])

(combinations [0 1 2 3] 4)
=> ([0 1 2 3])
```

SEE ALSO

[cartesian-product](#)

Returns the cartesian product of two or more collections.

[top](#)

comment

```
(comment & body)
```

Ignores body, yields nil

```
(comment  
  (println 1)  
  (println 5))  
=> nil
```

[top](#)

comp

```
(comp f*)
```

Takes a set of functions and returns a fn that is the composition of those fns. The returned fn takes a variable number of args, applies the rightmost of fns to the args, the next fn (right-to-left) to the result, etc.

```
((comp str +) 8 8 8)  
=> "24"  
  
(map (comp - (partial + 3) (partial * 2)) [1 2 3 4])  
=> (-5 -7 -9 -11)  
  
((reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100)  
=> 207  
  
(filter (comp not zero?) [0 1 0 2 0 3 0 4])  
=> (1 2 3 4)  
  
(do  
  (def fifth (comp first rest rest rest rest))  
  (fifth [1 2 3 4 5]))  
=> 5
```

[top](#)

compare

```
(compare x y)
```

Comparator. Returns -1, 0, or 1 when x is logically 'less than', 'equal to', or 'greater than' y. For list and vectors the longer sequence is always 'greater' regardless of its contents. For sets and maps only the size of the collection is compared.

```
(compare nil 0)  
=> -1  
  
(compare 0 nil)  
=> 1  
  
(compare 1 0)  
=> 1
```

```
(compare 1 1)
=> 0

(compare 1M 2M)
=> -1

(compare 1 nil)
=> 1

(compare nil 1)
=> -1

(compare "aaa" "bbb")
=> -1

(compare [0 1 2] [0 1 2])
=> 0

(compare [0 1 2] [0 9 2])
=> -1

(compare [0 9 2] [0 1 2])
=> 1

(compare [1 2 3] [0 1 2 3])
=> -1

(compare [0 1 2] [3 4])
=> 1
```

[top](#)

compare-and-set!

```
(compare-and-set! atom oldval newval)
```

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set happened, else false.

```
(do
  (def counter (atom 2))
  (compare-and-set! counter 2 4)
  @counter)
=> 4
```

SEE ALSO

[atom](#)

Creates an atom with the initial value x.

[top](#)

complement

```
(complement f)
```

Takes a fn `f` and returns a fn that takes the same arguments as `f`, has the same effects, if any, and returns the opposite truth value.

```
(complement even?)  
=> anonymous-39763169-3474-4958-b541-a5527116ec65
```

```
(filter (complement even?) '(1 2 3 4))  
=> (1 3)
```

[top](#)

complete-on-timeout

```
(complete-on-timeout p value time time-unit)
```

Completes the promise with the given value if not otherwise completed before the given timeout.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))  
    (complete-on-timeout "The fox did not jump" 500 :milliseconds)  
    (deref))  
=> "The quick brown fox"
```

```
(-> (promise (fn [] (sleep 500) "The quick brown fox"))  
    (complete-on-timeout "The fox did not jump" 100 :milliseconds)  
    (deref))  
=> "The fox did not jump"
```

```
(-> (promise (fn [] (sleep 500) "The quick brown fox"))  
    (complete-on-timeout "The fox did not jump" 100 :milliseconds)  
    (then-apply str/upper-case)  
    (deref))  
=> "THE FOX DID NOT JUMP"
```

```
(-> (promise (fn [] (sleep 50) 100))  
    (complete-on-timeout 888 100 :milliseconds)  
    (then-apply #(do (sleep 200) (* % 3))))  
    (complete-on-timeout 999 220 :milliseconds)  
    (deref))  
=> 999
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

[then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

[then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

[then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[top](#)

component/Component

Defines a protocol for components.

Definition:

```
(defprotocol Component
  (start [component] component)
  (stop [component] component))
```

Function `start` :

Begins operation of this component. Synchronous, does not return until the component is started. Returns an updated version of this component.

Function `stop` :

Ceases operation of this component. Synchronous, does not return until the component is stopped. Returns an updated version of this component.

[top](#)

component/dep

```
(dep c k)
```

Returns a dependency given by its key 'k' from the component 'c' dependencies.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server []
    c/Component
    (start [this] (println "Store: " (c/dep this :store)) this)
    (stop [this] this))

  (deftype :database []
    c/Component
    (start [this] this)
    (stop [this] this))

  (defn create-system []
    (-> (c/system-map
        "test"
        :server (server. )
        :store (database. ))
      (c/system-using {:server [:store]})))
```

```

SEE ALSO

[component/dep](#)

Returns a dependency given by its key 'k' from the component 'c' dependencies.

[component/deps](#)

Returns the dependencies of the component 'c' or nil if there aren't any dependencies.

component/system-map

```
(system-map name keyval*)
```

Returns a system constructed of components given as key/value pairs. The 'key' is a `keyword` (the component's id) referencing the component given as 'value'.

The system has default implementations of the Lifecycle 'start' and 'stop' methods which recursively starts/stops all components in the system.

Note:

`system-map` just creates a raw system without any dependencies between the components. Use `system-using` after creating the system map to establish the dependencies.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server [port :long]
    c/Component
    (start [this] (println "server started") this))
```

```

    (stop [this] (println "server stopped") this))

(deftype :database [user      :string
                   password  :string]

  c/Component
  (start [this] (println "database started") this)
  (stop [this] (println "database stopped") this))

(c/system-map
 "test"
 :server (server. 4600)
 :store (database. "foo" "123"))

nil)

```

SEE ALSO

[component/system-using](#)

Associates a component dependency graph with the 'system' that has been created through a call to `system-map`. 'dependency-map' is a ...

top

component/system-using

```
(system-using system dependency-map)
```

Associates a component dependency graph with the 'system' that has been created through a call to `system-map`. 'dependency-map' is a map of keys to maps or vectors specifying the the dependencies of the component at that key in the system.

Throws an exception if a component dependency circle is detected.

The system is started and stopped calling the lifecycle `start` or `stop` method on the system component.

Upon succesfully starting a component the flag `{:started true}` is added to the component's meta data. It's up to the components lifecycle `start` method to decide what to do with multiple start requests. The lifecycle `start` method can for instance simply return the unaltered component if it has already been started.

Upon succesfully stopping a component the flag `{:started false}` is added to the component's meta data. It's up to the components lifecycle `stop` method to decide what to do with multiple stop requests. The lifecycle `stop` method can for instance simply return the unaltered component if it has not been started or has already been stopped.

```

(concatv {:a 1})
=> [[:a 1]]

(concatv {:a 1} {:b 2 :c 3})
=> [[:a 1] [:b 2] [:c 3]]

(concatv "abc")
=> [#\a #\b #\c]

(concatv "abc" "def")
=> [#\a #\b #\c #\d #\e #\f]
```

SEE ALSO

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[into](#)

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[top](#)

cond

(cond & clauses)

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the value of the corresponding expr and doesn't evaluate any of the other tests or exprs. (cond) returns nil.

```
(let [n 5]
  (cond
    (< n 0) "negative"
    (> n 0) "positive"
    :else "zero"))
=> "positive"
```

SEE ALSO

[condp](#)

Takes a binary predicate, an expression, and a set of clauses.

[case](#)

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

[top](#)

cond->

(cond-> expr & clauses)

Takes an expression and a set of test/form pairs. Threads expr (via ->) through each form for which the corresponding test expression is true. Note that, unlike cond branching, cond-> threading does not short circuit after the first true test expression.

It is useful in situations where you want selectively assoc, update, or dissoc something from a map.

```
(cond-> m
  (some-pred? q) (assoc :key :value))

(cond-> 1 ; we start with 1
  true inc ; the condition is true so (inc 1) => 2
  false (* 42) ; the condition is false so the operation is skipped
  (= 2 2) (* 3)) ; (= 2 2) is true so (* 2 3) => 6
=> 6
```

SEE ALSO

Takes an expression and a set of test/form pairs. Threads expr (via ->>) through each form for which the corresponding test expression ...

top

cond->>

(cond->> expr & clauses)

Takes an expression and a set of test/form pairs. Threads expr (via ->>) through each form for which the corresponding test expression is true. Note that, unlike cond branching, cond->> threading does not short circuit after the first true test expression.

```
(cond->> 1      ; we start with 1
  true inc    ; the condition is true so (inc 1) => 2
  false (* 42) ; the condition is false so the operation is skipped
  (= 2 2) (* 3)) ; (= 2 2) is true so (* 3 2) => 6
=> 6
```

SEE ALSO

[cond->](#)

Takes an expression and a set of test/form pairs. Threads expr (via ->) through each form for which the corresponding test expression ...

top

condp

(condp pred expr & clauses)

Takes a binary predicate, an expression, and a set of clauses.

Each clause can take the form of either:

```
test-expr result-expr
test-expr :>> result-fn
```

Note :>> is an ordinary keyword.

For each clause, (pred test-expr expr) is evaluated. If it returns logical true, the clause is a match. If a binary clause matches, the result-expr is returned, if a ternary clause matches, its result-fn, which must be a unary function, is called with the result of the predicate as its argument, the result of that call being the return value of condp. A single default expression can follow the clauses, and its value will be returned if no clause matches. If no default expression is provided and no clause matches, a VncException is thrown.

```
(condp some [1 2 3 4]
  #{0 6 7} :>> inc
  #{4 5 9} :>> dec
  #{1 2 3} :>> #(* % 10))
=> 3
```

```
(condp some [-10 -20 0 10]
  pos? 1
  neg? -1
  (constantly true) 0)
=> 1
```

SEE ALSO

[cond](#)

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the ...

case

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

[top](#)

config/build

(build & parts)

Merges given configuration parts and returns it as a map.

Configuration parts:

- JSON classpath resource file
- JSON file
- Environment variables
- System properties

Example:

```
(do
  (load-module :config)

  (def cfg (config/build
    (config/env "java")
    (config/env-var "SERVER_PORT" [:http :port] "8080")))

  (println "home:" (-> cfg :11 :zulu :home))
  ; => home: /Library/Java/JavaVirtualMachines/zulu-11.jdk/Contents/Home

  (println "port:" (-> cfg :http :port))
  ; => port: 8080
```

```
;; -----
;; Example I) Configuration builder
(do
  (load-module :config ['config :as 'cfg])

  (cfg/build
    (cfg/resource "config-defaults.json" :key-fn keyword)
    (cfg/file "./config-local.json" :key-fn keyword)
    (cfg/env-var "SERVER_PORT" [:http :port])
    (cfg/env-var "SERVER_THREADS" [:http :threads])
    (cfg/property-var "MASTER_PWD" [:app :master-pwd])))

;; -----
;; Example II) Using configurations with the component module
(do
  (load-module :config ['config :as 'cfg])
  (load-module :component ['component :as 'cmp])

  ;; define the server component
  (deftype :server []
    cmp/Component
    (start [this]
      (let [config (cmp/dep this :config)
            port (get-in config [:server :port])]
        (println (cmp/id this) "started at port" port)
        this))
    (stop [this]
      (println (cmp/id this) "stopped"))
```

```

        this))

;; note that the configuration is a plain vanilla Venice map and
;; does not implement the protocol 'Component'
(defn create-system []
  (-> (cmp/system-map
        "test"
        :config (cfg/build
                  (cfg/env-var "SERVER_PORT" [:server :port] "8800"))
        :server (server. ))
      (cmp/system-using
        {:server [:config]})))

(-> (create-system)
    (cmp/start)
    (cmp/stop))

nil)

```

[config/property-var](#)

Reads a configuration value from an system property and associates it to the given path in a map.

[config/env](#)

Reads configuration part from environment variables, filtered by a prefix. nil may passed as prefix to get env vars.

[config/build](#)

Merges given configuration parts and returns it as a map.

top

config/file

```
(file f)
(file f reader-opts)
```

Reads a JSON configuration part from given file `f`.

`f` may be a:

- string file path, e.g: `"/temp/foo.json"`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`
- `java.io.Reader`
- `java.net.URL`
- `java.net.URI`

The optional 'reader-opts' are defined by `json/read-str`.

E.g.: `:key-fn keyword` will convert all config keys to keywords

```
(config/file "/foo/app/config-production.json" :key-fn keyword)

(do
  (def cfg-json ""
    { "db" : {
      "classname" : "com.mysql.jdbc.Driver",
      "subprotocol" : "mysql",
      "subname" : "//127.0.0.1:3306/test",
      "user" : "test",
      "password" : "123"
    }
    }
    "")
  (-> (io/buffered-reader cfg-json)
    (config/file :key-fn keyword)))
```

=> {:a 1 :b 2 :c 3}
```

```
(cons! 1 (stack))
=> (1)
```

```
(cons! 1 (queue))
=> (1)
```

constantly

```
(constantly x)
```

Returns a function that takes any number of arguments and returns always the value x.

```
(do
  (def fix (constantly 10))
  (fix 1 2 3)
  (fix 1)
  (fix ))
=> 10
```

SEE ALSO

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

contains?

```
(contains? coll key)
```

Returns true if key is present in the given collection, otherwise returns false.

Note: To test if a value is in a vector or list use `any?`

```
(contains? #{:a :b} :a)
=> true
```

```
(contains? {:a 1 :b 2} :a)
=> true
```

```
(contains? [10 11 12] 1)
=> true
```

```
(contains? [10 11 12] 5)
=> false
```

```
(contains? "abc" 1)
=> true
```

```
(contains? "abc" 5)
=> false
```

SEE ALSO

[not-contains?](#)

Returns true if key is not present in the given collection, otherwise returns false.

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[top](#)

count

```
(count coll)
```

Returns the number of items in the collection. `(count nil)` returns 0. Also works on strings, and Java Collections

```
(count {:a 1 :b 2})
=> 2
```

```
(count [1 2])
=> 2
```

```
(count "abc")
=> 3
```

[top](#)

cpus

(cpus)

Returns the number of available processors or number of hyperthreads if the CPU supports hyperthreads.

(cpus)

=> 8

top

crypt/add-bouncy-castle-provider

(crypt/add-bouncy-castle-provider

Adds the BouncyCastle provider to the Java security.

```
(do
  (load-module :crypt)
  (crypt/add-bouncy-castle-provider))
```

SEE ALSO

[crypt/provider?](#)

Returns true if the Java security provider with name exists, else false.

top

crypt/ciphers

(crypt/ciphers)
(crypt/ciphers opt)

Returns a list of the ciphers the Java VM supports

Argument opt

:default returns the names of the cipher suites which are enabled by default.

:available returns the names of the cipher suites which could be enabled for use on an SSL connection created by this `SSLServerSocketFactory`.

```
(do
  (load-module :crypt)
  (crypt/ciphers :default))
```

```
(do
  (load-module :crypt)
  (crypt/ciphers :available))
```

```
(do
  (load-module :crypt)
  (docoll println (crypt/ciphers :available)))
```

top

crypt/decrypt

(crypt/decrypt algorithm passphrase & options)

Returns a new thread safe function to decrypt a string or a bytebuf given the algorithm and passphrase. If a string is passed it is base64 decoded, decrypted, and returned as string. If a bytebuf is passed the decrypted bytebuf is returned.

Supported algorithms: DES, 3DES, AES256

Options:

:url-safe The boolean option directs the base64 decoder to decode standard or URL safe base64 encoded strings. If enabled (true) the base64 decoder will convert '-' and '_' characters back to '+' and '/' before decoding.
Defaults to false.

:salt An optional salt. A bytebuf or a string.
DES and 3DES require exactly 8 bytes, AES256 1 or more bytes

```
(do
  (load-module :crypt)
  (def encrypt (crypt/encrypt "AES256" "secret" :url-safe true))
  (def decrypt (crypt/decrypt "AES256" "secret" :url-safe true))
  (encrypt "hello") ; => "e4m1qe6Fyx3Rr7NTIZe97g=="
  (decrypt "e4m1qe6Fyx3Rr7NTIZe97g==") ; => "hello"
  (encrypt (bytebuf [128 216 205]))) ; => [43 195 99 118 231 225 142 76 132 194 129 237 158 12 12 203]
=> [43 195 99 118 231 225 142 76 132 194 129 237 158 12 12 203]
```

```
(do
  (load-module :crypt)
  (def encrypt (crypt/encrypt "AES256" "secret" :salt "salty"))
  (def decrypt (crypt/decrypt "AES256" "secret" :salt "salty"))
  (-> "hello"
    (encrypt)
    (decrypt)))
=> "hello"
```

SEE ALSO

[crypt/encrypt](#)

Returns a new thread safe function to encrypt a string or a bytebuf given the algorithm and passphrase. If a string is passed it is ...

[top](#)

crypt/decrypt-file

(crypt/decrypt-file algorithm passphrase in)
(crypt/decrypt-file algorithm passphrase in out)

Decrypts an encrypted file that has been created by `crypt/encrypt-file`.

Returns a byte buffer with the decrypted data if the 'out' argument is missing. Otherwise returns nil and writes the decrypted file data to the destination given by 'out'.

The arg 'algorithm' is one of: "AES256-GCM", "AES256-CBC", "ChaCha20"

The arg 'in' may be a:

- string file path, e.g: "/temp/foo.json"
- bytebuf
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

- `java.io.InputStream`

The arg 'out' may be a:

- string file path, e.g: `"/temp/foo.json"`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.OutputStream`

```
(do
  (load-module :crypt)
  (let [file-in    (io/temp-file "test-", ".data")
        file-out   (io/temp-file "test-", ".data.enc")
        passphrase "42"]
    (io/delete-file-on-exit file-in file-out)
    (io/spit file-in "1234567890")

=> "1234567890"
```

SEE ALSO

[crypt/encrypt-file](#)

Encrypts a file.

top

crypt/encrypt

(crypt/encrypt algorithm passphrase & options)

Returns a new thread safe function to encrypt a string or a bytebuf given the algorithm and passphrase. If a string is passed it is encrypted and returned as a base64 encoded string. If a bytebuf is passed the encrypted bytebuf is returned.

Supported algorithms: "DES", "3DES", "AES256"

Options:

:url-safe	The boolean option directs the base64 encoder to emit standard or URL safe base64 encoded strings. If <code>true</code> the base64 encoder will emit '-' and '_' instead of the usual '+' and '/' characters. Defaults to false. Note: no padding is added when encoding using the URL-safe alphabet.
:salt	An optional salt. A bytebuf or a string. DES and 3DES require exactly 8 bytes, AES256 1 or more bytes

```
(do
  (load-module :crypt)
  (def encrypt (crypt/encrypt "3DES" "secret" :url-safe true))
  (encrypt "hello") ; => "ndmW1NLsDHA="
  (encrypt "world") ; => "KPYjndkZ8vM="
  (encrypt (bytebuf [1 2 3 4]))) ; => [128 216 205 163 62 43 52 82]
=> [128 216 205 163 62 43 52 82]
```

```
(do
  (load-module :crypt)
  (def encrypt (crypt/encrypt "3DES" "secret" :url-safe true :salt "salty"))
  (encrypt "hello") ; => "3MrQGcgbv00="
```

```
(encrypt "world") ; => "a6UyBZUnK4I="
(encrypt (bytebuf [1 2 3 4])) ; => [86 66 56 135 239 120 10 150]
=> [86 66 56 135 239 120 10 150]
```

[top](#)

crypt/encrypt-file

```
(crypt/encrypt-file algorithm passphrase in)
(crypt/encrypt-file algorithm passphrase in out)
```

Encrypts a file.

Returns a byte buffer with the encrypted data if the 'out' argument is missing. Otherwise returns nil and writes the encrypted file data to the destination given by 'out'.

Supported algorithms:

- AES256-GCM ¹
- AES256-CBC ²
- ChaCha20 ³
- ChaCha20-BC ⁴

¹ Recommended by NIST

² AES256-CBC is regarded as a broken or risky cryptographic algorithm (CWE-327, CWE-328). Use AES256-GCM in production!

³ 256 bit key, only available with Java 11+

⁴ 256 bit key, only available with BouncyCastle libraries but works with Java 8+

Warning: files encrypted with ChaCha20 cannot be decrypted by ChaCha20-BC (and vice versa) due to different initial counter handling and the IV size (96bit vs 64bit)

The ChaCha family of ciphers are an order of magnitude more efficient on servers that do not provide hardware acceleration. Apple Silicon does not seem to have AES hardware acceleration probably due to its RISC nature.

The arg 'in' may be a:

- string file path, e.g: "/temp/foo.json"
- bytebuf
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`

The arg 'out' may be a:

- string file path, e.g: "/temp/foo.json"
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.OutputStream`

The 256 bit encryption key is derived from the passphrase using a *PBKDF2WithHmacSHA256* secret key factory with a 16 byte random salt and 65536 iterations. Carefully choose a long enough passphrase.

Salt, *IV*, *Nonce* and/or *Counter* are random and unique for every call of `crypt/encrypt-file`.

While encrypting a file the random *Salt* (when a passphrase is used), *IV*, *Nonce* and/or *Counter* are written to the start of the encrypted file and read before decrypting the file:

AES256-GCM	AES256-CBC	ChaCha20
AES/GCM/NoPadding	AES/CBC/PKCS5Padding	

+-----+	+-----+	+-----+
salt (16)	salt (16)	salt (16)
+-----+	+-----+	+-----+
iv (12)	iv (12)	nonce (12)
+-----+	+-----+	+-----+
data (n)	data (n)	counter (4)
+-----+	+-----+	+-----+
		data (n)
		+-----+

```
(do

SEE ALSO

[crypt/decrypt-file](#)

Decrypts an encrypted file that has been created by `crypt/encrypt-file`.

top

crypt/hash-file

(crypt/hash-file algorithm salt file)

Computes a hash for a file. The hash is used together with the function `crypt/verify-file-hash` to detect file modifications.

Returns the hash Base64 encoded.

The functions uses the fast MD5 hash algorithm.

The arg 'file' may be a:

- string file path, e.g: `"/temp/foo.json"`
- bytebuf
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`

Supported hash algorithms:

- MD5 (default)
- SHA-1
- SHA-512

MD5 is the fastest hash algorithm and precise enough to detect file changes.

```
(do
  (load-module :crypt)
  (let [file (io/temp-file "test-", ".data")
        data (bytebuf-allocate-random 1000)]
    (io/delete-file-on-exit file)
    (io/spit file data)
    (crypt/hash-file "SHA-256" "-salt-" file)))
=> "m36bdmB2fE3YZsQ3VXFkJTKSBkfzeZVSvybQv01uWkg="
```

SEE ALSO

[crypt/verify-file-hash](#)

Verifies a file against a hash (Base64 encoded). Returns true if the file's actual hash is equal to the given hash otherwise false.

top

crypt/max-key-size

```
(crypt/max-key-size algorithm)
```

Returns the max allowed key size

```
(do
  (load-module :crypt)
  (crypt/max-key-size "AES"))
=> 2147483647I
```

top

crypt/md5-hash

```
(crypt/md5-hash data)
(crypt/md5-hash data salt)
```

Hashes a string or a bytebuf using MD5 with an optional salt.

Note: MD5 is not safe any more use PBKDF2 to hash passwords!

```
(> (crypt/md5-hash "hello world")
   (str/bytebuf-to-hex :upper))
=> "5EB63BBE01EEED093CB22BB8F5ACDC3"
```

```
(> (crypt/md5-hash "hello world" "-salt-")

[top](#)

crypt/verify-file-hash

```
(crypt/verify-file-hash algorithm salt file hash)
```

Verifies a file against a hash (Base64 encoded). Returns true if the file's actual hash is equal to the given hash otherwise false.

The arg 'file' may be a:

- string file path, e.g: `"/temp/foo.json"`
- `bytebuf`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`

Supported hash algorithms:

- MD5
- SHA-1
- SHA-512

Warning: The MD5 hash function's security is considered to be severely compromised. Collisions can be found within seconds, and they can be used for malicious purposes.

```
(do
  (load-module :crypt)
  (let [file (io/temp-file "test-", ".data")
        data (bytebuf-allocate-random 1000)
        salt "salt"]
    (io/delete-file-on-exit file)
    (io/spit file data)
    (let [hash (crypt/hash-file "SHA-256" "-salt-" file)]
      (crypt/verify-file-hash "SHA-256" "-salt-" file hash))))
=> true
```

SEE ALSO

[crypt/hash-file](#)

Computes a hash for a file. The hash is used together with the function `crypt/verify-file-hash` to detect file modifications.

[top](#)

csv/read

`(csv/read source & options)`

Reads CSV-data from a source.

The source may be a:

- `string`
- `bytebuf`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`, `
- `java.io.InputStream`
- `java.io.Reader`

Options:

<code>:encoding enc</code>	used when reading from a binary data source e.g <code>:encoding :utf-8</code> , defaults to <code>:utf-8</code>
<code>:separator val</code>	e.g. <code>","</code> , defaults to a comma
<code>:quote val</code>	e.g. <code>""</code> , defaults to a double quote

```
(csv/read ""1,"ab",false"")
=> (("1" "ab" "false"))

(csv/read "1||'|ab'|false" :separator "|" :quote "'")
=> (("1" nil nil "ab" "false"))
```

[top](#)

csv/write

(csv/write sink records & options)

Spits data to a sink in CSV format.

The sink may be a:

- `java.io.File`, e.g. `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.OutputStream`
- `java.io.Writer`

Options:

:separator val e.g. ",", defaults to a comma

:quote val e.g. "\"", defaults to a double quote

:newline val :lf (default) or :cr+lf

:encoding enc used when writing to a binary data sink. e.g. :encoding :utf-8, defaults to :utf-8

```
(csv/write (io/file "test.csv") [[1 "AC" false] [2 "WS" true]])
```

[top](#)

csv/write-str

(csv/write-str records & options)

Writes data to a string in CSV format.

All fields containing a quote char, a separator char or a newline are quoted.

Options:

:separator val e.g. ",", defaults to a comma

:quote val e.g. "\"", defaults to a double quote

:newline val :lf (default) or :cr+lf

```
(csv/write-str [[1 "AC" false] [2 "WS" true]])
=> "1,AC,false\n2,WS,true"
```

```
(csv/write-str [[1 "AC" false] [2 "WS, '-1'" true]]
                :quote "\""
                :separator ","
                :newline :cr+lf)
=> "1,AC,false\r\n2,'WS, '-1'',true"
```

current-time-millis

```
(current-time-millis)
```

Returns the current time in milliseconds.

```
(current-time-millis)
=> 1712386039029
```

SEE ALSO

[nano-time](#)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

cycle

```
(cycle coll)
```

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

```
(doall (take 5 (cycle [1 2])))
=> (1 2 1 2 1)
```

SEE ALSO

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

dag/add-edges

```
(add-edges edges*)
```

Add edges to a DAG. Returns a new DAG with added edges.

An edge is a vector of two nodes forming a parent/child relationship. Any *Venice* value can be used for a node.

Note: The graph is reconstructed after adding edges. To have best performance pass the edges with a single `add-edges` call to the DAG.

```
(dag/add-edges (dag/dag) ["A" "B"] ["B" "C"])
=> (["A" "B"] ["B" "C"])
```

(defn- sum [x y] (+ x y))  
=> user/sum
```

SEE ALSO

defn

Same as `(def name (fn name [args*] condition-map? expr*))` or `(def name (fn name ([args*] condition-map? expr*)+))`

fn

Defines an anonymous function.

def

Creates a global variable.

top

defonce

```
(defonce name expr)
```

Creates a global variable that can not be overwritten

```
(defonce x 5)  
=> user/x
```

```
(defonce ^{:private true} x 5)  
=> user/x
```

SEE ALSO

def

Creates a global variable.

def-dynamic

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

top

defprotocol

```
(defprotocol protocol fn-spec*)
```

Defines a new protocol with the supplied function specs.

Formats:

- `(defprotocol P (foo [x]))`
- `(defprotocol P (foo [x] [x y]))`
- `(defprotocol P (foo [x] [x y] nil))`
- `(defprotocol P (foo [x] [x y] 100))`
- `(defprotocol P (foo [x]) (bar [x] [x y]))`

```
(do
  (ns foo)
  (deftype :complex [re :long, im :long])
  (defprotocol XMath (+ [x y]
                       (- [x y]))
    (extend :foo/complex XMath
      (+ [x y] (complex. (core/+ (:re x) (:re y))
                          (core/+ (:im x) (:im y))))
      (- [x y] (complex. (core/- (:re x) (:re y))
                          (core/- (:im x) (:im y)))))

    (extend :core/long XMath
      (+ [x y] (core/+ x y))
      (- [x y] (core/- x y)))
    (foo/+ (complex. 1 1) (complex. 4 5)))
=> {:custom-type* :foo/complex :re 5 :im 6}
```

```
(do
  (ns foo)
  (defprotocol Lifecycle (start [c]) (stop [c]))
  (deftype :component [name :string]
    Lifecycle (start [c] (println "'~(:name c)' started"))
              (stop [c] (println "'~(:name c)' stopped")))
  (let [c (component. "test")
        lifecycle? (extends? (type c) Lifecycle)]
    (println "'~(:name c)' extends Lifecycle protocol: ~{lifecycle?}")
    (start c)
    (stop c)))
'test' extends Lifecycle protocol: true
'test' started
'test' stopped
=> nil
```

SEE ALSO

[extend](#)

Extends protocol for type with the supplied functions.

[extends?](#)

Returns true if the type extends the protocol.

[defmulti](#)

Creates a new multimethod with the associated dispatch function.

[top](#)

deftype

```
(deftype name fields)
```

```
(deftype name fields validator)
```

Defines a new custom *record* type for the name with the fields.

The optional validator is a single arg function receiving the value as the argument and throwing an an exception if the value is not valid.

Venice implicitly creates a builder and a type check function suffixed with a dot and a question mark:

```
(deftype :point [x :long, y :long])

(point. 200 300)           ; builder
(point? (point. 200 300)) ; type check
```

The builder accepts values of any subtype of the field's type.

Validation example:

```
(deftype :point
  [x :long, y :long]
  (fn [t]
    (assert (pos? (:x t)) "x must be positive!"))))
```

```
(do
  (ns foo)
  (deftype :point [x :long, y :long])
  ; explicitly creating a custom type value
  (def x (. :point 100 200))
  ; Venice implicitly creates a builder function
  ; suffixed with a '.'
  (def y (point. 200 300))
  ; ... and a type check function
  (point? y)
  y)
=> {:custom-type* :foo/point :x 200 :y 300}
```

```
(do
  (ns foo)
  (deftype :point [x :long, y :long])
  (def x (point. 100 200))
  (type x))
=> :foo/point
```

```
(do
  (ns foo)
  (deftype :point [x :long, y :long]
    (fn [p]
      (assert (pos? (:x p)) "x must be positive")
      (assert (pos? (:y p)) "y must be positive"))))
  (def p (point. 100 200))
  [(:x p) (:y p)])
=> [100 200]
```

```
(do
  (ns foo)
  (deftype :named [name :string, value :any])
  (def x (named. "count" 200))
  (def y (named. "seq" [1 2]))
  [x y])
=> [{:custom-type* :foo/named :name "count" :value 200} {:custom-type* :foo/named :name "seq" :value [1 2]}]
```

;; modifying a custom type field

```
(do
  (deftype :point [x :long, y :long])
  (def p (point. 0 0))
  (def q (assoc p :x 1 :y 2)) ; q is a 'point'
```

```

(pr-str q))
=> "{:custom-type* :user/point :x 1 :y 2}"

;; removing a custom type field
(do

[top](#)

delay

`(delay & body)`

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with `force` or `deref / @`), and will cache the result and return it on all subsequent force calls.

```
(do
  (def x (delay (println "working...") 100))
  (deref x))
working...
=> 100
```

SEE ALSO

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[force](#)

If x is a delay, returns its value, else returns x

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[delay?](#)

Returns true if x is a Delay created with delay

[memoize](#)

Returns a memoized version of a referentially transparent function.

[top](#)

delay-queue

`(delay-queue)`

Creates a new delay queue.

A delay-queue is an unbounded blocking queue of delayed elements, in which an element can only be taken when its delay has expired. The head of the queue is that delayed element whose delay expired furthest in the past. If no delay has expired there is no head and `poll!` will return nil. Unexpired elements cannot be removed using `take!` or `poll!`, they are otherwise treated as normal elements. For example, the `count` method returns the count of both expired and unexpired elements. This queue does not permit `nil` elements.

Example rate limiter:

```
(do
  (defprotocol RateLimiter (init [x]) (acquire [x]))

  (deftype :rate-limiter [queue                :core/delay-queue
                        limit-for-period      :long
                        limit-refresh-period :long]

    RateLimiter
    (init [this] (let [q (:queue this)
                      n (:limit-for-period this)]
                  (empty q)
                  (repeatedly n #(put! q :token 0))
                  this))
    (acquire [this] (let [q (:queue this)
                        p (:limit-refresh-period this)]
                     (take! q)
                     (put! q :token p))))

  ;; create a limiter with a limit of 5 actions within a 2s period
  (def limiter (init (rate-limiter. (delay-queue) 5 2000)))

  ;; test the limiter
  (doseq [x (range 1 26)]
    (acquire limiter)
    (printf "%s: run %2d%n" (time/local-date-time) x)))
```

```
(let [q (delay-queue)]
  (put! q 1 100)
  (put! q 1 200)
  (take! q))
=> 1
```

SEE ALSO

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

[take!](#)

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

[poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value `:indefinite`.

[empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[delay-queue?](#)

Returns true if coll is a delay-queue

delay-queue?

```
(delay-queue? coll)
```

Returns true if coll is a delay-queue

```
(delay-queue? (delay-queue))  
=> true
```

[top](#)

delay?

```
(delay? x)
```

Returns true if x is a Delay created with delay

```
(do

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[top](#)

deliver

```
(deliver ref value)
```

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

```
(do  
  (def p (promise))  
  (deliver p 10)  
  (deliver p 20) ; no effect  
  @p)  
=> 10
```

SEE ALSO

[deliver-ex](#)

Delivers the supplied exception to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

[promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[top](#)

deliver-ex

```
(deliver-ex ref ex)
```

Delivers the supplied exception to the promise, releasing any pending derefs. A subsequent call to `deliver` on a promise will have no effect.

```
(do
  (def p (promise))
  (deliver-ex p (ex :VncException "error"))
  (deliver p 20) ; no effect
  (try
    @p
    (catch :VncException e (ex-message e))))
=> "error"
```

SEE ALSO

[deliver](#)

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to `deliver` on a promise will have no effect.

[promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[top](#)

deref

```
(deref x)
(deref x timeout-ms timeout-val)
```

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will block if computation is not complete. The variant taking a timeout can be used for futures and will return `timeout-val` if the timeout (in milliseconds) is reached before a value is available. If a future is deref'd and the waiting thread is interrupted the futures are cancelled.

```
(do
  (def counter (atom 10))
  (deref counter))
=> 10

(do
  (def counter (atom 10))
  @counter)
=> 10

(deref? (just 100))  
=> true
```

[top](#)

difference

```
(difference s1)  
(difference s1 s2)  
(difference s1 s2 & sets)
```

Return a set that is the first set without elements of the remaining sets

```
(difference (set 1 2 3))  
=> #{1 2 3}  
  
(difference (set 1 2) (set 2 3))  
=> #{1}  
  
(difference (set 1 2) (set 1) (set 1 4) (set 3))  
=> #{2}
```

SEE ALSO

[union](#)

Return a set that is the union of the input sets

[intersection](#)

Return a set that is the intersection of the input sets

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[disj](#)

Returns a new set with the x, xs removed.

[top](#)

digits

```
(digits x)
```

Returns the number of digits of x. The number x must be of type integer, long, or bigint

```
(digits 124)  
=> 3
```

```
(digits -10)
=> 2

(digits 111111111111111111111111111111N)
=> 32
```

[top](#)

disj

```
(disj set x)
(disj set x & xs)
```

Returns a new set with the x, xs removed.

```
(disj (set 1 2 3) 3)
=> #{1 2}
```

[top](#)

dissoc

```
(dissoc coll key)
(dissoc coll key & ks)
```

Returns a new coll of the same type, that does not contain a mapping for key(s)

```
(dissoc {:a 1 :b 2 :c 3} :b)
=> {:a 1 :c 3}
```

```
(dissoc {:a 1 :b 2 :c 3} :c :b)
=> {:a 1}
```

```
(dissoc [1 2 3] 0)
=> [2 3]
```

```
(do
  (deftype :complex [real :long, imaginary :long])

                {:name "John" :age 43} ])
  (dissoc-in users [1 :age]))
=> [{:name "James" :age 26} {:name "John"}]
```

[top](#)

distinct

```
(distinct coll)
```

Returns a collection with all duplicates removed.
Returns a stateful transducer when no collection is provided.

```
(distinct [1 2 3 4 2 3 4])
=> [1 2 3 4]
```

```
(distinct '(1 2 3 4 2 3 4))  
=> (1 2 3 4)
```

SEE ALSO

[dedupe](#)

Returns a collection with all consecutive duplicates removed.

[distinct?](#)

Returns true if no two of the arguments are equal

[top](#)

distinct?

```
(distinct? x) (distinct? x y) (distinct? x y & more)
```

Returns true if no two of the arguments are equal

```
(distinct? 1 2 3)  
=> true
```

```
(distinct? 1 2 3 3)  
=> false
```

```
(distinct? 1 2 3 1)  
=> false
```

SEE ALSO

[distinct](#)

Returns a collection with all duplicates removed.

[top](#)

do

```
(do exprs)
```

Evaluates the expressions in order and returns the value of the last.

```
(do (println "Test...") (+ 1 1))  
Test...  
=> 2
```

[top](#)

doall

```
(doall coll)  
(doall n coll)
```

When lazy sequences are produced `doall` can be used to force any effects and realize the lazy sequence. Returns the realized items in a list!

```
(->> (lazy-seq #(rand-long 100))
      (doall 4))
=> (79 78 73 91)
```

Returns a new collection where x is the first element and coll is the rest.

```

```

[top](#)

docker/container-exec-by-name

```
(docker/container-exec-by-name name command)
```

Execute a command in the running container with the specified name (always in non detached mode).

Returns the captured stdout text if the command succeeds.

Throws `ShellException` if the command fails. The exception carries the exit code and the captured stderr text.

```
(docker/container-exec-by-name "myapp" "touch /tmp/execWorks")
```

SEE ALSO

[docker/container-exec-by-name&](#)

Execute a command in the running container with the specified name (always in detached mode).

[docker/run](#)

Create and run a new container from an image.

[docker/container-running-with-name?](#)

Checks if there is container with the specified name in 'running' state.

[docker/container-exec-by-name](#)

Execute a command in the running container with the specified name (always in non detached mode).

[docker/container-logs](#)

Returns the container logs.

[top](#)

docker/container-exec-by-name&

```
(docker/container-exec-by-name& name command)
```

Execute a command in the running container with the specified name (always in detached mode).

Returns always an empty string because the command is run in detached mode. To get the commands captured stdout text use `docker /container-exec-by-name` instead.

Throws a `ShellException` if the command fails. The `ShellException` carries the exit code, stdout, and stderr text.

```
(docker/container-exec-by-name& "myapp" "touch /tmp/execWorks")
```

SEE ALSO

Checks if there is container with the specified name in 'running' state.

[docker/container-stop-by-name](#)

Stops a container with the specified name.

[docker/container-remove-by-name](#)

Removes a container with the specified name.

[docker/container-status-by-name](#)

Returns the status of container with the specified name.

[docker/container-logs](#)

Returns the container logs.

[top](#)

docker/cp

(docker/cp src-path dst-path & options)

Copy files/folders between a container and the local filesystem

Options:

:archive {true, false}	Archive mode (copy all uid/gid information)
:follow-link {true, false}	Always follow symbol link in SRC_PATH
:quiet {true, false}	Suppress progress output during copy. Progress output is automatically suppressed if no terminal is attached

```
;; Copy file from host to docker container  
(docker/cp "data.txt" "74789744g489:/data.txt")
```

```
;; Copy file from docker container to host  
(docker/cp "74789744g489:/data.txt" "data.txt")
```

```
;; Copy a folder from host to docker container  
(docker/cp "Desktop/images" "74789744g489:/root/img_files/car_photos/images")
```

```
;; Copy a folder from docker container to host  
(docker/cp "74789744g489:/root/img_files/car_photos/images Desktop/images")
```

SEE ALSO

[docker/diff](#)

Inspect changes to files or directories on a container's filesystem.

[docker/ps](#)

List containers.

[docker/run](#)

Create and run a new container from an image.

[top](#)

docker/debug

(docker/debug mode)

Sets the debugging mode.

Without argument returns the current debug mode.

Mode:

:off	No debug output
:on	Prints the raw docker command line to the current stdout channel ahead of running the command
:on-no-exec	Prints the raw docker command line to the current stdout channel without running the command

```
(docker/debug :on)
```

```
(docker/debug :on-no-exec)
```

```
(docker/debug :off)
```

[top](#)

docker/diff

```
(docker/diff container & options)
```

Inspect changes to files or directories on a container's filesystem.

Options:

:format {;string, ;json} Returns the output either as a string or as JSON data

```
(println (docker/diff "74789744g489"))
```

```
(docker/diff "74789744g4892" :format :json)
```

SEE ALSO

[docker/cp](#)

Copy files/folders between a container and the local filesystem

[docker/ps](#)

List containers.

[docker/run](#)

Create and run a new container from an image.

[top](#)

docker/exec

```
(docker/exec container command args)
```

Execute a command in a running container (always in non detached mode).

Returns the captured stdout text if the command succeeds.

Throws `ShellException` if the command fails. The exception carries the exit code and the captured stderr text.

```
(docker/exec "74789744g489" "touch" "/tmp/execWorks")
```

```
(println (docker/exec "74789744g489" "ls" "-la" "/var"))
```

SEE ALSO

[docker/exec&](#)

Execute a command in a running container (always in detached mode).

[docker/ps](#)

List containers.

[docker/run](#)

Create and run a new container from an image.

[top](#)

docker/exec&

```
(docker/exec& container command args)
```

Execute a command in a running container (always in detached mode).

Returns always an empty string because the command is run in detached mode. To get the commands captured stdout text use `docker/exec` instead.

Throws `ShellException` if the command fails. The `ShellException` carries the exit code, stdout, and stderr text.

```
(docker/exec& "74789744g489" "touch" "/tmp/execWorks")
```

```
(docker/exec& "74789744g489" "ls" "/var")
```

SEE ALSO

[docker/exec](#)

Execute a command in a running container (always in non detached mode).

[docker/ps](#)

List containers.

[docker/run](#)

Create and run a new container from an image.

[top](#)

docker/image-prune

```
(docker/image-prune & options)
```

Remove unused images.

If `:all true` is specified, will also remove all images not referenced by any container. This is what you usually expect

Returns the stdout text from the command.

Options:

`:all {true, false}` Remove all unused images, not just dangling ones

```
(println (docker/image-prune))
```

```
(println (docker/image-prune :all true))
```

SEE ALSO

[docker/image-pull](#)

Download an image from a registry.

[docker/rmi](#)

Remove an image.

[docker/image-rm](#)

Remove an image.

[top](#)

docker/image-pull

(docker/image-pull name & options)

Download an image from a registry.

Images can be pulled by name, name and tag, or digest

Returns the stdout text from the command.

Options:

:quiet {true, false} Suppress verbose output

```
(println (docker/image-pull "arangodb/arangodb:3.10.10"))
```

```
(println (docker/image-pull "arangodb/arangodb"))
```

SEE ALSO

Returns all pulled local images for a given repo.

[docker/image-ready?](#)

Returns true if the image exists locally (is pulled) else false.

[top](#)

docker/images-query-by-repo

```
(docker/images-query-by-repo repo)
```

Returns all pulled local images for a given repo.

```
(docker/images-query-by-repo "arangodb/arangodb")
```

```
;; return a list of ids for "arangodb/arangodb" images
(->> (docker/images-query-by-repo "arangodb/arangodb")
      (map #(get % "ID")))
```

SEE ALSO

[docker/images](#)

List images.

[docker/image-ready?](#)

Returns true if the image exists locally (is pulled) else false.

[top](#)

docker/logs

```
(docker/logs container & options)
```

Get the logs of a container

Options:

:tail n	Number of lines to show from the end of the logs
:since ts	Show logs since timestamp or relative (e.g. "42m" for 42 minutes)
:until ts	Show logs until timestamp or relative (e.g. "42m" for 42 minutes)
:follow {true, false}	Follow log output
:details {true, false}	Show extra details provided to logs

```
(docker/logs "74789744g489")
```

([docker/logs](#) "74789744g489" :tail 100)

([docker/logs](#) "74789744g489" :since "60m" :until "30m")

[docker/image-prune](#)

Remove unused images.

[top](#)

docker/run

(docker/run image & options)

Create and run a new container from an image.

Images can be run by name, name and tag, or image id

Options:

:detach {true, false}	Run container in background and return container ID
:attach s	Attach to STDIN, STDOUT or STDERR. Use one of {:stdin, :stdout, :stderr}
:publish port	Publish a container's port to the host. To expose port 8080 inside the container to port 3000 outside the container, pass "3000:8080"
:envs vars	Set environment variable (a sequence of env var defs)
:memory limit	Memory limit

<code>:name name</code>	Assign a name to the container
<code>:quiet {true, false}</code>	Suppress the pull output
<code>:volumes vol</code>	Bind mount a volume (a sequence of volume defs)
<code>:workdir dir</code>	Working directory inside the container
<code>:args args</code>	Arguments passed to container process (a sequence of args or a string)

See also `cargo/start` / `cargo/stop` for a smarter way to start/stop a container.

```
;; Run an ArangoDB container (use bind mounts, very slow on macOSX)
(docker/run "arangodb/arangodb:3.10.10"
  :name "myapp"
  :publish [ "8529:8529" ]
  :detach true
  :envs [ "ARANGO_ROOT_PASSWORD=xxxxxx"
    "ARANGODB_OVERRIDE_DETECTED_TOTAL_MEMORY=8G"

List containers.

[docker/rm](#)

Remove a container.

[docker/run](#)

Create and run a new container from an image.

docoll

(docoll f coll)

Applies f to the items of the collection presumably for side effects. Returns nil.

If coll is a lazy sequence, `docoll` iterates over the lazy sequence and realizes value by value while calling function f on the realized values.

```
(docoll #(println %) [1 2 3 4])
1
2
3
4
=> nil

(docoll (fn [[k v]] (println (pr-str k v)))
  {:a 1 :b 2 :c 3 :d 4})
:a 1
:b 2
:c 3
:d 4
=> nil

;; docoll all elements of a queue. calls (take! queue) to get the
;; elements of the queue.
;; note: use nil to mark the end of the queue otherwise docoll will
;; block forever!
(let [q (conj! (queue) 1 2 3 nil)]
  (docoll println q))
1
2
3
=> nil

;; lazy sequence
(let [q (conj! (queue) 1 2 3 nil)]
  (defn f []
    (let [v (poll! q)]
      (println "Producing " v)
      v))
    (docoll #(println "Collecting" %)
      (lazy-seq f)))
Producing 1
Collecting 1
Producing 2
Collecting 2
Producing 3
Collecting 3
Producing nil
=> nil
```

SEE ALSO

[mapv](#)

Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of ...

[top](#)

done?

```
(done? f)
```

Returns true if the future or promise is done otherwise false

```
(do
  (def wait (fn [] (sleep 200) 100))
  (let [f (future wait)]
    (sleep 50)
    (printf "After 50ms: done=%b\n" (done? f))
    (sleep 300)
    (printf "After 300ms: done=%b\n" (done? f))))
After 50ms: done=false
After 300ms: done=true
=> nil
```

SEE ALSO

[future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[cancel](#)

Cancels a future or a promise

[cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

[top](#)

dorun

```
(dorun count expr)
```

Runs the `expr` `count` times in the most effective way. It's main purpose is supporting benchmark tests. Returns the expression result of the last invocation.

Note:

For best performance enable `macroexpand-on-load` ! The expression is evaluated for every run. Alternatively a zero or one arg function referenced by a symbol can be passed:

```
(let [f (fn [] (+ 1 1))]
  (dorun 10 f))
```

When passing a one arg function `dorun` passes the incrementing counter value (0..N) to the function:

```
(let [f (fn [x] (+ x 1))]
  (dorun 10 f))
```

```
(dorun 10 (+ 1 1))
=> 2
```

[top](#)

doseq

```
(doseq seq-exprs & body)
```

Repeatedly executes `body` (presumably for side-effects) with bindings and filtering as provided by `list-comp` . Does not retain the head of the sequence. Returns `nil` .

Supported modifiers are: `:when` predicate

```
(doseq [x (range 10)] (print x))
0123456789
=> nil

(doseq [x (range 10)] (print x) (print "-"))
0-1-2-3-4-5-6-7-8-9-
=> nil

(doseq [x (range 5)] (print (* x 2)))
02468
=> nil

(doseq [x (range 10) :when (odd? x)] (print x))
13579
=> nil

(doseq [x (range 10) :when (odd? x)] (print (* x 2)))
26101418
=> nil

(doseq [x [1 2 3] y [1 2 3]] (println [x y]))
[1 1]
[1 2]
[1 3]
[2 1]
[2 2]
[2 3]
[3 1]
[3 2]
[3 3]
=> nil

(doseq [[x y] [[0 1] [1 2]]] (println [x y]))
[0 1]
[1 2]
=> nil

(doseq [[k v] {:a 1 :b 2}] (println [k v]))
[:a 1]
[:b 2]
=> nil

(doseq [[c vals] (group-by count ["a" "as" "asd" "aa" "asdf" "qwer"])]
  (println c vals))
1 [a]
2 [as aa]
3 [asd]
4 [asdf qwer]
=> nil
```

SEE ALSO

[list-comp](#)

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and ...

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

dotimes

```
(dotimes bindings & body)
```

Repeatedly executes body with name bound to integers from 0 through n-1.

```
(dotimes [n 3] (println (str "n is " n)))  
n is 0  
n is 1  
n is 2  
=> nil
```

SEE ALSO

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

[doseq](#)

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

[list-comp](#)

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and ...

[top](#)

doto

```
(doto x & forms)
```

Evaluates x then calls all of the methods and functions with the value of x supplied at the front of the given arguments. The forms are evaluated in order. Returns x.

```
(doto (. :java.util.HashMap :new)  
      (. :put :a 1)  
      (. :put :b 2))  
=> {"a" 1 "b" 2}
```

[top](#)

double

```
(double x)
```

Converts to double

```
(double 1)  
=> 1.0
```

```
(double nil)  
=> 0.0
```

```
(double false)
=> 0.0

(double true)
=> 1.0

(double 1.2)
=> 1.2

(double 1.2M)
=> 1.2

(double "1.2")
=> 1.2
```

[top](#)

double-array

```
(double-array coll)
(double-array len)
(double-array len init-val)
```

Returns an array of Java primitive doubles containing the contents of coll or returns an array with the given length and optional init value

```
(double-array '(1.0 2.0 3.0))
=> [1.0, 2.0, 3.0]

(double-array '(1I 2 3.2 3.56M))
=> [1.0, 2.0, 3.2, 3.56]

(double-array 10)
=> [0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0]

(double-array 10 42.0)
=> [42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0]
```

[top](#)

double?

```
(double? n)
```

Returns true if n is a double

```
(double? 4.0)
=> true

(double? 3)
=> false

(double? 3I)
=> false
```

```
(double? 3.0M)
=> false

(double? true)
=> false

(double? nil)
=> false

(double? {})
=> false
```

[top](#)

drop

```
(drop n coll)
```

Returns a collection of all but the first n items in coll.
Returns a stateful transducer when no collection is provided.

```
(drop 3 [1 2 3 4 5])
=> [4 5]

(drop 10 [1 2 3 4 5])
=> []
```

[top](#)

drop-last

```
(drop-last n coll)
```

Return a sequence of all but the last n items in coll.
Returns a stateful transducer when no collection is provided.

```
(drop-last 3 [1 2 3 4 5])
=> [1 2]

(drop-last 10 [1 2 3 4 5])
=> []
```

[top](#)

drop-while

```
(drop-while predicate coll)
```

Returns a list of the items in coll starting from the first item for which `(predicate item)` returns logical false.
Returns a stateful transducer when no collection is provided.

```
(drop-while neg? [-2 -1 0 1 2 3])  
=> [0 1 2 3]
```

[top](#)

empty

```
(empty coll)
```

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection and returns the the emptied collection.

```
(empty {:a 1})  
=> {}
```

```
(empty [1 2])  
=> []
```

```
(empty '(1 2))  
=> ()
```

[top](#)

empty-to-nil

```
(empty-to-nil x)
```

Returns nil if x is empty

```
(empty-to-nil "")  
=> nil
```

```
(empty-to-nil [])  
=> nil
```

```
(empty-to-nil '())  
=> nil
```

```
(empty-to-nil {})  
=> nil
```

[top](#)

empty?

```
(empty? x)
```

Returns true if x is empty. Accepts strings, collections and bytebufs.

```
(empty? {})  
=> true
```

```
(empty? [])  
=> true  
  
(empty? '())  
=> true  
  
(empty? nil)  
=> true  
  
(empty? "")  
=> true
```

SEE ALSO

[not-empty?](#)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

[top](#)

entries

```
(entries m)
```

Returns a collection of the map's entries.

```
(entries {:a 1 :b 2 :c 3})  
=> ([:a 1] [:b 2] [:c 3])  
  
(let [e (entries {:a 1 :b 2 :c 3})]  
  (println (map key e))  
  (println (map val e)))  
(:a :b :c)  
(1 2 3)  
=> nil  
  
;; compare to 'into'  
(let [e (into [] {:a 1 :b 2 :c 3})]  
  (println (map first e))  
  (println (map second e)))  
(:a :b :c)  
(1 2 3)  
=> nil
```

SEE ALSO

[map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

[key](#)

Returns the key of the map entry.

[val](#)

Returns the val of the map entry.

[keys](#)

Returns a collection of the map's keys.

[vals](#)

Returns a collection of the map's values.

map-entry

Creates a new map entry

top

enum?

(enum? class)

Returns true if class is a Java *enum*.

Get all values of a Java *enum*:

```
(. :java.time.Month :values)
```

Get a Java *enum* value:

```
(let [jan (. :java.time.Month :JANUARY)]  
  (. :java.time.LocalDate :of 1994 jan 21))
```

This can be simplified to:

```
(. :java.time.LocalDate :of 1994 :JANUARY 21)
```

```
(enum? :java.time.Month)  
=> true
```

top

eval

(eval form)

Evaluates the form data structure (not text!) and returns the result.

```
(eval '(let [a 10] (+ 3 4 a)))  
=> 17
```

```
(eval (list + 1 2 3))  
=> 6
```

```
(let [s "(+ 2 x)" x 10]  
  (eval (read-string s)))  
=> 12
```

SEE ALSO

[read-string](#)

Reads Venice source from a string and transforms its content into a Venice data structure, following the rules of the Venice syntax.

top

even?

(even? n)

Returns true if n is even, throws an exception if n is not an integer

```
(even? 4)  
=> true
```

```
(even? 3)  
=> false
```

```
(even? (int 3))  
=> false
```

SEE ALSO

[odd?](#)

Returns true if n is odd, throws an exception if n is not an integer

[top](#)

every-pred

```
(every-pred p1 & p)
```

Takes a set of predicates and returns a function f that returns true if all of its composing predicates return a logical true value against all of its arguments, else it returns false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical false result against the original predicates.

```
((every-pred number?) 1)  
=> true
```

```
((every-pred number?) 1 2)  
=> true
```

```
((every-pred number? even?) 2 4 6)  
=> true
```

[top](#)

every?

```
(every? pred coll)
```

Returns true if the predicate is true for all collection items, false otherwise.

```
(every? number? nil)  
=> false
```

```
(every? number? [])  
=> false
```

```
(every? number? [1 2 3 4])  
=> true
```

```
(every? number? [1 2 3 :a])  
=> false
```

```
(every? #(>= % 10) [10 11 12])
=> true
```

SEE ALSO

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

[not-every?](#)

Returns false if the predicate is true for all collection items, true otherwise

[top](#)

ex

```
(ex class)
(ex class args*)
```

Creates an exception of type *class* with optional *args*. The *class* must be a subclass of `:java.lang.Exception`

The exception types:

- `:java.lang.Exception`
- `:java.lang.RuntimeException`
- `:com.github.jlangch.venice.VncException`
- `:com.github.jlangch.venice.ValueException`

are imported implicitly so its alias `:Exception`, `:RuntimeException`, `:VncException`, and `:ValueException` can be used.

Checked vs unchecked exceptions

All exceptions in Venice are *unchecked*.

If *checked* exceptions are thrown in Venice they are immediately wrapped in a `:RuntimeException` before being thrown!

If Venice catches a *checked* exception from a Java Interop call it wraps it in a `:RuntimeException` before handling it by the catch block selectors.

```
(try
  (throw (ex :VncException)))
(catch :VncException e "caught :VncException"))
=> "caught :VncException"
```

```
(try
  (throw (ex :RuntimeException "#test")))
(catch :Exception e
  "msg: ~(ex-message e)")
=> "msg: #test"
```

```
(try
  (throw (ex :ValueException 100)))
(catch :ValueException e
  "value: ~(ex-value e)")
=> "value: 100"
```

```
(do
  (defn throw-ex-with-cause []
    (try
      (throw (ex :java.io.IOException "I/O failure"))
```

```
(catch :Exception e
  (throw (ex :VncException "failure" (ex-cause e))))))
(try
  (throw-ex-with-cause)
  (catch :Exception e
    "msg: ~(ex-message e), cause: ~(ex-message (ex-cause e))"))
=> "msg: failure, cause: I/O failure"
```

SEE ALSO

[throw](#)

Throws an exception.

[try](#)

Exception handling: try - catch - finally

[try-with](#)

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

[ex?](#)

Returns true if x is a an instance of :java.lang.Throwable

[ex-venice?](#)

Returns true if x is a an instance of :VncException

[top](#)

ex-cause

```
(ex-cause x)
```

Returns the exception cause or nil

```
(ex-cause (ex :VncException "a message" (ex :RuntimeException "..cause..")))
=> java.lang.RuntimeException: ..cause..
```

```
(ex-cause (ex :VncException "a message"))
=> nil
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-message](#)

Returns the message of the exception

[ex-value](#)

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

[top](#)

ex-java-stacktrace

```
(ex-java-stacktrace x)
(ex-java-stacktrace x format)
```

Returns the Java stacktrace for an exception.

The optional format (:string or :list) controls the format of the returned stacktrace. The default format is :string.

```
(println (ex-java-stacktrace (ex :RuntimeException "message")))
```

```
(println (ex-java-stacktrace (ex :VncException "message") :list))
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-venice-stacktrace](#)

Returns the Venice stacktrace for an exception or nil if the exception is not a venice exception.

[top](#)

ex-message

```
(ex-message x)
```

Returns the message of the exception

```
(ex-message (ex :VncException "a message"))  
=> "a message"
```

```
(ex-message (ex :RuntimeException))  
=> nil
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-cause](#)

Returns the exception cause or nil

[ex-value](#)

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

[top](#)

ex-value

```
(ex-value x)
```

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

```
(ex-value (ex :ValueException [10 20]))  
=> (10 20)
```

```
(ex-value (ex :RuntimeException))  
=> nil
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-message](#)

Returns the message of the exception

[ex-cause](#)

Returns the exception cause or nil

[top](#)

ex-venice-stacktrace

```
(ex-venice-stacktrace x)
(ex-venice-stacktrace x format)
```

Returns the Venice stacktrace for an exception or nil if the exception is not a venice exception.

The optional format (:string or :list) controls the format of the returned stacktrace. The default format is :string.

```
(println (ex-venice-stacktrace (ex :ValueException [10 20])))
Exception in thread "main" ValueException:

[Callstack]
  at: ex (example: line 42, col 43)
=> nil

(println (ex-venice-stacktrace (ex :RuntimeException "message")))
nil
=> nil

(println (ex-venice-stacktrace (ex :ValueException [10 20]) :list))
({:fn ex :file example :line 42 :col 43})
=> nil
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-java-stacktrace](#)

Returns the Java stacktrace for an exception.

[top](#)

ex-venice?

```
(ex-venice? x)
```

Returns true if x is a an instance of :VncException

```
(ex-venice? (ex :VncException))
=> true

(ex-venice? (ex :RuntimeException))
=> false
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex?](#)

Returns true if x is a an instance of :java.lang.Throwable

[top](#)

[ex?](#)

(ex? x)

Returns true if x is a an instance of :java.lang.Throwable

```
(ex? (ex :RuntimeException))
=> true
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-venice?](#)

Returns true if x is a an instance of :VncException

[top](#)

[excel/add-area-chart](#)

```
(add-area-chart sheet chart-title
                  chart-addr-range
                  legend-position

excel/add-column

(add-column sheet title)

(add-column sheet title options)

Defines a column with optional attributes on the sheet.

Note: The column cell value is just read from the passed tabular dataset. If there is any mapping or conversion needed it has to be applied to the dataset before writing it to the sheet!

Options:

:id id	a column id
:field f	a field, e.g. :first-name
:width n	width in points, e.g. 100
:skip s	skip column, e.g. true, false
:header-style r	style name for header row, e.g. :header
:body-style r	style name for body rows, e.g. :body
:footer-style r	style name for footer row, e.g. :footer
:footer-value v	explicit text or numeric value for the column's footer cell, e.g. "done", 10000.00M, nil
:footer-aggregate e	aggregation mode for the column's footer cell value, e.g. {:min, :max, :avg, :sum, :none}

```

excel/add-sheet

(add-sheet wbook title)

(add-sheet wbook title options)

Adds a sheet with optional attributes to an Excel.

Options:

:no-header-row b	without header row, e.g. true, false
:default-column-width n	default column width in points, e.g. 100
:default-header-style s	default header style, e.g. :header
:default-body-style s	default body style, e.g. :body
:default-footer-style s	default footer style, e.g. :footer
:merged-region r	merged region [row-from row-to col-from col-to], e.g. [1 1 4 10]
:display-zeros b	display zeros, e.g. true, false. Defines if a cell should show 0 (zero) when containing zero value. When false, cells with zero value appear blank instead of showing the number zero.

```

```

SEE ALSO

[excel/add-style](#)

Add a style with optional attributes to an Excel.

[excel/add-font](#)

Add font with optional attributes to an Excel.

[excel/write-value](#)

Writes a value to a specific cell given by its row and col.

excel/cell-type

(cell-type sheet row col)

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

Note:

1. Excel returns cells containing long, double, date or datetime values as `:numeric` . The reader decides how to read a numeric cell using either of `excel/read-long-val` , `excel/read-double-val` , or `excel/read-date-val` .
2. To evaluate formulas to values call `excel/evaluate-formulas` on the workbook the right after opening the excel document.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 "101" 102.0]])
      (excel/write->bytebuf wbook)))

  (let [wbook (excel/open (test-xls))
        sheet (excel/sheet wbook "Data")]
    [(excel/cell-type sheet 1 1)
     (excel/cell-type sheet 1 2)
     (excel/cell-type sheet 1 3)
     (excel/cell-type sheet 1 4)]))
```

SEE ALSO

[excel/cell-formula-result-type](#)

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown } after formula ...

[excel/cell-empty?](#)

Returns true if the sheet cell given by row/col is empty.

[excel/read-string-val](#)

Returns the sheet cell value as string.

[excel/read-boolean-val](#)

Returns the sheet cell value as boolean.

[excel/read-long-val](#)

Returns the sheet cell value as long.

[excel/read-double-val](#)

Returns the sheet cell value as double.

[excel/read-date-val](#)

Returns the sheet cell value as a date (:java.time.LocalDate).

[excel/read-datetime-val](#)

Returns the sheet cell value as a datetime (:java.time.LocalDateTime).

[top](#)

excel/col->string

(col->string col)

Returns an Excel A-style column number string representation for a column number

```
(excel/col->string 1)
```

```
(excel/col->string 56)
```

SEE ALSO

[excel/addr->string](#)

Returns an Excel A1-style cell address string representation for a row and column address

[top](#)

excel/col-width

```
(col-width sheet col width)
```

Set the width of a column (1..n) in the sheet.

```
(do
  (load-module :excel)
  (let [os      (io/file-out-stream "sample.xlsx")
        data   [ { :first "John" :last "Doe"   :age 28 }

  :SQUARE
  (excel/cell-address-range 2 2 1 5))

```

SEE ALSO

[excel/cell-address-range](#)

Build a cell address range

[top](#)

excel/open

(open source)

Opens an Excel from a source and returns an Excel reader.

Supported sources are string file path, bytebuf, `:java.io.File`, or `:java.io.InputStream`.

```
(do
  (load-module :excel)

  (let [wbook (excel/open "sample.xlsx")]
    (println "Sheet count: " (excel/sheet-count wbook))))
```

SEE ALSO

[excel/sheet-count](#)

Returns the number of sheets in the Excel.

[excel/sheet](#)

Returns a sheet from the Excel reader referenced by its name or sheet index.

[excel/evaluate-formulas](#)

Evaluate all formulas in the Excel.

[top](#)

excel/pie-data-series

(pie-data-series data-address-range)

Build a pie chart data series

Arguments:

data-address-range The series data in the Excel

```
(excel/pie-data-series (excel/cell-address-range 2 2 1 5))
```

SEE ALSO

(write-data sheet data row col)
```

Writes the data of a 2D array to an excel sheet.

Optionally the data can be written to a region starting at a row/col position.

```
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Data")
        dt    (time/local-date 2021 1 1)
        ts    (time/local-date-time 2021 1 1 15 30 45)
        data  [[100 101 102 103 104 105]
                [200 "ab" 1.23 dt ts false]]]
    (excel/write-data sheet data)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx"))

  (do
    (load-module :excel)
    (let [wbook (excel/writer :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 101 102] [200 201 203]])
      (excel/write-data sheet [[300 301 302] [400 401 403]] 3 4)
      (excel/auto-size-columns sheet)
      (excel/write->file wbook "sample.xlsx"))))
```

SEE ALSO

[excel/write->stream](#)

Writes the excel to a Java :OutputStream.

[excel/write->bytebuf](#)

Writes the excel to a bytebuf. Returns the bytebuf.

excel/write-item

```
(write-item sheet item)
```

Render a single data item to the sheet

```
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-item sheet {:first "John" :last "Doe" :age 28 })
    (excel/write-item sheet {:first "Sue" :last "Ford" :age 26 })
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-value](#)

Writes a value to a specific cell given by its row and col.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

excel/write-items

```
(write-items sheet items)
```

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :age 28 }
               {:first "Sue" :last "Ford" :age 26 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-items sheet data))
```

```
(excel/auto-size-columns sheet)
(excel/write->file wbook "sample.xlsx"))
```

SEE ALSO

[excel/write-item](#)

Render a single data item to the sheet

[excel/write-value](#)

Writes a value to a specific cell given by its row and col.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

excel/write-value

```
(write-value sheet row col val)
```

Writes a value to a specific cell given by its row and col.

```
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-value sheet 1 1 "John")
    (excel/write-value sheet 1 2 "Doe")
    (excel/write-value sheet 1 3 28)
    (excel/write-value sheet 2 1 "Sue")
    (excel/write-value sheet 2 2 "Ford")
    (excel/write-value sheet 2 3 26)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

```
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-font wbook :italic { :italic true })
    (excel/add-font wbook :bold { :bold true })
    (excel/add-style wbook :italic { :font :italic })
    (excel/add-style wbook :bold { :font :bold })
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-value sheet 1 1 "John" :italic)
    (excel/write-value sheet 1 2 "Doe" :italic)
    (excel/write-value sheet 1 3 28 :bold)
    (excel/write-value sheet 2 1 "Sue" :italic))
```

```
(excel/write-value sheet 2 2 "Ford" :italic)
(excel/write-value sheet 2 3 26 :bold)
(excel/auto-size-columns sheet)
(excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

excel/writer

(writer type)

Creates a new Excel builder for the given type :xls or :xlsx.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :age 28 }
                {:first "Sue" :last "Ford" :age 26 } ]
        wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-items sheet data)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/add-sheet](#)

Adds a sheet with optional attributes to an Excel.

[excel/add-font](#)

Add font with optional attributes to an Excel.

[excel/add-style](#)

Add a style with optional attributes to an Excel.

[excel/write->file](#)

Writes the excel to a file.

[excel/write->stream](#)

Writes the excel to a Java :OutputStream.

[excel/write->bytebuf](#)

Writes the excel to a bytearray. Returns the bytearray.

[excel/evaluate-formulas](#)

Evaluate all formulas in the Excel.

top

exists-class?

(exists-class? name)

Returns true if the Java class for the given name exists otherwise returns false.

```
(exists-class? :java.util.ArrayList)
=> true
```

top

exp

(exp x)

Returns Euler's number e raised to the power of a value.

```
(exp 10)
=> 22026.465794806718
```

```
(exp 10.23)
=> 27722.51006805505
```

```
(exp 10.23M)
=> 27722.51006805505
```

SEE ALSO

[exp](#)

Returns Euler's number e raised to the power of a value.

top

extend

(extend type protocol fns*)

Extends protocol for type with the supplied functions.

Formats:

- (extend :core/long P (foo [x] x))
- (extend :core/long P (foo [x] x) (foo [x y] x))
- (extend :core/long P (foo [x] x) (bar [x] x))

```
(do
  (ns foo)
  (deftype :complex [re :long, im :long])
  (defprotocol XMath (+ [x y])
                    (- [x y]))
  (extend :foo/complex XMath
    (+ [x y] (complex. (core/+ (:re x) (:re y))
                      (core/+ (:im x) (:im y)))))
    (- [x y] (complex. (core/- (:re x) (:re y))
                      (core/- (:im x) (:im y)))))

  (extend :core/long XMath
    (+ [x y] (core/+ x y))
    (- [x y] (core/- x y)))
  (foo/+ (complex. 1 1) (complex. 4 5)))
=> {:custom-type* :foo/complex :re 5 :im 6}
```

SEE ALSO

[defprotocol](#)

Defines a new protocol with the supplied function specs.

[extends?](#)

Returns true if the type extends the protocol.

[top](#)

extends?

```
(extends? type protocol)
```

Returns true if the type extends the protocol.

```
(do
  (ns foo)
  (deftype :complex [re :long, im :long])
  (defprotocol XMath (+ [x y])
                    (- [x y]))
  (extend :foo/complex XMath
    (+ [x y] (complex. (core/+ (:re x) (:re y))
                      (core/+ (:im x) (:im y)))))
    (- [x y] (complex. (core/- (:re x) (:re y))
                      (core/- (:im x) (:im y)))))

  (extend :core/long XMath
    (+ [x y] (core/+ x y))
    (- [x y] (core/- x y)))
  (extends? :foo/complex XMath))
=> true
```

SEE ALSO

[defprotocol](#)

Defines a new protocol with the supplied function specs.

[extend](#)

Extends protocol for type with the supplied functions.

[top](#)

false?

```
(false? x)
```

Returns true if x is false, false otherwise

```
(false? true)
=> false
```

```
(false? false)
=> true
```

```
(false? nil)
=> false
```

```
(false? 0)
=> false
```

```
(false? (== 1 2))
=> true
```

SEE ALSO

[true?](#)

Returns true if x is true, false otherwise

[not](#)

Returns true if x is logical false, false otherwise.

[top](#)

filter

```
(filter predicate coll)
```

Returns a collection of the items in coll for which `(predicate item)` returns logical true.
Returns a transducer when no collection is provided.

```
(filter even? [1 2 3 4 5 6 7])
=> (2 4 6)
```

```
(filter #(even? (val %)) {:a 1 :b 2})
=> ([:b 2])
```

```
(filter even? #{1 2 3})
=> (2)
```

SEE ALSO

[map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

[reduce](#)

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

[top](#)

filter-k

```
(filter-k f map)
```

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

```
(filter-k #(= % :a) {:a 1 :b 2 :c 3})  
=> {:a 1}
```

SEE ALSO

[filter-kv](#)

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

[top](#)

filter-kv

```
(filter-kv f map)
```

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

```
(filter-kv (fn [k v] (= k :a)) {:a 1 :b 2 :c 3})  
=> {:a 1}
```

```
(filter-kv (fn [k v] (= v 2)) {:a 1 :b 2 :c 3})  
=> {:b 2}
```

SEE ALSO

[filter-k](#)

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

[top](#)

find

```
(find map key)
```

Returns the map entry for key, or nil if key not present.

```
(find {:a 1 :b 2} :b)  
=> [:b 2]
```

```
(find {:a 1 :b 2} :z)  
=> nil
```

[top](#)

finder

(finder & args)

Finds symbols that match one more glob patterns or regular expressions.

Filters the symbol names by 0 to n glob patterns or regular expressions.

Glob patterns and regular expressions are ANDed, flags are ORed.

Flags:

:function	filter functions
:macro	filter macros
:special-form	filter special forms
:protocol	filter protocols
:value	filter values
:machine	return the result as Venice data otherwise print it in table format

```

SEE ALSO

[doc](#)

Prints documentation for a var or special form given x as its name. Prints the definition of custom types.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[modules](#)

Lists the available Venice modules

[top](#)

first

```
(first coll)
```

Returns the first element of coll or nil if coll is nil or empty.

```
(first nil)
=> nil

(first [])
=> nil

(first [1 2 3])
=> 1

(first '())
=> nil

(first '(1 2 3))
=> 1

(first "abc")
=> #\a
```

[top](#)

flatten

```
(flatten coll)
```

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. `(flatten nil)` returns an empty list.
Returns a transducer when no collection is provided.

```
(flatten [])
=> []

(flatten [[1 2 3] [4 [5 6]] [7 [8 [9]]]])
=> [1 2 3 4 5 6 7 8 9]

(flatten [1 2 {:a 3 :b [4 5 6]}])
=> [1 2 {:a 3 :b [4 5 6]}]

(flatten (seq {:a 1 :b 2}))
=> (:a 1 :b 2)
```

SEE ALSO

[mapcat](#)

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

[top](#)

float-array

```
(float-array coll)
(float-array len)
(float-array len init-val)
```

Returns an array of Java primitive floats containing the contents of coll or returns an array with the given length and optional init value

```
(float-array '(1.0 2.0 3.0))  
=> [1.0, 2.0, 3.0]  
  
(float-array '(1I 2 3.2 3.56M))  
=> [1.0, 2.0, 3.200000047683716, 3.559999942779541]  
  
(float-array 10)  
=> [0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0]  
  
(float-array 10 42.0)  
=> [42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0]
```

[top](#)

floor

```
(floor x)
```

Returns the largest integer that is less than or equal to x

```
(floor 1.4)  
=> 1.0  
  
(floor -1.4)  
=> -2.0  
  
(floor 1.23M)  
=> 1.00M  
  
(floor -1.23M)  
=> -2.00M
```

SEE ALSO

[ceil](#)

Returns the largest integer that is greater than or equal to x

[top](#)

flush

```
(flush)  
(flush os)
```

Without arg flushes the output stream that is the current value of `*out*`. With arg flushes the passed stream that must be a subclass of either `:java.io.OutputStream` or `:java.io.Writer`.

Returns `nil`.

```
(flush)  
=> nil
```

```
(flush *out*)  
=> nil
```

```
(flush *err*)  
=> nil
```

SEE ALSO

[io/flush](#)

Flushes a :java.io.OutputStream or a :java.io.Writer.

[io/close](#)

Closes a :java.io.InputStream, :java.io.OutputStream, :java.io.Reader, or a :java.io.Writer.

[top](#)

fn

```
(fn name? [params*] condition-map? expr*)
```

Defines an anonymous function.

```
(do  
  (def sum (fn [x y] (+ x y)))  
  (sum 2 3))  
=> 5
```

```
;; multi-arity anonymous function  
(let [f (fn ([x] x) ([x y] (+ x y)))]  
  [(f 1) (f 4 6)])  
=> [1 10]
```

```
(map (fn double [x] (* 2 x)) (range 1 5))  
=> (2 4 6 8)
```

```
(map #(* 2 %) (range 1 5))  
=> (2 4 6 8)
```

```
(map #(* 2 %1) (range 1 5))  
=> (2 4 6 8)
```

```
;; anonymous function with two params, the second is destructured  
(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})  
=> {1 :a 2 :b 3 :c}
```

```
;; defining a pre-condition  
(do  
  (def square-root  
    (fn [x]  
      { :pre [(>= x 0)] }  
      (. :java.lang.Math :sqrt x)))  
  (square-root 4))  
=> 2.0
```

```
;; closures  
(do  
  (defn pow [n]  
    (fn [x] (apply * (repeat n x)))) ; closes over n
```

```
;; n is provided here as 2 and 3, then n goes out of scope
(def square (pow 2))
(def cubic (pow 3))
(square 4))
=> 16

;; higher-order function
(do
  (def discount
    (fn [percentage]
      { :pre [(and (>= percentage 0) (<= percentage 100))] }
        (fn [price] (- price (* price percentage 0.01))))))
  ((discount 50) 300))
=> 150.0
```

SEE ALSO

[defn](#)

Same as (def name (fn name [args*] condition-map? expr*)) or (def name (fn name ([args*] condition-map? expr*)+))

[defn-](#)

Same as defn, yielding non-public def

[def](#)

Creates a global variable.

[top](#)

fn-about

```
(fn-about f)
```

Returns the meta information about a function

```
(fn-about and)
=> {:name "and" :ns "core" :type :macro :visibility :public :native false :class :VncMultiArityFunction :source
{:file "core" :line 482 :column 3}}
```

```
(fn-about println)
=> {:name "println" :ns "core" :type :function :visibility :public :native false :class :VncMultiArityFunction :
source {:file "core" :line 1477 :column 3}}
```

```
(fn-about +)
=> {:name "+" :ns "core" :type :function :visibility :public :native true :class :VncFunction :source {}}
```

SEE ALSO

[fn-name](#)

Returns the qualified name of a function or macro

[fn-body](#)

Returns the body (a list of forms) of a function.

[fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

fn-body

```
(fn-body fn)
(fn-body fn arity)
```

Returns the body (a list of forms) of a function.

Returns `nil` if `fn` is not a function or if `fn` is a native function.

```
(do
  (defn calc [& x]
    (->> x
      (filter even?)
      (map #(* % 10)))))
  (fn-body (var-get calc)))
=> ((->> x (filter even?) (map (fn [%] (* % 10)))))
```

SEE ALSO

[fn-name](#)

Returns the qualified name of a function or macro

[fn-about](#)

Returns the meta information about a function

[fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

fn-name

```
(fn-name f)
```

Returns the qualified name of a function or macro

```
(fn-name (fn sum [x y] (+ x y)))
=> "user/sum"
```

```
(let [f str/digit?]
  (fn-name f))
=> "str/digit?"
```

SEE ALSO

[name](#)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If `x` is a registered namespace returns `x`.

[fn-about](#)

Returns the meta information about a function

[fn-body](#)

Returns the body (a list of forms) of a function.

[fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

fn-pre-conditions

```
(fn-pre-conditions fn)
(fn-pre-conditions fn arity)
```

Returns the pre-conditions (a vector of forms) of a function.

Returns `nil` if `fn` is not a function.

```
(do
  (defn sum [x y]
    { :pre [(> x 0) (> y 0)] }
    (+ x y))
  (fn-pre-conditions (var-get sum)))
=> [(> x 0) (> y 0)]
```

SEE ALSO

[fn-name](#)

Returns the qualified name of a function or macro

[fn-about](#)

Returns the meta information about a function

[fn-body](#)

Returns the body (a list of forms) of a function.

fn?

```
(fn? x)
```

Returns true if `x` is a function

```
(do
  (def sum (fn [x] (+ 1 x)))
  (fn? sum))
=> true
```

fnil

```
(fnil f x)
(fnil f x y)
(fnil f x y z)
```

Takes a function `f`, and returns a function that calls `f`, replacing a `nil` first argument to `f` with the supplied value `x`. Higher arity versions can replace arguments in the second and third positions (`y`, `z`). Note that the function `f` can take any number of arguments, not just the one(s) being `nil`-patched.

```
;; e.g.: change the `str/lower-case` handling of nil arguments by
;; returning an empty string instead of nil.
((fnil str/lower-case "") nil)
=> ""

((fnil + 10) nil)
=> 10

((fnil + 10) nil 1)
=> 11

((fnil + 10) nil 1 2)
=> 13

((fnil + 10) 20 1 2)
=> 23

((fnil + 10) nil 1 2 3 4)
=> 20

((fnil + 1000 100) nil nil)
=> 1100

((fnil + 1000 100) 2000 nil 1)
=> 2101

((fnil + 1000 100) nil 200 1 2)
=> 1203

((fnil + 1000 100) nil nil 1 2 3 4)
=> 1110
```

[top](#)

fonts/download-demo-fonts

```
(fonts/download-demo-fonts dir)
(fonts/download-demo-fonts dir silent)
```

Downloads the Venice demo fonts

- "Open Sans"
- "Source Code Pro"
- "Audiowide"
- "Roboto"

to the specified dir

```
(do
  (load-module :fonts)
  (fonts/download-demo-fonts (repl/libs-dir) false))
```

[top](#)

fonts/download-font-family

```
(fonts/download-font-family family-name options*)
```

Download a font family from the [Google fonts](#) repository

Some useful font families with name and true type font files globbing pattern to extract the files from the family zip file:

Family	TTF glob pattern
"Open Sans"	"static/OpenSans/*.ttf"
"Source Code Pro"	"static/*.ttf"
"Audiowide"	"*.ttf"
"Roboto"	"*.ttf"

Options:

:extract {true,false}	if true extract the TTF files from the font family ZIP, else just download the ZIP
:glob-pattern {pat}	an optional glob pattern to select the TTF files to be extracted. E.g.: "*.ttf"
:dir path	download dir, defaults to "."
:silent {true,false}	if silent is true does not print download info, defaults to true

```
(do
  (load-module :fonts)

  (fonts/download-font-family "Open Sans"
    :dir (repl/libs-dir)
    :extract true
    :glob-pattern "static/OpenSans/*.ttf"
    :silent false)

  (fonts/download-font-family "Source Code Pro"
    :dir (repl/libs-dir)
    :extract true
    :glob-pattern "static/*.ttf"
    :silent false)

  (fonts/download-font-family "Roboto"
    :dir (repl/libs-dir)
    :extract true
    :glob-pattern "*.ttf"
    :silent false))
```

[top](#)

force

```
(force x)
```

If x is a delay, returns its value, else returns x

```
(do
  (def x (delay (println "working...") 100))
  (force x))
working...
=> 100

(force (+ 1 2))
=> 3
```

SEE ALSO

[delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[top](#)

formal-type

(formal-type object)

Returns the *formal type* of a Java object.

The *formal type* of an object is defined as the explicit Java return type given by the function's definition. The *formal type* may differ from the real type of the returned Java object. A type cast will also change the object's formal type and set it to the cast type.

Venice must honor Java's static type system while interacting with Java objects. Therefore Venice adheres to *formal types* strictly when calling methods of Java objects.

Venice

```
;; The Circle constructor returns an object of type Circle
(let [c (. :Circle :new 1.5)]
  (. c :area)      ;; OK    Circle::area()
  (. c :radius))   ;; OK    Circle::radius()

;; Builder::circle returns an object of the formal type Shape
(let [c (. :Builder :circle 1.5)]
  (. c :area)      ;; OK    Shape::area()
  (. c :radius))   ;; FAIL  Shape::radius(), undefined method
```

Java

```
public class Builder {
  public static Shape circle(double radius) {
    return new Circle(radius);
  }
}

public interface Shape {
  double area();
}

public class Circle implements Shape {
  public Circle(double radius) {...}
  public double area() {...}
  public double radius() {...}
}
```

```
(do
  (import :java.awt.Point)
  (import :java.awt.geom.Point2D)

  ;; upcasting :java.awt.Point to :java.awt.geom.Point2D
  ;; Point2D does not define the translate method!
  (let [p1 (. :Point :new 1.0 1.0)
        p2 (cast :Point2D p1)]
    (println "p1 ->" p1))
```

```

    (println "p2 ->" p2)
    (println "Formal type p1 ->" (formal-type p1))
    (println "Formal type p2 ->" (formal-type p2))
    (println "p1' ->" (doto p1 (. :translate 2.0 2.0)))
    ;; the translate method is not defined by Point2D
    ;; and will fail with a JavaMethodInvocationException!
    ;; (doto p2 (. :translate 2.0 2.0))
  ))
p1 -> java.awt.Point[x=1,y=1]
p2 -> java.awt.Point[x=1,y=1]
Formal type p1 -> :java.awt.Point
Formal type p2 -> :java.awt.geom.Point2D
p1' -> java.awt.Point[x=3,y=3]
=> nil

```

SEE ALSO

[remove-formal-type](#)

Removes the formal type from a Java object.

[cast](#)

Casts a Java object to a specific type

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

SEE ALSO

[format-milli-time](#)

Formats a time given in milliseconds as long or double.

[format-micro-time](#)

Formats a time given in microseconds as long or double.

[nano-time](#)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

[top](#)

fourth

```
(fourth coll)
```

Returns the fourth element of coll.

```
(fourth nil)
=> nil
```

```
(fourth [])
=> nil
```

```
(fourth [1 2 3 4 5])
=> 4
```

```
(fourth '())
=> nil
```

```
(fourth '(1 2 3 4 5))
=> 4
```

[top](#)

frequencies

```
(frequencies coll)
```

Returns a map from distinct items in coll to the number of times they appear.

```
(frequencies [:a :b :a :a])
=> {:a 3 :b 1}

;; Turn a frequency map back into a coll.
(mapcat (fn [[x n]] (repeat n x)) {:a 2 :b 1 :c 3})
=> (:a :a :b :c :c :c)
```

[top](#)

future

```
(future fn)
```

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result and return it on all subsequent calls to deref. If the computation has not yet finished, calls to deref will block, unless the variant of deref with timeout is used.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
(do
  (defn wait [] (sleep 300) 100)
  (let [f (future wait)]
    (deref f)))
=> 100

(let [f (future #(do (sleep 300) 100))]
  (deref f))
=> 100

(do
  (defn wait [x] (sleep 300) (+ x 100))
  (let [f (future (partial wait 10))]
    (deref f)))
=> 110

(do
  (defn sum [x y] (+ x y))
  (let [f (future (partial sum 3 4))]
    (deref f)))
=> 7

;; demonstrates the use of thread locals with futures
(do
  ;; parent thread locals
  (binding [a 10 b 20]
    ;; future with child thread locals
    (let [f (future (fn [] (binding [b 90] {:a a :b b})))]
      {:child @f :parent {:a a :b b}})))
=> {:parent {:a 10 :b 20} :child {:a 10 :b 90}}
```

SEE ALSO

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[done?](#)

Returns true if the future or promise is done otherwise false

[cancel](#)

Cancels a future or a promise

[cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

[future-task](#)

Takes a function `f` without arguments and yields a future object that will invoke the function in another thread.

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[futures-fork](#)

Creates a list of count futures. The worker factory is single argument function that gets the worker index (0..count-1) as argument ...

[futures-wait](#)

Waits for all futures to get terminated. If the waiting thread is interrupted the futures are cancelled.

[top](#)

future-task

```
(future-task f completed-fn)
(future-task f success-fn failure-fn)
```

Takes a function `f` without arguments and yields a future object that will invoke the function in another thread.

If a single completed function is passed it will be called with the future as its argument as soon as the future has completed. If a success and a failure function are passed either the success or failure function will be called as soon as the future has completed. Upon success the success function will be called with the future's result as its argument, upon failure the failure function will be called with the exception as its argument.

In combination with a queue a completion service can be built. The tasks appear in the queue in the order they have completed.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
;; building a completion service
;; CompletionService = incoming worker queue + worker threads + output data queue
(do
  (def q (queue 10))
  (defn process [s v] (sleep s) v)
  (defn failure [s m] (sleep s) (throw (ex :VncException m))))

geip/ip-to-city-loc-resolver

```
(geip/ip-to-city-loc-resolver geip-zip)
```

Returns a resolve function that resolves an IP address to its associated city and latitude/longitude location. The resolve function returns the city and the latitude/longitude or nil if no data is found.

The MindMax city geip-zip may be a bytebuf, a file, a string (file path) or an InputStream.

The resolver loads the MindMax IPv4 and IPv6 city database and caches the data for IP address resolves.

As of July 2020 the MaxMind city database has:

2'917'097	IPv4 blocks
459'294	IPv6 blocks
118'189	cities

Note:

The MaxMind city IPv4 and IPv6 databases have 220MB of size on disk. It takes considerable time to load the data. Preprocessed and ready to work in the GEO IP modules ~3GB of memory is required.

Once the resolver has loaded the data the lookups are very fast.

```
(do
  (def rv (geoip/ip-to-city-loc-resolver "./geoip-city.zip"))

  (rv "192.241.235.46")) ;; => {:ip "192.241.235.46"
                                ;;   :loc ["37.7353" "-122.3732"]
                                ;;   :country-name "United States"
                                ;;   :country-iso "US"
                                ;;   :region "California"
                                ;;   :city "San Francisco"}
```

top

get

```
(get map key)
(get map key not-found)
```

Returns the value mapped to key, not-found or nil if key not present.

Note: `(get :x foo)` is almost twice as fast as `(:x foo)`

```
(get {:a 1 :b 2} :b)
=> 2
```

```
(get [0 1 2 3] 1)
=> 1
```

;; keywords act like functions on maps

```
(:b {:a 1 :b 2})
=> 2
```

get-in

```
(get-in m ks)
(get-in m ks not-found)
```

Returns the value in a nested associative structure, where ks is a sequence of keys. Returns nil if the key is not present, or the not-found value if supplied.

```
(get-in {:a 1 :b {:c 2 :d 3}} [:b :c])
=> 2

(get-in [:a :b :c] [0])
=> :a

(get-in [:a :b [:c :d :e]] [2 1])
=> :d

(get-in {:a 1 :b {:c [4 5 6]}} [:b :c 1])
=> 5
```

gradle/task

```
(gradle/task name & options)
(gradle/task name out-fn & options)
(gradle/task name out-fn err-fn throw-ex & options)
```

Runs a gradle task

```
(gradle/with-home "/Users/foo/Documents/Tools/gradle-5.6.2"
                  "/Users/foo/Documents/Projects/my-project"
  (gradle/task compile)
  (gradle/task compile "--warning-mode=all" "--stacktrace")
  (gradle/task compile println)
  (gradle/task compile println println true)
  (gradle/task compile println println true "--stacktrace"))
```

gradle/version

```
(gradle/version)
```

Returns the Gradle version

```
(gradle/with-home "/Users/foo/Documents/Tools/gradle-5.6.2"
                  "/Users/foo/Documents/Projects/my-project"
  (gradle/version))
```

gradle/with-home

(with-home gradle-dir proj-dir & forms)

Sets the Gradle home and the project directory for all subsequent forms.

```
(gradle/with-home "/Users/foo/Documents/Tools/gradle-5.6.2"
                  "/Users/foo/Documents/Projects/my-project"
  (gradle/version))
```

gradlew/run

(gradlew/run proj-home out-fn err-fn & args)

Runs one or more Gradle tasks.

Note: Use this module only for projects based on the Gradle wrapper

Arguments:

proj-home	The project directory
out-fn	a function with a single string argument that receives line by line from the process' stdout.
err-fn	a function with a single string argument that receives line by line from the process' stderr.
args	Any number of task names and Gradle options

```
(do
  (load-module :gradlew)
  (let [java-home (system-env :JAVA_11_HOME)]
    (gradlew/run "/Users/foo/projects/bar"
      println
      println
      ;; tasks
      "clean"
      "build"
      ;; options
      "--warning-mode=all"
      "--console=plain"
      "--stacktrace"
      (str "-Dorg.gradle.java.home=\"" java-home "\""))
```

gradlew/run*

(gradlew/run* proj-home out-fn err-fn & args)

Runs one or more Gradle tasks and prints a list of the tasks and the options taken from the passed arguments.

Note: Use this module only for projects based on the Gradle wrapper

Apart from printing the passed tasks and options the function is identical to `gradlew/run`.

Arguments:

proj-home	The project directory
out-fn	a function with a single string argument that receives line by line from the process' stdout. May be nil.
err-fn	a function with a single string argument that receives line by line from the process' stderr. May be nil.
args	Any number of task names and Gradle options

```
(do
  (load-module :gradlew)
  (let [java-home (system-env :JAVA_11_HOME)]
    (gradlew/run* "/Users/foo/projects/bar"
      println
      println
      ;; tasks
      "clean"
      "build"
      ;; options
      "--warning-mode=all"
      "--console=plain"
      "--stacktrace"
      (str "-Dorg.gradle.java.home=\"" java-home "\""))))
```

[top](#)

gradlew/version

(gradlew/version)

Returns the Gradle version

Note: Use this module only for projects based on the Gradle wrapper

```
(do
  (load-module :gradlew)
  (gradlew/version "/Users/foo/projects/bar"))
```

[top](#)

grep/grep

(grep dir file-glob line-pattern & options)

Search for lines that match a regular expression in text files. The search starts from a base directory and chooses all files that match a globbing pattern.

Options:

:print b e.g :print false, defaults to true

With the print option :print true, grep prints the matches in a human readable form, one line per match in the format `"{{filename}}:{{lineno}}:{{line}}"`.

With the print option :print false, grep prints the matches in a machine readable form. It returns a list of tuples `[[{{filename}}, {{lineno}}, {{line}}]`.

```
(do
  (load-module :grep)
  (grep/grep "/Users/foo/logs" "*.log" ".*Error.*"))
```

SEE ALSO

[grep/grep-zip](#)

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match ...

[io/file-matches-glob?](#)

Returns true if the file *f* matches the glob pattern. *f* must be a file or a string (file path).

top

grep/grep-zip

```
(grep/grep-zip dir zipfile-glob file-glob line-pattern & options)
```

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match a globbing pattern. The search starts from a base directory and chooses all ZIP files that match the zipfile globbing pattern.

Options:

:print b e.g :print false, defaults to true

With the print option `:print true`, `grep-zip` prints the matches in a human readable form, one line per match in the format `"{{zipfile}}!{{filename}}:{{lineno}}:{{line}}"`.

With the print option `:print false`, `grep-zip` prints the matches in a machine readable form. It returns a list of tuples `[[{{zipname}}, {{filename}}, {{lineno}}, {{line}}]`.

```
(do
  (load-module :grep)
  (grep/grep-zip "/Users/foo/logs" "logs*.zip" "**/*.log" ".*Error.*"))
```

[io/file-matches-glob?](#)

Returns true if the file *f* matches the glob pattern. *f* must be a file or a string (file path).

top

group-by

```
(group-by f coll)
```

Returns a map of the elements of *coll* keyed by the result of *f* on each element. The value at each key will be a vector of the corresponding elements, in the order they appeared in *coll*.

```
(group-by count ["a" "as" "asd" "aa" "asdf" "qwer"])
=> {1 ["a"] 2 ["as" "aa"] 3 ["asd"] 4 ["asdf" "qwer"]}
```

```
(group-by odd? (range 10))
=> {false [0 2 4 6 8] true [1 3 5 7 9]}
```

```
(group-by identity (seq "abracadabra"))
=> {#\a [#\a #\a #\a #\a #\a #\a] #\b [#\b #\b] #\r [#\r #\r] #\c [#\c] #\d [#\d]}
```

[top](#)

halt-when

```
(halt-when pred)
(halt-when pred retf)
```

Returns a transducer that ends transduction when pred returns true for an input. When retf is supplied it must be a fn of 2 arguments - it will be passed the (completed) result so far and the input that triggered the predicate, and its return value (if it does not throw an exception) will be the return value of the transducer. If retf is not supplied, the input that triggered the predicate will be returned. If the predicate never returns true the transduction is unaffected.

```
(do
  (def xf (comp (halt-when #(<= % 10)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> [1 3 5 7 9]
```

```
(do
  (def xf (comp (halt-when #(> % 5)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> 6
```

[top](#)

hash-map

```
(hash-map & keyvals)
(hash-map map)
```

Creates a new hash map containing the items.

```
(hash-map :a 1 :b 2)
=> {:a 1 :b 2}
```

```
(hash-map (sorted-map :a 1 :b 2))
=> {:a 1 :b 2}
```

[top](#)

hash-map?

```
(hash-map? obj)
```

Returns true if obj is a hash map

```
(hash-map? (hash-map :a 1 :b 2))
=> true
```

[top](#)

hexdump/dump

(dump s & opts)

Prints a hexdump of the given argument to `*out*`. Optionally supply byte offset (:offset, default: 0) and size (:size, default: :all) arguments. Can create hexdump from a collection of values, a bytebuf, a java.io.File, or a string representing a path to a file.

Example: (hexdump/dump (range 100))

```
00000000: 0001 0203 0405 0607 0809 0a0b 0c0d 0e0f .....
00000010: 1011 1213 1415 1617 1819 1a1b 1c1d 1e1f .....
00000020: 2021 2223 2425 2627 2829 2a2b 2c2d 2e2f !"#%&'()*+,-./
00000030: 3031 3233 3435 3637 3839 3a3b 3c3d 3e3f 0123456789;<=>?
00000040: 4041 4243 4445 4647 4849 4a4b 4c4d 4e4f @ABCDEFGHIJKLMNO
00000050: 5051 5253 5455 5657 5859 5a5b 5c5d 5e5f PQRSTUVWXYZ[\]^_
00000060: 6061 6263 `abc
```

(hexdump/dump [0 1 2 3])

(hexdump/dump (range 1000))

(hexdump/dump (range 10000) :offset 9000 :size 256)

(hexdump/dump "./img.png")

(hexdump/dump "./img.png" :offset 0 :size 64)

```
(try-with [ps (io/capturing-print-stream)]
(binding [*out* ps]
(hexdump/dump [0 1 2 3])
(str ps)))
```

http-client-legacy/send

(send method uri & options)

Send a request

Request Options:

:headers	A map of request headers. Headers can be single- or multi-value (comma separated): { "X-Header-1" "value1" "X-Header-2" "value1, value2, value3" }
:body	An optional body to send with the request The body may be of type <i>string</i> , <i>bytebuf</i> , <code>:java.io.InputStream</code>
:conn-timeout	An optional connection timeout in milliseconds
:read-timeout	An optional read timeout in milliseconds
:follow-redirects	Sets whether HTTP redirects (requests with response code 3xx) should be automatically followed.
:hostname-verifier	Sets the hostname verifier. An object of type <code>:javax.net.ssl.HostnameVerifier</code> . Use only for HTTPS requests
:ssl-socket-factory	Sets the SSL socket factory. An object of type <code>:javax.net.ssl.SSLSocketFactory</code> . Use only for HTTPS requests
:user-agent	User agent. Defaults to "Venice HTTP client (legacy)"
:debug	Debug true/false. Defaults to false

Returns a map with the response fields:

:http-status	The HTTP status (a long)
:content-type	The content type
:content-encoding	The content encoding (a keyword), if available else nil
:content-length	The content length (a long), if available else -1
:headers	A map of headers. key: header name, value: list of header values
:data-stream	The response data input stream

```
;; GET (get)
;;

http-client-legacy/upload-multipart

(upload-multipart parts uri & options)

Upload multiple parts.

The upload support file parts and generic parts. Any number of parts can be uploaded.

The parts are passed as a map of part data:

```
{ ;; a string part
  "Part-1" "xxxxxxxxxxxx"

  ;; a file part
```

```

"Part-2" (io/file "/user/foo/image.png")

;; a generic part
;; The charset of a generic part is only required for text based
;; data. When passing binary data the charset can be left out.
"Part-3" { :filename "data.xml"
           :mimetype "application/xml"
           :charset  :utf-8
           :data      "<user><name>foo</name></user>" }})

```

Request Options:

:headers	A map of request headers. Headers can be single- or multi-value (comma separated): { "X-Header-1" "value1" "X-Header-2" "value1, value2, value3" }
:conn-timeout	An optional connection timeout in milliseconds
:read-timeout	An optional read timeout in milliseconds
:follow-redirects	Sets whether HTTP redirects (requests with response code 3xx) should be automatically followed.
:hostname-verifier	Sets the hostname verifier. An object of type <code>:javax.net.ssl.HostnameVerifier</code> . Use only for HTTPS requests
:ssl-socket-factory	Sets the SSL socket factory. An object of type <code>:javax.net.ssl.SSLSocketFactory</code> . Use only for HTTPS requests
:user-agent	User agent. Defaults to "Venice HTTP client (legacy)"
:debug	Debug true/false. Defaults to false

Returns a map with the response fields:

[top](#)

import

```
(import class & classes)  
(import class :as alias)
```

Imports one or multiple Java classes. Imports are bound to the current namespace.

Example

Without import

```
(. :java.lang.Math :max 2 10)
```

With import

```
(do
  (import :java.lang.Math)
  (. :Math :max 2 10))
```

Aliases

Aliases are helpful if Java classes have the same name but different packages like `java.util.Date` and `java.sql.Date` :

```
(do
  (import :java.util.Date)
  (import :java.sql.Date :as :SqlDate)

  (println (. :Date :new))
  (println (. :SqlDate :valueOf "2022-06-24")))
```

Static nested classes

Venice

```
(do
  (import :foo.OuterClass)
  (import :foo.OuterClass$NestedStaticClass)

  (-> (. :OuterClass :new)
    (. :message))
  (-> (. :OuterClass$NestedStaticClass :new)
    (. :message)))
```

Java

```
package foo;
public class OuterClass {
  public String message() {
    return "OuterClass::message()";
  }

  public static class NestedStaticClass {
    public String message() {
      return "NestedStaticClass::message()";
    }
  }
}
```

```
(do
  (import :java.lang.Math)
  (. :Math :max 2 10))
=> 10

(do
  (import :java.awt.Point
    :java.lang.Math)
  (. :Math :max 2 10))
=> 10

(do
  (import :java.awt.Color :as :AwtColor)
  (. :AwtColor :new 200I 230I 255I 180I))
=> java.awt.Color[r=200,g=230,b=255]
```

```
(do
  (ns util)
  (defn import? [clazz ns_]
    (any? #(== % clazz) (map first (imports ns_)))))

  (ns alpha)
  (import :java.lang.Math)
  (println "alpha:" (util/import? :java.lang.Math 'alpha))

  (ns beta)
  (println "beta:" (util/import? :java.lang.Math 'beta))

  (ns alpha)
  (println "alpha:" (util/import? :java.lang.Math 'alpha))
)
alpha: true
beta: false
alpha: true
=> nil
```

SEE ALSO

[imports](#)

Without namespace arg returns a list with the registered imports for the current namespace. With namespace arg returns a list with ...

[top](#)

imports

```
(imports & options)
(imports ns & options)
```

Without namespace arg returns a list with the registered imports for the current namespace. With namespace arg returns a list with the registered imports for the given namespace.

Options:

:print print the import list to the current value of `*out*`

```
(do
  (import :java.lang.Math)
  (imports))
=> [:com.github.jlangch.venice.AssertionException :AssertionException] [:com.github.jlangch.venice.
SecurityException :SecurityException] [:com.github.jlangch.venice.ValueException :ValueException] [:com.github.

[top](#)

inet/inet-addr

```
(inet/inet-addr addr)
```

Converts a stringified IPv4 or IPv6 to a Java InetAddress.

```
(inet/inet-addr "222.192.0.0")
=> /222.192.0.0
```

```
(inet/inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")
=> /2001:db8:85a3:8d3:1319:8a2e:370:7347
```

[top](#)

inet/inet-addr-from-bytes

```
(inet/inet-addr-bytes addr)
```

Converts a IPv4 or IPv6 byte address (a vector of unsigned integers) to a Java InetAddress.

```
(inet/inet-addr-from-bytes [222I 192I 12I 0I])
=> /222.192.12.0
```

```
(inet/inet-addr-from-bytes [32I 1I 13I 184I 133I 163I 8I 211I 19I 25I 138I 46I 3I 112I 115I 71I])
=> /2001:db8:85a3:8d3:1319:8a2e:370:7347
```

[top](#)

inet/inet-addr-to-bytes

```
(inet/inet-addr-to-bytes addr)
```

Converts a stringified IPv4/IPv6 address or a Java InetAddress to an InetAddress byte vector.

```
(inet/inet-addr-to-bytes "222.192.12.0")
=> [222I 192I 12I 0I]
```

```
(inet/inet-addr-to-bytes "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")
=> [32I 1I 13I 184I 133I 163I 8I 211I 19I 25I 138I 46I 3I 112I 115I 71I]
```

```
(inet/inet-addr-to-bytes (inet/inet-addr "222.192.0.0"))
=> [222I 192I 0I 0I]
```

[top](#)

inet/ip4?

```
(inet/ip4? addr)
```

Returns true if addr is an IPv4 address.

```
(inet/ip4? "222.192.0.0")
=> true
```

```
(inet/ip4? (inet/inet-addr "222.192.0.0"))
=> true
```

[top](#)

inet/ip6?

```
(inet/ip6? addr)
```

Returns true if addr is an IPv6 address.

```
(inet/ip6? "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")  
=> true
```

```
(inet/ip6? (inet/inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347"))  
=> true
```

[top](#)

inet/linklocal-addr?

```
(inet/linklocal-addr? addr)
```

Returns true if addr is a link local address.

```
(inet/linklocal-addr? "169.254.0.0")  
=> true
```

```
(inet/linklocal-addr? (inet/inet-addr "169.254.0.0"))  
=> true
```

[top](#)

inet/multicast-addr?

```
(inet/multicast-addr? addr)
```

Returns true if addr is a multicast address.

```
(inet/multicast-addr? "224.0.0.1")  
=> true
```

```
(inet/multicast-addr? (inet/inet-addr "224.0.0.1"))  
=> true
```

[top](#)

inet/reachable?

```
(inet/reachable? addr timeout)
```

Test whether that address is reachable. Best effort is made by the implementation to try to reach the host, but firewalls and server configuration may block requests resulting in a unreachable status while some specific ports may be accessible. A typical implementation will use ICMP ECHO REQUESTs if the privilege can be obtained, otherwise it will try to establish a TCP connection on port 7 (Echo) of the destination host.

The timeout value, in milliseconds, indicates the maximum amount of time the try should take. If the operation times out before getting an answer, the host is deemed unreachable.

```
(inet/reachable? "google.com" 500)
=> false
```

```
(inet/reachable? "74.125.193.113" 500)
=> false
```

[top](#)

inet/sitelocal-addr?

```
(inet/sitelocal-addr? addr)
```

Returns true if addr is a site local address.

```
(inet/sitelocal-addr? "192.168.0.0")
=> true
```

```
(inet/sitelocal-addr? (inet/inet-addr "192.168.0.0"))
=> true
```

[top](#)

infinite?

```
(infinite? x)
```

Returns true if x is infinite else false. x must be a double!

```
(infinite? 1.0E300)
=> false
```

```
(infinite? (* 1.0E300 1.0E100))
=> true
```

```
(infinite? (/ 1.0 0))
=> true
```

```
(pr (/ 4.1 0))
:Infinite
=> nil
```

SEE ALSO

[nan?](#)

Returns true if x is a NaN else false. x must be a double!

[double](#)

Converts to double

top

installer/clean

```
(clean dir)
```

Remove Java libraries (except any Jansi library) and TTF font files from the specified directory.

The removal does NOT recursively traverse the directory tree.

```
(do
  (load-module :installer)
  (installer/clean (repl/libs-dir)))
```

SEE ALSO

Install Java libraries.

top

installer/install-demo

```
(install-demo options*)
```

Install all demo fonts and the 3rdparty libraries for all Venice extension modules that require Java libraries:

- :jansi
- :bouncycastle
- :chatgpt
- :excel
- :pdf
- :qrbill
- :tomcat
- :xchart

Options:

:dir path	download dir, defaults to "." except when run in a REPL where it defaults to the value of <code>(repl/libs-dir)</code>
:silent {true,false}	if silent is true does not show a progress bar, defaults to true
:force {true,false}	if force is true download the artifact even if it exist already on the download dir, else skip the download if it exists. Defaults to true.

In the REPL run:

```
venice> (load-module :installer)
venice> (installer/install-demo)
venice> !restart
```

The installed libraries and fonts can be cleaned with:

```
(installer/clean (repl/libs-dir))
```

```
(do
  (load-module :installer)
  (installer/install-demo :dir (repl/libs-dir) :silent false))
```

SEE ALSO

=> false  
  
(int? nil)  
=> false  
  
(int? {})  
=> false
```

[top](#)

interleave

```
(interleave c1 c2)  
(interleave c1 c2 & colls)
```

Returns a collection of the first item in each coll, then the second etc.

Supports lazy sequences as long at least one collection is not a lazy sequence.

```
(interleave [:a :b :c] [1 2])  
=> (:a 1 :b 2)
```

```
(interleave [:a :b :c] (lazy-seq 1 inc))
=> (:a 1 :b 2 :c 3)

(interleave (lazy-seq (constantly :v)) [1 2 3])
=> (:v 1 :v 2 :v 3)
```

[top](#)

interpose

```
(interpose sep coll)
```

Returns a collection of the elements of coll separated by sep.

```
(interpose ", " [1 2 3])
=> (1 ", " 2 ", " 3)
```

```
(apply str (interpose ", " [1 2 3]))
=> "1, 2, 3"
```

[top](#)

intersection

```
(intersection s1)
(intersection s1 s2)
(intersection s1 s2 & sets)
```

Return a set that is the intersection of the input sets

```
(intersection (set 1))
=> #{1}
```

```
(intersection (set 1 2) (set 2 3))
=> #{2}
```

```
(intersection (set 1 2) (set 3 4))
=> #{} 
```

SEE ALSO

[union](#)

Return a set that is the union of the input sets

[difference](#)

Return a set that is the first set without elements of the remaining sets

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[disj](#)

Returns a new set with the x, xs removed.

into

```
(into)
(into to)
(into to from)
```

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

```
(into (sorted-map) [ [:a 1] [:c 3] [:b 2] ])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) [ {:a 1} {:c 3} {:b 2} ])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) [(map-entry :b 2) (map-entry :c 3) (map-entry :a 1)])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) {:b 2 :c 3 :a 1})
=> {:a 1 :b 2 :c 3}

(into [] {:a 1, :b 2})
=> [[:a 1] [:b 2]]

(into [] '(1 2 3))
=> [1 2 3]

(into '() '(1 2 3))
=> (3 2 1)

(into [1 2 3] '(4 5 6))
=> [1 2 3 4 5 6]

(into '(1 2 3) '(4 5 6))
=> (6 5 4 1 2 3)

(into [] (bytebuf [0 1 2]))
=> [0 1 2]

(into '() (bytebuf [0 1 2]))
=> (0 1 2)

(into [] "abc")
=> [#\a #\b #\c]

(into '() "abc")
=> (#\a #\b #\c)
```

SEE ALSO

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

into!

```
(into!)
(into! to)
(into! to from)
```

Adds all of the items of 'from' conjoined to the mutable 'to' collection

```
(into! (queue) [1 2 3 4])
=> (1 2 3 4)

(into! (stack) [1 2 3 4])
=> (4 3 2 1)

(do
  (into! (. :java.util.concurrent.CopyOnWriteArrayList :new)
    (doto (. :java.util.ArrayList :new)
      (. :add 3)
      (. :add 4))))
=> (3 4)

(do
  (into! (. :java.util.concurrent.CopyOnWriteArrayList :new)
    '(3 4)))
=> (3 4)
```

SEE ALSO

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

io/->uri

```
(io/->uri s)
(io/->uri scheme user-info host port path)
(io/->uri scheme user-info host port path query)
(io/->uri scheme user-info host port path query fragment)
```

Converts s to an URI or builds an URI from its spec elements.

s may be:

- a string (a spec string to be parsed as a URI.)
- a `java.io.File`
- a `java.nio.file.Path`
- a `java.net.URL`

Arguments:

scheme Scheme name
userInfo User name and authorization information

host Host name
port Port number
path Path
query Query
fragment Fragment

```
(io/->uri "file:/tmp/test.txt")
=> file:/tmp/test.txt

(io/->uri (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt

(io/->uri (io/->url (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt

(str (io/->uri (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"

;; to create an URL from spec details:
(io/->uri "http" nil "foo.org" 8080 "/info.html" nil nil)
=> http://foo.org:8080/info.html
```

SEE ALSO

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[io/->url](#)

Converts s to an URL or builds an URL from its spec elements.

[top](#)

io/->url

```
(io/->url s)
(io/->url protocol host port file)
```

Converts s to an URL or builds an URL from its spec elements.

s may be:

- a string (a spec string to be parsed as a URL.)
- a `java.io.File`
- a `java.nio.file.Path`
- a `java.net.URI`

Arguments:

protocol the name of the protocol to use.
host the name of the host.
port the port number on the host.
file the file on the host

```
(io/->url "file:/tmp/test.txt")
=> file:/tmp/test.txt

(io/->url (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt
```

```
(io/->url (io/->uri (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt

(str (io/->url (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"

;; to create an URL from spec details:
(io/->url "http" "foo.org" 8080 "/info.html")
=> http://foo.org:8080/info.html
```

SEE ALSO

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[io/->uri](#)

Converts `s` to an URI or builds an URI from its spec elements.

[top](#)

io/await-for

```
(io/await-for timeout time-unit file & modes)
```

Blocks the current thread until the file has been created, deleted, or modified according to the passed modes `{:created, :deleted, :modified}`, or the timeout has elapsed. Returns logical false if returning due to timeout, logical true otherwise.

Supported time units are: `{:milliseconds, :seconds, :minutes, :hours, :days}`

```
(io/await-for 10 :seconds "/tmp/data.json" :created)
```

SEE ALSO

[io/watch-dir](#)

Watch a directory for changes, and call the function `event-fn` when it does. Calls the optional `failure-fn` if errors occur. On closing ...

[top](#)

io/buffered-reader

```
(io/buffered-reader f & options)
```

Create a `java.io.Reader` from `f`.

`f` may be a:

- string
- `bytebuffer`
- `java.io.File`, e.g. `(io/file "/temp/foo.json")`
- `java.nio.file.Path`
- `java.io.InputStream`
- `java.io.Reader`
- `java.net.URL`
- `java.net.URI`

Options:

:encoding enc e.g.: :encoding :utf-8 , defaults to :utf-8

`io/buffered-reader` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the reader!

```
(let [data (bytebuf [108 105 110 101 32 49 10 108 105 110 101 32 50])]
  (try-with [rd (io/buffered-reader data :encoding :utf-8)]
    (println (read-line rd))
    (println (read-line rd))))
```

line 1

line 2

=> nil

```
(try-with [rd (io/buffered-reader "1\n2\n3\n4")]
  (println (read-line rd))
  (println (read-line rd)))
```

1

2

=> nil

SEE ALSO

[read-line](#)

Without arg reads the next line from the stream that is the current value of *in*. With arg reads the next line from the passed stream ...

[io/string-reader](#)

Creates a java.io.StringReader from a string.

[io/buffered-writer](#)

Creates a java.io.Writer for f.

top

io/buffered-writer

(io/buffered-writer f & options)

Creates a `java.io.Writer` for f.

f may be a:

- `java.io.File`, e.g.: `(io/file "/temp/foo.json")`
- `java.nio.file.Path`
- `java.io.OutputStream`
- `java.io.Writer` Options:

:append true/false e.g.: :append true , defaults to false

:encoding enc e.g.: :encoding :utf-8 , defaults to :utf-8

`io/buffered-writer` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

SEE ALSO

[println](#)

Prints the values xs to the stream that is the current value of *out* or to the passed output stream os if given followed by a (newline).

[io/string-writer](#)

Creates a java.io.StringWriter.

[io/buffered-reader](#)

Create a `java.io.Reader` from `f`.

[top](#)

[io/bytebuf-in-stream](#)

`(io/bytebuf-in-stream buf)`

Returns a `java.io.InputStream` from a `bytebuf`.

Note: The caller is responsible for closing the stream!

```
(try-with [is (io/bytebuf-in-stream (bytebuf [97 98 99]))]
  ; do something with is
)
```

SEE ALSO

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For ...

[io/file-in-stream](#)

Returns a `java.io.InputStream` for the file `f`.

[io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

[top](#)

[io/bytebuf-out-stream](#)

`(io/bytebuf-out-stream)`

Returns a new `java.io.ByteArrayOutputStream` .

Dereferencing a `:ByteArrayOutputStream` returns the captured `bytebuf`.

Note: The caller is responsible for closing the stream!

```
(try-with [os (io/bytebuf-out-stream)]
  (io/spit-stream os (bytebuf [97 98 99]) :flush true)
  (str/format-bytebuf @os ", " :prefix0x))
=> "0x61, 0x62, 0x63"
```

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For ...

[io/file-in-stream](#)

Returns a `java.io.InputStream` for the file `f`.

[io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

[top](#)

io/capturing-print-stream

(io/capturing-print-stream)

Creates a new capturing print stream.

Dereferencing a capturing print stream returns the captured string.

Note: The caller is responsible for closing the stream!

```
(try-with [ps (io/capturing-print-stream)]
  (binding [*out* ps]
    (println 100)
    (println 200)
    (flush)
    @ps))
=> "100\n200\n"
```

```
(try-with [ps (io/capturing-print-stream)]
  (println ps 100)
  (println ps 200)
  (flush ps)
  @ps)
=> "100\n200\n"
```

top

io/classpath-resource?

(io/classpath-resource? name)

Returns true if the classpath resource exists otherwise false.

```
(io/classpath-resource? "com/github/jlangch/venice/images/venice.png")
=> true
```

SEE ALSO

[io/load-classpath-resource](#)

Loads a classpath resource. Returns a bytebuf

top

io/close

(io/close s)

Closes a `:java.io.InputStream`, `:java.io.OutputStream`, `:java.io.Reader`, or a `:java.io.Writer`.

Often it is more elegant to use try-with to let Venice implicitly close the stream when its leaves the scope:

```
(let [file (io/file "foo.txt")]
  (try-with [is (io/file-in-stream file)]
    (io/slurp-stream is :binary false)))
```

SEE ALSO

[io/flush](#)

Flushes a `java.io.OutputStream` or a `java.io.Writer`.

[top](#)

io/close-watcher

`(io/close-watcher watcher)`

Closes a watcher created from 'io/watch-dir'.

SEE ALSO

[io/watch-dir](#)

Watch a directory for changes, and call the function `event-fn` when it does. Calls the optional `failure-fn` if errors occur. On closing ...

[top](#)

io/copy-file

`(io/copy-file source dest & options)`

Copies `source` to `dest`. Returns `nil` or throws a `VncException`. `Source` must be a file or a string (file path), `dest` must be a file, a string (file path), or an `java.io.OutputStream`.

Options:

<code>:replace</code> true/false	e.g.: if true replace an existing file, defaults to false
<code>:copy-attributes</code> true/false	e.g.: if true copy attributes to the new file, defaults to false
<code>:no-follow-links</code> true/false	e.g.: if true do not follow symbolic links, defaults to false

SEE ALSO

[io/copy-files-glob](#)

Copies all files that match the glob pattern from a source to a destination directory. `src-dir` and `dst-dir` must be a file or a string ...

[io/copy-file-tree](#)

Copies a file tree from source to dest. Returns `nil` or throws a `VncException`. `Source` must be a file or a string (file path), `dest` must ...

[io/move-file](#)

Moves `source` to `target`. Returns `nil` or throws a `VncException`. `Source` and `target` must be a file or a string (file path).

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If `f` is a directory the directory must be empty. `f` ...

[io/touch-file](#)

Updates the `lastModifiedTime` of the file to the current time, or creates a new empty file if the file doesn't already exist. File must ...

[io/copy-stream](#)

Copies the input stream to the output stream. Returns `nil` on success or throws a `VncException` on failure. Input and output must be a ...

[top](#)

io/copy-file-tree

(io/copy-file-tree source dest & options)

Copies a file tree from source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a string (file path), or an `java.io.OutputStream`.

Options:

:replace true/false	e.g.: if true replace an existing file, defaults to false
:copy-attributes true/false	e.g.: if true copy attributes to the new file, defaults to false
:no-follow-links true/false	e.g.: if true do not follow symbolic links, defaults to false

top

io/copy-files-glob

(io/copy-files-glob src-dir dst-dir glob & options)

Copies all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

Options:

:replace true/false	e.g.: if true replace an existing file, defaults to false
:copy-attributes true/false	e.g.: if true copy attributes to the new file, defaults to false
:no-follow-links true/false	e.g.: if true do not follow symbolic links, defaults to false

Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in .txt
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with .txt or .xml
<code>foo.?[xy]</code>	Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/copy-files-glob "from" "to" "*.log")
```

SEE ALSO

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

[io/copy-file-tree](#)

Copies a file tree from source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must ...

[io/move-files-glob](#)

Move all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

top

io/copy-stream

```
(io/copy-stream in-stream out-stream)
```

Copies the input stream to the output stream. Returns `nil` on success or throws a VncException on failure. Input and output must be a `java.io.InputStream` and `java.io.OutputStream`.

SEE ALSO

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

top

io/create-hard-link

```
(io/create-hard-link link target)
```

Creates a hard link to a target. link and target must be a file or a string (file path).

```
(io/create-hard-link "/tmp/hard-link" "/tmp/test.txt")
```

SEE ALSO

[io/create-symbolic-link](#)

Creates a symbolic link to a target. link and target must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

[top](#)

io/create-symbolic-link

```
(io/create-symbolic-link link target)
```

Creates a symbolic link to a target. link and target must be a file or a string (file path).

```
(io/create-symbolic-link "/tmp/sym-link" "/tmp/test.txt")
```

SEE ALSO

[io/create-hard-link](#)

Creates a hard link to a target. link and target must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

[top](#)

io/default-charset

```
(io/default-charset)
```

Returns the default charset.

[top](#)

io/delete-file

```
(io/delete-file f & files)
```

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f must be a file or a string (file path).

SEE ALSO

Deletes a file or a directory with all its content. Silently skips delete if the file or directory does not exist. `f` must be a file ...

[io/move-files-glob](#)

Move all files that match the glob pattern from a source to a destination directory. `src-dir` and `dst-dir` must be a file or a string (file path).

[io/copy-files-glob](#)

Copies all files that match the glob pattern from a source to a destination directory. `src-dir` and `dst-dir` must be a file or a string ...

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

[top](#)

io/download

```
(io/download uri & options)
```

Downloads the content from the `uri` and reads it as text (string) or binary (bytebuf). Supports http and https protocols!

Options:

:binary b	e.g.: <code>:binary true</code> , defaults to false
:user-agent agent	e.g.: <code>:user-agent "Mozilla"</code> , defaults to nil
:encoding enc	e.g.: <code>:encoding :utf-8</code> , defaults to <code>:utf-8</code>
:user u	optional user for basic authentication
:password p	optional password for basic authentication
:follow-redirects b	e.g.: <code>:follow-redirects true</code> , defaults to false
:conn-timeout val	e.g.: <code>:conn-timeout 10000</code> , connection timeout in milliseconds. 0 is interpreted as an infinite timeout.
:read-timeout val	e.g.: <code>:read-timeout 10000</code> , read timeout in milliseconds. 0 is interpreted as an infinite timeout.
:progress-fn fn	an optional progress function that takes 2 args [1] progress (0..100%) [2] status {start:progress:end:failed}
:debug-fn fn	an optional debug function that takes a message as argument

Note:

If the server returns the HTTP response status code 403 (*Access Denied*) sending a user agent like "Mozilla" may fool the website and solve the problem.

To debug pass a printing function like: `(io/download https://foo.org/bar :debug-fn println)`

```
(-<> "https://live.staticflickr.com/65535/51007202541_ea453871d8_o_d.jpg"
  (io/download <> :binary true :user-agent "Mozilla")
  (io/spit "space-x.jpg" <>))

(do
  (load-module :ansi)
  (-<> "https://live.staticflickr.com/65535/51007202541_ea453871d8_o_d.jpg"
    (io/download <> :binary true
                  :user-agent "Mozilla"
                  :progress-fn (ansi/progress :caption "Download:"))
    (io/spit "space-x.jpg" <>)))
```

top

io/exists-dir?

```
(io/exists-dir? f)
```

Returns true if the file `f` exists and is a directory. `f` must be a file or a string (file path).

```
(io/exists-dir? (io/file "/temp"))
=> false
```

SEE ALSO

[io/exists-file?](#)

Returns true if the file `f` exists and is a file. `f` must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

top

io/exists-file?

```
(io/exists-file? f)
```

Returns true if the file `f` exists and is a file. `f` must be a file or a string (file path).

Returns the canonical path of the file `f`. `f` must be a file or a string (file path).

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[io/file-absolute](#)

Returns the absolute path of the file `f`. `f` must be a file or a string (file path).

[top](#)

io/file-basename

```
(io/file-basename f)
```

Returns the base name (file name without file extension) of the file `f` as a string. `f` must be a file or a string (file path).

```
(io/file-basename (io/file "/tmp/test/x.txt"))  
=> "x"
```

SEE ALSO

[io/file-name](#)

Returns the name of the file `f` as a string. `f` must be a file or a string (file path).

[io/file-parent](#)

Returns the parent file of the file `f`. `f` must be a file or a string (file path).

[io/file-ext](#)

Returns the file extension of a file. `f` must be a file or a string (file path).

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[str/normalize-utf](#)

Normalizes an UTF string.

[top](#)

io/file-can-execute?

```
(io/file-can-execute? f)
```

Returns true if the file or directory `f` exists and can be executed. `f` must be a file or a string (file path).

```
(io/file-can-execute? "/tmp/test.txt")
```

SEE ALSO

[io/file-set-executable](#)

Set the owner's execute permission to the file or directory `f`. `f` must be a file or a string (file path).

[io/file-can-read?](#)

Returns true if the file or directory `f` exists and can be read. `f` must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory `f` exists and can be written. `f` must be a file or a string (file path).

[io/file-hidden?](#)

Returns true if the file or directory `f` exists and is hidden. `f` must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

io/file-can-read?

```
(io/file-can-read? f)
```

Returns true if the file or directory `f` exists and can be read. `f` must be a file or a string (file path).

```
(io/file-can-read? "/tmp/test.txt")
```

SEE ALSO

[io/file-set-readable](#)

Set the owner's read permission to the file or directory `f`. `f` must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory `f` exists and can be written. `f` must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory `f` exists and can be executed. `f` must be a file or a string (file path).

[io/file-hidden?](#)

Returns true if the file or directory `f` exists and is hidden. `f` must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

io/file-can-write?

```
(io/file-can-write? f)
```

Returns true if the file or directory `f` exists and can be written. `f` must be a file or a string (file path).

```
(io/file-can-write? "/tmp/test.txt")
```

SEE ALSO

[io/file-set-writable](#)

Set the owner's write permission to the file or directory `f`. `f` must be a file or a string (file path).

```

```
(io/file-ext "/tmp/test/some")  
=> nil
```

SEE ALSO

[io/file-ext?](#)

Returns true if the file *f* has the extension *ext*. *f* must be a file or a string (file path).

[io/file-basename](#)

Returns the base name (file name without file extension) of the file *f* as a string. *f* must be a file or a string (file path).

[top](#)

io/file-ext?

```
(io/file-ext? f ext & exts)
```

Returns true if the file *f* has the extension *ext*. *f* must be a file or a string (file path).

```
(io/file-ext? "/tmp/test/x.txt" "txt")
=> true

(io/file-ext? (io/file "/tmp/test/x.txt") ".txt")
=> true

(io/file-ext? "/tmp/test/x.docx" "doc" "docx")
=> false
```

SEE ALSO

[io/file-ext](#)

Returns the file extension of a file. *f* must be a file or a string (file path).

[top](#)

io/file-hidden?

```
(io/file-hidden? f)
```

Returns true if the file or directory *f* exists and is hidden. *f* must be a file or a string (file path).

```
(io/file-hidden? "/tmp/test.txt")
```

SEE ALSO

[io/file-can-read?](#)

Returns true if the file or directory *f* exists and can be read. *f* must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory *f* exists and can be written. *f* must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory *f* exists and can be executed. *f* must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file *f* exists and is a symbolic link. *f* must be a file or a string (file path).

[top](#)

io/file-in-stream

```
(io/file-in-stream f)
```

Returns a `java.io.InputStream` for the file *f*.

f may be a:

- string file path, e.g: `"/temp/foo.json"`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

`io/file-in-stream` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the stream!

SEE ALSO

[io/slurp](#)

Reads the content of file `f` as text (string) or binary (bytebuf).

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` `is`. Supports the option `:binary` to either slurp binary or string data. For ...

[io/string-in-stream](#)

Returns a `java.io.InputStream` for the string `s`.

[io/bytebuf-in-stream](#)

Returns a `java.io.InputStream` from a `bytebuf`.

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

io/file-last-modified

```
(io/file-last-modified f)
```

Returns the last modification time (a Java `LocalDateTime`) of `f` or `nil` if `f` does not exist. `f` must be a file or a string (file path).

```
(io/file-last-modified "/tmp/test.txt")
```

SEE ALSO

[io/file-can-read?](#)

Returns true if the file or directory `f` exists and can be read. `f` must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory `f` exists and can be written. `f` must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory `f` exists and can be executed. `f` must be a file or a string (file path).

[top](#)

io/file-matches-glob?

```
(io/file-matches-glob? glob f)
```

Returns true if the file `f` matches the glob pattern. `f` must be a file or a string (file path).

Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in <code>.txt</code>
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with <code>.txt</code> or <code>.xml</code>
<code>foo.?[xy]</code>	Matches file names starting with <code>foo.</code> and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/file-matches-glob? "*.log" "file.log")
=> true

(io/file-matches-glob? "**/*.log" "x/y/file.log")
=> true

(io/file-matches-glob? "**/*.log" "file.log") ; take care, doesn't match!
=> false

(io/file-matches-glob? (io/glob-path-matcher "*.log") (io/file "file.log"))
=> true

(io/file-matches-glob? (io/glob-path-matcher "**/*.log") (io/file "x/y/file.log"))
=> true
```

SEE ALSO

[io/glob-path-matcher](#)

Returns a file matcher for glob file patterns.

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

[top](#)

io/file-name

```
(io/file-name f)
```

Returns the name of the file f as a string. f must be a file or a string (file path).

```
(io/file-name (io/file "/tmp/test/x.txt"))
=> "x.txt"
```

SEE ALSO

[io/file-basename](#)

Returns the base name (file name without file extension) of the file f as a string. f must be a file or a string (file path).

[io/file-parent](#)

Returns the parent file of the file f. f must be a file or a string (file path).

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[str/normalize-utf](#)

Normalizes an UTF string.

top

io/file-normalize-utf

```
(io/file-normalize-utf file)
(io/file-normalize-utf file form)
```

Normalizes the UTF string of a file path.

On MacOS file names with umlauts like ä are just encoded as 'a' plus the combining diaeresis character. Therefore an 'ä' (`\u00FC`) and an 'ä' (a + `\u0308`) from a MacOS file name are different! Under normal circumstances this not problem. But as soon as some file name processing is in place (comparing, matching, ...) this can result in strange behaviour due of the two different technical representations of umlaut characters.

The *form* argument defaults to :NFC and is one of:

- :NFD Canonical decomposition
- :NFC Canonical decomposition, followed by canonical composition
- :NFKD Compatibility decomposition
- :NFKC Compatibility decomposition, followed by canonical composition

Returns an UTF normalized `java.io.File` from a file path

See the function `str/normalize-utf` for details on UTF normalization.

```
(io/file-normalize-utf "/tmp/test_u\u0308.txt")
```

```
(io/file-normalize-utf (io/file "/tmp/test_u\u0308.txt"))
```

SEE ALSO

[str/normalize-utf](#)

Normalizes an UTF string.

top

io/file-out-stream

```
(io/file-out-stream f options)
```

Returns a `java.io.OutputStream` for the file `f`.

`f` may be a:

- string file path, e.g: `"/temp/foo.json"`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

Options:

:append true/false e.g.: `:append true`, defaults to false

:encoding enc e.g.: `:encoding utf-8`, defaults to `utf-8`

`io/file-out-stream` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the stream!

SEE ALSO

[io/slurp](#)

Reads the content of file *f* as text (string) or binary (bytebuf).

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` *is*. Supports the option `:binary` to either slurp binary or string data. For ...

[io/string-in-stream](#)

Returns a `java.io.InputStream` for the string *s*.

[io/bytebuf-in-stream](#)

Returns a `java.io.InputStream` from a `bytebuf`.

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

io/file-parent

```
(io/file-parent f)
```

Returns the parent file of the file *f*. *f* must be a file or a string (file path).

```
(io/file-path (io/file-parent (io/file "/tmp/test/x.txt")))
=> "/tmp/test"
```

SEE ALSO

[io/file-name](#)

Returns the name of the file *f* as a string. *f* must be a file or a string (file path).

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

io/file-path

```
(io/file-path f)
```

Returns the path of the file *f* as a string. *f* must be a file or a string (file path).

```
(io/file-path (io/file "/tmp/test/x.txt"))
=> "/tmp/test/x.txt"
```

SEE ALSO

[io/file-absolute](#)

Returns the absolute path of the file *f*. *f* must be a file or a string (file path).

[io/file-canonical](#)

Returns the canonical path of the file *f*. *f* must be a file or a string (file path).

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[str/normalize-utf](#)

Normalizes an UTF string.

[top](#)

io/file-path-slashify

```
(io/file-path-slashify f)
```

Returns the path of the file `f` as a string, turns backslashes into slashes.

`f` must be a file or a string (file path).

`C:\Users\foo\image.png -> C:/Users/foo/image.png`

Note: Windows only. On other OSs works identical to 'io/file-path'.

```
(io/file-path-slashify (io/file "C:" "Users" "foo" "image.png"))  
=> "C:/Users/foo/image.png"
```

SEE ALSO

[io/file-path](#)

Returns the path of the file `f` as a string. `f` must be a file or a string (file path).

[top](#)

io/file-set-executable

```
(io/file-set-executable f executable owner-only)
```

Set the owner's execute permission to the file or directory `f`. `f` must be a file or a string (file path).

Returns true if and only if the operation succeeded. The operation will fail if the user does not have permission to change the access permissions of this abstract pathname. If 'readable' is false and the underlying file system does not implement a read permission, then the operation will fail.

If 'executable' is true sets the access permission to allow execute operations; if false to disallow execute operations.

If 'owner-only' is true the execute permission applies only to the owner's execute permission; otherwise, it applies to everybody. If the underlying file system can not distinguish the owner's execute permission from that of others, then the permission will apply to everybody, regardless of this value.

```
(io/file-set-executable "/tmp/test.txt" true true)
```

SEE ALSO

[io/file-can-execute?](#)

Returns true if the file or directory `f` exists and can be executed. `f` must be a file or a string (file path).

[io/file-set-readable](#)

Set the owner's read permission to the file or directory `f`. `f` must be a file or a string (file path).

[io/file-set-writable](#)

Set the owner's write permission to the file or directory `f`. `f` must be a file or a string (file path).

[top](#)

io/file-set-readable

```
(io/file-set-readable f readable owner-only)
```

Set the owner's read permission to the file or directory *f*. *f* must be a file or a string (file path).

Returns true if and only if the operation succeeded. The operation will fail if the user does not have permission to change the access permissions of this abstract pathname. If 'readable' is false and the underlying file system does not implement a read permission, then the operation will fail.

If 'readable' is true sets the access permission to allow read operations; if false to disallow read operations.

If 'owner-only' is true the read permission applies only to the owner's read permission; otherwise, it applies to everybody. If the underlying file system can not distinguish the owner's read permission from that of others, then the permission will apply to everybody, regardless of this value.

```
(io/file-set-readable "/tmp/test.txt" true true)
```

SEE ALSO

[io/file-can-read?](#)

Returns true if the file or directory *f* exists and can be read. *f* must be a file or a string (file path).

[io/file-set-writable](#)

Set the owner's write permission to the file or directory *f*. *f* must be a file or a string (file path).

[io/file-set-executable](#)

Set the owner's execute permission to the file or directory *f*. *f* must be a file or a string (file path).

[top](#)

io/file-set-writable

```
(io/file-set-writable f writable owner-only)
```

Set the owner's write permission to the file or directory *f*. *f* must be a file or a string (file path).

Returns true if and only if the operation succeeded. The operation will fail if the user does not have permission to change the access permissions of this abstract pathname. If 'writable' is false and the underlying file system does not implement a read permission, then the operation will fail.

If 'writable' is true sets the access permission to allow write operations; if false to disallow write operations.

If 'owner-only' is true the write permission applies only to the owner's write permission; otherwise, it applies to everybody. If the underlying file system can not distinguish the owner's write permission from that of others, then the permission will apply to everybody, regardless of this value.

```
(io/file-set-writable "/tmp/test.txt" true true)
```

SEE ALSO

[io/file-can-write?](#)

Returns true if the file or directory *f* exists and can be written. *f* must be a file or a string (file path).

[io/file-set-readable](#)

Set the owner's read permission to the file or directory *f*. *f* must be a file or a string (file path).

[io/file-set-executable](#)

Set the owner's execute permission to the file or directory *f*. *f* must be a file or a string (file path).

[top](#)

io/file-size

```
(io/file-size f)
```

Returns the size of the file `f`. `f` must be a file or a string (file path).

```
(io/file-size "/tmp/test.txt")
```

SEE ALSO

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

io/file-within-dir?

```
(io/file-within-dir? dir file)
```

Returns true if the file is within the dir else false.

The file and dir args must be absolute paths.

```
(io/file-within-dir? (io/file "/temp/foo")
                     (io/file "/temp/foo/img.png"))
=> true

(io/file-within-dir? (io/file "/temp/foo")
                     (io/file "/temp/foo/../bar/img.png"))
=> false
```

SEE ALSO

[io/file](#)

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

io/file?

```
(io/file? f)
```

Returns true if `x` is a `java.io.File`.

```
(io/file? (io/file "/tmp/test.txt"))
=> true
```

[top](#)

io/filesystem-total-space

```
(io/filesystem-total-space)
(io/filesystem-total-space file)
```

Returns the total disk space in bytes. With no args returns the total disk space of the current working directory's file store. With a file argument returns the total disk space of the file store the file is located.

```
(io/filesystem-total-space)
```

SEE ALSO

[io/filesystem-usable-space](#)

Returns the usable disk space in bytes. With no args returns the usable disk space of the current working directory's file store. With ...

```
(io/filesystem-usable-space)
(io/filesystem-usable-space file)
```

Returns the usable disk space in bytes. With no args returns the usable disk space of the current working directory's file store. With a file argument returns the usable disk space of the file store the file is located.

```
(io/filesystem-usable-space)
```

SEE ALSO

[io/filesystem-total-space](#)

Returns the total disk space in bytes. With no args returns the total disk space of the current working directory's file store. With ...

[top](#)

io/flush

```
(io/flush s)
```

Flushes a `:java.io.OutputStream` or a `:java.io.Writer`.

SEE ALSO

[io/close](#)

Closes a `:java.io.InputStream`, `:java.io.OutputStream`, `:java.io.Reader`, or a `:java.io.Writer`.

[top](#)

io/glob-path-matcher

```
(io/glob-path-matcher pattern)
```

Returns a file matcher for glob file patterns.

Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in .txt
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with .txt or .xml
<code>foo.?[xy]</code>	Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/glob-path-matcher "*.log")
```

```
(io/glob-path-matcher "**/*.log")
```

SEE ALSO

[io/file-matches-glob?](#)

Returns true if the file `f` matches the glob pattern. `f` must be a file or a string (file path).

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

[top](#)

io/gzip

```
(io/gzip f)
```

`gzipt f`. `f` may be a file, a string (file path), a `bytebuf` or an `InputStream`. Returns a `bytebuf`.

```
(->> (io/gzip "a.txt")
      (io/spit "a.gz"))
```

```
(io/gzip (bytebuf-from-string "abcdef" :utf-8))
```

SEE ALSO

[io/gzip?](#)

Returns true if `f` is a gzipped file. `f` may be a file, a string (file path), a `bytebuf`, or an `InputStream`

[io/ungzip](#)

ungzips f. f may be a file, a string (file path), a bytebuf, or an InputStream. Returns a bytebuf.

[io/zip](#)

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

[io/spit](#)

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

[top](#)

io/gzip-to-stream

```
(io/gzip f os)
```

gzips f to the OutputStream os. f may be a file, a string (file path), a bytebuf, or an InputStream.

```
(do
  (import :java.io.ByteArrayOutputStream)
  (try-with [os (. :ByteArrayOutputStream :new)]
    (-> (bytebuf-from-string "abcdef" :utf-8)
      (io/gzip-to-stream os))
    (-> (. os :toByteArray)
      (io/ungzip)
      (bytebuf-to-string :utf-8))))
=> "abcdef"
```

SEE ALSO

[io/gzip](#)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[top](#)

io/gzip?

```
(io/gzip? f)
```

Returns true if f is a gzipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

```
(-> (io/gzip (bytebuf-from-string "abc" :utf-8))
  (io/gzip?))
=> true
```

SEE ALSO

[io/gzip](#)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[top](#)

io/in-stream?

```
(io/in-stream? is)
```

Returns true if 'is' is a `java.io.InputStream`

```
(try-with [is (io/string-in-stream "123")]  
  (io/in-stream? is))  
=> true
```

SEE ALSO

[io/out-stream?](#)

Returns true if 'os' is a `java.io.OutputStream`

[top](#)

io/internet-avail?

```
(io/internet-avail?)  
(io/internet-avail? url)
```

Checks if an internet connection is present for a given url. Defaults to URL *http://www.google.com*.

```
(io/internet-avail?)
```

```
(io/internet-avail? "http://www.google.com")
```

[top](#)

io/list-file-tree

```
(io/list-file-tree dir)  
(io/list-file-tree dir filter-fn)
```

Lists all files in a directory tree. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found. The filter gets a `java.io.File` as argument.

Returns files as `java.io.File`

```
(io/list-file-tree "/tmp")
```

```
(io/list-file-tree "/tmp" #(io/file-ext? % ".log"))
```

SEE ALSO

[io/list-file-tree-lazy](#)

Returns a lazy sequence of all the files in a directory tree. `dir` must be a file or a string (file path). `filter-fn` is an optional ...

[io/list-files](#)

Lists files in a directory. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found.

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

[top](#)

io/list-file-tree-lazy

```
(io/list-file-tree-lazy dir)
(io/list-file-tree-lazy dir filter-fn)
```

Returns a lazy sequence of all the files in a directory tree. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found. The filter gets a `java.io.File` as argument.

The lazy sequence returns files as `java.io.File`

```
(->> (io/list-file-tree-lazy "/tmp")
      (docoll println))

(->> (io/list-file-tree-lazy "/tmp" #(io/file-ext? % ".log"))
      (docoll println))
```

SEE ALSO

[io/list-file-tree](#)

Lists all files in a directory tree. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files ...

[io/list-files](#)

Lists files in a directory. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found.

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

[top](#)

io/list-files

```
(io/list-files dir)
(io/list-files dir filter-fn)
```

Lists files in a directory. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found. The filter gets a `java.io.File` as argument.

Returns files as `java.io.File`

```
(io/list-files "/tmp")

(io/list-files "/tmp" #(io/file-ext? % ".log"))
```

SEE ALSO

[top](#)

io/list-files-glob

```
(io/list-files-glob dir glob)
```

Lists all files in a directory that match the glob pattern. `dir` must be a file or a string (file path). Returns files as `java.io.File`

Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in <code>.txt</code>
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with <code>.txt</code> or <code>.xml</code>
<code>foo.?[xy]</code>	Matches file names starting with <code>foo.</code> and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/list-files-glob "." "sample*.txt")
```

SEE ALSO

[io/list-files](#)

Lists files in a directory. `dir` must be a file or a string (file path). `filter-fn` is an optional filter that filters the files found.

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

[io/touch-file](#)

Updates the lastModifiedTime of the file to the current time, or creates a new empty file if the file doesn't already exist. File must ...

[top](#)

io/move-files-glob

(io/move-files-glob src-dir dst-dir glob & options)

Move all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

Options:

:replace true/false e.g.: if true replace an existing file, defaults to false
:atomic-move true/false e.g.: if true move the file as an atomic file system operation, defaults to false

Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in .txt
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with .txt or .xml
<code>foo.?[xy]</code>	Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

(io/move-files-glob "from" "to" "*.log")

SEE ALSO

[io/move-file](#)

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

[io/move-files-glob](#)

Move all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

[io/copy-files-glob](#)

Copies all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string ...

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

top

io/out-stream?

```
(io/out-stream? os)
```

Returns true if 'os' is a `java.io.OutputStream`

```
(try-with [os (io/bytebuf-out-stream)]
  (io/out-stream? os))
=> true
```

SEE ALSO

io/reader?

```
(io/reader? rd)
```

Returns true if 'rd' is a `:java.io.Reader`

```
(try-with [rd (io/string-reader "123")]  
  (io/reader? rd))  
=> true
```

SEE ALSO

[io/writer?](#)

Returns true if 'rd' is a `:java.io.Writer`

top

io/slurp

```
(io/slurp f & options)
```

Reads the content of file `f` as text (string) or binary (bytebuf).

`f` may be a:

- string file path, e.g: `"/temp/foo.json"`
- `bytebuffer`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`
- `java.io.Reader`
- `java.nio.file.Path`
- `java.net.URL`
- `java.net.URI`

Returns a `bytebuf` or string depending on the passed `:binary` option.

Options:

`:binary true/false` e.g.: `:binary true`, defaults to `false`

`:encoding enc` e.g.: `:encoding utf-8`, defaults to `utf-8`

`io/slurp` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: For HTTP and HTTPS downloads prefer to use `io/download`.

SEE ALSO

[io/slurp-lines](#)

Read all lines from `f`.

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` is. Supports the option `:binary` to either slurp binary or string data. For ...

[io/slurp-reader](#)

Slurps string data from a `java.io.Reader` `rd`. Note:

[io/spit](#)

Opens file `f`, writes content, and then closes `f`. `f` may be a file or a string (file path). The content may be a string or a `bytebuf`.

[io/download](#)

Downloads the content from the `uri` and reads it as text (string) or binary (bytebuf). Supports `http` and `https` protocols!

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

io/slurp-lines

`(io/slurp-lines f & options)`

Read all lines from `f`.

`f` may be a:

- string file path, e.g: `"/temp/foo.json"`
- `bytebuffer`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`
- `java.io.Reader`
- `java.nio.file.Path`
- `java.net.URL`

- `java.net.URI`

Returns the a list of strings.

Options:

:encoding enc e.g.: :encoding :utf-8 , defaults to :utf-8

`io/slurp-lines` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```

    (io/gzip)
    (io/ungzip-to-stream)
    (io/slurp-stream :binary false :encoding :utf-8))
=> "abcdef"
```

SEE ALSO

[io/gzip](#)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[top](#)

io/unzip

```
(io/unzip f entry-name)
```

Unzips an entry from zip f the entry's data as a bytebuf. f may be a bytebuf, a file, a string (file path) or an InputStream.

```
(-> (io/zip "a.txt" (bytebuf-from-string "abcdef" :utf-8))
    (io/unzip "a.txt"))
=> [97 98 99 100 101 102]
```

SEE ALSO

[io/zip](#)

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

[io/zip?](#)

Returns true if f is a zipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

[top](#)

io/unzip-all

```
(io/unzip-all f)
(io/unzip-all glob f)
```

Unzips all entries of the zip f returning a map with the entry names as key and the entry data as bytebuf values. f may be a bytebuf, a file, a string (file path) or an InputStream.

An optional globbing pattern can be passed to filter the files to be unzipped.

Note: globbing patterns with unzip are always relative. E.g. `static/**/*.png`

Globbing patterns:

<code>*.txt</code>	Matches a path that represents a file name ending in .txt
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with .txt or .xml
<code>foo.?</code>	Matches file names starting with foo. and a single character extension
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\foo</code> and <code>C:\\bar</code> on the Windows platform

```
(-> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
          "b.txt" (bytebuf-from-string "def" :utf-8)
          "c.txt" (bytebuf-from-string "ghi" :utf-8))
  (io/unzip-all))
=> {"a.txt" [97 98 99] "b.txt" [100 101 102] "c.txt" [103 104 105]}
```

```
(->> (io/zip "foo/a.txt" (bytebuf-from-string "abc" :utf-8)
            "bar/b.txt" (bytebuf-from-string "def" :utf-8)
            "bar/c.log" (bytebuf-from-string "ghi" :utf-8))
  (io/unzip-all "bar/*.txt"))
=> {"bar/b.txt" [100 101 102]}
```

(io/user-home-dir)
```

Returns the user's home dir as a `java.io.File`.

SEE ALSO

[user-name](#)

Returns the logged-in's user name.

[io/user-dir](#)

Returns the user dir (current working dir) as a `java.io.File`.

[io/tmp-dir](#)

Returns the tmp dir as a java.io.File.

[top](#)

io/watch-dir

```
(io/watch-dir dir event-fn)
(io/watch-dir dir event-fn failure-fn)
(io/watch-dir dir event-fn failure-fn termination-fn)
```

Watch a directory for changes, and call the function `event-fn` when it does. Calls the optional `failure-fn` if errors occur. On closing the watcher `termination-fn` is called.

`event-fn` is a two argument function that receives the path and mode `{:created, :deleted, :modified}` of the changed file.

`failure-fn` is a two argument function that receives the watch dir and the failure exception.

`termination-fn` is a one argument function that receives the watch dir.

Returns a *watcher* that is actively watching a directory. The *watcher* is a resource which should be closed with `(io/close-watcher w)`.

```
(do
  (defn log [msg] (locking log (println msg)))

  (let [w (io/watch-dir "/tmp"
                        #(log (str %1 " " %2))

Returns true if 'rd' is a `java.io.Reader`

[top](#)

io/zip

`(io/zip & entries)`

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be `nil`, a `bytebuf`, a file, a string (file path), or an `InputStream`.

An entry name with a trailing `'/'` creates a directory. Returns the zip as `bytebuf`.

```
; single entry
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8))
  (io/spit "test.zip"))

; multiple entries
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
  "b.txt" (bytebuf-from-string "def" :utf-8)
  "c.txt" (bytebuf-from-string "ghi" :utf-8))
  (io/spit "test.zip"))

; multiple entries with subdirectories
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
  "x/b.txt" (bytebuf-from-string "def" :utf-8)
  "x/y/c.txt" (bytebuf-from-string "ghi" :utf-8))
  (io/spit "test.zip"))

; empty directory z/
(->> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)
  "z/" nil)
  (io/spit "test.zip"))
```

SEE ALSO

[io/zip-remove](#)

Remove entries from a zip file f.

[top](#)

io/zip-file

(io/zip-file options* zip-file & files)

Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file my be a file, a string (file path) or an OutputStream.

Options:

:filter-fn fn a predicate function that filters the files to be added to the zip.

`:mapper-fn fn` a mapper function that can map the file content of a file before it gets zipped. Returns nil or a `:java.io.InputStream`. The real file is used when nil is returned.

`:silent b` if false prints the added entries to *out*, defaults to false

Example:

```
venice> (io/zip-file :silent false "test.zip" "dirA" "dirB")
```

Output:

```
adding: dirA/
adding: dirA/a1.png
adding: dirA/a2.png
adding: dirB/
adding: dirB/b1.png
```

```
; zip files
(io/zip-file "test.zip" "a.txt" "x/b.txt")

; zip all files from a directory
(io/zip-file "test.zip" "dir")

; zip all files in from two directories
(io/zip-file "test.zip" "dirA" "dirB")

; zip all files in from two directories and print the added entries
(io/zip-file :silent false "test.zip" "dirA" "dirB")

; zip all *.txt files from a directory
(io/zip-file :filter-fn (fn [dir name] (str/ends-with? name ".txt"))
  "test.zip"
  "dir")
```

Returns the Java major version (8, 9, 11, ...).

```
(java-major-version)
=> 8
```

SEE ALSO

[java-version](#)

Returns the Java VM version (1.8.0_252, 11.0.7, ...)

[java-version-info](#)

Returns the Java VM version info.

top

java-obj?

(java-obj? obj)

Returns true if obj is a Java object

```
(java-obj? (. :java.math.BigInteger :new "0"))
=> true
```

top

java-package-version

(java-package-version class)

Returns version information for a Java package or nil if the package does not exist or is not visible.

```
(java-package-version :java.lang.String)
=> {:implementation-title "Java Runtime Environment" :implementation-vendor "Azul Systems, Inc." :
implementation-version "1.8.0_392" :specification-title "Java Platform API Specification" :specification-vendor
"Oracle Corporation" :specification-version "1.8"}
```

```
(java-package-version (class :java.lang.String))
=> {:implementation-title "Java Runtime Environment" :implementation-vendor "Azul Systems, Inc." :
implementation-version "1.8.0_392" :specification-title "Java Platform API Specification" :specification-vendor
"Oracle Corporation" :specification-version "1.8"}
```

SEE ALSO

[jar-maven-manifest-version](#)

Returns the Maven version for a loaded JAR's manifest or nil if there is no Maven manifest.

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

java-source-location

(java-source-location class)

Returns the path of the source location of a class (fully qualified class name).

(java-source-location :com.github.jlangch.venice.Venice)

[top](#)

java-unwrap-optional

(java-unwrap-optional val)

Unwraps a Java :java.util.Optional to its contained value or nil

[top](#)

java-version

(java-version)

Returns the Java VM version (1.8.0_252, 11.0.7, ...)

(java-version)
=> "1.8.0_392"

java/javadoc

`(javadoc class-or-object)`

Opens a browser window displaying the javadoc for argument.

([java/javadoc](#) :[java.lang.String](#))

[top](#)

json/pretty-print

([json/pretty-print](#) s & options)

Pretty prints a JSON string

Options:

:indent s The indent for indented output. Must contain spaces or tabs only. Defaults to two spaces.

```
(-> (json/write-str {:a 100 :b 100 :c [1 2 3]}))
(json/pretty-print)
(println))

{
  "a": 100,
  "b": 100,
  "c": [1,2,3]
}
=> nil

(-> (json/write-str {:a 100 :b 100 :c [1 2 {:x 7 :y 8}] :d {:z 9}})
(json/pretty-print :indent "  ")
(println))

{
  "a": 100,
  "b": 100,
  "c": [1,2,{
    "x": 7,
    "y": 8
  }],
  "d": {
    "z": 9
  }
}
=> nil
```

SEE ALSO

[json/write-str](#)

Writes the val to a JSON string.

[json/read-str](#)

Reads a JSON string and returns it as a Venice datatype.

[json/spit](#)

Spits the JSON converted val to the output.

[json/slurp](#)

Slurps a JSON data from a source and returns it as a Venice data.

[top](#)

json/read-str

([json/read-str](#) s & options)

Reads a JSON string and returns it as a Venice datatype.

Options:

- :key-fn** fn Single argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.
- :value-fn** fn Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.
- :decimal** b If true use BigDecimal for decimal numbers instead of Double. Default is false.

```
(json/read-str (json/write-str {:a 100 :b 100}))
=> {"a" 100 "b" 100}
```

```
(json/read-str (json/write-str {:a 100 :b 100}) :key-fn keyword)
=> {:a 100 :b 100}
```

```
(json/read-str (json/write-str {:a 100 :b 100})
               :value-fn (fn [k v] (if (== "a" k) (inc v) v)))
=> {"a" 101 "b" 100}
```

Writes the val to a JSON string.

[json/spit](#)

Spits the JSON converted val to the output.

[json/slurp](#)

Slurps a JSON data from a source and returns it as a Venice data.

[json/pretty-print](#)

Pretty prints a JSON string

[top](#)

json/slurp

```
(json/slurp source & options)
```

Slurps a JSON data from a source and returns it as a Venice data.

The source may be a:

- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.InputStream`
- `java.io.Reader`

Options:

- :key-fn** fn Single-argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.
- :value-fn** fn Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.
- :decimal** b If true use BigDecimal for decimal numbers instead of Double. Default is false.
- :encoding** e e.g :encoding utf-8, defaults to :utf-8

```
(let [json (json/write-str {:a 100 :b 100 :c 1.233})]
  (try-with [in (io/string-reader json)]
    (pr-str (json/slurp in))))
=> "{\"a\" 100 \"b\" 100 \"c\" 1.233}"

(let [json (json/write-str {:a 100 :b 100 :c 1.233})]
  (try-with [in (io/string-reader json)]
    (pr-str (json/slurp in :decimal true :key-fn keyword)))))
=> "{:a 100 :b 100 :c 1.233M}"
```

Slurps a JSON data from a source and returns it as a Venice data.

[json/pretty-print](#)

Pretty prints a JSON string

[top](#)

jsonl/lazy-seq-slurper

(`jsonl/lazy-seq-slurper` *in* & *options*)

Returns a lazy sequence of the parsed JSON line strings from the input '*in*'.

'*in*' may be a:

- `java.io.InputStream`
- `java.io.Reader`

Note: The caller is responsible for closing the in stream/reader!

Options:

:key-fn *fn* Single argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.

:value-fn *fn* Function to transform values in JSON objects in the output. For each JSON property, *value-fn* is called with two arguments: the property name (transformed by *key-fn*) and the value. The return value of *value-fn* will replace the value in the output. The default *value-fn* returns the value unchanged.

:decimal b If true use BigDecimal for decimal numbers instead of Double. Default is false.

:filter-fn fn Single argument function called on every read value from a JSON line. If it returns true the value will be kept otherwise it will be skipped

:encoding e e.g :encoding :utf-8, defaults to :utf-8

`jsonl/lazy-seq-slurper` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
;; use a lazy sequence to read the JSON lines data
(do
  (load-module :jsonl)
  (let [file (io/temp-file "data-" ".jsonl")]
    (io/delete-file-on-exit file)
    (try-with [wr (io/buffered-writer file)]

```

SEE ALSO

[jsonl/write-str](#)

Writes the value 'val' to a JSON lines string.

[top](#)

jsonl/slurp

(jsonl/slurp in & options)

Slurps a list of JSON line strings from the input 'in' and returns it as a list of Venice data types.

'in' may be a:

- string
- bytebuf
- `java.io.File`, e.g. `(io/file "/temp/foo.json")`
- `java.nio.file.Path`
- `java.io.InputStream`
- `java.io.Reader`

Note: The caller is responsible for closing the in stream/reader!

Options:

- :key-fn fn Single argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.

`:value-fn fn` Function to transform values in JSON objects in the output. For each JSON property, `value-fn` is called with two arguments: the property name (transformed by `key-fn`) and the value. The return value of `value-fn` will replace the value in the output. The default `value-fn` returns the value unchanged.

`:decimal b` If true use `BigDecimal` for decimal numbers instead of `Double`. Default is false.

`:filter-fn fn` Single argument function called on every read value from a JSON line. If it returns true the value will be kept otherwise it will be skipped. The filter is applied after the '`key-fn`' and the '`value-fn`' have been applied to the line data value.

`:encoding e` e.g `:encoding :utf-8`, defaults to `:utf-8`

`jsonl/slurp` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(do
  (load-module :jsonl)

```

SEE ALSO

[jsonl/read-str](#)

Reads a JSON line string 's' and returns it as a Venice data type.

[jsonl/lazy-seq-slurper](#)

Returns a lazy sequence of the parsed JSON line strings from the input 'in'.

top

jsonl/spit

(`jsonl/spit` out val & options)

Spits the JSON Lines converted value 'val' to the output 'out'.

The 'out' may be a:

- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.OutputStream`
- `java.io.Writer`

Note: The caller is responsible for closing the out stream/writer!

Any reasonable Venice value like string, integer, long, double, decimal, boolean, list, vector, set, or map can be passed. Sequences like list or vector are converted to multiple JSON lines, one line for each value in the sequence. All other types are converted to a single JSON line.

Options:

:decimal-as-double b If true emit a decimal as double else as string. Defaults to false.

:append true/false e.g.: `:append true`, defaults to false

:encoding e e.g `:encoding :utf-8`, defaults to `:utf-8`

`jsonl/spit` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(do
  (load-module :jsonl)

[top](#)

juxt

```
(juxt f)  
(juxt f g)  
(juxt f g h)  
(juxt f g h & fs)
```

Takes a set of functions and returns a fn that is the juxtaposition of those fns. The returned fn takes a variable number of args, and returns a vector containing the result of applying each fn to the args (left-to-right).

```
((juxt a b c) x) => [(a x) (b x) (c x)]
```

```
((juxt first last) '(1 2 3 4))  
=> [1 4]
```

```
(do  
  (defn index-by [coll key-fn]  
    (into {} (map (juxt key-fn identity) coll)))  
  
  (index-by [{:id 1 :name "foo"}  
             {:id 2 :name "bar"}  
             {:id 3 :name "baz"}]  
            :id))  
=> {1 {:name "foo" :id 1} 2 {:name "bar" :id 2} 3 {:name "baz" :id 3}}
```

[top](#)

keep

```
(keep f coll)
```

Returns a sequence of the non-nil results of `(f item)`. Note, this means false return values will be included. f must be free of side-effects. Returns a transducer when no collection is provided.

```
(keep even? (range 1 4))  
=> (false true false)
```

```
(keep (fn [x] (if (odd? x) x)) (range 4))  
=> (1 3)
```

```
(keep #{3 5 7} '(1 3 5 7 9))  
=> (3 5 7)
```

[top](#)

key

```
(key e)
```

Returns the key of the map entry.

```
(key (find {:a 1 :b 2} :b))  
=> :b
```

```
(key (first (entries {:a 1 :b 2 :c 3})))  
=> :a

[kira/escape-xml](#)

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

[kira/escape-html](#)

Returns a HTML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

[top](#)

kira/fn

```
(kira/fn args source)
(kira/fn args source delimiters)
```

Compile a template into a function that takes the supplied arguments. The template source may be a string, or an I/O source such as a File, Reader or InputStream.

```
(do
  (load-module :kira)

  (def hello (kira/fn [name] "Hello <%= name %>"))
  (println (hello "Alice"))
  (println (hello "Bob")))
Hello Alice
Hello Bob
=> nil
```

SEE ALSO

[kira/eval](#)

Evaluate a template using the supplied bindings. The template source may be a string, or an I/O source such as a File, Reader or InputStream.

[kira/escape-xml](#)

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

[kira/escape-html](#)

Returns a HTML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

[top](#)

last

```
(last coll)
```

Returns the last element of coll.

```
(last nil)
=> nil
```

```
(last [])
=> nil
```

```
(last [1 2 3])
=> 3
```

```
(last '())  
=> nil  
  
(last '(1 2 3))  
=> 3  
  
(last "abc")  
=> #\c
```

[top](#)

lazy-seq

```
(lazy-seq)  
(lazy-seq f)  
(lazy-seq seed f)  
(lazy-seq head tail-lazy-seq)
```

Creates a new lazy sequence.

```
(lazy-seq)  
empty lazy sequence
```

```
(lazy-seq f)  
(theoretically) infinitely lazy sequence using a repeatedly invoked supplier function for each next value. The supplier function f is a no arg function. The sequence ends if the supplier function returns nil.
```

```
(lazy-seq seed f)  
(theoretically) infinitely lazy sequence with a seed value and a supplier function to calculate the next value based on the previous. f is a single arg function. The sequence ends if the supplier function returns nil.
```

```
(lazy-seq head tail-lazy-seq)  
Constructs a lazy sequence of a head element and a lazy sequence tail supplier.
```

```
; empty lazy sequence  
(->> (lazy-seq)  
      (doall))  
=> ()  
  
; lazy sequence with a supplier function producing random longs  
(->> (lazy-seq rand-long)  
      (take 4)  
      (doall))  
=> (3360958803753416510 3133039373466090 9031294888996632108 2533295383056865379)  
  
; lazy sequence with a constant value  
(->> (lazy-seq (constantly 5))  
      (take 4)  
      (doall))  
=> (5 5 5 5)  
  
; lazy sequence with a seed value and a supplier function  
; producing of all positive numbers (1, 2, 3, 4, ...)  
(->> (lazy-seq 1 inc)  
      (take 10)  
      (doall))  
=> (1 2 3 4 5 6 7 8 9 10)  
  
; producing of all positive even numbers (2, 4, 6, ...)  
(->> (lazy-seq 2 #(+ % 2))
```

```

    (take 10)
    (doall))
=> (2 4 6 8 10 12 14 16 18 20)

; lazy sequence as value producing function
(interleave [:a :b :c] (lazy-seq 1 inc))
=> (:a 1 :b 2 :c 3)

; lazy sequence with a mapping
(->> (lazy-seq 1 (fn [x] (do (println "realized" x)
                             (inc x)))))

    (take 10)
    (map #(* 10 %))
    (take 2)
    (doall))
realized 1
=> (10 20)

; finite lazy sequence from a vector
(->> (lazy-seq [1 2 3 4])
    (doall))
=> (1 2 3 4)

; finite lazy sequence with a supplier function that
; returns nil to terminate the sequence
(do
  (def counter (atom 5))
  (defn generate []
    (swap! counter dec)
    (if (pos? @counter) @counter nil))
  (doall (lazy-seq generate)))
=> (4 3 2 1)

; lazy sequence from a head element and a tail lazy
; sequence
(->> (cons -1 (lazy-seq 0 #(+ % 1)))
    (take 5)
    (doall))
=> (-1 0 1 2 3)

; lazy sequence from a head element and a tail lazy
; sequence
(->> (lazy-seq -1 (lazy-seq 0 #(+ % 1)))
    (take 5)
    (doall))
=> (-1 0 1 2 3)

; lazy sequence show its power to generate the Fibonacci sequence
(do
  (def fib (map first (lazy-seq [0N 1N] (fn [[a b]] [b (+ a b)]))))
  (doall (take 10 fib)))
=> (0N 1N 1N 2N 3N 5N 8N 13N 21N 34N)

```

SEE ALSO

[doall](#)

When lazy sequences are produced `doall` can be used to force any effects and realize the lazy sequence. Returns the realized items in a list!

[lazy-seq?](#)

Returns true if `obj` is a lazyseq

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[cycle](#)

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[top](#)

lazy-seq?

```
(lazy-seq? obj)
```

Returns true if obj is a lazyseq

```
(lazy-seq? (lazy-seq rand-long))  
=> true
```

SEE ALSO

[lazy-seq](#)

Creates a new lazy sequence.

[top](#)

let

```
(let [bindings*] exprs*)
```

Evaluates the expressions and binds the values to symbols in the new local context.

```
(let [x 1] x)  
=> 1
```

```
(let [x 1  
      y 2]  
  (+ x y))  
=> 3
```

```
;; Destructured list  
(let [[x y] '(1 2)]  
  (printf "x: %d, y: %d\n" x y))  
x: 1, y: 2  
=> nil
```

```
;; Destructured map  
(let [{:keys [width height title]  
       :or {width 640 height 500}  
       :as styles}  
      {:width 1000 :title "Title"}]  
  (println "width: " width)  
  (println "height: " height)  
  (println "title: " title)  
  (println "styles: " styles))  
width: 1000
```

```
height: 500
title: Title
styles: {:width 1000 :title Title}
=> nil
```

SEE ALSO

[letfn](#)

Takes a vector of function specs and a body, and generates a set of bindings of functions to their names. All of the names are available ...

[if-let](#)

bindings is a vector with 2 elements: binding-form test.

[when-let](#)

bindings is a vector with 2 elements: binding-form test.

[binding](#)

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

[top](#)

letfn

```
(letfn [fnspec*] exprs*)
```

Takes a vector of function specs and a body, and generates a set of bindings of functions to their names. All of the names are available in all of the definitions of the functions, as well as the body.

fnspec ==> (fname [params*] exprs) or (fname ([params*] exprs)+)

```
(letfn [(foo [] "abc")] (foo))
```

is equivalent to

```
(let [foo (fn [] "abc")] (foo))
```

```
(letfn [(foo [] "abc")
        (bar [] (str (foo) "def"))]
  (bar))
=> "abcdef"
```

SEE ALSO

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[top](#)

list

```
(list & items)
```

Creates a new list containing the items.

```
(list)
=> ()
```

```
(list 1 2 3)
=> (1 2 3)
```

```
(list 1 2 3 [:a :b])  
=> (1 2 3 [:a :b])
```

[top](#)

list*

```
(list* args)  
(list* a args)  
(list* a b args)  
(list* a b c args)  
(list* a b c d & more)
```

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

```
(list* 1 '(2 3))  
=> (1 2 3)  
  
(list* 1 2 3 [4])  
=> (1 2 3 4)  
  
(list* 1 2 3 '(4 5))  
=> (1 2 3 4 5)  
  
(list* '(1 2) 3 [4])  
=> ((1 2) 3 4)  
  
(list* nil)  
=> nil  
  
(list* nil [2 3])  
=> (nil 2 3)  
  
(list* 1 2 nil)  
=> (1 2)
```

SEE ALSO

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[vector*](#)

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

list-comp

```
(list-comp seq-exprs body-expr)
```

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and yields a collection of evaluations of expr.

Supported modifiers are: `:when` predicate

```
(list-comp [x (range 10)] x)
=> (0 1 2 3 4 5 6 7 8 9)

(list-comp [x (range 5)] (* x 2))
=> (0 2 4 6 8)

(list-comp [x (range 10) :when (odd? x)] x)
=> (1 3 5 7 9)

(list-comp [x (range 10) :when (odd? x)] (* x 2))
=> (2 6 10 14 18)

(list-comp [x (seq "abc") y [0 1 2]] [x y])
=> ([#\a 0] [#\a 1] [#\a 2] [#\b 0] [#\b 1] [#\b 2] [#\c 0] [#\c 1] [#\c 2])
```

SEE ALSO

[doseq](#)

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[top](#)

list?

```
(list? obj)
```

Returns true if obj is a list

```
(list? (list 1 2))
=> true
```

```
(list? '(1 2))
=> true
```

[top](#)

load-classpath-file

```
(load-classpath-file f)
(load-classpath-file f force)
(load-classpath-file f nsalias)
(load-classpath-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the classpath file. The function is restricted to classpath files with the extension '.venice'.

Returns a tuple with the file's name and the keyword `:loaded` if the file has been successfully loaded or `:already-loaded` if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

Loaded files are cached by Venice and subsequent loads are just skipped. To enforce a reload call the file load with the force flag set to true:

```
(load-classpath-file "com/github/jlangch/venice/test.venice" true)
```

An optional namespace alias can be passed: `(load-classpath-file "com/github/jlangch/venice/test.venice" ['test :as 't])`

`load-classpath-file` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice")
  (test-support/test-fn "hello"))
=> "test: hello"

(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice")
  (test-support/test-fn "hello")
  ; reload the classpath file
  (ns-remove 'test-support)
  (load-classpath-file "com/github/jlangch/venice/test-support.venice" true)
  (test-support/test-fn "hello"))
=> "test: hello"

;; namespace aliases
(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice" ['test-support :as 't])
  (t/test-fn "hello"))
=> "test: hello"
```

SEE ALSO

[load-file](#)

Sequentially read and evaluate the set of forms contained in the file.

[load-string](#)

Sequentially read and evaluate the set of forms contained in the string.

[load-module](#)

Loads a Venice predefined extension module.

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

load-file

```
(load-file f)
(load-file f force)
(load-file f nsalias)
(load-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the file.

If the file is found on one of the defined load paths it is read and the forms it contains are evaluated. If the file is not found an exception is raised.

Returns a tuple with the file's name and the keyword `:loaded` if the file has been successfully loaded or `:already-loaded` if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

The function is restricted to load files with the extension `'venice'`. If the file extension is missing `'venice'` will be implicitly added.

An optional namespace alias can be passed: `(load-file "coffee.venice" ['coffee :as 'c])`

`load-file` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
;; With load-paths: [/users/foo/scripts]
;;      -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee")

;; With load-paths: [/users/foo/scripts]
;;      -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee.venice")

;; With load-paths: [/users/foo/scripts]
;;      -> loads: /users/foo/scripts/beverages/coffee.venice
(load-file "beverages/coffee")

;; With load-paths: [/users/foo/resources.zip]
;;      -> loads: /users/foo/resources.zip!beverages/coffee.venice
(load-file "beverages/coffee")
```

[top](#)

load-module

```
(load-module m)
(load-module m force)
(load-module m nsalias)
(load-module m force nsalias)
```

Loads a Venice predefined extension module.

Returns a tuple with the module's name and the keyword `:loaded` if the module has been successfully loaded or `:already-loaded` if the module has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the module is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

Loaded modules are cached by Venice and subsequent loads are just skipped. To enforce a reload call the module load with the force flag set to true: `(load-module :hexdump true)`

An optional namespace alias can be passed: `(load-module :hexdump ['hexdump :as 'h])`

`load-module` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(load-module :trace)
```

```
;; loading the :trace modul and define a ns alias 't for namespace
;; 'trace used in the module
(load-module :trace ['trace :as 't])

;; reloading a module
(do
  (load-module :trace)
  ; reload the module
  (ns-remove 'trace)
  (load-module :trace true))

;; namespace aliases
(do
  (load-module :hexdump ['hexdump :as 'h])
  (h/dump (range 32 64)))

;; dynamically load a module
(let [mname (keyword "hexdump")]
  (load-module mname))
```

loaded-modules

(loaded-modules)

Returns the names of the loaded modules.

SEE ALSO

[load-module](#)

Loads a Venice predefined extension module.

loadpath/normalize

(loadpath/normalize f)

Normalize a relative file regarding the load paths.

With the load paths: `["/Users/foo/img.png", "/Users/foo/resources"]`

- `(loadpath/normalize "img.png") -> "/Users/foo/img.png"`
- `(loadpath/normalize "test.json") -> "/Users/foo/resources/test.json"`
- `(loadpath/normalize "/tmp/data.json") -> "/tmp/data.json"`

SEE ALSO

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[loadpath/unrestricted?](#)

Returns true if the load paths are unrestricted.

loadpath/paths

(loadpath/paths)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the application level. They are passed as part of the sandbox to the Venice evaluator.

The functions that support load paths try sequentially every load path to access files. If a load path is a ZIP file, files can be read from within that ZIP file.

Example:

```
/Users/foo/demo
|
+--- resources.zip
|
+--- /data
|
```

```
+--- config.json
|
+--- /scripts
|
+--- script1.venice
```

With a load path configuration of `["/Users/foo/demo/resources.zip", "/Users/foo/demo/data"]`

- `(io/slurp "config.json")` -> slurps `/Users/foo/demo/data/config.json`
- `(io/slurp "scripts/script1.venice")` -> slurps `/Users/foo/demo/data/scripts/script1.venice`
- `(io/slurp "img1.png")` -> slurps `/Users/foo/demo/resources.ziplimg1.png`

I/O functions with support for load paths:

- `load-file`
- `io/slurp`
- `io/slurp-lines`
- `io/spit`
- `io/file-in-stream`
- `io/file-out-stream`
- `io/delete-file`

To enforce a Venice script to read/write files on the load paths only:

- Define a custom sandbox
- Disable all I/O functions
- Enable the I/O functions that support load paths

SEE ALSO

[loadpath/unrestricted?](#)

Returns true if the load paths are unrestricted.

[loadpath/normalize](#)

Normalize a relative file regarding the load paths.

[load-file](#)

lock

(lock)

Creates a new lock object.

The lock object implements the Java `AutoClosable` interface thus it can be used with try-with-resources.

```
(let [l (lock)]
  (acquire l)
  ;; do something
  (release l))
=> nil
```

```
(let [l (lock)]
  (try-with [l (acquire l)]
    ;; do something
  ))
=> nil
```

SEE ALSO

[acquire](#)

Acquires a lock, blocking until the lock is available.

[try-acquire](#)

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

[release](#)

Releases a lock.

[locked?](#)

Returns true if the lock is in use else false.

[lock?](#)

Returns true if o is a lock object else false.

[top](#)

lock?

(lock? o)

Returns `true` if o is a lock object else `false`.

```
(let [l (lock)]
  (lock? l))
=> true
```

SEE ALSO

[acquire](#)

Acquires a lock, blocking until the lock is available.

[try-acquire](#)

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

[release](#)

Releases a lock.

locked?

Returns true if the lock is in use else false.

[top](#)

locked?

long-array

```
(long-array coll)
(long-array len)
(long-array len init-val)
```

Returns an array of Java primitive longs containing the contents of coll or returns an array with the given length and optional init value

```
(long-array '(1 2 3))
=> [1, 2, 3]

(long-array '(1I 2 3.2 3.56M))
=> [1, 2, 3, 3]

(long-array 10)
=> [0, 0, 0, 0, 0, 0, 0, 0, 0, 0]

(long-array 10 42)
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

[top](#)

long?

```
(long? n)
```

Returns true if n is a long

```
(long? 4)
=> true

(long? 4I)
=> false

(long? 3.1)
=> false

(long? true)
=> false

(long? nil)
=> false
```

```
(long? {})  
=> false
```

top

loop

```
(loop [bindings*] exprs*)
```

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

```
;; tail recursion  
(loop [x 10]  
  (when (> x 1)  
    (println x)  
    (recur (- x 2)))))  
10  
8  
6  
4  
2  
=> nil  
  
;; tail recursion  
(do  
  (defn sum [n]  
    (loop [cnt n acc 0]  
      (if (zero? cnt)  
        acc  
        (recur (dec cnt) (+ acc cnt))))))  
  (sum 10000))  
=> 50005000
```

SEE ALSO

[recur](#)

Evaluates the exprs and rebinds the bindings of the recursion point to the values of the exprs. The recur expression must be at the ...

top

macro?

```
(macro? x)
```

Returns true if x is a macro

```
(macro? and)  
=> true
```

top

macroexpand

(macroexpand form)

If form represents a macro form, returns its expansion, else returns form.

To recursively expand all macros in a form use (macroexpand-all form) .

```
(macroexpand '(> c (+ 3) (* 2)))  
=> (* (+ c 3) 2)
```

SEE ALSO

[defmacro](#)

Macro definition

[macroexpand-all](#)

Recursively expands all macros in the form.

[top](#)

macroexpand-all

(macroexpand-all form)

Recursively expands all macros in the form.

```
(macroexpand-all '(and true true))  
=> (let [cond__25108__auto true] (if cond__25108__auto true cond__25108__auto))  
  
(macroexpand-all '(and true (or true false) true))  
=> (let [cond__25133__auto true] (if cond__25133__auto (let [cond__25133__auto (let [cond__25134__auto true]  
(if cond__25134__auto cond__25134__auto false))] (if cond__25133__auto true cond__25133__auto))  
cond__25133__auto))  
  
(macroexpand-all '(let [n 5] (cond (< n 0) -1 (> n 0) 1 :else 0)))  
=> (let [n 5] (if (< n 0) -1 (if (> n 0) 1 (if :else 0 nil))))
```

SEE ALSO

[macroexpand](#)

If form represents a macro form, returns its expansion, else returns form.

[defmacro](#)

Macro definition

[top](#)

macroexpand-on-load?

(macroexpand-on-load?)

Returns true if `macroexpand-on-load` feature is enabled else false.

The activation of `macroexpand-on-load` (upfront macro expansion) results in 3x to 15x better performance. Upfront macro expansion can be activated through the `!macroexpand` command in the REPL.

```
(macroexpand-on-load?)  
=> false
```

[top](#)

make-array

```
(make-array type len)  
(make-array type dim &more-dims)
```

Returns an array of the given type and length

```
(str (make-array :long 5))  
=> "[0, 0, 0, 0, 0]"
```

```
(str (make-array :java.lang.Long 5))  
=> "[nil, nil, nil, nil, nil]"
```

```
(str (make-array :long 2 3))  
=> "[[0 0 0], [0 0 0]]"
```

```
(aset (make-array :java.lang.Long 5) 3 9999)  
=> [nil, nil, nil, 9999, nil]
```

[top](#)

map

```
(map f coll colls*)
```

Applies `f` to the set of first items of each `coll`, followed by applying `f` to the set of second items in each `coll`, until any one of the `colls` is exhausted. Any remaining items in other `colls` are ignored.

Returns a transducer when no collection is provided.

Note: if Java collections are used the mapper converts all mapped items back to Java data types to keep Java compatibility as much as possible!

To avoid this just convert the Java collection to a Venice collection. E.g.: `(into [] ...)`.

```
(map inc [1 2 3 4])  
=> (2 3 4 5)
```

```
(map + [1 2 3 4] [10 20 30 40])  
=> (11 22 33 44)
```

```
(map list '(1 2 3 4) '(10 20 30 40))  
=> ((1 10) (2 20) (3 30) (4 40))
```

```
(map vector (lazy-seq 1 inc) [10 20 30 40])  
=> ([1 10] [2 20] [3 30] [4 40])
```

```
(map (fn [[k v]] [k v]) {:a 1 :b 2})  
=> ([:a 1] [:b 2])
```

```
(map (fn [e] [(key e) (inc (val e))]) {:a 1 :b 2})  
=> ([:a 2] [:b 3])
```

```

(map inc #{1 2 3})
=> (2 3 4)

;; Venice enforces Java types when using java collections instead
;; of Venice collections!
;; -> The returned element type is a 'java.util.ArrayList'
;; and not a 'core/vector'
(->> (doto (. :java.util.ArrayList :new) (. :add 1) (. :add 2))
      (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
      (first)
      (type))
=> :java.util.ArrayList

;; Same example with a Venice collection!
;; -> The returned element type is a 'core/vector'
(->> [1 2]
      (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
      (first)
      (type))
=> :core/vector

```

SEE ALSO

[filter](#)

Returns a collection of the items in coll for which (predicate item) returns logical true.

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. (flatten ...

[top](#)

mapv

```
(mapv f coll colls*)
```

Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the colls is exhausted. Any remaining items in other colls are ignored.

```
(mapv inc [1 2 3 4])  
=> [2 3 4 5]
```

```
(mapv + [1 2 3 4] [10 20 30 40])  
=> [11 22 33 44]
```

```
(mapv vector [1 2 3 4] [10 20 30 40])  
=> [[1 10] [2 20] [3 30] [4 40]]
```

SEE ALSO

[docoll](#)

Applies f to the items of the collection presumably for side effects. Returns nil.

[top](#)

match?

```
(match? s regex)
```

Returns true if the string s matches the regular expression regex.

The argument 'regex' may be a string representing a regular expression or a `java.util.regex.Pattern`.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. `regex/matches?` performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"[0-9]+" "")]  
  (filter #(regex/matches? m %) ["100" "1a1" "200"])))
```

```
(match? "1234" "[0-9]+")  
=> true
```

```
(match? "1234ss" "[0-9]+")  
=> false
```

```
(match? "1234" #"[0-9]+")  
=> true
```

SEE ALSO

[not-match?](#)

Returns true if the string s does not match the regular expression regex.

[regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

[regex/matches-not?](#)

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

[regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

[regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

[regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[top](#)

math/acos

```
(math/acos x)
```

Returns the arc cosine of a value; the returned angle is in the range `0.0` through `pi`

[top](#)

maven/dependencies

```
(maven/dependencies artifacts & options)
```

Returns the dependency tree of an artifact

Relies on the environment variable `MAVEN_HOME` to access Maven.

Options:

<code>:scope s</code>	A scope. <code>:compile</code> , <code>:provided</code> , <code>:runtime</code> , <code>:test</code> . Defaults to <code>:compile</code>
<code>:verbose v</code>	if true invokes for verbose output else standard output. Defaults to false
<code>:excludes e</code>	A list of excluded dependencies
<code>:format f</code>	An output format. <code>:raw</code> , <code>:tree</code> , or <code>:list</code> . Defaults to <code>:tree</code>
<code>:print p</code>	If true prints the data else returns the data. Defaults to true.
<code>:print-pom p</code>	If true print the generated pom for debugging purposes. Defaults to false.
<code>:managed-dependencies d</code>	An optional list of managed dependencies (artifacts). See example 2.

The scope is one of:

- `:compile` - build, test and run
- `:provided` - build and test
- `:runtime` - test and run
- `:test` - compile and test

Excludes dependencies with the group ids (except for `:test` scope):

- `org.junit.*`
- `org.opentest4j`
- `org.apiguardian`
- `junit`

Example 1:

```
(maven/dependencies [ "org.knowm.xchart:xchart:3.8.6" ])  
  
org.knowm.xchart:xchart:jar:3.8.6:compile  
+- de.erichseifert.vectorgraphics2d:VectorGraphics2D:jar:0.13:compile  
+- de.rototor.pdfbox:graphics2d:jar:3.0.0:compile  
| \- org.apache.pdfbox:pdfbox:jar:3.0.0:compile  
|   +- org.apache.pdfbox:pdfbox-io:jar:3.0.0:compile  
|   +- org.apache.pdfbox:fontbox:jar:3.0.0:compile  
|   \- commons-logging:commons-logging:jar:1.2:compile  
\- com.madgag:animated-gif-lib:jar:1.4:compile
```

Example 2:

lock down a transitive dependency to a specific version using Maven managed dependencies

```
(maven/dependencies ["org.knowm.xchart:xchart:3.8.6"]  
                   :managed-dependencies ["org.apache.pdfbox:pdfbox:2.0.27"])  
  
org.knowm.xchart:xchart:jar:3.8.6::compile  
+- de.erichseifert.vectorgraphics2d:VectorGraphics2D:jar:0.13:runtime  
+- de.rototor.pdfbox:graphics2d:jar:3.0.0:runtime  
| \- org.apache.pdfbox:pdfbox:jar:2.0.27:runtime  
|   +- org.apache.pdfbox:fontbox:jar:2.0.27:runtime  
|   \- commons-logging:commons-logging:jar:1.2:runtime  
\- com.madgag:animated-gif-lib:jar:1.4:runtime
```

```
(do  
  (load-module :maven)  
  (maven/dependencies [ "org.knowm.xchart:xchart:3.8.6" ]))  
  
(do  
  (load-module :maven)  
  (maven/dependencies [ "org.knowm.xchart:xchart:3.8.6" ]  
                       :scope :compile  
                       :verbose true))
```

```
(do
  (load-module :maven)
  (maven/dependencies [ "org.knowm.xchart:xchart:3.8.6" ]
    :scope :runtime
    :format :list))
```

[top](#)

maven/download

(maven/download artifact options*)

Downloads an artifact in the format 'group-id:artifact-id:version' from a Maven repository. Can download any combination of the jar, sources, or pom artifacts to a directory.

Accepts a sequence of artifacts as well.

Options:

:jar {true,false}	download the jar, defaults to true
:sources {true,false}	download the sources, defaults to false
:pom {true,false}	download the pom, defaults to false
:dir path	download dir, defaults to "."
:repo maven-repo	a maven repo, defaults to "https://repo1.maven.org/maven2"
:silent {true,false}	if silent is true does not show a progress bar, defaults to true
:force {true,false}	if force is true download the artifact even if it exist already on the download dir, else skip the download if it exists. Defaults to true.

```
(do
  (load-module :maven)
  (maven/download "org.knowm.xchart:xchart:3.8.6"))
```

```
(do
  (load-module :maven)
  (maven/download "org.knowm.xchart:xchart:3.8.6"
    :sources true
    :pom true))
```

```
(do

Parses a Maven artifact

[top](#)

maven/home-dir

(maven/home-dir)

Returns the Apache Maven home directory or nil if Maven is not installed.

If a REPL is active checks first for local Apache Maven installation in the REPL, if none is available checks the environment variable 'MAVEN_HOME'.

If a REPL is not active checks the environment variable 'MAVEN_HOME'.

```
(do
  (load-module :maven)
  (maven/home-dir))
```

SEE ALSO

[maven/mvn](#)

Runs a Maven command

[maven/version](#)

Runs the Maven version command and prints the commands output.

[top](#)

maven/install

(maven/install)
(maven/install version)

Installs Apache Maven to {repl-home-dir}/tools/apache-maven-x.y.z

Installation is possible from within a REPL only!

```
(do
  (load-module :maven)
  (maven/install)) ;; installs default version 3.9.6

(do
  (load-module :maven)
  (maven/install "3.9.5"))
```

SEE ALSO

[maven/home-dir](#)

Returns the Apache Maven home directory or nil if Maven is not installed.

[maven/uninstall](#)

Uninstalls Apache Maven from {repl-home-dir}/tools

maven/mvn

```
(maven/mvn proj-dir & args)
```

Runs a Maven command

Relies on the environment variable `MAVEN_HOME` to access Maven.

```
(do
  (load-module :maven)
  (->> (maven/mvn "/Users/foo/projects/my-project" "compile")
    (println)))

(do
  (load-module :maven)

[maven/get](#)

Downloads artifact in the format 'group-id:artifact-id:version' from a Maven repository. The artifact type 'type' is one of {jar, ...

[top](#)

maven/uninstall

(maven/uninstall)

Uninstalls Apache Maven from {repl-home-dir}/tools

Uninstallation is possible from within a REPL only!

```
(do
  (load-module :maven)
  (maven/uninstall))
```

SEE ALSO

[maven/home-dir](#)

Returns the Apache Maven home directory or nil if Maven is not installed.

[maven/install](#)

Installs Apache Maven to {repl-home-dir}/tools/apache-maven-x.y.z

[top](#)

maven/version

(maven/version)

Runs the Maven version command and prints the commands output.

Relies on the environment variable `MAVEN_HOME` to access Maven.

```
(do
  (load-module :maven)
  (maven/version))
```

SEE ALSO

[maven/mvn](#)

Runs a Maven command

[maven/home-dir](#)

Returns the Apache Maven home directory or nil if Maven is not installed.

max

```
(max x)
(max x y)
(max x y & more)
```

Returns the greatest of the values

```
(max 1)
=> 1

(max 1 2)
=> 2

(max 4 3 2 1)
=> 4

(max 1I 2I)
=> 2I

(max 1.0)
=> 1.0

(max 1.0 2.0)
=> 2.0

(max 4.0 3.0 2.0 1.0)
=> 4.0

(max 1.0M)
=> 1.0M

(max 1.0M 2.0M)
=> 2.0M

(max 4.0M 3.0M 2.0M 1.0M)
=> 4.0M

(max 1.0M 2)
=> 2
```

SEE ALSO

[min](#)

Returns the smallest of the values

[clamp](#)

Restricts a given value between a lower and upper bound. In this way, it acts like a combination of the min and max functions.

memoize

```
(memoize f)
```

Returns a memoized version of a referentially transparent function.

Note:

Use memoization for expensive calculations. If used with fast calculations it has the opposite effect and can slow it down actually!

```
(do
  (def fibonacci
    (memoize
      (fn [n]
        (cond
          (<= n 0) 0
          (< n 2) 1
          :else (+ (fibonacci (- n 1)) (fibonacci (- n 2)))))))

  (time (fibonacci 25)))
```

Elapsed time: 864.33µs

=> 75025

```
(do
  (defn test [a b]
    (println (str "calculating a=" a ", b=" b))
    (+ a b))

  (def test-memo (memoize test))
```

```
(test-memo 1 1)
(test-memo 1 2)
(test-memo 1 1)
(test-memo 1 2)
(test-memo 1 1)
```

calculating a=1, b=1

calculating a=1, b=2

=> 2

SEE ALSO

[delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

[top](#)

merge

```
(merge & maps)
```

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from the latter (left-to-right) will be the mapping in the result.

```
(merge {:a 1 :b 2 :c 3} {:b 9 :d 4})
=> {:a 1 :b 9 :c 3 :d 4}
```

```
(merge {:a 1} nil)
=> {:a 1}
```

```
(merge nil {:a 1})
=> {:a 1}
```

```
(merge nil nil)
=> nil
```

SEE ALSO

[merge-with](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from ...

[merge-deep](#)

Recursively merges maps.

[into](#)

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[top](#)

merge-deep

```
(merge-deep values)
(merge-deep strategy & values)
```

Recursively merges maps.

If the first parameter is a keyword it defines the strategy to use when merging non-map collections. Options are:

1. *:replace*, the default, the last value is used
2. *:into*, if the value in every map is a collection they are concatenated using `into`. Thus the type of (first) value is maintained.

```
(merge-deep {:a {:c 2}} {:a {:b 1}})
=> {:a {:b 1 :c 2}}
```

```
(merge-deep :replace {:a [1]} {:a [2]})
=> {:a [2]}
```

```
(merge-deep :into {:a [1]} {:a [2]})
=> {:a [1 2]}
```

```
(merge-deep {:a 1} nil)
=> nil
```

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from ...

[top](#)

merge-with

```
(merge-with f & maps)
```

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from the latter (left-to-right) will be combined with the mapping in the result by calling (f val-in-result val-in-latter).

```
(merge-with + {:a 1 :b 2} {:a 9 :b 98 :c 0})
=> {:a 10 :b 100 :c 0}

(merge-with into {:a [1] :b [2]} {:b [3 4] :c [5 6]})
=> {:a [1] :b [2 3 4] :c [5 6]}
```

SEE ALSO

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[merge-deep](#)

Recursively merges maps.

[top](#)

meta

```
(meta obj)
```

Returns the metadata of obj, returns nil if there is no metadata.

```
(meta (vary-meta [1 2] assoc :foo 3))
=> {:foo 3 :line 42 :column 28 :file "example"}
```

SEE ALSO

[vary-meta](#)

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

[with-meta](#)

Returns a copy of the object obj, with a map m as its metadata.

[var-val-meta](#)

Returns the var's value meta data.

[var-sym-meta](#)

Returns the var's symbol meta data.

[top](#)

mimetypes/probe-content-type

```
(probe-content-type f)
```

Probes the content type of a file.

The function uses a built-in "mime.types" data file to lookup the file's mimetype based on the file extension.

f must be a string or a java.io.File.

Returns `nil` if a mapping is not defined.

```
(do
  (load-module :mimetypes)
```

```
(mimetypes/probe-content-type "foo.png"))  
=> :image/png
```

[top](#)

min

```
(min x)  
(min x y)  
(min x y & more)
```

Returns the smallest of the values

```
(min 1)  
=> 1
```

```
(min 1 2)  
=> 1
```

```
(min 4 3 2 1)  
=> 1
```

```
(min 1I 2I)  
=> 1I
```

```
(min 1.0)  
=> 1.0
```

```
(min 1.0 2.0)  
=> 1.0
```

```
(min 4.0 3.0 2.0 1.0)  
=> 1.0
```

```
(min 1.0M)  
=> 1.0M
```

```
(min 1.0M 2.0M)  
=> 1.0M
```

```
(min 4.0M 3.0M 2.0M 1.0M)  
=> 1.0M
```

```
(min 1.0M 2)  
=> 1.0M
```

SEE ALSO

[max](#)

Returns the greatest of the values

[clamp](#)

Restricts a given value between a lower and upper bound. In this way, it acts like a combination of the min and max functions.

[top](#)

mod

```
(mod n d)
```

Modulus of n and d.

```
(mod 10 4)  
=> 2
```

```
(mod -1 5)  
=> 4
```

```
(mod 10I 4I)  
=> 2I
```

SEE ALSO

[mod-floor](#)

floor a number towards 0 to the nearest multiple of a number

[top](#)

mod-floor

```
(mod-floor n m)
```

floor a number towards 0 to the nearest multiple of a number

```
(mod-floor 9 3)  
=> 9
```

```
(mod-floor 10 3)  
=> 9
```

```
(mod-floor 11 3)  
=> 9
```

```
(mod-floor -11 3)  
=> -9
```

SEE ALSO

[mod](#)

Modulus of n and d.

[top](#)

module-name

```
(module-name class)
```

Returns the Java module name of a class.

```
(module-name (class :java.util.ArrayList))
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-name](#)

Returns the Java class name of a class.

[top](#)

modules

```
(modules)
```

Lists the available Venice modules

SEE ALSO

[doc](#)

Prints documentation for a var or special form given x as its name. Prints the definition of custom types.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[top](#)

multipart/http-content-type-header

```
(http-content-type-header)
```

Returns the HTTP content type header value for *multipart/form-data* HTTP requests.

The `multipart/render` function uses this boundary.

E.g: Content-Type: multipart/form-data; boundary=1234567890N

```
(do
  (load-module :multipart ['multipart :as 'm])

  (m/http-content-type-header))
```

SEE ALSO

[multipart/render](#)

Renders a map of named parts as multipart/form-data format.

[multipart/parse](#)

Parses a multipart bytebuf.

[top](#)

multipart/parse

(parse buffer boundary)

Parses a multipart bytebuf.

```
(do
  (load-module :multipart ['multipart :as 'm])
  (load-module :hexdump ['hexdump :as 'h])

  (defn render []
    (m/render { "Part-1" "xxxxxxxxxx"
                "Part-4" { :filename "data.xml"
                           :mimetype "application/xml"
                           :charset  :utf-8
                           :data      "<user><name>foo</name></user>" }}}))

  (-> (render)
      (m/parse (m/boundary))))

;; Returns a list of part maps:
;; ( { :name "Part-1"
;;     :filename nil
;;     :mimetype nil
;;     :charset nil
;;     :data [120 ... 120] ;; shortened for brevity
;;     :data-len 11 }
;;   { :name "Part-4"
;;     :filename "data.xml"
;;     :mimetype "application/xml"
;;     :charset "utf-8"
;;     :data [60 ... 62] ;; shortened for brevity
;;     :data-len 29 })
```

SEE ALSO

[multipart/render](#)

Renders a map of named parts as multipart/form-data format.

[multipart/http-content-type-header](#)

Returns the HTTP content type header value for multipart/form-data HTTP requests.

[top](#)

multipart/render

(render parts)

Renders a map of named parts as *multipart/form-data* format.

The part name must be a string and the part data may be of type:

- string
- string ("file:/user/foo/image.png" to reference a file)
- map (describing a part as :name, :mimetype, :data (string or bytebuf), and an optional charset) elements)
- io/file
- all other part data types are converted with `(str data)` to a string

Returns a bytebuf with all the rendered parts.

```
POST / HTTP/1.1
HOST: host.example.com
Connection: Keep-Alive
```

```
Content-Type: multipart/form-data; boundary=12345

--12345
Content-Disposition: form-data; name="notes"

Lorem ipsum ...
--12345
Content-Disposition: form-data; name="foo"; filename="foo.json"
Content-Type: application/json; charset=utf-8

content of foo.xjson
--12345
Content-Disposition: form-data; name="image"; filename="picture.png"
Content-Type: image/png

content of picture.jpg
--12345--
```

See [multipart/form-data](#)

```
(do
  (load-module :multipart ['multipart :as 'm])

  (->> (m/render { "Part-1" "xxxxxxxxxxx"
                   "Part-2" "yyyyyyyyyyy"})
    (bytebuf-to-string)
    (println)))

(do
  (load-module :multipart ['multipart :as 'm])

  (m/render { "Part-1" "xxxxxxxxxxx"
              "Part-2" "file:/user/foo/image.png"
              "Part-3" (io/file "/user/foo/image.png")
              "Part-4" { :filename "data.xml"
                         :mimetype "application/xml"
                         :charset   :utf-8
                         :data      "<user><name>foo</name></user>" }}))
```

SEE ALSO

[multipart/parse](#)

Parses a multipart bytebuf.

[multipart/http-content-type-header](#)

Returns the HTTP content type header value for multipart/form-data HTTP requests.

[top](#)

mutable-list

```
(mutable-list & items)
```

Creates a new mutable list containing the items.

The list is backed by `java.util.ArrayList` and is not thread-safe.

```
(mutable-list)
=> ()
```

```
(mutable-list 1 2 3)
=> (1 2 3)
```

```
(mutable-list 1 2 3 [:a :b])
=> (1 2 3 [:a :b])
```

[top](#)

mutable-list?

```
(mutable-list? obj)
```

Returns true if obj is a mutable list

```
(mutable-list? (mutable-list 1 2))
=> true
```

[top](#)

mutable-map

```
(mutable-map & keyvals)
(mutable-map map)
```

Creates a new mutable threadsafe map containing the items.

```
(mutable-map :a 1 :b 2)
=> {:a 1 :b 2}

(mutable-map {:a 1 :b 2})
=> {:a 1 :b 2}
```

[top](#)

mutable-map?

```
(mutable-map? obj)
```

Returns true if obj is a mutable map

```
(mutable-map? (mutable-map :a 1 :b 2))
=> true
```

[top](#)

mutable-set

```
(mutable-set & items)
```

Creates a new mutable set containing the items.

```
(mutable-set)
=> #{}

(mutable-set nil)
=> #{nil}

(mutable-set 1)
=> #{1}

(mutable-set 1 2 3)
=> #{1 2 3}

(mutable-set [1 2] 3)
=> #{3 [1 2]}
```

[top](#)

mutable-set?

```
(mutable-set? obj)
```

Returns true if obj is a mutable-set

```
(mutable-set? (mutable-set 1))
=> true
```

[top](#)

mutable-vector

```
(mutable-vector & items)
```

Creates a new mutable threadsafe vector containing the items.

```
(mutable-vector)
=> []

(mutable-vector 1 2 3)
=> [1 2 3]

(mutable-vector 1 2 3 [:a :b])
=> [1 2 3 [:a :b]]
```

[top](#)

mutable-vector?

```
(mutable-vector? obj)
```

Returns true if obj is a mutable vector

```
(mutable-vector? (mutable-vector 1 2))  
=> true
```

[top](#)

name

(name x)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

```
(name 'foo) ;; symbol  
=> "foo"
```

```
(name 'user/foo) ;; symbol  
=> "foo"
```

```
(name (symbol "user/foo")) ;; symbol  
=> "foo"
```

```
(name :foo) ;; keyword  
=> "foo"
```

```
(name :user/foo) ;; keyword  
=> "foo"
```

```
(name +) ;; function  
=> "+"
```

```
(name str/digit?) ;; function  
=> "digit?"
```

```
(name "ab/text") ;; string  
=> "ab/text"
```

```
(name (. :java.time.Month :JANUARY)) ;; java enum  
=> "JANUARY"
```

SEE ALSO

[qualified-name](#)

Returns the qualified name String of a string, symbol, keyword, or function

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[fn-name](#)

Returns the qualified name of a function or macro

[top](#)

namespace

```
(namespace x)
```

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

Throws an exception if x does not support namespaces like `(namespace 2)`.

```
(namespace 'user/foo) ;; symbol  
=> "user"
```

```
(namespace (symbol "user/foo")) ;; symbol  
=> "user"
```

```
(namespace :user/foo) ;; keyword  
=> "user"
```

```
(namespace str/digit?) ;; function  
=> "str"
```

```
(namespace *ns*) ;; symbol  
=> "user"
```

SEE ALSO

[name](#)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

[fn-name](#)

Returns the qualified name of a function or macro

[ns](#)

Opens a namespace.

[*ns*](#)

The current namespace

[var-ns](#)

Returns the namespace of the var's symbol.

[top](#)

nan?

```
(nan? x)
```

Returns true if x is a NaN else false. x must be a double!

```
(nan? 0.0)  
=> false
```

```
(nan? (/ 0.0 0))  
=> true
```

```
(nan? (sqrt -1))  
=> true
```

```
(pr (sqrt -1))  
:NaN  
=> nil
```

SEE ALSO

[infinite?](#)

Returns true if x is infinite else false. x must be a double!

[double](#)

Converts to double

[top](#)

nano-time

`(nano-time)`

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

`(nano-time)`

```
=> 217213256671125
```

```
(let [t (nano-time)
      _ (sleep 100)
      e (nano-time)]
  (format-nano-time (- e t) :precision 2))
=> "104.75ms"
```

SEE ALSO

[current-time-millis](#)

Returns the current time in milliseconds.

[format-nano-time](#)

Formats a time given in nanoseconds as long or double.

[top](#)

neg?

`(neg? x)`

Returns true if x smaller than zero else false

`(neg? -3)`

```
=> true
```

`(neg? 3)`

```
=> false
```

`(neg? (int -3))`

```
=> true
```

`(neg? -3.2)`

```
=> true
```

`(neg? -3.2M)`

```
=> true
```

SEE ALSO

[zero?](#)

Returns true if x zero else false

[pos?](#)

Returns true if x greater than zero else false

[negate](#)

Negates x

top

negate

(negate x)

Negates x

```
(negate 10)  
=> -10
```

```
(negate 10I)  
=> -10I
```

```
(negate 1.23)  
=> -1.23
```

```
(negate 1.23M)  
=> -1.23M
```

SEE ALSO

[abs](#)

Returns the absolute value of the number

[sgn](#)

sgn function for a number.

top

newline

(newline)
(newline os)

Without arg writes a platform-specific newline to the output channel that is the current value of `*out*`. With arg writes a newline to the passed stream that must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Returns `nil`.

```
(newline)  
=> nil
```

```
(newline *out*)  
=> nil
```

```
(newline *err*)  
=> nil
```

SEE ALSO

[print](#)

Prints the values xs to the stream that is the current value of *out* or to the passed stream os that must be a subclass of either ...

[println](#)

Prints the values xs to the stream that is the current value of *out* or to the passed output stream os if given followed by a (newline).

[printf](#)

Without output stream prints formatted output as per format to the stream that is the current value of *out*. With a stream prints ...

[top](#)

nfirst

```
(nfirst coll n)
```

Returns a collection of the first n items

```
(nfirst nil 2)  
=> ()
```

```
(nfirst [] 2)  
=> []
```

```
(nfirst [1] 2)  
=> [1]

=> (1 2)
```

```
(nfirst "abcdef" 2)  
=> (#\a #\b)
```

```
(nfirst (lazy-seq 1 #(+ % 1)) 4)  
=> (...)
```

SEE ALSO

[str/nfirst](#)

Returns a string of the n first characters of s.

[top](#)

nil?

```
(nil? x)
```

Returns true if x is nil, false otherwise

```
(nil? nil)  
=> true
```

```
(nil? 0)  
=> false
```

```
(nil? false)  
=> false
```

SEE ALSO

[some?](#)

Returns true if x is not nil, false otherwise

[top](#)

nlast

```
(nlast coll n)
```

Returns a collection of the last n items

```
(nlast nil 2)  
=> ()
```

```
(nlast [] 2)  
=> []
```

```
(nlast [1] 2)  
=> [1]
```

```
(nlast [1 2 3] 2)  
=> [2 3]
```

```
(nlast '() 2)  
=> ()
```

```
(nlast '(1) 2)  
=> (1)
```

```
(nlast '(1 2 3) 2)  
=> (2 3)
```

```
(nlast "abcdef" 2)  
=> (#\e #\f)
```

SEE ALSO

[str/nlast](#)

Returns a string of the n last characters of s.

[top](#)

not

```
(not x)
```

Returns true if x is logical false, false otherwise.

```
(not true)
=> false
```

```
(not (== 1 2))
=> true
```

SEE ALSO

[and](#)

Ands the predicate forms

[or](#)

Ors the predicate forms

[top](#)

not-any?

```
(not-any? pred coll)
```

Returns false if the predicate is true for at least one collection item, true otherwise

```
(not-any? number? nil)
=> true
```

```
(not-any? number? [])
=> true
```

```
(not-any? number? [1 :a :b])
=> false
```

```
(not-any? number? [1 2 3])
=> false
```

```
(not-any? #(>= % 10) [1 5 10])
=> false
```

SEE ALSO

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[every?](#)

Returns true if the predicate is true for all collection items, false otherwise.

not-every?

Returns false if the predicate is true for all collection items, true otherwise

[top](#)

not-contains?

```
(not-contains? coll key)
```

Returns true if key is not present in the given collection, otherwise returns false.

```
(not-contains? #{:a :b} :c)
=> true
```

```
(not-contains? {:a 1 :b 2} :c)
=> true
```

```
(not-contains? [10 11 12] 1)
=> false
```

```
(not-contains? [10 11 12] 5)
=> true
```

```
(not-contains? "abc" 1)
=> false
```

```
(not-contains? "abc" 5)
=> true
```

SEE ALSO

[contains?](#)

Returns true if key is present in the given collection, otherwise returns false.

[top](#)

not-empty?

```
(not-empty? x)
```

Returns true if x is not empty. Accepts strings, collections and bytebufs.

```
(not-empty? {:a 1})
=> true
```

```
(not-empty? [1 2])
=> true
```

```
(not-empty? '(1 2))
=> true
```

```
(not-empty? "abc")
=> true
```

```
(not-empty? nil)
=> false
```

```
(not-empty? "")
=> false
```

SEE ALSO

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[top](#)

not-every?

```
(not-every? pred coll)
```

Returns false if the predicate is true for all collection items, true otherwise

```
(not-every? number? nil)
=> true
```

```
(not-every? number? [])
=> true
```

```
(not-every? number? [1 2 3 4])
=> false
```

```
(not-every? number? [1 2 3 :a])
=> true
```

```
(not-every? #(>= % 10) [10 11 12])
=> false
```

SEE ALSO

[every?](#)

Returns true if the predicate is true for all collection items, false otherwise.

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

[top](#)

not-match?

```
(not-match? s regex)
```

Returns true if the string s does not match the regular expression regex.

The argument 'regex' may be a string representing a regular expression or a `:java.util.regex.Pattern`.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. `regex/matches-not?` performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"[0-9]+" "")]
  (filter #(regex/matches-not? m %) ["100" "1a1" "200"])))
```

```
(not-match? "S1000" "[0-9]+")
=> true
```

```
(not-match? "S1000" #"[0-9]+")
=> true
```

```
(not-match? "1000" "[0-9]+")
=> false
```

SEE ALSO

[match?](#)

Returns true if the string `s` matches the regular expression `regex`.

[regex/matches-not?](#)

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

[regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

[regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

[regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

[regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

top

not=

```
(not= x)
(not= x y)
(not= x y & more)
```

Same as `(not (= x y))`

```
(not= "abc" "abc")
=> false
```

```
(not= 0 0)
=> false
```

```
(not= 0 1)
=> true
```

```
(not= 0 0.0)
=> true
```

```
(not= 0 0.0M)
=> true

(not= "0" 0)
=> true

(not= 4)
=> false

(not= 1 2 3)
=> true
```

SEE ALSO

[=](#)

Returns true if both operands have equivalent type and value

[==](#)

Returns true if both operands have equivalent value.

[top](#)

ns

```
(ns sym)
```

Opens a namespace.

```
(do
  (ns xxx)
  (def foo 1)
  (ns yyy)
  (def foo 5)
  (println xxx/foo foo yyy/foo))
1 5 5
=> nil
```

SEE ALSO

[*ns*](#)

The current namespace

[ns?](#)

Returns true if n is an existing namespace that has been defined with (ns n) else false.

[ns-unmap](#)

Removes the mappings for the symbol from the namespace.

[ns-remove](#)

Removes the mappings for all symbols from the namespace.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[ns-alias](#)

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name ...

[ns-meta](#)

Returns the meta data of the namespace n or nil if n is not an existing namespace

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

var-ns

Returns the namespace of the var's symbol.

[top](#)

ns-alias

```
(ns-alias alias namespace-sym)
```

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name of the target namespace.

```
(ns-alias 'p 'parsatron)
=> nil
```

```
(do
  (load-module :hexdump)
  (ns-alias 'h 'hexdump)
  (h/dump [0 1 2 3]))
00000000: 0001 0203                ....
=> nil
```

SEE ALSO

[ns-unalias](#)

Removes a namespace alias in the current namespace.

[ns-aliases](#)

Returns a map of the aliases defined in the current namespace.

[*ns*](#)

The current namespace

[ns](#)

Opens a namespace.

[top](#)

ns-aliases

```
(ns-aliases)
```

Returns a map of the aliases defined in the current namespace.

```
(ns-aliases)
=> {}
```

```
(do
  (ns-alias 'h 'hexdump)
  (ns-alias 'p 'parsatron)
  (ns-aliases))
=> {h hexdump p parsatron}
```

`*ns*`

The current namespace

`ns-remove`

Removes the mappings for all symbols from the namespace.

`ns-list`

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

`namespace`

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

`var-ns`

Returns the namespace of the var's symbol.

[top](#)

ns?

```
(ns? n)
```

Returns true if n is an existing namespace that has been defined with `(ns n)` else false.

```
(do
  (ns foo)
  (ns? foo))
=> true
```

SEE ALSO

`ns`

Opens a namespace.

[top](#)

nth

```
(nth coll idx)
(nth coll idx defaultVal)
```

Returns the nth element of coll.

Throws an exception if the index does not exist and there is no default value passed else returns the default value.

```
(nth nil 1)
=> nil
```

```
(nth [1 2 3] 1)
=> 2
```

```
(nth '(1 2 3) 1)
=> 2

```

```
(number? "a")
=> false
```

[top](#)

object-array

```
(object-array coll)
(object-array len)
(object-array len init-val)
```

Returns an array of Java Objects containing the contents of coll or returns an array with the given length and optional init value

```
(object-array '(1 2 3 4 5))
=> [1, 2, 3, 4, 5]
```

```
(object-array '(1 2.0 3.45M "4" true))
=> [1, 2.0, 3.45M, 4, true]

(object-array 10)
=> [nil, nil, nil, nil, nil, nil, nil, nil, nil, nil]

(object-array 10 42)
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

[top](#)

odd?

```
(odd? n)
```

Returns true if n is odd, throws an exception if n is not an integer

```
(odd? 3)
=> true

(odd? 4)
=> false

(odd? (int 4))
=> false
```

SEE ALSO

[even?](#)

Returns true if n is even, throws an exception if n is not an integer

[top](#)

offer!

```
(offer! queue v)
(offer! queue timeout v)
```

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary for space to become available. For an indefinite timeout pass the timeout value :indefinite. If no timeout is given returns immediately false if the queue does not have any more capacity. Returns true if the element was added to this queue, else false.

```
(let [q (queue)]
  (offer! q 1)
  (offer! q 1000 2)
  (offer! q :indefinite 3)
  (offer! q 3)
  (poll! q)
  q)
=> (2 3 3)
```

SEE ALSO

[queue](#)

Creates a new mutable threadsafe bounded or unbounded queue.

[put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

[take!](#)

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

[poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

or

```
(or x)
(or x & next)
```

Ors the predicate forms

```
(or true false)
=> true
```

```
(or false false)
=> false
```

```
(or nil 100)
=> 100
```

```
(or)
=> false
```

SEE ALSO

[and](#)

Ands the predicate forms

[not](#)

Returns true if x is logical false, false otherwise.

[top](#)

or-timeout

```
(or-timeout p time time-unit)
```

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

```

(-> (promise (fn [] (sleep 100) "The quick brown fox"))
      (or-timeout 500 :milliseconds)
      (then-apply str/upper-case)
      (deref))
=> "THE QUICK BROWN FOX"

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
      (or-timeout 200 :milliseconds)
      (then-apply str/upper-case)
      (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
      (then-apply str/upper-case)
      (or-timeout 200 :milliseconds)
      (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

[then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

[then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

[then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completest normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

ordered-map

```

(ordered-map & keyvals)
(ordered-map map)

```

Creates a new ordered map containing the items.

```

(ordered-map :a 1 :b 2)
=> {:a 1 :b 2}

```

```
(ordered-map (hash-map :a 1 :b 2))  
=> {:a 1 :b 2}
```

[top](#)

ordered-map?

```
(ordered-map? obj)
```

Returns true if obj is an ordered map

```
(ordered-map? (ordered-map :a 1 :b 2))  
=> true
```

[top](#)

os-arch

```
(os-arch)
```

Returns the OS architecture. E.g: "x86_64"

```

top

parsifal/>>

```
(>> p)
(>> p q)
(>> p q & ps)
```

Returns a new parser that parses a list of parsers. Returns the value of the last parser if all parsers succeed, else the parser fails.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parser `>>` does not rewind the input state if any of the sub parsers fails. `>>*` is the backtracking version of `>>` that wraps the parsers within a call to `attempt`. See the backtracking example below.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/>> (p/char #\lparen) (p/digit) (p/char #\rparen)) "(1)")
  ; => #\

  ; Using bindings
  (p/run (p/let->> [l (p/char #\lparen)
                   d (p/digit)
                   r (p/char #\rparen)]
              (p/always (str l d r)))
          "(1)")
  ; => "(1)"
)
```

```

; Backtracking demo
(do
  (load-module :parsifal ['parsifal :as 'p])

  ; No backtracking with `>>` parser
  (p/run (p/either (p/>> (p/letter) (p/digit))
                (p/letter))
        "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Backtracking with `>>` parser
  (p/run (p/either (p/>>* (p/letter) (p/digit))
                (p/letter))
        "abc")
  ; => #\a
)

```

[top](#)

parsifal/SourcePosition

Defines a protocol to add line and column information for custom tokens.

Definition:

```

(defprotocol SourcePosition
  (line [p])
  (column [p]))

```

```

(do
  (load-module :parsifal ['parsifal :as 'p])

  (deftype :Token [type :keyword, val :string, line :long, column :long]
    Object
      (toString [this] (str/format "[%s %s (%d,%d)]"
                                   (pr-str (:type this))
                                   (pr-str (:val this))
                                   (:line this)
                                   (:column this))))

    p/SourcePosition
      (line [this] (:line this))
      (column [this] (:column this)))

  (p/defparser lbracket []
    (p/let->> [[l c] (p/pos)
              t      (p/char #\[])]
      (p/always (Token. :lbracket (str t) l c))))

  (p/run (lbracket) "[1,2,3]")
  ; => [:lbracket "[" (1,1)]
)

```

SEE ALSO

[defprotocol](#)

Defines a new protocol with the supplied function specs.

[deftype](#)

Defines a new custom record type for the name with the fields.

[top](#)

parsifal/always

(always x)

A parser that always succeeds with the value given and consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [t (p/many1 (p/digit))]
      (p/always (long (apply str t)))))

  (p/run (integer) "400")
  ; => 400
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser optional [p default-value]
    (p/either (p/attempt p)
      (p/always default-value)))

  (p/run (optional (p/char #\X) #\?) "X400")
  ; => #\X

  (p/run (optional (p/char #\X) #\?) "400")
  ; => #\?
)
```

[top](#)

parsifal/any

(any)

Consume any single item from the head of the input. This parser will fail to consume if the input is empty.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any) "Cats")
  ; => #\C

  (p/run (p/any) [#\C #\a #\t #\s])
  ; => #\C
)
```

[top](#)

parsifal/any-char

(any-char)

Consume any character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any-char) "Cats")
  ; => #\C

  (p/run (p/any-char) [#\C #\a #\t #\s])
  ; => #\C
)
```

[top](#)

parsifal/any-char-of

(any-char-of s)

Consume any of the characters given in the string. E.g.: (any-char-of "({}") .

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any-char-of "XYZ") "Hello, world!")
  ; => #\H
)
```

[top](#)

parsifal/attempt

(attempt p)

A parser that will attempt to parse `p`, and upon failure never consume any input.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parsers `>>` and `let->>` do not rewind the input state if any of the sub parsers fails. To add backtracking parsers can be wrapped with `attempt!`

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser optional [p default-value]
    (p/either (p/attempt p)
              (p/always default-value)))

  (p/run (optional (p/char #\X) #\?) "400")
  ; => #\?
)
```

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  ; Backtracking

  ; No implicit backtracking with `>>` parser!
  (p/run (p/either (p/>> (p/letter) (p/digit))
                  (p/letter))
          "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Explicit backtracking with `>>` parser using `attempt`!
  (p/run (p/either (p/attempt (p/>> (p/letter) (p/digit)))
                  (p/letter))
          "abc")
  ; => #\a
)
```

[top](#)

parsifal/between

(between open close p)

Returns a new parser that parses `open`, `p`, and `close` returning the value of `p` and discarding the values of `open` and `close`. Does not consume any input on failure.

```
(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/run (p/between (p/char #\lparen)
                    (p/char #\rparen)
                    (p/many1 (p/digit)))
          "(123)")
  ; => [#\1 #\2 #\3]
)
```

[top](#)

parsifal/char

(char)

Consume the given character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/char #\H) "Hello")
  ; => #\H

  (p/run (p/char #\H) [#\H #\e #\l #\l #\o])
  ; => #\H
)
```

[top](#)

parsifal/choice

```
(choice & p)
```

Returns a new parser that tries each given parsers in turn, returning the value of the first one that succeeds.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "Hello")
  ; => [#\H #\e #\l #\l #\o]

  (p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
  ; => [#\4 #\2]
)
```

[top](#)

parsifal/defparser

```
(defparser name args & body)
```

The `defparser` macro defines `_functions_` that create parsers.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parsers created by this macro do not rewind the input state if one of the sub parsers fails. To allow backtracking `attempt` can be used!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser sample []
    (p/string "Hello")
    (p/always 42))

  (p/run (sample) "Hello, world!")
  ; => 42
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  ; Backtracking

  (p/defparser letter-and-digit []
    (p/letter)
    (p/digit))

  ; No implicit backtracking!
  (p/run (p/either (letter-and-digit) (p/letter)) "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Explicit backtracking with `attempt`!
  (p/run (p/either (p/attempt (letter-and-digit)) (p/letter)) "abc")
  ; => #\a
)
```

parsifal/digit

(digit)

Consume a digit [0-9] character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/digit) "123")
  ; => #\1

  (p/run (p/any-char) [#\1 #\2 #\3])
  ; => #\1
)
```

parsifal/either

(either p q)

Returns a new parser that tries `p`, upon success, returning its value, and upon failure (if no input was consumed) tries to parse `q`

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter))) "Hello")
  ; => [#\H #\e #\l #\l #\o]

  (p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
  ; => [#\4 #\2]
)
```

parsifal/eof

(eof)
(eof err-msg)

A parser to detect the end of input. If there is nothing more to consume from the underlying input, this parser succeeds with a `nil` value, otherwise it fails.

A custom error message can be provided for the case the parser fails.

```
(do
  (load-module :parsifal ['parsifal :as 'p])
```

```
(p/run (p/eof) "")
; => nil

(p/run (p/eof) "a")
; => ParseError: Expected end of input at line: 1 column: 1
)
```

[top](#)

parsifal/hexdigit

```
(hexdigit)
```

Consume a hex digit [0-9a-fA-F] character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/hexdigit) "A00")
  ; => #\A

  (p/run (p/hexdigit) [#\A #\0 #\0])
  ; => #\A
)
```

[top](#)

parsifal/let->>

```
(let->> [[& bindings_] & body])
```

Binds parser results to names for further processing input.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parser `let->>` does not rewind the input state if one of the sub parsers fails. `let->>*` is the backtracking version of `let->>` that wraps the parsers within a call to `attempt`. See the backtracking example below.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser float []
    (p/let->> [i (p/many1 (p/digit))
              d (p/char #\.)
              f (p/many1 (p/digit))]
      (p/always (apply str (flatten (list i d f))))))

  (p/run (float) "10.56")
  ; => "10.56"
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser int []
```

```

(p/let->> [i (p/many1 (p/digit))])
  (let [n (long (apply str i))]
    (if (even? n)
      (p/always (str n " is even"))
      (p/always (str n " is odd"))))))

(p/run (int) "500")
; => "500 is even"
)

; Backtracking demo
(do
  (load-module :parsifal ['parsifal :as 'p])

  ; No backtracking with `let->>` parser!
  (p/run (p/either (p/let->> [c (p/letter)
                             d (p/digit)]
                        (p/always (list c d)))
            (p/letter))
    "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Backtracking with `let->>` parser
  (p/run (p/either (p/let->>* [c (p/letter)
                             d (p/digit)]
                       (p/always (list c d)))
            (p/letter))
    "abc")
  ; => #\a
)

```

[top](#)

parsifal/letter

(letter)

Consume a letter character defined by Java `Character.isLetter(ch)` .

Note: Works with char items only!

```

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/letter) "Cats")
  ; => #\C

  (p/run (p/letter) [#\C #\a #\t #\s])
  ; => #\C
)

```

[top](#)

parsifal/letter-or-digit

(letter-or-digit)

Consume a letter or digit character defined by Java `Character.isLetterOrDigit(ch)`.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/letter-or-digit) "Cats")
  ; => #\C

  (p/run (p/letter-or-digit) "5Cats")
  ; => #\5

  (p/run (p/letter-or-digit) [#\C #\a #\t #\s])
  ; => #\C
)
```

[top](#)

parsifal/lineno

```
(lineno)
```

A parser that returns the current line number. It consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [l (p/lineno)
                t (p/many1 (p/digit))]
      (p/always [:int (apply str t) l])))

  (p/run (integer) "400")
  ; => [:int "400" 1]
)
```

[top](#)

parsifal/lookahead

```
(lookahead p)
```

A parser that upon success consumes no input, but returns what was parsed.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser block-string-tok []
    (p/between (p/times 3 (p/char #\quote))
               (p/times 3 (p/char #\quote))
               (p/many (p/let->> [cs (p/lookahead (p/times 3 (p/any-char)))]
                                (if (= cs [#\quote #\quote #\quote])
                                    (p/never))))))
)
```

```

        (p/any-char))))))

(p/defparser block-string []
  (p/let->> [s (block-string-tok)]
    (p/always (apply str s))))

(p/run (block-string) "\"\"A \"string\" with quotes!\"\"")
; => "A \"string\" with quotes!"
)

```

top

parsifal/many

```
(many p)
```

Returns a new parser that will parse zero or more items that match the given parser `p`. The matched items are concatenated into a sequence.

Note: A `ParseError` will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/many (p/digit)) "1234-0000")
  ; => [#\1 #\2 #\3 #\4]

  (p/run (p/many (p/digit)) "ABC-12345")
  ; => []
)

```

top

parsifal/many1

```
(many1 p)
```

Returns a new parser that will parse one or more items that match the given parser `p`. The matched items are concatenated into a sequence.

Note: A `ParseError` will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/many1 (p/digit)) "1234-0000")
  ; => [#\1 #\2 #\3 #\4]

  (p/run (p/many1 (p/digit)) "ABC-12345")
  ; => ParseError: Unexpected token 'A' at line: 1 column: 1
)

```

top

parsifal/never

```
(never)
(never err-msg)
(never err-msg line column)
```

A parser that always fails, consuming no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  ;; parse a string with a single integer
  (p/defparser single-integer []
    (p/let->> [i (p/many1 (p/digit))
               t (p/either (p/eof) (p/any))])
    (if (nil? t)
        (p/always (apply str i))
        (p/never (str "Unexpected token '" t "'")))))

  (p/run (single-integer) "400")
  ; => "400"

  (p/run (single-integer) "400-")
  ; => ParseError: Unexpected token '-' at line: 1 column: 5
)
```

[top](#)

parsifal/none-char-of

```
(none-char-of s)
```

Consume all but of the characters given in the string. E.g.: `(none-char-of "([{")` .

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/none-char-of "()[]{}") "Hello, world!")
  ; => #\H
)
```

[top](#)

parsifal/not-char

```
(not-char)
```

Consume all but the given character

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/not-char #\x) "Cats")
  ; => #\C

  (p/run (p/not-char #\x) [#\C #\a #\t #\s])
```

```
; => #\C
)
```

[top](#)

parsifal/pos

(pos)

A parser that returns the current line/column number as tuple of `[line col]`. It consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [[l c] (p/pos)
               t      (p/many1 (p/digit))])
    (p/always [:int (apply str t) (list l c)])))

(p/run (integer) "400")
; => [:int "400" (1,1)]
)
```

[top](#)

parsifal/run

(run p input)

Run a parser `p` over some input. The input can be a string or a seq of tokens, if the parser produces an error, its message is wrapped in a *ParseError* and thrown, and if the parser succeeds, its value is returned.

Parsifal is port of Nate Young's Clojure Parsatron [parser combinators](#) project.

Parsifal is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

A simple parser example:

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/char #\H) "Hello")
  ; => #\H

  (p/run (p/char #\H) [#\H #\e #\l #\l #\o])
  ; => #\H
)
```

[top](#)

parsifal/string

(string s)

Consume the given string and returns a string. Does not consume any input upon failure.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/string "Hello") "Hello, world!")
  ; => "Hello"

  (p/run (p/string "Hello") (seq "Hello, world!"))
  ; => "Hello"
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
  ; => "Hello"

  (p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
  ; => #\H
)
```

[top](#)

parsifal/times

(times n p)

Returns a new parser that consumes exactly `n` times what the parser `p` matches. The matched items are concatenated into a sequence. Does not consume any input if not all of the repetitions match.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/times 5 (p/letter)) "Hello, world!")
  ; => [#\H #\e #\l #\l #\o]

  ;; Note: `p/times` is different from parsing letters explicitly
  (p/run (p/>> (p/letter)
              (p/letter)
              (p/letter)
              (p/letter)
              (p/letter))
        "Hello, world!")
  ; => [#\o]
)
```

[top](#)

parsifal/token

(token)

Consume a single item from the head of the input if `(consume? item)` predicate is not `nil`. This parser will fail to consume if either the `consume?` test returns `false` or if the input is empty.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/token #(< % 5)) [3 5 7])
  ; => 3

  (p/run (p/token str/upper-case) "Hello")
  ; => #\H
)
```

top

partial

```
(partial f args*)
```

Takes a function `f` and fewer than the normal arguments to `f`, and returns a fn that takes a variable number of additional args. When called, the returned function calls `f` with `args` + additional args.

```
((partial * 2) 3)
=> 6

(map (partial * 2) [1 2 3 4])
=> (2 4 6 8)

(map (partial reduce +) [[1 2 3 4] [5 6 7 8]])
=> (10 26)

(do
  (def hundred-times (partial * 100))
  (hundred-times 5))
=> 500
```

top

partition

```
(partition n coll)
(partition n step coll)
(partition n step padcoll coll)
```

Returns a collection of lists of `n` items each, at offsets `step` apart. If `step` is not supplied, defaults to `n`, i.e. the partitions do not overlap. If a `padcoll` collection is supplied, use its elements as necessary to complete last partition upto `n` items. In case there are not enough padding elements, return a partition with less than `n` items. `padcoll` may be a lazy sequence

```
(partition 3 [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5])

(partition 3 3 (repeat 99) [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6 99 99])

(partition 3 3 [] [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6])
```

```
(partition 2 3 [0 1 2 3 4 5 6])
=> ([0 1] [3 4])

(partition 3 1 [0 1 2 3 4 5 6])
=> ([0 1 2] [1 2 3] [2 3 4] [3 4 5] [4 5 6])

(partition 3 6 ["a"] (range 20))
=> ((0 1 2) (6 7 8) (12 13 14) (18 19 "a"))

(partition 4 6 ["a" "b" "c" "d"] (range 20))
=> ((0 1 2 3) (6 7 8 9) (12 13 14 15) (18 19 "a" "b"))
```

```
(do
  (perf (+ 120 200) 12000 1000)
  (println (prof :data-formatted)))
```

SEE ALSO

[time](#)

Evaluates expr and prints the time it took. Returns the value of expr.

[prof](#)

Controls the code profiling. See the companion functions/macros 'dorun' and 'perf'. The perf macro is built on prof and dorun and provides ...

[top](#)

pid

```
(pid)
```

Returns the PID of this process.

```
(pid)
=> "48435"
```

[top](#)

pmap

```
(pmap f coll)
(pmap f coll & colls)
```

Like `map`, except `f` is applied in parallel. Only useful for computationally intensive functions where the time of `f` dominates the coordination overhead.

The result collection is sorted in the same way as for `map`, i.e. it preserves the items' order in the `coll` (or `colls`) parameter(s) of `pmap`. In other words: calculation is done parallel, but the result is delivered in the order the input came (in `coll/colls`). In contrast, side effects of `f` (if any) are coming in random order!

`pmap` is implemented using Venice futures and processes `(+ 2 (cpus))` items in parallel.

;; With ``pmap``, the total elapsed time is just over 2 seconds:

```
(do
  (defn long-running-job [n]
    (sleep 2000) ; wait for 2 seconds
    (+ n 10))
  (time (pmap long-running-job (range 4))))
```

Elapsed time: 2.01s

=> (10 11 12 13)

;; With ``map``, the total elapsed time is roughly 4 * 2 seconds:

```
(do
  (defn long-running-job [n]
    (sleep 2000) ; wait for 2 seconds
    (+ n 10))
  (time (map long-running-job (range 4))))
```

Elapsed time: 8.01s

=> (10 11 12 13)

SEE ALSO

[pcalls](#)

Executes the no-arg fns in parallel, returning a sequence of their values in the same order the functions are passed. In contrast, ...

Reduces a collection using a parallel reduce-combine strategy. The collection is partitioned into groups of approximately `n` items, ...

[map](#)

Applies `f` to the set of first items of each `coll`, followed by applying `f` to the set of second items in each `coll`, until any one of the ...

[cpus](#)

Returns the number of available processors or number of hyperthreads if the CPU supports hyperthreads.

[top](#)

poll!

```
(poll! queue)
(poll! queue timeout)
```

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value `:indefinite`. If no timeout is given returns the item if one is available else returns `nil`. With a timeout returns the item if one is available within the given timeout else returns `nil`.

```
(let [q (conj! (queue) 1 2 3 4)]
  (poll! q)
  (poll! q 1000)
  q)
=> (3 4)
```

SEE ALSO

[queue](#)

Creates a new mutable threadsafe bounded or unbounded queue.

[put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

[take!](#)

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

[offer!](#)

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

top

pop

```
(pop coll)
```

For a list, returns a new list without the first item, for a vector, returns a new vector without the last item.

```
(pop '(1 2 3 4))  
=> (2 3 4)
```

```
(pop [1 2 3 4])  
=> [1 2 3]
```

top

pop!

```
(pop! stack)
```

Pops an item from a stack.

```

zero?

Returns true if x zero else false

neg?

Returns true if x smaller than zero else false

[top](#)

postwalk

```
(postwalk f form)
```

Performs a depth-first, post-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

```
(postwalk (fn [x] (println "Walked:" (pr-str x)) x)
 '(1 2 {:a 1 :b 2}))
```

Walked: 1

Walked: 2

Walked: :a

Walked: 1

Walked: [:a 1]

Walked: :b

Walked: 2

Walked: [:b 2]

Walked: {:a 1 :b 2}

```
Walked: (1 2 {:a 1 :b 2})
=> (1 2 {:a 1 :b 2})
```

SEE ALSO

[prewalk](#)

Performs a depth-last, pre-order traversal of form. Calls `f` on each sub-form, uses `f`'s return value in place of the original.

[top](#)

postwalk-replace

```
(postwalk-replace smap form)
```

Recursively transforms `form` by replacing keys in `smap` with their values. Like `replace` but works on any data structure. Does replacement at the leaves of the tree first.

`postwalk-replace` is the equivalent of *Common Lisp*'s `sublis` function.

```
(postwalk-replace {:a 1 :b 2} [:a :b])
=> [1 2]
```

```
(postwalk-replace {:a 1 :b 2} [:a :b :c])
=> [1 2 :c]
```

```
(postwalk-replace {:a 1 :b 2} [:a :b [:a :b] :c])
=> [1 2 [1 2] :c]
```

```
(postwalk-replace {'x 1 'y 2} '(+ x y))
=> (+ 1 2)
```

SEE ALSO

[postwalk](#)

Performs a depth-first, post-order traversal of form. Calls `f` on each sub-form, uses `f`'s return value in place of the original.

[top](#)

pow

```
(pow x y)
```

Returns the value of `x` raised to the power of `y`

```
(pow 10 2)
=> 100.0
```

```
(pow 10.23 2)
=> 104.6529
```

```
(pow 10.23 2.5)
=> 334.7257199023319
```

pr

```
(pr & xs)
(pr os & xs)
```

Prints the values `xs` to the output stream that is the current value of `*out*` or to the passed output stream `os` if given. The passed stream must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Prints the values, separated by spaces if there is more than one. `pr` and `prn` print in a way that objects can be read by the reader.

Returns `nil`.

```
(pr "hello")
"hello"
=> nil

(pr {:foo "hello" :bar 34.5})
{:foo "hello" :bar 34.5}
=> nil

(pr ['a :b "\n" #\space "c"])
[a :b "\n" #\space "c"]
=> nil

(pr *out* [10 20 30])
[10 20 30]
=> nil

(pr *err* [10 20 30])
[10 20 30]
=> nil
```

SEE ALSO

[prn](#)

Prints the values `xs` to the output stream that is the current value of `*out*` or to the passed stream `os` if given followed by a (newline).

[newline](#)

Without `arg` writes a platform-specific newline to the output channel that is the current value of `*out*`. With `arg` writes a newline ...

[pr-str](#)

With no args, returns the empty string. With one arg `x`, returns `x.toString()`. With more than one arg, returns the concatenation of ...

pr-str

```
(pr-str & xs)
```

With no args, returns the empty string. With one arg `x`, returns `x.toString()`. With more than one arg, returns the concatenation of the `str` values of the args with delimiter `' '`.

```
(pr-str)
=> ""
```

```
(pr-str 1 2 3)
=> "1 2 3"
```

With no args, returns the empty string. With one arg x, returns x.toString(). (str nil) returns the empty string. With more than one ...

[top](#)

reduce

```
(reduce n combine-fn combine-seed reduce-fn reduce-seed coll)
(reduce n reduce-fn reduce-seed coll)
```

Reduces a collection using a parallel reduce-combine strategy. The collection is partitioned into groups of approximately n items, each of which is reduced with reduce-fn (with reduce-seed as its seed value) in parallel. The results of these reductions are then reduced with the combine-fn (with combine-seed as its seed value). Without an explicit combine-fn the reduce-fn and its seed reduce-seed will be used as combine-fn and combine-seed.

```
(reduce 3 + 0 [1 2 3 4 5])
=> 15
```

```
(reduce 3 (fn [acc x] (+ acc x)) 0 (fn [acc x] (+ acc x)) 0 [1 2 3 4 5])
=> 15
```

```
(reduce 3 + 0 [1 2 3 4 5])

prof

```
(prof opts)
```

Controls the code profiling. See the companion functions/macros `'dorun'` and `'perf'`. The `perf` macro is built on `prof` and `dorun` and provides all for simple Venice profiling.

The profiler reports a function's elapsed time as "time with children"!

Profiling recursive functions:

Because the profiler reports "time with children" and accumulates the elapsed time across all recursive calls the resulting time for a particular recursive function is higher than the effective time.

```
(do
  (prof :on)    ; turn profiler on
  (prof :off)   ; turn profiler off
  (prof :status) ; returns the profiler on/off status
  (prof :clear) ; clear profiler data captured so far
  (prof :data)  ; returns the profiler data as map
  (prof :data-formatted) ; returns the profiler data as formatted text
  (prof :data-formatted "Metrics") ; returns the profiler data as formatted text with a title
  nil)
=> nil
```

SEE ALSO

[perf](#)

Performance test with the given expression.

[time](#)

Evaluates expr and prints the time it took. Returns the value of expr.

[top](#)

promise

```
(promise)
(promise fn)
```

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, unless the variant of `deref` with `timeout` is used. All subsequent derefs will return the same delivered value without blocking.

Promises are implemented on top of Java's `CompletableFuture`.

```
(do
  (def p (promise))
  (deliver p 10)
  (deliver p 20) ; no effect
  @p)
=> 10

;; deliver the promise from a future
(do
  (def p (promise))
  (defn task1 [] (sleep 500) (deliver p 10))
  (defn task2 [] (sleep 800) (deliver p 20))
  (future task1)
  (future task2)
  @p)
=> 10

;; deliver the promise from a task's return value
(do
  (defn task [] (sleep 300) 10)
  (def p (promise task))
  @p)
=> 10
```

```
(let [p (promise #(do (sleep 300) 10))]  
  @p)  
=> 10
```

SEE ALSO

[deliver](#)

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

[promise?](#)

Returns true if f is a Promise otherwise false

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[done?](#)

Returns true if the future or promise is done otherwise false

[cancel](#)

Cancels a future or a promise

[cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

[all-of](#)

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

[any-of](#)

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise complete normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[timeout-after](#)

Returns a promise that timeouts after the specified time. The promise throws a TimeoutException.

promise?

```
(promise? p)
```

Returns true if f is a Promise otherwise false

```
(promise? (promise))  
=> true
```

[top](#)

proxify

```
(proxify interface method-map)
```

Proxies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

The dynamic invocation handler takes care that the methods are called in the context of a Venice sandbox even if the Java method that invokes the callback methods is running in another thread.

Supports default method implementations in the proxied Java interface. These Java interface methods can be either overridden by a Venice function or just be omitted. In the latter case the return value of methods default implementation will be handed back.

In case a Java `FunctionalInterface` is required the proxy wrappers from the `:java` module are often simpler to use:

- `java/as-runnable`
- `java/as-callable`
- `java/as-predicate`
- `java/as-function`
- `java/as-consumer`
- `java/as-supplier`
- `java/as-bipredicate`
- `java/as-bifunction`
- `java/as-biconsumer`
- `java/as-binaryoperator`

```
(do  
  (import :java.io.File :java.io FilenameFilter)  
  
  (def file-filter  
    (fn [dir name] (str/ends-with? name ".xxx")))  
  
  (let [dir (io/tmp-dir)]  
    ;; create a dynamic proxy for the interface FilenameFilter  
    ;; and implement its function 'accept' by 'file-filter'  
    (. dir :list (proxify :FilenameFilter {:accept file-filter})))  
=> []
```

;; Instead of explicit proxies, functional interface wrappers are
;; often simpler to use

```
(do  
  (load-module :java)  
  (import :java.util.stream.Collectors)  
  
  (-> (. [1 2 3 4] :stream)  
    (. :filter (java/as-predicate #( > % 2)))
```

```
(. :map (java/as-function #(* % 10)))  
(. :collect (. :Collectors :toList)))  
=> (30 40)
```

=> 3
```

SEE ALSO

[stack](#)

Creates a new mutable threadsafe stack.

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[pop!](#)

Pops an item from a stack.

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

put!

```
(put! queue val)
(put! queue val delay)
```

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

queue: (put! queue val)

Puts the value 'val' to the tail of the queue.

delay-queue: (put! queue val delay)

Puts the value 'val' with a delay of 'delay' milliseconds to a delay-queue

```
(let [q (queue)]
  (put! q 1)
  (poll! q)
  q)
=> ()
```

```
(let [q (delay-queue)]
  (put! q 1 100)
  (take! q))
=> 1
```

SEE ALSO

queue

Creates a new mutable threadsafe bounded or unbounded queue.

take!

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

offer!

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

(qualified-symbol? (symbol "foo/a"))
=> true

(qualified-symbol? 'a)
=> false

(qualified-symbol? nil)
=> false

(qualified-symbol? :a)
=> false
```

[top](#)

quasiquote

(quasiquote form)

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

unquote:

It is possible to unquote part of the form that is quoted with `~`. Unquoting allows you to evaluate parts of the syntax quoted expression.

unquote-splicing:

Unquote evaluates to a collection of values and inserts the collection into the quoted form. But sometimes you want to unquote a list and insert its elements (not the list) inside the quoted form. This is where `~@` (unquote-splicing) comes to rescue.

```
(quasiquote (16 17 (inc 17)))
=> (16 17 (inc 17))

`(16 17 (inc 17))
=> (16 17 (inc 17))

`(16 17 ~(inc 17))
=> (16 17 18)

`(16 17 ~(map inc [16 17]))
=> (16 17 (17 18))

`(16 17 ~@(map inc [16 17]))
=> (16 17 17 18)

`(1 2 ~@#{1 2 3})
=> (1 2 1 2 3)

`(1 2 ~@{:a 1 :b 2 :c 3})
=> (1 2 [:a 1] [:b 2] [:c 3])
```

SEE ALSO

[quote](#)

There are two equivalent ways to quote a form either with `quote` or with `'`. They prevent the quoted form from being evaluated.

queue

```
(queue)
(queue capacity)
```

Creates a new mutable threadsafe bounded or unbounded queue.

The queue can be turned into a synchronous queue when using the functions `put!` and `take!`. `put!` waits until the value be added and `take!` waits until a value is available from queue thus synchronizing the producer and consumer.

```
; unbounded queue
(let [q (queue)]
  (offer! q 1)
  (offer! q 2)
  (offer! q 3)
  (poll! q)
  q)
=> (2 3)

; bounded queue
(let [q (queue 10)]
  (offer! q 1000 1)
  (offer! q 1000 2)
  (offer! q 1000 3)
  (poll! q 1000)
  q)
=> (2 3)

; synchronous unbounded queue
(let [q (queue)]
  (put! q 1)
  (put! q 2)
  (put! q 3)
  (take! q)
  q)
=> (2 3)

; synchronous bounded queue
(let [q (queue 10)]
  (put! q 1)
  (put! q 2)
  (put! q 3)
  (take! q)
  q)
=> (2 3)
```

SEE ALSO

[peek](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[queue?](#)

Returns true if coll is a queue

[reduce](#)

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

[transduce](#)

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be ...

[docoll](#)

Applies f to the items of the collection presumably for side effects. Returns nil.

[into!](#)

Adds all of the items of 'from' conjoined to the mutable 'to' collection

[conj!](#)

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

[top](#)

queue?

```
(queue? coll)
```

Returns true if coll is a queue

```
(queue? (queue))  
=> true
```

[top](#)

quote

```
(quote form)
```

There are two equivalent ways to quote a form either with `quote` or with `'`. They prevent the quoted form from being evaluated.

Regular quotes work recursively with any kind of forms and types: strings, maps, lists, vectors...

```
(quote (1 2 3))  
=> (1 2 3)
```

```
(quote (+ 1 2))  
=> (+ 1 2)
```

```
'(1 2 3)  
=> (1 2 3)
```

```
'(+ 1 2)
=> (+ 1 2)
```

```
'(a (b (c d (+ 1 2))))
=> (a (b (c d (+ 1 2))))
```

SEE ALSO

[quasiquote](#)

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

recur

```
(recur expr*)
```

Evaluates the exprs and rebinds the bindings of the recursion point to the values of the exprs. The recur expression must be at the tail position. The tail position is a position which an expression would return a value from.

```
;; tail recursion
(loop [x 10]
  (when (> x 1)
    (println x)
    (recur (- x 2)))))
10
8
6
4
2
=> nil
```

```
;; tail recursion
(do
  (defn sum [n]
    (loop [cnt n acc 0]
      (if (zero? cnt)
        acc
        (recur (dec cnt) (+ acc cnt)))))
    (sum 10000)))
=> 50005000
```

SEE ALSO

loop

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

reduce

```
(reduce f coll)
(reduce f val coll)
```

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then applying f to that result and the 3rd item, etc. If coll contains no items, f must accept no arguments as well, and reduce returns the result of calling f with no arguments. If coll has only 1 item, it is returned and f is not called. If val is supplied, returns the result of applying f to val and the first item in coll, then applying f to that result and the 2nd item, etc. If coll contains no items, returns val and f is not called.

`reduce` can work with queues as collection, given that the end of the queue is marked by adding a `nil` element. Otherwise the reducer does not know when to stop reading elements from the queue.

```
(reduce + [1 2 3 4 5 6 7])
=> 28
```

```
(reduce + 10 [1 2 3 4 5 6 7])
=> 38
```

```

(reduce (fn [x y] (+ x y 10)) [1 2 3 4 5 6 7])
=> 88

(reduce (fn [x y] (+ x y 10)) 10 [1 2 3 4 5 6 7])
=> 108

((reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100)
=> 207

(reduce (fn [m [k v]] (assoc m k v)) {} [[:a 1] [:b 2] [:c 3]])
=> {:a 1 :b 2 :c 3}

(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})
=> {1 :a 2 :b 3 :c}

(reduce (fn [m c] (assoc m (first c) c)) {} [[:a 1] [:b 2] [:c 3]])
=> {:a [a 1] :b [b 2] :c [c 3]}

;; sliding window (width 3) average
(->> (partition 3 1 (repeatedly 10 #(rand-long 30)))
      (map (fn [window] (/ (reduce + window) (count window)))))
=> (19 15 20 20 22 22 19 18)

;; reduce all elements of a queue.
;; calls (take! queue) to get the elements of the queue.
;; note: use nil to mark the end of the queue otherwise
;;       reduce will block forever!
(let [q (conj! (queue) 1 2 3 4 5 6 7 nil)]
  (reduce + q))
=> 28

;; reduce data supplied by a finit lazy seq
(do
  (def counter (atom 5))
  (defn generate []
    (swap! counter dec)
    (if (pos? @counter) @counter nil))
  (reduce + 100 (lazy-seq generate)))
=> 110

```

regex/find

```
(regex/find matcher)
(regex/find pattern s)
```

Returns the next regex match or `nil` if there is no further match. Returns `nil` if there is no match.

To get the positional data for the matched group use `(regex/find+ matcher)`.

```
(regex/find #"[0-9]+" "672-345-456-3212")
=> "672"
```

```
(let [m (regex/matcher #"[0-9]+" "672-345-456-3212")]
      (println (regex/find m))
      (println (regex/find m))
      (println (regex/find m))
      (println (regex/find m))
      (println (regex/find m)))
672
345
456
3212
nil
=> nil
```

SEE ALSO

[match?](#)

Returns true if the string `s` matches the regular expression `regex`.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[regex/find+](#)

Returns the next regex match and returns the group with its positional data. Returns `nil` if there is no match.

[regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

```
(let [m (regex/matcher #"(\d+)(.*)" "100abc")]
  (regex/groups m))
=> ("100abc" "100" "abc")

(let [m (regex/matcher #"(\d+)([a-z]+)" "100abc:")]
  (regex/groups m))
=> ()
```

SEE ALSO

[match?](#)

Returns true if the string *s* matches the regular expression *regex*.

[regex/group](#)

Returns the input subsequence captured by the given group during the previous match operation.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

[regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

[regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

regex/matcher

([regex/matcher](#) pattern str)

Returns an instance of `java.util.regex.Matcher` .

The pattern can be either a string or a pattern created by ([regex/pattern s](#)) .

Matchers are mutable and are not safe for use by multiple concurrent threads!

JavaDoc: [Pattern](#)

```
(regex/matcher #"[0-9]+" "100")
=> java.util.regex.Matcher[pattern=[0-9]+ region=0,3 lastmatch=]
```

```
(regex/matcher (regex/pattern"[0-9]+" "100")
=> java.util.regex.Matcher[pattern=[0-9]+ region=0,3 lastmatch=]
```

```

```

SEE ALSO

[match?](#)

Returns true if the string s matches the regular expression regex.

[regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

[regex/find?](#)

Attempts to find the next subsequence that matches the pattern. If the match succeeds then more information can be obtained via the ...

[regex/reset](#)

Resets the matcher with a new string

[regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

[regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

regex/matches

([regex/matches](#) pattern str)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()` .

If the matcher's pattern matches the entire region sequence returns a list with the entire region sequence and the matched groups otherwise returns an empty list.

Returns matching info as meta data on the region and the groups.

Region meta data:

:start start pos of the overall group
:end end pos of the overall group
:group-count the number of matched elements groups

Group meta data:

:start start pos of the element group
:end end pos of the element group

JavaDoc: [Pattern](#)

```
;; Entire region sequence matched
(regex/matches "hello, (.*)" "hello, world")
=> ("hello, world" "world")

```

SEE ALSO

[match?](#)

Returns true if the string `s` matches the regular expression `regex`.

[regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

[regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

[regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[top](#)

regex/pattern

(`regex/pattern` `s`)

Returns an instance of `java.util.regex.Pattern`.

Patterns are immutable and are safe for use by multiple concurrent threads!

Alternatively regex pattern literals can be used to define a pattern: `#"[0-9]+"`

```
"\\d" ;; regex string to match one digit
```

Notice that you have to escape the backslash to get a literal backslash in the string. However, regex pattern literals are smart. They don't need to double escape:

```
#"\\d" ;; regex pattern literal to match one digit
```

JavaDoc: [Pattern](#)

```
(regex/pattern "[0-9]+")
=> [0-9]+
```

```
(regex/pattern "\\d+")
=> \d+
```

```
#"[0-9]+"
=> [0-9]+
```

```
#"\\d+"
=> \d+
```

SEE ALSO

[match?](#)

Returns true if the string `s` matches the regular expression `regex`.

[regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

[regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using `java.util.regex.Matcher.matches()`.

[regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[top](#)

regex/reset

(`regex/reset` `matcher` `str`)

Resets the matcher with a new string

```
(do
  (let [m (regex/matcher #"[0-9]+" "100")]
    (println (regex/find m))
    (let [m (regex/reset m "200")]
      (println (regex/find m)))))
100
200
=> nil
```

SEE ALSO

[match?](#)

Returns true if the string `s` matches the regular expression `regex`.

[regex/matcher](#)

Returns an instance of `java.util.regex.Matcher`.

[regex/pattern](#)

Returns an instance of `java.util.regex.Pattern`.

[top](#)

release

(`release` `lock`)

Releases a lock.

```
(let [l (lock)]
  (acquire l)
  ;; do something
  (release l))
=> nil
```

SEE ALSO

[lock](#)

Creates a new lock object.

[acquire](#)

Acquires a lock, blocking until the lock is available.

[try-acquire](#)

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

[locked?](#)

Returns true if the lock is in use else false.

[top](#)

remove

```
(remove predicate coll)
```

Returns a collection of the items in coll for which `(predicate item)` returns logical false.
Returns a transducer when no collection is provided.

```
(remove nil? [1 nil nil 4 5 6])  
=> (1 4 5 6)
```

```
(remove even? [1 2 3 4 5 6 7])  
=> (1 3 5 7)
```

```
(remove #{3 5} '(1 3 5 7 9))  
=> (1 7 9)
```

```
(remove #(= 3 %) '(1 2 3 4 5 6))  
=> (1 2 4 5 6)
```

[top](#)

remove-formal-type

```
(remove-formal-type object)
```

Removes the *formal type* from a Java object.

This is identical to casting an object back to its real type without knowing its real type.

```
(do  
  (let [p0 (. :java.awt.Point :new 0 0)  
        p1 (cast :java.lang.Object p0)  
        p2 (remove-formal-type p1)]  
    (println "p0 ->" (formal-type p0))  
    (println "p1 ->" (formal-type p1))  
    (println "p2 ->" (formal-type p2))))  
p0 -> :java.awt.Point  
p1 -> :java.lang.Object  
p2 -> :java.awt.Point  
=> nil
```

SEE ALSO

[formal-type](#)

Returns the formal type of a Java object.

[cast](#)

Casts a Java object to a specific type

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

remove-tap

```
(remove-tap f)
```

Remove f from the tap set.

```
(do
  (add-tap prn)
  (remove-tap prn))
=> nil
```

SEE ALSO

[add-tap](#)

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via tap>.

[tap>](#)

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

remove-watch

```
(remove-watch ref key)
```

Removes a watch function from an agent/atom reference.

```
(do
  (def x (agent 10))
  (defn watcher [key ref old new]
    (println "watcher: " key))
  (add-watch x :test watcher)
  (remove-watch x :test))
=> nil
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

repeat

```
(repeat x)
(repeat n x)
```

Returns a lazy sequence of x values or a collection with the value x repeated n times.

```
(repeat 3 "hello")
=> ("hello" "hello" "hello")
```

```
(repeat 5 [1 2])  
=> ([1 2] [1 2] [1 2] [1 2] [1 2])
```

```
(repeat " :")  
=> (...)
```

```
(interleave [:a :b :c] (repeat 100))  
=> (:a 100 :b 100 :c 100)
```

SEE ALSO

[repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

repeatedly

```
(repeatedly n fn)
```

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

```
(repeatedly 5 #(rand-long 11))  
=> (0 5 7 3 4)
```

```
;; compare with repeat, which only calls the 'rand-long'  
;; function once, repeating the value five times.  
(repeat 5 (rand-long 11))  
=> (6 6 6 6 6)
```

SEE ALSO

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

repl/color-theme

```
(repl/color-theme)
```

Returns REPL's color theme (:light, :dark, :none)

```
(repl/color-theme)
```

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/color-theme!](#)

Set the REPL's color theme (:light, :dark)

[repl/prompt!](#)

Sets the REPL prompt string

[repl/handler!](#)

Sets the REPL command handler

[repl/info](#)

Returns information on the REPL.

[top](#)

repl/color-theme!

```
(repl/color-theme! theme)
```

Set the REPL's color theme (:light, :dark)

```

Returns true if running within a REPL.

[repl/color-theme](#)

Returns REPL's color theme (:light, :dark, :none)

[repl/prompt!](#)

Sets the REPL prompt string

[repl/handler!](#)

Sets the REPL command handler

[repl/info](#)

Returns information on the REPL.

[top](#)

repl/handler!

```
(repl/handler! f)
```

Sets the REPL command handler

```
(do
  (defn handle-command [cmd]
    ;; run the command 'cmd'
    (println "Demo:" cmd))

  (repl/handler! handle-command))
```

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/prompt!](#)

Sets the REPL prompt string

[repl/color-theme](#)

Returns REPL's color theme (:light, :dark, :none)

[repl/info](#)

Returns information on the REPL.

[top](#)

repl/home-dir

(repl/home-dir)

Returns the REPL home directory.

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/libs-dir](#)

Returns the REPL libs directory

[top](#)

repl/info

(repl/info)

Returns information on the REPL.

Note: This function is only available when called from within a REPL!

E.g.:

```
{ :term-name "JLine terminal"
  :term-type "xterm-256color"
  :term-cols 80
  :term-rows 24
  :term-colors 256
  :term-class :org.repackage.org.jline.terminal.impl.PosixSysTerminal
  :color-mode :light }
```

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-rows](#)

Returns number of rows in the REPL terminal.

[repl/term-cols](#)

Returns number of columns in the REPL terminal.

[top](#)

[repl/libs-dir](#)

`(repl/libs-dir)`

Returns the REPL libs directory

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

Returns the REPL home directory.

[top](#)

[repl/prompt!](#)

`(repl/prompt! s)`

Sets the REPL prompt string

`(repl/prompt! "venice> ")`

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/handler!](#)

Sets the REPL command handler

[repl/color-theme](#)

Returns REPL's color theme (:light, :dark, :none)

[repl/info](#)

Returns information on the REPL.

[top](#)

[repl/term-cols](#)

`(repl/term-cols)`

Returns number of columns in the REPL terminal.

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-rows](#)

Returns number of rows in the REPL terminal.

[repl/info](#)

Returns information on the REPL.

[top](#)

repl/term-rows

(repl/term-rows)

Returns number of rows in the REPL terminal.

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-cols](#)

Returns number of columns in the REPL terminal.

[repl/info](#)

Returns information on the REPL.

[top](#)

repl?

(repl?)

Returns true if running within a REPL.

([repl?](#))

[top](#)

replace

(replace smap coll)

Given a map of replacement pairs and a collection, returns a collection with any elements that are a key in smap replaced with the corresponding value in smap.

```
(replace {2 :two, 4 :four} [4 2 3 4 5 6 2])  
=> [:four :two 3 :four 5 6 :two]
```

```
(replace {2 :two, 4 :four} #{1 2 3 4 5})
=> #{1 3 5 :four :two}

(replace [{:a 10} [:c 30]] {:a 10 :b 20})
=> {:b 20 :c 30}
```

[top](#)

reset!

```
(reset! box newval)
```

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

```
(do
  (def counter (atom 0))
  (reset! counter 99)
  @counter)
=> 99

(do
  (def counter (atom 0))
  (reset! counter 99))
=> 99

(do
  (def counter (volatile 0))
  (reset! counter 99)
  @counter)
=> 99
```

SEE ALSO

[atom](#)

Creates an atom with the initial value x.

[volatile](#)

Creates a volatile with the initial value x

[top](#)

reset-ns-meta!

```
(reset-ns-meta! n datamap)
```

Resets the metadata for a namespace

```
(do
  (ns foo)
  (reset-ns-meta! foo {}))
=> {}

(do
  (ns foo)
  (def n 'foo)
  (reset-ns-meta! (var-get n) {}))
```

```
(pr-str (ns-meta (var-get n))))  
=> "{}"
```

SEE ALSO

[ns-meta](#)

Returns the meta data of the namespace n or nil if n is not an existing namespace

[alter-ns-meta!](#)

Alters the metadata for a namespace. f must be free of side-effects.

[ns](#)

Opens a namespace.

top

resolve

```
(resolve symbol)
```

Resolves a symbol.

```
(resolve '+)  
=> +
```

```
(resolve 'y)  
=> nil
```

```
(resolve (symbol "+"))  
=> +
```

```
((resolve (symbol "core" "+")) 1 2)  
=> 3
```

```
((-> "first" symbol resolve) [1 2 3])  
=> 1
```

SEE ALSO

[symbol](#)

Returns a symbol from the given name

top

rest

```
(rest coll)
```

Returns a possibly empty collection of the items after the first.

```
(rest nil)  
=> nil
```

```
(rest [])  
=> []
```

```
(rest [1])
=> []

(rest [1 2 3])
=> [2 3]

(rest '())
=> ()

(rest '(1))
=> ()

(rest '(1 2 3))
=> (2 3)

(rest "1234")
=> (#\2 #\3 #\4)
```

SEE ALSO

[str/rest](#)

Returns a possibly empty string of the characters after the first.

top

restart-agent

```
(restart-agent agent state)
```

When an agent is failed, changes the agent state to new-state and then un-fails the agent so that sends are allowed again.

```
(do
  (def x (agent 100))
  (restart-agent x 200)
  (deref x))
=> 200
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

top

reverse

```
(reverse coll)
```

Returns a collection of the items in coll in reverse order.
Returns a stateful transducer when no collection is provided.

```
(reverse [1 2 3 4 5 6])
=> [6 5 4 3 2 1]
```

```
(reverse "abcdef")  
=> (#\f #\e #\d #\c #\b #\a)
```

SEE ALSO

[str/reverse](#)

Reverses a string

[top](#)

rf-any?

```
(rf-any? pred)
```

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

```
(transduce (filter number?) (rf-any? pos?) [true -1 1 2 false])  
=> true
```

SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

rf-every?

```
(rf-every? pred)
```

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

```
(transduce (filter number?) (rf-every? pos?) [1 2 3])  
=> true
```

SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

[top](#)

rf-first

```
(rf-first)
```

Returns a reducing function for a transducer that returns the first item.

```
(transduce (filter number?) rf-first [false 1 2])  
=> 1
```

```
(transduce identity rf-first [nil 1 2])  
=> nil
```

SEE ALSO

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

[rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

rf-last

```
(rf-last)
```

Returns a reducing function for a transducer that returns the last item.

```
(transduce (filter number?) rf-last [false 1 2])  
=> 2
```

```
(transduce identity rf-last [1 2 1.2])  
=> 1.2
```

SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

[rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

ring/create-servlet

```
(ring/create-servlet handler)
```

Create a ring servlet.

SEE ALSO

[ring/match-routes](#)

Compile the routes and return a function that calls the handler matching the URI.

[top](#)

[ring/debug?](#)

`(ring/debug? req)`

Returns true if debugging is turned on else false

[top](#)

[ring/get-request-header](#)

`(ring/get-request-header req name)`

Returns the value of the specified request header. If the request did not include a header of the specified name, this method returns nil. If there are multiple header with the same name, this method returns the first header in the request.

[top](#)

[ring/get-request-header-accept-mimetypes](#)

`(ring/get-request-header-accept-mimetypes req)`

Returns all 'Accept' header mime-types of the request as a set. Strips off the ratings

[top](#)

[ring/get-request-parameters](#)

`(ring/get-request-parameters req name)`

Returns all the values of the specified request parameter as a list

[top](#)

[ring/html-request?](#)

`(ring/html-request? req)`

Returns true if the request has content type 'text/html'

[top](#)

ring/json-request?

```
(ring/json-request? req)
```

Returns true if the request has content type 'application/json'

[top](#)

ring/match-routes

```
(ring/match-routes routes)
```

Compile the routes and return a function that calls the handler matching the URI.

A route is defined by a HTTP verb, a URI filter and a handle function. If multiple routes match the route with the longest URI filter will be chosen.

```
(def routes [
  [:get    "/"**"                hello-world-handler]
  [:get    "/test/**"            test-handler]
  [:get    "/static/images/*.png" image-handler]

  [:get    "/employees"          get-all-employees]
  [:get    "/employees/:id"       get-employee]
  [:post   "/employees"          create-employee]
  [:put    "/employees/:id"       update-employee]
  [:delete "/employees/:id"       delete-employee] ])
```

Routing URI pattern filters:

- `"/**"`
- `"/app/**"`
- `"/static/images/chart.png"`
- `"/static/images/*.png"`
- `"/static/**/*.png"`

A routing handler is single argument function that receives the request and returns a response.

Handler request:

:server-port	The server port. E.g.: 8080
:server-name	The server name. E.g.: localhost
:remote-addr	The remote address. E.g.: "0:0:0:0:0:0:1"
:uri	The request URI. E.g.: "/employees"
:query-string	The query string
:scheme	The scheme { :http, :https }
:request-method	The lower case request method. { :get, :post, :put, :delete, :head, :options, :trace }
:protocol	The protocol. E.g. "HTTP/1.1"
:headers	A map of part's headers. Key: header name, value: list of header values. The header names are mapped to lower case. Use <code>(first ("xxxx" :headers))</code> to get a single value header
:parameters	A name/value map of the request parameters
:cookies	A map of the cookies. Key: cookie name, value: the Java servlet cookie object
:content-type	The content type (may be nil)
:content-length	The content length
:character-encoding	The character encoding
:ssl-client-cert	The client certificate, if available

:parts A list of parts, empty for non multipart requests

:body The content part as input stream

Handler response:

```
{ :status 400
  :headers { "Content-Type" "text/plain" }
  :body "Not a json request!" }
```

Rigging up a Ring WEB App and starting Tomcat:

```
(tc/run-tomcat
  (ring/create-servlet (-> (ring/match-routes routes) ; >--+
                           ; |
                           (ring/mw-dump-request)      ; ^ |
                           (ring/mw-request-counter)    ; | |
                           (ring/mw-add-session 3600)   ; | |
                           (ring/mw-print-uri)          ; | |
                           (ring/mw-debug :on)))         ; +--+
  {:await? false}))
```

SEE ALSO

[ring/create-servlet](#)

Create a ring servlet.

top

ring/multipart-request?

```
(ring/multipart-request? req)
```

Returns true if the request is a multipart request 'multipart/form-data'

SEE ALSO

[ring/parts](#)

Returns a list of parts of a multipart HTTP request.

[ring/parts-delete-all](#)

Safely deletes for all parts the underlying storage for the file items, including deleting any associated temporary disk files.

top

ring/mw-debug

```
(ring/mw-debug handler option)
```

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

SEE ALSO

[ring/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

ring/mw-dump-request

```
(ring/mw-dump-request handler)
```

Dumps the request and then calls the handler.

SEE ALSO

[ring/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

ring/mw-dump-response

```
(ring/mw-dump-response handler)
```

Calls the handler and the dumps the handler's response.

SEE ALSO

[ring/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

ring/mw-identity

(ring/mw-identity handler)

Identity, does effectively just delegate to the handler

SEE ALSO

[ring/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

ring/mw-print-uri

(ring/mw-print-uri handler)

Prints the URI from the request and then calls the handler

SEE ALSO

[ring/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring/mw-dump-response](#)

Calls the handler and then dumps the handler's response.

[top](#)

ring/mw-request-counter

`(ring/mw-request-counter handler)`

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

SEE ALSO

[ring/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the `MaxInactiveInterval`. If a timeout is not ...

[ring/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring/mw-dump-response](#)

Calls the handler and then dumps the handler's response.

[top](#)

ring/not-found-response

`(ring/not-found-response)`

`(ring/not-found-response msg)`

Create a HTTP Not-Found 404 response with content-type text/html.

[top](#)

ring/parse-charset

`(ring/parse-charset text)`

Parses the charset from a header value

E.g.: Returns `utf-8` for a content type header like: `Content-Type: text/html; charset=utf-8`

[top](#)

ring/parts

```
(ring/parts req)
```

Returns a list of parts of a multipart HTTP request.

A part is map with the fields:

:name	The name of the part
:file-name	The file-name of the part or <i>nil</i> if not available
:size	The size of the file
:content-type	The content type of the part
:headers	A map of part's headers. key: header name, value: list of header values. The header names are mapped to lower case. Use <code>(first ("xxxx" :headers))</code> to get a single value header
:in-stream	The content part as input stream
:delete-fn	A function that deletes the underlying storage for a file item, including deleting any associated temporary disk file.

The part list is empty if the request is not a multipart request.

SEE ALSO

[ring/multipart-request?](#)

Returns true if the request is a multipart request 'multipart/form-data'

[ring/parts-delete-all](#)

Safely deletes for all parts the underlying storage for the file items, including deleting any associated temporary disk files.

[top](#)

ring/parts-delete-all

```
(ring/parts-delete-all req)
```

Safely deletes for all parts the underlying storage for the file items, including deleting any associated temporary disk files.

Calls the *delete-fn* on every part data map.

SEE ALSO

[ring/multipart-request?](#)

Returns true if the request is a multipart request 'multipart/form-data'

[ring/parts](#)

Returns a list of parts of a multipart HTTP request.

[top](#)

ring/redirect

```
(ring/redirect request url)
```

Redirect to the given URL.

ring/session-clear

```
(ring/session-clear req)
```

Removes all attributes from the session

SEE ALSO

[ring/session-invalidate](#)

Invalidate the session

[ring/session-id](#)

Get the session ID

[ring/session-set-value](#)

Sets a value on the session

[ring/session-get-value](#)

Get a value from the session

[ring/session-remove-value](#)

Remove a value from the session

[ring/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[ring/session-creation-time](#)

Returns the time (milliseconds since epoch) when this session was created.

ring/session-creation-time

```
(ring/session-creation-time req)
```

Returns the time (milliseconds since epoch) when this session was created.

SEE ALSO

[ring/session-invalidate](#)

Invalidate the session

[ring/session-clear](#)

Removes all attributes from the session

[ring/session-id](#)

Get the session ID

[ring/session-set-value](#)

Sets a value on the session

[ring/session-get-value](#)

Get a value from the session

[ring/session-remove-value](#)

Remove a value from the session

[ring/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

ring/session-get-value

```
(ring/session-get-value req name)
```

Get a value from the session

SEE ALSO

[ring/session-invalidate](#)

Invalidate the session

[ring/session-clear](#)

Removes all attributes from the session

[ring/session-id](#)

Get the session ID

[ring/session-set-value](#)

Sets a value on the session

[ring/session-remove-value](#)

Remove a value from the session

[ring/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[ring/session-creation-time](#)

Returns the time (milliseconds since epoch) when this session was created.

ring/session-id

```
(ring/session-id req)
```

Get the session ID

SEE ALSO

[ring/session-invalidate](#)

Invalidate the session

[ring/session-clear](#)

Removes all attributes from the session

[ring/session-set-value](#)

Sets a value on the session

[ring/session-get-value](#)

Get a value from the session

[ring/session-remove-value](#)

Remove a value from the session

[ring/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[ring/session-creation-time](#)

Returns the time (milliseconds since epoch) when this session was created.

[top](#)

ring/session-invalidate

(ring/session-invalidate req)

Invalidate the session

SEE ALSO

[ring/session-clear](#)

Removes all attributes from the session

[ring/session-id](#)

Get the session ID

[ring/session-set-value](#)

Sets a value on the session

[ring/session-get-value](#)

Get a value from the session

[ring/session-remove-value](#)

Remove a value from the session

[ring/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[ring/session-creation-time](#)

Returns the time (milliseconds since epoch) when this session was created.

[top](#)

ring/session-remove-value

(ring/session-remove-value req name)

Remove a value from the session

SEE ALSO

[ring/session-invalidate](#)

Invalidate the session

[ring/session-clear](#)

Removes all attributes from the session

[ring/session-id](#)

Get the session ID

[ring/session-set-value](#)

Sets a value on the session

[ring/session-get-value](#)

Get a value from the session

[ring/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[ring/session-creation-time](#)

Returns the time (milliseconds since epoch) when this session was created.

[top](#)

run!

```
(run! f coll)
```

Runs the supplied function, for purposes of side effects, on successive items in the collection. Returns `nil`

```
(run! prn [1 2 3 4])
1
2
3
4
=> nil
```

SEE ALSO

[docoll](#)

Applies `f` to the items of the collection presumably for side effects. Returns `nil`.

[mapv](#)

Returns a vector consisting of the result of applying `f` to the set of first items of each `coll`, followed by applying `f` to the set of ...

[top](#)

sandbox/functions

```
(sandbox/functions group)
```

Lists the sandboxed functions defined by a sandbox function group.

Groups:

- `:io`
- `:print`
- `:concurrency`
- `:java-interop`
- `:system`
- `:special-forms`
- `:unsafe`

```
(sandbox/functions :print)
```

SEE ALSO

[sandboxed?](#)

Returns true if there is a sandbox other than `:AcceptAllInterceptor` otherwise false.

[top](#)

sandbox/type

(sandbox/type)

Returns the sandbox type.

Venice sandbox types:

- `:AcceptAllInterceptor` - accepts all (no restrictions)
- `:RejectAllInterceptor` - safe sandbox, rejects access to all I/O functions, system properties, environment vars, extension modules, dynamic code loading, multi-threaded functions (futures, agents, ...), and Java calls
- `:SandboxInterceptor` - customized sandbox

([sandbox/type](#))

```
=> :AcceptAllInterceptor
```

SEE ALSO

[sandboxed?](#)

Returns true if there is a sandbox other than `:AcceptAllInterceptor` otherwise false.

[top](#)

sandboxed?

(sandboxed?)

Returns true if there is a sandbox other than `:AcceptAllInterceptor` otherwise false.

([sandboxed?](#))

```
=> false
```

SEE ALSO

[sandbox/type](#)

Returns the sandbox type.

[top](#)

schedule-at-fixed-rate

(schedule-at-fixed-rate fn initial-delay period time-unit)

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period. Returns a future. `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future. Time unit is one of `:milliseconds`, `:seconds`, `:minutes`, `:hours`, or `:days`.

```
(schedule-at-fixed-rate #(println "test") 1 2 :seconds)
```

```
(let [s (schedule-at-fixed-rate #(println "test") 1 2 :seconds)]
  (sleep 16 :seconds)
  (cancel s))
```

SEE ALSO

[schedule-delay](#)

Creates and executes a one-shot action that becomes enabled after the given delay.

[top](#)

schedule-delay

```
(schedule-delay fn delay time-unit)
```

Creates and executes a one-shot action that becomes enabled after the given delay.

Returns a future. `(deref f)`, `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future.

Time unit is one of `:milliseconds`, `:seconds`, `:minutes`, `:hours`, or `:days`.

```
(schedule-delay (fn [] (println "test"))) 1 :seconds)
```

```
(deref (schedule-delay (fn [] 100) 2 :seconds))
```

SEE ALSO

[schedule-at-fixed-rate](#)

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period.

[top](#)

second

```
(second coll)
```

Returns the second element of coll.

```
(second nil)
```

```
=> nil
```

```
(second [])
```

```
=> nil
```

```
(second [1 2 3])
```

```
=> 2
```

```
(second '())
```

```
=> nil
```

```
(second '(1 2 3))
```

```
=> 2
```

[top](#)

select-keys

```
(select-keys map keyseq)
```

Returns a map containing only those entries in map whose key is in keys

```
(select-keys {:a 1 :b 2} [:a])  
=> {:a 1}
```

```
(select-keys {:a 1 :b 2} [:a :c])  
=> {:a 1}
```

```
(select-keys {:a 1 :b 2 :c 3} [:a :c])  
=> {:a 1 :c 3}
```

[top](#)

semver/parse

(semver/parse s)

Parses string 's' into a semantic version map.

Semantic versioning format:

```
standard
  version:      1.0.0
  pre-release:  1.0.0-beta
  meta data:    1.0.0-beta+001

with revision
  version:      1.0.0.0
  pre-release:  1.0.0.0-beta
  meta data:    1.0.0.0-beta+001
```

```
E.g.: { :major 1, :minor 3, :patch 5 }
      { :major 1, :minor 3, :patch 5 :pre-release "beta" }
      { :major 1, :minor 3, :patch 5 :pre-release "beta" }
      { :major 1, :minor 3, :patch 5 :pre-release "beta" :meta "001" }
```

(semver/parse "1.2.3")

```
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}
```

(semver/parse "1.2.3-beta")

```
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release "beta"}
```

(semver/parse "1.2.3-beta+001")

```
=> {:patch 3 :meta-data "001" :minor 2 :major 1 :revision nil :pre-release "beta"}
```

SEE ALSO

[semver/version](#)

If 'v' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'v' and return a version map.

[semver/valid-format?](#)

Checks the string 's' for semantic versioning formatting

[top](#)

semver/valid-format?

(semver/valid-format? s)

Checks the string 's' for semantic versioning formatting

```
(semver/valid-format? "1.2.3")  
=> true
```

SEE ALSO

[semver/parse](#)

Parses string 's' into a semantic version map.

[semver/valid?](#)

Checks if the supplied version map is valid regarding semantic versioning or not.

[top](#)

semver/valid?

```
(semver/valid? v)
```

Checks if the supplied version map is valid regarding semantic versioning or not.

```
(semver/valid? (semver/parse "1.2.3"))  
=> true
```

SEE ALSO

[semver/parse](#)

Parses string 's' into a semantic version map.

[semver/valid?](#)

Checks if the supplied version map is valid regarding semantic versioning or not.

[top](#)

semver/version

```
(semver/version o)
```

If 'o' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'o' and return a version map.

```
(semver/version "1.2.3")  
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}
```

SEE ALSO

[semver/parse](#)

Parses string 's' into a semantic version map.

[top](#)

send

```
(send agent action-fn args)
```

Dispatch an action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do
  (def x (agent 100))
  (send x + 5)
  (send x (partial + 7))
  (sleep 100)
  (deref x))
=> 112
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

[top](#)

send-off

```
(send-off agent fn args)
```

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do
  (def x (agent 100))
  (send-off x + 5)
  (send-off x (partial + 7))
  (sleep 100)
  (deref x))
=> 112
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send](#)

Dispatch an action to an agent. Returns the agent immediately.

[top](#)

seq

```
(seq coll)
```

Returns a seq on the collection. If the collection is empty, returns nil. `(seq nil)` returns nil. seq also works on Strings and converts Java streams to lists.

```
(seq nil)
=> nil

(seq [])
=> nil

(seq [1 2 3])
=> (1 2 3)

(seq '(1 2 3))
=> (1 2 3)

(seq {:a 1 :b 2})
=> ([:a 1] [:b 2])

(seq "abcd")
=> (#\a #\b #\c #\d)

(flatten (seq {:a 1 :b 2}))
=> (:a 1 :b 2)
```

[top](#)

sequential?

```
(sequential? coll)
```

Returns true if coll is a sequential collection

```
(sequential? '(1))
=> true

(sequential? [1])
=> true

(sequential? {:a 1})
=> false

(sequential? nil)
=> false

(sequential? "abc")
=> false
```

[top](#)

service

```
(service name method & args)
```

Calls a service with the specified name from the Venice's service registry.

Venice's service registry is used with application scripting scenarios where multiple external services must be made available to Venice. E.g.: the service registry can be used to register an application's *Spring Framework* services and make them discoverable by a Venice script.

Example:

```
Venice venice = new Venice();

venice.getServiceRegistry()
    .register("Calculator", new Calculator())
    .registerServiceDiscovery(new TestServiceDiscovery());

long r = (Long)venice.eval("(service :Calculator :multiply 10 20)");
venice.eval("(service :Logger :log (version))");
```

while `Calculator` and `TestServiceDiscovery` are defined as:

```
public static class TestServiceDiscovery implements IServiceDiscovery {
    @Override public Object lookup(final String name) {
        if (name == null) {
            throw new IllegalArgumentException("A service name must not be null");
        }
        else if (name.equals("Logger")) {
            return logger;
        }
        else {
            throw new VncException("Service " + name + " is not registered");
        }
    }
    private final Logger logger = new Logger();
}

public class Calculator {
    public long multiply(long v1, long v2) {
        return v1 * v2;
    }
}

public static class Logger {
    public void log(String message) {
        System.out.println(message);
    }
}
```

```
(service :UserService :find "Smith" "John")
```

SEE ALSO

[service?](#)

Returns true if the named service exists otherwise false

top

service?

```
(service? name)
```

Returns true if the named service exists otherwise false

```
(service? :UserService
```

SEE ALSO

[service](#)

Calls a service with the specified name from the Venice's service registry.

set

```
(set & items)
```

Creates a new set containing the items.

```
(set)
=> #{} 
```

```
(set nil)
=> #{nil} 
```

```
(set 1)
=> #{1} 
```

```
(set 1 2 3)
=> #{1 2 3} 
```

```
(set [1 2] 3)
=> #{[1 2] 3} 
```

set!

```
(set! var-symbol expr)
```

Sets a global or thread-local variable to the value of the expression.

```
(do
  (def x 10)
  (set! x 20)
  x)
=> 20 
```

```
(do
  (def-dynamic x 100)
  (set! x 200)
  x)
=> 200 
```

```
(do
  (def-dynamic x 100)
  (without-str
    (print x)
    (binding [x 200]
      (print (str "- " x))
      (set! x (inc x))
      (print (str "- " x)))
    (print (str "- " x))))
=> "100-200-201-100" 
```

SEE ALSO

[def](#)

Creates a global variable.

[def-dynamic](#)

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[top](#)

set-error-handler!

```
(set-error-handler! agent handler-fn)
```

Sets the error-handler of an agent to `handler-fn` . If an action being run by the agent throws an exception `handler-fn` will be called with two arguments: the agent and the exception.

```
(do
  (def x (agent 100))
  (defn err-handler-fn [ag ex]
    (println "error occurred: "
             (:message ex)
             " and we still have value"
             @ag))
  (set-error-handler! x err-handler-fn)
  (send x (fn [n] (/ n 0))))
=> (agent :value 100)
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[agent-error-mode](#)

Returns the agent's error mode

[agent-error](#)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

[top](#)

set?

```
(set? obj)
```

Returns true if obj is a set

```
(set? (set 1))
=> true
```

[top](#)

sgn

```
(sgn x)
```

sgn function for a number.

```
-1 if x < 0
 0 if x = 0
 1 if x > 0
```

```
(sgn -10)
=> -1
```

```
(sgn 0)
=> 0
```

```
(sgn 10)
=> 1
```

```
(sgn -10I)
=> -1
```

```
(sgn -10.1)
=> -1
```

```
(sgn -10.12M)
=> -1
```

SEE ALSO

[abs](#)

Returns the absolute value of the number

[negate](#)

Negates x

[top](#)

sh

```
(sh & args)
```

Launches a new sub-process.

Options:

:in	may be given followed by input source as InputStream, Reader, File, ByteBuf, or String, to be fed to the sub-process's stdin.
:in-enc	option may be given followed by a String, used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the input string specified by the :in option to the sub-process's stdin. Defaults to "UTF-8". If the :in option provides a byte array, then the bytes are passed unencoded, and this option is ignored.
:out-enc	option may be given followed by :bytes or a String. If a String is given, it will be used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the sub-process's stdout to a String which is returned. If :bytes is given, the sub-process's stdout will be stored in a Bytebuf and returned. Defaults to UTF-8.
:out-fn	a function with a single string argument that receives line by line from the process' stdout. If passed the :out value in the return map will be empty.
:err-fn	a function with a single string argument that receives line by line from the process' stderr. If passed the :err value in the return map will be empty.
:env	override the process env with a map.
:dir	override the process dir with a String or java.io.File.
:throw-ex	If true throw an exception if the exit code is not equal to zero, if false returns the exit code. Defaults to false. It's recommended to use

```
(with-sh-throw (sh "ls" "-l"))  
instead.
```

:timeout A timeout in milliseconds

You can bind :env, :dir for multiple operations using with-sh-env or with-sh-dir . with-sh-throw is binds :throw-ex as true.

sh returns a map of

```
:exit => sub-process's exit code  
:out  => sub-process's stdout (as Bytebuf or String)  
:err  => sub-process's stderr (String via platform default encoding)
```

E.g.:

```
(sh "uname" "-r")  
=> {:err "" :out "20.5.0\n" :exit 0}
```

```
(println (sh "ls" "-l"))  
  
(println (sh "ls" "-l" "/tmp"))  
  
(println (sh "sed" "s/[aeiou]/oo/g" :in "hello there\n"))  
  
(println (sh "cat" :in "x\u25bax\n"))  
  
(println (sh "echo" "x\u25bax"))  
  
(println (sh "/bin/sh" "-c" "ls -l"))  
  
(sh "ls" "-l" :out-fn println)  
  
(sh "ls" "-l" :out-fn println :err-fn println)  
  
;; background process  
(println (sh "/bin/sh" "-c" "sleep 30 >/dev/null 2>&1 &"))  
  
(println (sh "/bin/sh" "-c" "nohup sleep 30 >/dev/null 2>&1 &"))  
  
;; asynchronously slurping stdout and stderr  
(sh "/bin/sh"  
  "-c" "for i in {1..5}; do sleep 1; echo \"Hello $i\"; done"  
  :out-fn println  
  :err-fn println)  
  
;; asynchronously slurping stdout and stderr with a timeout  
(sh "/bin/sh"  
  "-c" "for i in {1..5}; do sleep 1; echo \"Hello $i\"; done"  
  :out-fn println  
  :err-fn println  
  :timeout 2500)  
  
;; reads 4 single-byte chars  
(println (sh "echo" "x\u25bax" :out-enc "ISO-8859-1"))  
  
;; reads binary file into bytes[]  
(println (sh "cat" "birds.jpg" :out-enc :bytes))  
  
;; working directory  
(println (with-sh-dir "/tmp" (sh "ls" "-l") (sh "pwd"))))
```

```
(println (sh "pwd" :dir "/tmp"))

;; throw an exception if the shell's subprocess exit code is not equal to 0
(println (with-sh-throw (sh "ls" "-l")))

(println (sh "ls" "-l" :throw-ex true))

;; windows
(println (sh "cmd" "/c dir 1>&2"))
```

SEE ALSO

[with-sh-throw](#)

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

[with-sh-dir](#)

Sets the directory for use with sh, see sh for details.

[with-sh-env](#)

Sets the environment for use with sh.

top

sh/open

```
(sh/open f)
```

Opens a *file* or an *URL* with the associated platform specific application.

Uses the OS commands:

- *MacOS*: `/usr/bin/open f`
- *Windows*: `cmd /C start f`
- *Linux*: `/usr/bin/xdg-open f`

Note: `sh/open` can only be run from a REPL!

```
(sh/open "sample.pdf")
```

```
(sh/open "https://github.com/jlangch/venice")
```

top

sh/pwd

```
(sh/pwd)
```

Returns the current working directory.

Note:

You can't change the current working directory of the Java VM but if you were to launch another process using (sh & args) you can specify the working directory for the new spawned process.

```
(sh/pwd)
```

SEE ALSO

sh

Launches a new sub-process.

[top](#)

shell/alive?

```
(alive? pid)
(alive? process-handle)
```

Returns true if the process represented by a PID or a process handle is alive otherwise false.

Requires Java 9+.

```
(shell/alive? 4556)
```

SEE ALSO

[shell/pid](#)

Without argument returns the PID (type long) of this process. With a process-handle (:java.lang.ProcessHandle) returns the PID for ...

shell/process-info

(process-info pid)

(process-info process-handle)

Returns the process info for a process represented by a PID or a process handle.

The process info is a map with the keys:

:pid	the PID
:alive	true if the process is alive else false
:arguments	the list of strings of the arguments of the process
:command	the executable pathname of the process
:command-line	the command line of the process
:start-time	the start time of the process
:total-cpu-millis	the total cputime accumulated of the process
:user	the user of the process.

Requires Java 9+.

```
(shell/process-info 4556)
```

```
;; find the PID of the ArangoDB process
;; like: pgrep -lf ArangoDB3 | cut -d ' ' -f 1
(->> (shell/processes)
  (map shell/process-info

Returns a snapshot of all processes visible to the current process. Returns a list of process infos for the processes.

top

shell/processes-info

(processes-info)

Returns a snapshot of all processes visible to the current process. Returns a list of process infos for the processes.

The process info is a map with the keys:

:pid	the PID
:alive	true if the process is alive else false
:arguments	the list of strings of the arguments of the process
:command	the executable pathname of the process
:command-line	the command line of the process
:start-time	the start time of the process
:total-cpu-millis	the total cputime accumulated of the process
:user	the user of the process.

Requires Java 9+.

([shell/processes-info](#))

```
;; find the PID of the ArangoDB process
;; like: pgrep -lf ArangoDB3 | cut -d ' ' -f 1
(->> (shell/processes-info)
  (filter #(str/contains? (:command-line %) "ArangoDB3"))
  (map :pid))
```

SEE ALSO

[shell/processes](#)

Returns a snapshot of all processes visible to the current process. Returns a list of `java.lang.ProcessHandle` for the processes.

shell/wait-for-process-exit

```
(wait-for-process-exit pid timeout)
(wait-for-process-exit process-handle timeout)
```

Waits until the process with the pid exits. Waits max timeout seconds. Returns nil if the process exits before reaching the timeout, else the pid is returned. Accepts a PID or a process handle (:java.lang.ProcessHandle).

Requires Java 9+.

```
(shell/wait-for-process-exit 12345 20)
```

SEE ALSO

[shell/pid](#)

Without argument returns the PID (type long) of this process. With a process-handle (:java.lang.ProcessHandle) returns the PID for ...

[shell/kill](#)

Requests the process to be killed. Returns true if the process is killed and false if the process stays alive. Returns nil if the process ...

[shell/processes](#)

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

shuffle

```
(shuffle coll)
```

Returns a collection of the items in coll in random order.

```
(shuffle '(1 2 3 4 5 6))
=> (2 5 6 3 1 4)
```

```
(shuffle [1 2 3 4 5 6])
=> [3 1 5 2 4 6]
```

```
(shuffle "abcdef")
=> (#\e #\b #\f #\c #\a #\d)
```

shutdown-agents

```
(shutdown-agents)
```

Initiates a shutdown of the thread pools that back the agent system. Running actions will complete, but no new actions will be accepted

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents))
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

shutdown-agents?

`(shutdown-agents?)`

Returns true if the thread-pool that backs the agents is shut down

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (sleep 300)
  (shutdown-agents?))
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

shutdown-hook

`(shutdown-hook f)`

Registers the function `f` as a JVM shutdown hook.

Shutdown hooks can be tested in a REPL:

- start a REPL
- run `(shutdown-hook (fn [] (println "SHUTDOWN") (sleep 3000)))`
- exit the REPL with `!exit`

The sandbox is active within the shutdown hook:

- start a REPL
- run `!sandbox customized`
- run `!sandbox add-rule blacklist:venice:func:+`
- run `(shutdown-hook (fn [] (try (+ 1 2) (catch :SecurityException ex (println ex) (sleep 3000)))))`
- exit the REPL with `!exit`

```
(shutdown-hook (fn [] (println "shutdown")))
```

[top](#)

sleep

```
(sleep n)
(sleep n time-unit)
```

Sleep for the time n. The default time unit is milliseconds.

Time unit is one of :milliseconds, :seconds, :minutes, :hours, or :days or their abbreviations :msec, :ms, :sec, :s, :min, :hr, :h, :d.

```
(sleep 30)
=> nil

(sleep 30 :milliseconds)
=> nil

(sleep 30 :msec)
=> nil

(sleep 5 :seconds)
=> nil

(sleep 5 :sec)
=> nil
```

[top](#)

some

```
(some pred coll)
```

Returns the first logical true value of (pred x) for any x in coll, else nil.

Stops processing the collection if the first value is found that meets the predicate.

```
(some even? '(1 2 3 4))
=> true

(some even? '(1 3 5 7))
=> nil

(some #{5} [1 2 3 4 5])
=> 5

(some #(<= 5 %) [1 2 3 4 5])
=> true

(some #(if (even? %) %) [1 2 3 4])
=> 2
```

[top](#)

some->

```
(some-> expr & forms)
```

When expr is not nil, threads it into the first form (via `->`), and when that result is not nil, through the next etc.

```
(some-> {:y 3 :x 5}
        :y
        (- 2))
=> 1
```

```
(some-> {:y 3 :x 5}
        :z
        (- 2))
=> nil
```

SEE ALSO

[some->>](#)

When `expr` is not `nil`, threads it into the first form (via `->`), and when that result is not `nil`, through the next etc.

[top](#)

some->>

```
(some->> expr & forms)
```

When `expr` is not `nil`, threads it into the first form (via `->>`), and when that result is not `nil`, through the next etc.

```
(some->> {:y 3 :x 5}
        :y
        (- 2))
=> -1
```

```
(some->> {:y 3 :x 5}
        :z
        (- 2))
=> nil
```

SEE ALSO

[some->](#)

When `expr` is not `nil`, threads it into the first form (via `->`), and when that result is not `nil`, through the next etc.

[top](#)

some?

```
(some? x)
```

Returns true if `x` is not `nil`, false otherwise

```
(some? nil)
=> false
```

```
(some? 0)
=> true
```

```
(some? 4.0)
=> true
```

```
(some? false)
=> true
```

```
(some? [])
=> true
```

```
(some? {})
=> true
```

SEE ALSO

[nil?](#)

Returns true if x is nil, false otherwise

[top](#)

sort

```
(sort coll)
(sort comparefn coll)
```

Returns a sorted list of the items in coll. If no compare function comparefn is supplied, uses the natural compare. The compare function takes two arguments and returns -1, 0, or 1

```
(sort [3 2 5 4 1 6])
=> [1 2 3 4 5 6]
```

```
(sort compare [3 2 5 4 1 6])
=> [1 2 3 4 5 6]
```

```
; reversed
(sort (comp - compare) [3 2 5 4 1 6])
=> [6 5 4 3 2 1]
```

```
(sort {:c 3 :a 1 :b 2})
=> ([:a 1] [:b 2] [:c 3])
```

SEE ALSO

[sort-by](#)

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, ...

[top](#)

sort-by

```
(sort-by keyfn coll)
(sort-by keyfn compfn coll)
```

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, uses compare.

To sort by multiple values use `juxt`, see the examples below.

```

(sort-by :id [{:id 2 :name "Smith"} {:id 1 :name "Jones"} ])
=> [{:name "Jones" :id 1} {:name "Smith" :id 2}]

(sort-by count ["aaa" "bb" "c"])
=> ["c" "bb" "aaa"]

; reversed
(sort-by count (comp - compare) ["aaa" "bb" "c"])
=> ["aaa" "bb" "c"]

(sort-by first [[1 2] [3 4] [2 3]])
=> [[1 2] [2 3] [3 4]]

; sort tuples by first value, and where first value is equal,
; sort by second value
(sort-by (juxt first second) [[3 2] [1 3] [3 1] [1 2]])
=> [[1 2] [1 3] [3 1] [3 2]]

; reversed
(sort-by first (comp - compare) [[1 2] [3 4] [2 3]])
=> [[3 4] [2 3] [1 2]]

(sort-by :rank [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 1} {:rank 2} {:rank 3}]

; reversed
(sort-by :rank (comp - compare) [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 3} {:rank 2} {:rank 1}]

; sort entries in a map by value
(sort-by val {:foo 7, :bar 3, :baz 5})
=> ([:bar 3] [:baz 5] [:foo 7])

; sort by :foo, and where :foo is equal, sort by :bar
(do
  (def x [ {:foo 2 :bar 11}
            {:foo 1 :bar 99}
            {:foo 2 :bar 55}
            {:foo 1 :bar 77} ])
    (sort-by (juxt :foo :bar) x))
=> [{:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11} {:foo 2 :bar 55}]

; sort by a given key order
(do
  (def x [ {:foo 2 :bar 11}
            {:foo 1 :bar 99}
            {:foo 2 :bar 55}
            {:foo 1 :bar 77} ])
    (def order [55 77 99 11])
    (sort-by #((into {}) (map-indexed (fn [i e] [e i]) order)) (:bar %))
      x))
=> [{:foo 2 :bar 55} {:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11}]

```

SEE ALSO

[sort](#)

Returns a sorted list of the items in coll. If no compare function `comparefn` is supplied, uses the natural compare. The compare function ...

sorted

```
(sorted cmp coll)
```

Returns a sorted collection using the compare function `cmp`. The compare function takes two arguments and returns -1, 0, or 1. Returns a stateful transducer when no collection is provided.

```
(sorted compare [4 2 1 5 6 3])  
=> [1 2 3 4 5 6]
```

```
(sorted (comp (partial * -1) compare) [4 2 1 5 6 3])  
=> [6 5 4 3 2 1]
```

[top](#)

sorted-map

```
(sorted-map & keyvals)  
(sorted-map map)
```

Creates a new sorted map containing the items.

```
(sorted-map :a 1 :b 2)  
=> {:a 1 :b 2}
```

```
(sorted-map (hash-map :a 1 :b 2))  
=> {:a 1 :b 2}
```

[top](#)

sorted-map?

```
(sorted-map? obj)
```

Returns true if `obj` is a sorted map

```
(sorted-map? (sorted-map :a 1 :b 2))  
=> true
```

[top](#)

sorted-set

```
(sorted-set & items)
```

Creates a new sorted-set containing the items.

```
(sorted-set)  
=> #{} 
```

```
(sorted-set nil)
=> #{nil}

(sorted-set 1)
=> #{1}

(sorted-set 6 2 4)
=> #{2 4 6}

(str (sorted-set [2 3] [1 2]))
=> "#[[1 2] [2 3]]"
```

[top](#)

sorted-set?

```
(sorted-set? obj)
```

Returns true if obj is a sorted-set

```
(sorted-set? (sorted-set 1))
=> true
```

[top](#)

split-at

```
(split-at n coll)
```

Returns a vector of [(take n coll) (drop n coll)]

```
(split-at 2 [1 2 3 4 5])
=> [(1 2) (3 4 5)]
```

```
(split-at 3 [1 2])
=> [(1 2) ()]
```

[top](#)

split-with

```
(split-with pred coll)
```

Splits the collection at the first false/nil predicate result in a vector with two lists

```
(split-with odd? [1 3 5 6 7 9])
=> [(1 3 5) (6 7 9)]
```

```
(split-with odd? [1 3 5])
=> [(1 3 5) ()]
```

```
(split-with odd? [2 4 6])  
=> [()] (2 4 6)]
```

[top](#)

sqrt

(sqrt x)

Square root of x

```
(sqrt 10)  
=> 3.1622776601683795
```

```
(sqrt 10I)  
=> 3.1622776601683795
```

```
(sqrt 10.23)

```

SEE ALSO

[sqrt](#)

stack

(stack)

Creates a new mutable threadsafe stack.

```
(let [s (stack)]
  (push! s 1)
  (push! s 2)
  (push! s 3))
=> (3 2 1)
```

SEE ALSO

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[pop!](#)

Pops an item from a stack.

[push!](#)

Pushes an item to a stack.

[empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[into!](#)

Adds all of the items of 'from' conjoined to the mutable 'to' collection

[conj!](#)

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

[stack?](#)

Returns true if coll is a stack

stack?

(stack? coll)

Returns true if coll is a stack

```
(stack? (stack))
=> true
```

stacktrace

```
(stacktrace ex)
```

Returns the stacktrace of a java exception

```
(println (stacktrace (. :VncException :new (str "test"))))
```

[top](#)

str

```
(str & xs)
```

With no args, returns the empty string. With one arg x, returns x.toString(). (str nil) returns the empty string. With more than one arg, returns the concatenation of the str values of the args.

```
(str)  
=> ""
```

```
(str 1 2 3)  
=> "123"
```

```
(str +)  
=> "+"
```

```
(str [1 2 3])  
=> "[1 2 3]"
```

```
(str "total " 100)  
=> "total 100"
```

```
(str #\h #\i)  
=> "hi"
```

SEE ALSO

[pr-str](#)

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of ...

[top](#)

str/align

```
(str/align width align overflow text)
```

Aligns a text within a string of width characters.

align: :left, :center, :right

overflow: :newline :clip-left, :clip-right, :ellipsis-left, :ellipsis-right

```
(str/align 6 :left :clip-right "abc")
=> "abc  "

(str/align 6 :center :clip-right "abc")
=> "  abc  "

(str/align 6 :right :clip-right "abc")
=> "    abc"

(str/align 6 :left :clip-left "abcdefgh")
=> "cdefgh"

(str/align 6 :left :ellipsis-left "abcdefgh")
=> "...defgh"

(str/align 6 :left :ellipsis-right "abcdefgh")
=> "abcde..."
```

SEE ALSO

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

str/blank?

```
(str/blank? s)
```

True if s is nil, empty, or contains only whitespace.

```
(str/blank? nil)
=> true
```

```
(str/blank? "")
=> true
```

```
(str/blank? " ")
=> true
```

```
(str/blank? "abc")
=> false
```

SEE ALSO

[str/not-blank?](#)

True if s contains at least one non whitespace char.

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[not-empty?](#)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

`nil?`

Returns true if x is nil, false otherwise

[top](#)

str/butlast

`(str/butlast s)`

Returns a possibly empty string of the characters without the last.

```
(str/butlast "abcdef")  
=> "abcde"
```

[top](#)

str/butnlast

`(str/butnlast s n)`

Returns a possibly empty string of the characters without the n last characters.

```
(str/butnlast "abcdef" 3)  
=> "abc"
```

[top](#)

str/bytebuf-to-hex

`(str/bytebuf-to-hex data)`
`(str/bytebuf-to-hex data :upper)`

Converts byte data to a hex string using the hexadecimal digits: `0123456789abcdef` .
If the `:upper` options is passed the hex digits `0123456789ABCDEF` are used.

```
(str/bytebuf-to-hex (bytebuf [0 1 2 3 4 5 6]))  
=> "00010203040506"  
  
(str/bytebuf-to-hex (bytebuf [202 254]) :upper)  
=> "CAFE"
```

[top](#)

str/char?

`(str/char? s)`

Returns true if s is a char or a single char string.

```
(str/char? "x")  
=> true
```

```
(str/char? #\x)  
=> true
```

[top](#)

str/chars

```
(str/chars s)
```

Converts a string to a char list.

```
(str/chars "abcdef")  
=> (#\a #\b #\c #\d #\e #\f)
```

```
(str/join (str/chars "abcdef"))  
=> "abcdef"
```

[top](#)

str/contains?

```
(str/contains? s substr)
```

True if s contains with substr.

```
(str/contains? "abc" "ab")  
=> true
```

```
(str/contains? "abc" #\b)  
=> true
```

[top](#)

str/cr-lf

```
(str/cr-lf s mode)
```

Convert a text to use LF or CR-LF.

```
(str/cr-lf "line1  
line2  
line3" :cr-lf)
```

```
(str/cr-lf "line1  
line2  
line3" :lf)
```

[top](#)

str/decode-base64

```
(str/decode-base64 s)
```

Base64 decode.

```
(str/decode-base64 (str/encode-base64 (bytebuf [0 1 2 3 4 5 6])))  
=> [0 1 2 3 4 5 6]
```

[top](#)

str/decode-url

```
(str/decode-url s)
```

URL decode.

```
(str/decode-url "The+string+%C3%BC%40foo-bar")  
=> "The string ü@foo-bar"
```

[top](#)

str/digit?

```
(str/digit? s)
```

True if s is a char and the char is a digit.

Defined by Java Character.isDigit(ch).

```
(str/digit? #\8)  
=> true
```

```
(str/digit? "8")  
=> false
```

SEE ALSO

[str/letter?](#)

True if s is a char and the char is a letter.

[str/hexdigit?](#)

True if s is a char and the char is a hex digit.

[top](#)

str/double-quote

```
(str/double-quote str)
```

Double quotes a string.

```
(str/double-quote "abc")  
=> "\"abc\""
```

```
(str/double-quote "")  
=> "\"\""
```

[top](#)

str/double-quoted?

```
(str/double-quoted? str)
```

Returns true if the string is double quoted.

```
(str/double-quoted? "\"abc\"")  
=> true
```

[top](#)

str/double-unquote

```
(str/double-unquote str)
```

Unquotes a double quoted string.

```
(str/double-unquote "\"abc\"")  
=> "abc"
```

```
(str/double-unquote "\"\"")  
=> ""
```

```
(str/double-unquote nil)  
=> nil
```

[top](#)

str/encode-base64

```
(str/encode-base64 data)
```

Base64 encode.

```
(str/encode-base64 (bytebuf [0 1 2 3 4 5 6]))  
=> "AAECAwQFBg=="
```

[top](#)

str/encode-url

```
(str/encode-url s)
```

URL encode.

```
(str/encode-url "The string ü@foo-bar")  
=> "The+string+%C3%BC%40foo-bar"
```

[top](#)

str/ends-with?

```
(str/ends-with? s substr)
```

True if s ends with substr.

```
(str/ends-with? "abc" "bc")  
=> true
```

[top](#)

str/equals-ignore-case?

```
(str/equals-ignore-case? s1 s2)
```

Compares two strings ignoring case. True if both are equal.

```
(str/equals-ignore-case? "abc" "abC")  
=> true
```

[top](#)

str/escape-html

```
(str/escape-html s)
```

HTML escape. Escapes `&`, `<`, `>`, `"`, `'`, and the non blocking space `U+00A0`

```
(str/escape-html "1 2 3 & < > \" ' \u00A0")  
=> "1 2 3 &amp; &lt; &gt; &quot; &apos; "
```

[top](#)

str/escape-xml

```
(str/escape-xml s)
```

XML escape. Escapes `&`, `<`, `>`, `"`, `'`

```
(str/escape-xml "1 2 3 & < > \" '\")
=> "1 2 3 &amp; &lt; &gt; &quot; &apos;"
```

[top](#)

str/expand

```
(str/expand s len fill mode*)
```

Expands a string to the max length len. Fills up with the fillstring if the string needs to be expanded. The fill string is added to the start or end of the string depending on the mode :start, :end. The mode defaults to :end

```
(str/expand "abcdefghij" 8 ".")
=> "abcdefghij"
```

```
(str/expand "abcdefghij" 20 ".")
=> "abcdefghij....."
```

```
(str/expand "abcdefghij" 20 "." :start)
=> ".....abcdefghij"
```

```
(str/expand "abcdefghij" 20 "." :end)
=> "abcdefghij....."
```

```
(str/expand "abcdefghij" 30 "1234" :start)
=> "12341234123412341234abcdefghij"
```

```
(str/expand "abcdefghij" 30 "1234" :end)
=> "abcdefghij12341234123412341234"
```

[top](#)

str/format

```
(str/format format args*)
(str/format locale format args*)
```

Returns a formatted string using the specified format string and arguments.
Venice uses the Java format syntax.

JavaDoc: [Format Syntax](#)

```
(str/format "value: %.4f" 1.45)
=> "value: 1.4500"
```

```
(str/format (. :java.util.Locale :new "de" "DE") "value: %.4f" 1.45)
=> "value: 1,4500"
```

```
(str/format (. :java.util.Locale :GERMANY) "value: %.4f" 1.45)
=> "value: 1,4500"
```

[top](#)

str/letter?

```
(str/letter? s)
```

True if s is a char and the char is a letter.

Defined by Java Character.isLetter(ch).

```
(str/letter? #\x)
=> true
```

[top](#)

str/levenshtein

```
(str/levenshtein s1 s2)
```

Returns the *Levenshtein* distance of two strings.

The *Damerau-Levenshtein* algorithm is an extension to the *Levenshtein* algorithm which solves the edit distance problem between a source string and a target string with the following operations:

- Character Insertion
- Character Deletion
- Character Replacement
- Adjacent Character Swap

Note that the adjacent character swap operation is an edit that may be applied when two adjacent characters in the source string match two adjacent characters in the target string, but in reverse order, rather than a general allowance for adjacent character swaps.

This implementation allows the client to specify the costs of the various edit operations with the restriction that the cost of two swap operations must not be less than the cost of a delete operation followed by an insert operation. This restriction is required to preclude two swaps involving the same character being required for optimality which, in turn, enables a fast dynamic programming solution.

The cost of the *Damerau-Levenshtein* algorithm is $O(n*m)$ where n is the length of the source string and m is the length of the target string. This implementation consumes $O(n*m)$ space.

```
(str/levenshtein "Tier" "Tor")
```

```
=> 2
```

```
(str/levenshtein "Tier" "tor")
```

```
=> 3
```

[top](#)

```

[top](#)

str/lower-case

```
(str/lower-case s)  
(str/lower-case locale s)
```

Converts s to lowercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/lower-case "aBcDeF")  
=> "abcdef"
```

```
(str/lower-case #\A)  
=> #\a
```

```
(str/lower-case (. :java.util.Locale :new "de" "DE") "aBcDeF")  
=> "abcdef"
```

```
(str/lower-case (. :java.util.Locale :GERMANY) "aBcDeF")  
=> "abcdef"
```

```
(str/lower-case (. :java.util.Locale :new "de" "CH") "aBcDeF")  
=> "abcdef"
```

```
(str/lower-case [ "de" ] "aBcDeF")  
=> "abcdef"
```

```
(str/lower-case [ "de" "DE" ] "aBcDeF")  
=> "abcdef"
```

```
(str/lower-case [ "de" "DE" ] "aBcDeF")  
=> "abcdef"
```

SEE ALSO

[str/upper-case](#)

Converts s to uppercase.

[top](#)

str/lower-case?

```
(str/lower-case? s)
```

True if s is a char and the char is a lower case char.

Defined by Java Character.isLowerCase(ch).

```
(str/lower-case? #\x)
```

```
=> true
```

```
(str/lower-case? #\X)
```

```
=> false
```

```

str/nlast

```
(str/nlast s n)
```

Returns a string of the n last characters of s.

```
(str/nlast "abcdef" 2)
```

```
=> "ef"
```

```
(str/nlast "abcdef" 10)
```

```
=> "abcdef"
```

```
(str/nlast "abcdef" 0)
```

```
=> ""
```

str/normalize-utf

```
(str/normalize-utf text form)
```

Normalizes an UTF string.

On MacOS umlauts like ä are just encoded as 'a' plus the combining dieresis character. Therefore an 'ä' (\u00FC) and an 'ä' (a + \u0308) from a MacOS filename are different!

This function normalizes UTF strings to simplify processing.

The *form* argument is one of:

- :NFD Canonical decomposition
- :NFC Canonical decomposition, followed by canonical composition
- :NFKD Compatibility decomposition
- :NFKC Compatibility decomposition, followed by canonical composition

```
(load-module :hexdump ['hexdump :as 'h])
```

```
;; Even though printed the same these two strings are NOT equal
;; 1: "ü"           prints to "ü"
;; 2: "u\u0308"     prints to "ü"
```

«If it looks like a duck and quacks like a duck, then it probably is a duck» is definitely WRONG here!

```
;; ü represented as u with combining dieresis char: \u0308
(println "u\u0308")
;; => u` (actually prints as ü on a terminal)
```

```
;; ü: \u00FC
(println "\u00FC")
;; => ü
```

```
;; u with combining dieresis character
(h/dump (bytebuf-from-string "u\u0308"))
;; 00000000: 75cc 88                                u..
```

```
;; ü
(h/dump (bytebuf-from-string "ü"))
;; 00000000: c3bc                                ..
```

```
;; ü: \u00FC
(h/dump (bytebuf-from-string "\u00FC"))
;; 00000000: c3bc                                ..
```

```
;; u with combined dieresis character normalized to get a standard ü
(h/dump (bytebuf-from-string (str/normalize-utf "u\u0308" :NFC)))
;; 00000000: c3bc                                ..
```

```
;; the reverse (decomposition)
(h/dump (bytebuf-from-string (str/normalize-utf "\u00FC" :NFD)))
;; 00000000: 75cc 88                                u..
```

SEE ALSO

[io/file-normalize-utf](#)

Normalizes the UTF string of a file path.

str/not-blank?

```
(str/not-blank? s)
```

True if s contains at least one non whitespace char.

```
(str/not-blank? "abc")  
=> true
```

```
(str/not-blank? " a ")  
=> true
```

```
(str/not-blank? nil)  
=> false
```

```
(str/not-blank? "")  
=> false
```

```
(str/not-blank? " ")  
=> false
```

SEE ALSO

[str/blank?](#)

True if s is nil, empty, or contains only whitespace.

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[not-empty?](#)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

[nil?](#)

Returns true if x is nil, false otherwise

str/nrest

```
(str/nrest s n)
```

Returns a possibly empty string of the characters after the n first characters.

```
(str/nrest "abcdef" 3)  
=> "def"
```

str/pos

```
(str/pos s pos)
```

Returns the 0 based row/column position within a string based on absolute character position. Returns a map with the keys 'row' and 'col'.

Note: CR & LF count together as one each regarding the absolute position.

```
(str/pos "abcdefghij" 4)
=> {:col 4 :row 0}
```

```
(str/pos "ab
cdefghij" 6)
=> {:col 3 :row 1}
```

[top](#)

str/quote

```
(str/quote str q)
(str/quote str start end)
```

Quotes a string.

```
(str/quote "abc" "-")
=> "-abc-"
```

```
(str/quote "abc" "<" ">")
=> "<abc>"
```

[top](#)

str/quoted?

```
(str/quoted? str q)
(str/quoted? str start end)
```

Returns true if the string is quoted.

```
(str/quoted? "-abc-" "-")
=> true
```

```
(str/quoted? "<abc>" "<" ">")
=> true
```

[top](#)

str/repeat

```
(str/repeat s n)
(str/repeat s n sep)
```

Repeats s n times with an optional separator.

```
(str/repeat "abc" 0)
=> ""
```

```
(str/repeat "abc" 3)
=> "abcabcabc"

(str/repeat "abc" 3 "-")
=> "abc-abc-abc"

[str/split-lines](#)

Splits *s* into lines.

[top](#)

str/split-columns

```
(str/split-columns s cols)
```

Splits a string into columns. The columns are given by their start positions.

```
(str/split-columns "1abc 2d 3gh" [0 6 12])
=> ("1abc" "2d" "3gh")
```

SEE ALSO

[str/split](#)

Splits string on a regular expression. Optional argument *limit* is the maximum number of splits. Returns a list of the splits.

[top](#)

str/split-lines

```
(str/split-lines s)
```

Splits `s` into lines.

```
(str/split-lines "line1  
line2  
line3")  
=> ("line1" "line2" "line3")
```

SEE ALSO

[str/split](#)

Splits string on a regular expression. Optional argument `limit` is the maximum number of splits. Returns a list of the splits.

[io/slurp-lines](#)

Read all lines from `f`.

[top](#)

str/starts-with?

```
(str/starts-with? s substr)
```

True if `s` starts with `substr`.

```
(str/starts-with? "abc" "ab")  
=> true
```

[top](#)

str/strip-end

```
(str/strip-end s substr)
```

Removes a `substr` only if it is at the end of a `s`, otherwise returns `s`.

```
(str/strip-end "abcdef" "def")  
=> "abc"
```

```
(str/strip-end "abcdef" "abc")  
=> "abcdef"
```

[top](#)

str/strip-indent

```
(str/strip-indent s)
```

Strip the indent of a multi-line string. The first line's leading whitespaces define the indent.

```
(str/strip-indent "  line1
  line2
  line3")
=> "line1\n  line2\n  line3"
```

[top](#)

str/strip-margin

```
(str/strip-margin s)
```

Strips leading whitespaces upto and including the margin '|' from each line in a multi-line string.

```
(str/strip-margin "line1
|  line2
|  line3")
=> "line1\n  line2\n  line3"
```

(str/subs s start end)
```

Returns the substring of s beginning at start inclusive, and ending at end (defaults to length of string), exclusive.

```
(str/subs "abcdef" 2)
=> "cdef"
```

```
(str/subs "abcdef" 2 5)
=> "cde"
```

[top](#)

str/trim

```
(str/trim s)
```

Trims leading and trailing whitespaces from s.

```
(str/trim " abc ")  
=> "abc"
```

SEE ALSO

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

str/trim-left

```
(str/trim-left s)
```

Trims leading whitespaces from s.

```
(str/trim-left " abc ")  
=> "abc "
```

SEE ALSO

[str/trim-right](#)

Trims trailing whitespaces from s.

[str/trim](#)

Trims leading and trailing whitespaces from s.

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[top](#)

str/trim-right

```
(str/trim-right s)
```

Trims trailing whitespaces from s.

```
(str/trim-right " abc ")  
=> " abc"
```

SEE ALSO

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim](#)

Trims leading and trailing whitespaces from s.

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[top](#)

str/trim-to-nil

```
(str/trim-to-nil s)
```

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

```
(str/trim-to-nil "")  
=> nil
```

```
(str/trim-to-nil "  ")  
=> nil
```

```
(str/trim-to-nil nil)  
=> nil
```

```
(str/trim-to-nil " abc ")  
=> "abc"
```

SEE ALSO

[str/trim](#)

Trims leading and trailing whitespaces from s.

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

str/truncate

```
(str/truncate s maxlen marker mode*)
```

Truncates a string to the max length maxlen and adds the marker if the string needs to be truncated. The marker is added to the start, middle, or end of the string depending on the mode :start, :middle, :end. The mode defaults to :end

```
(str/truncate "abcdefghij" 20 "...")  
=> "abcdefghij"
```

```
(str/truncate "abcdefghij" 9 "...")  
=> "abcdef..."
```

```
(str/truncate "abcdefghij" 4 "...")
=> "a..."

(str/truncate "abcdefghij" 7 "...":start)
=> "...ghij"

(str/truncate "abcdefghij" 7 "...":middle)
=> "ab...ij"

(str/truncate "abcdefghij" 7 "...":end)
=> "abcd..."
```

[top](#)

str/upper-case

```
(str/upper-case s)
(str/upper-case locale s)
```

Converts s to uppercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/upper-case "aBcDeF")
=> "ABCDEF"

(str/upper-case #\a)
=> #\A

(str/upper-case (. :java.util.Locale :new "de" "DE") "aBcDeF")
=> "ABCDEF"

(str/upper-case (. :java.util.Locale :GERMANY) "aBcDeF")
=> "ABCDEF"

(str/upper-case (. :java.util.Locale :new "de" "CH") "aBcDeF")
=> "ABCDEF"

(str/upper-case [ "de"] "aBcDeF")
=> "ABCDEF"

(str/upper-case [ "de" "DE"] "aBcDeF")
=> "ABCDEF"

(str/upper-case [ "de" "DE"] "aBcDeF")
=> "ABCDEF"
```

SEE ALSO

[str/lower-case](#)

Converts s to lowercase.

[top](#)

str/upper-case?

```
(str/upper-case? s)
```

True if s is a char and the char is an upper case char.

Defined by Java Character.toUpperCase(ch).

```
(str/upper-case? #\x)  
=> false
```

```
(str/upper-case? #\X)  
=> true
```

```
(str/upper-case? #\8)  
=> false
```

[top](#)

str/valid-email-addr?

```
(str/valid-email-addr? e)
```

Returns true if e is a valid email address according to RFC5322, else returns false

```
(str/valid-email-addr? "user@domain.com")  
=> true
```

```
(str/valid-email-addr? "user@domain.co.in")  
=> true
```

```
(str/valid-email-addr? "user.name@domain.com")  
=> true
```

```
(str/valid-email-addr? "user_name@domain.com")  
=> true
```

```
(str/valid-email-addr? "username@yahoo.corporate.in")  
=> true
```

[top](#)

str/whitespace?

```
(str/whitespace? s)
```

True if s is char and the char is a whitespace.

Defined by Java Character.isWhitespace(ch).

```
(str/whitespace? #\space)  
=> true
```

str/wrap

```
(str/wrap text & options)
```

Wraps ascii text to lines with a length of maxlen characters .

Options:

:maxlen n the max len of line (default 80)

:line-wrap controls the line wrap

```
{
  anywhere,
  :break-
  word}
```

```
(-> (str/lorem-ipsum :paragraphs 1)
    (str/wrap :maxlen 80 :line-wrap :break-word))
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis\nturpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat\naliquet, lectus diam fringilla velit, finibus eleifend

fringilla ligula quis interdum hendrerit. Etiam at massa tempor,\nfacilisis lacus placerat, congue erat."
```

string-array

```
(string-array coll)
```

```
(string-array len)
```

```
(string-array len init-val)
```

Returns an array of Java strings containing the contents of coll or returns an array with the given length and optional init value

```
(string-array '("1" "2" "3"))
```

```
=> [1, 2, 3]
```

```
(string-array 10)
```

```
=> [nil, nil, nil, nil, nil, nil, nil, nil, nil, nil]
```

```
(string-array 10 "42")
```

```
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

string?

```
(string? x)
```

Returns true if x is a string

```
(string? "abc")
=> true

(string? 1)
=> false

(string? nil)
=> false
```

[top](#)

sublist

```
(sublist l start) (sublist l start end)
```

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

`sublist` accepts a lazy-seq if both start and end is given.

```
(sublist '(1 2 3 4 5 6) 2)
=> (3 4 5 6)
```

```
(sublist '(1 2 3 4 5 6) 2 3)
=> (3)
```

```
(doall (sublist (lazy-seq 1 inc) 3 7))
=> (4 5 6 7)
```

SEE ALSO

[subvec](#)

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

[top](#)

subset?

```
(subset? set1 set2)
```

Return true if set1 is a subset of set2

```
(subset? #{2 3} #{1 2 3 4})
=> true
```

```
(subset? #{2 5} #{1 2 3 4})
=> false
```

SEE ALSO

[set](#)

Creates a new set containing the items.

[superset?](#)

Return true if set1 is a superset of set2

union

Return a set that is the union of the input sets

difference

Return a set that is the first set without elements of the remaining sets

intersection

Return a set that is the intersection of the input sets

top

subvec

```
(subvec v start) (subvec v start end)
```

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

```
(subvec [1 2 3 4 5 6] 2)
=> [3 4 5 6]
```

```
(subvec [1 2 3 4 5 6] 2 3)
=> [3]
```

SEE ALSO

sublist

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

top

supers

```
(supers class)
```

Returns the immediate and indirect superclasses and interfaces of class, if any.

```
(supers :java.util.ArrayList)
=> (:java.util.AbstractList :java.util.AbstractCollection :java.util.List :java.util.Collection :java.lang.
Iterable)
```

top

superset?

```
(superset? set1 set2)
```

Return true if set1 is a superset of set2

```
(superset? #{1 2 3 4} #{2 3} )
=> true
```

```
(superset? #{1 2 3 4} #{2 5})
=> false
```

SEE ALSO

[set](#)

Creates a new set containing the items.

[subset?](#)

Return true if set1 is a subset of set2

[union](#)

Return a set that is the union of the input sets

[difference](#)

Return a set that is the first set without elements of the remaining sets

[intersection](#)

Return a set that is the intersection of the input sets

[top](#)

supertype

```
(supertype x)
```

Returns the super type of x.

```
(supertype 5)  
=> :core/number
```

```
(supertype [1 2])  
=> :core/sequence
```

```
(supertype (. :java.math.BigInteger :valueOf 100))  
=> :java.lang.Number
```

SEE ALSO

[type](#)

Returns the type of x.

[supertypes](#)

Returns the super types of x.

[instance-of?](#)

Returns true if x is an instance of the given type

[top](#)

supertypes

```
(supertypes x)
```

Returns the super types of x.

```
(supertypes 5)  
=> (:core/number :core/val)
```

```
(supertypes [1 2])
=> (:core/sequence :core/collection :core/val)

(supertypes (. :java.math.BigInteger :valueOf 100))
=> (:java.lang.Number :java.lang.Object)
```

SEE ALSO

[type](#)

Returns the type of x.

[supertype](#)

Returns the super type of x.

[instance-of?](#)

Returns true if x is an instance of the given type

[top](#)

swap!

```
(swap! box f & args)
```

Atomically swaps the value of an atom or a volatile to be: `(apply f current-value-of-box args)` . Note that f may be called multiple times, and thus should be free of side effects. Returns the value that was swapped in.

```
(do
  (def counter (atom 0))
  (swap! counter inc))
=> 1

(do
  (def counter (atom 0))
  (swap! counter inc)
  (swap! counter + 1)
  (swap! counter #(inc %))
  (swap! counter (fn [x] (inc x)))
  @counter)
=> 4

(do
  (def fruits (atom ()))
  (swap! fruits conj :apple)
  (swap! fruits conj :mango)
  @fruits)
=> (:apple :mango)

(do
  (def counter (volatile 0))
  (swap! counter (partial + 6))
  @counter)
=> 6
```

SEE ALSO

[swap-vals!](#)

Atomically swaps the value of an atom to be: `(apply f current-value-of-atom args)`. Note that f may be called multiple times, and thus ...

[reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

[compare-and-set!](#)

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

[atom](#)

Creates an atom with the initial value x.

[volatile](#)

Creates a volatile with the initial value x

[top](#)

swap-vals!

```
(swap-vals! atom f & args)
```

Atomically swaps the value of an atom to be: `(apply f current-value-of-atom args)`. Note that f may be called multiple times, and thus should be free of side effects. Returns [old new], the value of the atom before and after the swap.

```
(do
  (def queue (atom '(1 2 3)))
  (swap-vals! queue pop))
=> [(1 2 3) (2 3)]
```

SEE ALSO

[swap!](#)

Atomically swaps the value of an atom or a volatile to be: `(apply f current-value-of-box args)`. Note that f may be called multiple ...

[reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

[compare-and-set!](#)

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

[atom](#)

Creates an atom with the initial value x.

[volatile](#)

Creates a volatile with the initial value x

[top](#)

symbol

```
(symbol name)
(symbol ns name)
```

Returns a symbol from the given name

```
(symbol "a")
=> a
```

```
(symbol "foo" "a")
=> foo/a
```

```
(symbol *ns* "a")
=> user/a

(symbol 'a)
=> a

((resolve (symbol "core" "+")) 1 2)
=> 3

(name str/reverse)
=> "reverse"

(namespace str/reverse)
=> "str"
```

SEE ALSO

[resolve](#)

Resolves a symbol.

[name](#)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[top](#)

symbol?

```
(symbol? x)
```

Returns true if x is a symbol

```
(symbol? 'a)
=> true
```

```
(symbol? (symbol "a"))
=> true
```

```
(symbol? nil)
=> false
```

```
(symbol? :a)
=> false
```

[top](#)

system-env

```
(system-env)
(system-env name)
(system-env name default-val)
```

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

Without arguments returns all system env variables authorized by the configured sandbox.

```
(system-env :SHELL)
=> "/bin/zsh"
```

```
(system-env :FOO "test")
=> "test"
```

```
(system-env "SHELL")
=> "/bin/zsh"
```

SEE ALSO

[system-prop](#)

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

[top](#)

system-exit-code

```
(system-exit-code code)
```

Defines the exit code that is used if the Java VM exits. Defaults to 0.

Note:

The exit code is only used when the Venice launcher has been used to run a script file, a command line script, a Venice app archive, or the REPL.

```
(system-exit-code 0)
```

[top](#)

system-prop

```
(system-prop)
(system-prop name)
(system-prop name default-val)
```

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

Without arguments returns all system properties authorized by the configured sandbox.

```
(system-prop :os.name)
=> "Mac OS X"
```

```
(system-prop :foo.org "abc")
=> "abc"
```

```
(system-prop "os.name")
=> "Mac OS X"
```

SEE ALSO

[system-env](#)

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

tail-pos

```
(tail-pos)
(tail-pos name)
```

Throws a `NotInTailPositionException` if the `expr` is not in tail position otherwise returns `nil`.

Definition:

The tail position is a position which an expression would return a value from. There are no more forms evaluated after the form in the tail position is evaluated.

```
;; in tail position
(do 1 (tail-pos))
=> nil

;; not in tail position
(do (tail-pos) 1)
=> NotInTailPositionException: Not in tail position
```

take

```
(take n coll)
```

Returns a collection of the first `n` items in `coll`, or all items if there are fewer than `n`.

Returns a stateful transducer when no collection is provided. Returns a lazy sequence if `coll` is a lazy sequence.

```
(take 3 [1 2 3 4 5])
=> [1 2 3]

(take 10 [1 2 3 4 5])
=> [1 2 3 4 5]

(doall (take 4 (repeat 3)))
=> (3 3 3 3)

(doall (take 10 (cycle (range 0 3))))
=> (0 1 2 0 1 2 0 1 2 0)
```

take!

```
(take! queue)
```

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

```
(let [q (queue)]
  (put! q 1))
```

```
(take! q)
q)
=> ()
```

SEE ALSO

[queue](#)

Creates a new mutable threadsafe bounded or unbounded queue.

[put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

[offer!](#)

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

[poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

take-last

```
(take-last n coll)
```

Return a sequence of the last n items in coll.

Returns a stateful transducer when no collection is provided.

```
(take-last 3 [1 2 3 4 5])
=> [3 4 5]
```

```
(take-last 10 [1 2 3 4 5])
=> [1 2 3 4 5]
```

[top](#)

take-while

```
(take-while predicate coll)
```

Returns a list of successive items from coll while (predicate item) returns logical true.

Returns a transducer when no collection is provided.

```
(take-while neg? [-2 -1 0 1 2 3])
=> [-2 -1]
```

[top](#)

tap>

```
(tap> x)
```

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

```
(do
  (add-tap prn)
  (tap> {:foo "hello" :bar 34.5}))
=> true
```

SEE ALSO

[add-tap](#)

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via tap>.

[remove-tap](#)

Remove f from the tap set.

[clear-taps](#)

Removes all tap sets.

[top](#)

test/deftest

```
(deftest name & body)
```

Defines a test function with no arguments.

All assertion macros are available for test assertions within the test function body:

- `assert`
- `assert-false`
- `assert-eq`
- `assert-ne`
- `assert-throws`
- `assert-does-not-throw`
- `assert-throws-with-msg`

It's recommended to use dedicated test namespaces for the tests and to group tests by namespaces.

Note: Actually, the test body goes in the `:test` metadata on the var, and the real function (the value of the var) calls `test-var` on itself.

```
(do
  (load-module :test)

  (ns foo-test)

  (test/deftest add-test []
    (assert-eq 0 (+ 0 0))
    (assert-eq 3 (+ 1 2)))

  (test/deftest mul-test []
    (assert-eq 6 (* 2 3)))

  (ns bar)
  (test/run-tests 'foo-test))
```

```

Testing namespace 'foo-test

PASS foo-test/add-test
PASS foo-test/mul-test

Ran 2 tests with 3 assertions
0 failures, 0 errors.
=> {:assert 3 :error 0 :pass 2 :test 2 :type :summary :fail 0}

;; Explicit setup/teardown
(do
  (ns foo-test)
  (load-module :test)

  (test/deftest sum-test []
    (let [f (io/temp-file "test-", ".txt")]
      (try
        (io/spit f "1234" :append true)
        (assert-eq "1234" (io/slurp f :binary false))
        (finally
          (io/delete-file f))))))

  (test/run-tests *ns*))

Testing namespace 'foo-test

PASS foo-test/sum-test

Ran 1 tests with 1 assertions
0 failures, 0 errors.
=> {:assert 1 :error 0 :pass 1 :test 1 :type :summary :fail 0}

```

SEE ALSO

[test/run-tests](#)

Runs all tests in the given namespaces; prints results. The tests are run grouped the namespace.

[test/run-test-var](#)

Runs a single test; prints results. Returns a map summarizing the test results.

[test/use-fixtures](#)

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different ...

[test/successful?](#)

Returns true if the given test summary indicates all tests were successful, false otherwise.

[assert](#)

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

[assert-false](#)

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

[assert-eq](#)

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

[assert-ne](#)

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

[assert-throws](#)

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

[assert-does-not-throw](#)

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

test/run-test-var

```
(run-test-var v)
```

Runs a single test; prints results. Returns a map summarizing the test results.

```
(do
  (ns foo-test)
  (load-module :test)

  (test/deftest plus-test []
    (assert-eq 3 (+ 1 2)))

  (test/run-test-var plus-test))

Testing namespace 'foo-test

PASS foo-test/plus-test

Ran 1 tests with 1 assertions
0 failures, 0 errors.
=> {:assert 1 :error 0 :pass 1 :test 1 :type :summary :fail 0}
```

[test/run-tests](#)

Runs all tests in the given namespaces; prints results. The tests are run grouped the namespace.

[test/run-test-var](#)

Runs a single test; prints results. Returns a map summarizing the test results.

test/use-fixtures

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different ...

[top](#)

test/use-fixtures

```
(use-fixtures ns fixture-type & fixture-fns)
```

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different namespaces have different fixtures.

A fixture of type `:each` is called before and after each test in the fixture's namespace.

A fixture of type `:once` is called before the first and after the last test in the fixture's namespace serving as an initial setup and final teardown.

To pass a value from a fixture to the tests dynamic vars can be used. See the 3rd example below.

```
;; Fixtures :each
;; Adds logic for a setup and teardown method that will be called
;; before and after each test
(do
  (load-module :test)

  (defn each-time-setup []
    (println "FIXTURE each time setup"))

  (defn each-time-teardown []
    (println "FIXTURE each time teardown"))

  (defn each-fixture [f]
    (each-time-setup)
    (try
      (f)
      (finally (each-time-teardown))))

  ;; register as an each-time callback
  (test/use-fixtures *ns* :each each-fixture)

  (test/deftest add-test []
    (assert-eq 3 (+ 1 2)))

  (test/deftest sub-test []
    (assert-eq 3 (- 4 1)))

  (test/run-tests *ns*))
```

Testing namespace 'user

```
FIXTURE each time setup
PASS user/add-test
FIXTURE each time teardown
FIXTURE each time setup
PASS user/sub-test
FIXTURE each time teardown
```

```
Ran 2 tests with 2 assertions
0 failures, 0 errors.
=> {:assert 2 :error 0 :pass 2 :test 2 :type :summary :fail 0}
```

```

;; Fixtures :once
;; Adds logic for a setup and teardown method that will be called
;; before the first and after the last test as an initial setup
;; and final teardown
(do
  (load-module :test)

  (defn one-time-setup []
    (println "FIXTURE one time setup"))

  (defn one-time-teardown []
    (println "FIXTURE one time teardown"))

  (defn one-fixture [f]
    (one-time-setup)
    (try
      (f)
      (finally (one-time-teardown))))

  ;; register as a one-time callback
  (test/use-fixtures *ns* :once one-fixture)

  (test/deftest add-test []
    (assert-eq 3 (+ 1 2)))

  (test/deftest sub-test []
    (assert-eq 3 (- 4 1)))

  (test/run-tests *ns*))

```

Testing namespace 'user

```

FIXTURE one time setup
PASS user/add-test

```

```

Ran 2 tests with 2 assertions
0 failures, 0 errors.
=> {:assert 2 :error 0 :pass 2 :test 2 :type :summary :fail 0}

```

SEE ALSO

[test/deftest](#)

Defines a test function with no arguments.

[test/run-tests](#)

Runs all tests in the given namespaces; prints results. The tests are run grouped the namespace.

[test/run-test-var](#)

Runs a single test; prints results. Returns a map summarizing the test results.

[top](#)

then-accept

```

(then-accept p f)

```

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

```

(-> (promise (fn [] "the quick brown fox"))
  (then-accept (fn [v] (println (pr-str v)))))
(deref))
"the quick brown fox"
=> nil

(let [result (promise)
      p      (promise)]
  (thread #(deliver p 5))
  (then-accept p (fn [v] (deliver result (+ v 2)))))
[@p @result]))
=> [5 7]

```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

then-accept-both

```
(then-accept-both p p-other f)
```

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two results as arguments.

```
(-> (promise (fn [] (sleep 200) "The quick brown fox"))
    (then-accept-both (promise (fn [] (sleep 100) "jumps over the lazy dog"))
                      (fn [u v] (println (pr-str (str u " " v))))))
    (deref))

```

```
(third '(1 2 3))
=> 3
```

[top](#)

thread

```
(thread f)
(thread f name)
(thread f name type)
```

Executes the function `f` in another thread, returning immediately to the calling thread. Returns a `promise` which will receive the result of calling the function `f` when completed. Optionally a name can be assigned to the spawned thread.

The thread can be given a name by passing the *name* argument. By default the thread name is set to "venice-thread". For each thread spawned on a name the thread's name will be suffixed with an incrementing index starting from 1.

The thread type (*daemon* or *user*) can be controlled by the *type* argument that must be one of `{:daemon, :user}`. By default a daemon thread is spawned.

Note: Each call to `thread` creates a new expensive system thread. Consider to use futures or promises that use an *ExecutorService* to deal efficiently with threads.

```
@(thread #(do (sleep 100) 1))
=> 1

@(thread #(do (sleep 100) (thread-name)))
=> "venice-thread-3"

@(thread #(do (sleep 100) (thread-name)) "job")
=> "job-1"

@(thread #(do (sleep 100) (thread-name)) "job" :daemon)
=> "job-2"

;; consumer / producer
(do
  (defn produce [q]
    (doseq [x (range 4)] (put! q x) (sleep 100))
    (put! q nil))
  (defn consume [q]
    (transduce (map println) (constantly nil) q))
  (let [q (queue 10)]
    (thread #(produce q))
    @(thread #(consume q))))

0
1
2
3
=> nil
```

SEE ALSO

[future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

thread-daemon?

`(thread-daemon?)`

Returns true if this Thread is a daemon thread else false.

```
(thread-daemon?)  
=> false
```

SEE ALSO

[thread-name](#)

Returns this thread's name.

[top](#)

thread-id

```
(thread-id)
```

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is unique and remains unchanged during its lifetime. When a thread is terminated, this thread ID may be reused.

```
(thread-id)  
=> 1
```

SEE ALSO

[thread-name](#)

Returns this thread's name.

[top](#)

thread-interrupted

```
(thread-interrupted)
```

Tests whether the current thread has been interrupted. The interrupted status of the thread is cleared by this method. In other words, if this method were to be called twice in succession, the second call would return false (unless the current thread were interrupted again, after the first call had cleared its interrupted status and before the second call had examined it).

Returns true if the current thread has been interrupted else false.

```
(thread-interrupted)  
=> false
```

  (dissoc! (thread-local) :a)  
  (get (thread-local) :a 999))  
=> 999
```

SEE ALSO

[thread-local-clear](#)

Removes all thread local vars

[thread-local-map](#)

Returns a snapshot of the thread local vars as a map.

[assoc!](#)

Associates key/vals with a mutable map, returns the map

[dissoc!](#)

Dissociates keys from a mutable map, returns the map

[get](#)

Returns the value mapped to key, not-found or nil if key not present.

thread-local-clear

```
(thread-local-clear)
```

Removes all thread local vars

```
(thread-local-clear)  
=> thread-local-clear
```

SEE ALSO

[thread-local](#)

Creates a new thread-local accessor

[dissoc!](#)

Dissociates keys from a mutable map, returns the map

thread-local-map

```
(thread-local-map)
```

Returns a snapshot of the thread local vars as a map.

Note:

The returned map is a copy of the current thread local vars. Thus modifying this map is not modifying the thread local vars! Use `assoc!` and `dissoc!` for that purpose!

```
(do  
  (thread-local-clear)  
  (thread-local :a 1 :b 2)  
  (thread-local-map))  
=> {:a 1 :b 2 :*assertions* (0)}
```

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is ...

[top](#)

throw

```
(throw)
(throw val)
(throw ex)
```

Throws an exception.

```
(throw)
```

Throws a :ValueException with `nil` as its value.

```
(throw val)
```

With `val` as a Venice value throws a :ValueException with `val` as its value.

E.g: `(throw [1 2 3])`

```
(throw ex)
```

With a `ex` as an exception type throws the exception.

E.g: `(throw (ex :VncException "invalid data"))`

```
(try
  (+ 100 200)
  (catch :Exception e
    "caught ~(ex-message e)"))
=> 300
```

```

(try
  (+ 100 200)
  (throw)
  (catch :ValueException e
    "caught ~(pr-str (ex-value e))"))
=> "caught nil"

(try
  (+ 100 200)
  (throw 100)
  (catch :ValueException e
    "caught ~(ex-value e)"))
=> "caught 100"

;; The finally block is just for side effects, like
;; closing resources. It never returns a value!
(try
  (+ 100 200)
  (throw [100 {:a 3}])
  (catch :ValueException e
    "caught ~(ex-value e)")
  (finally (println "#finally")
    :finally))
#finally
=> "caught [100 {:a 3}]"

(try
  (throw (ex :RuntimeException "#test")))
  (catch :RuntimeException e
    "caught ~(ex-message e)"))
=> "caught #test"

;; Venice wraps thrown checked exceptions with a RuntimeException!
(do
  (import :java.io.IOException)
  (try
    (throw (ex :IOException "#test"))
    (catch :RuntimeException e
      "caught ~(ex-message (ex-cause e))")))
=> "caught #test"

```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of `:java.lang.Exception`

[try](#)

Exception handling: try - catch - finally

[try-with](#)

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

[top](#)

time

```
(time expr)
```

Evaluates `expr` and prints the time it took. Returns the value of `expr`.

```
(time (+ 100 200))  
Elapsed time: 3.63µs  
=> 300
```

SEE ALSO

[dorun](#)

Runs the expr count times in the most effective way. It's main purpose is supporting benchmark tests. Returns the expression result ...

time/format

```
(time/format date format)  
(time/format date format locale)  
(time/format date formatter)  
(time/format date formatter locale)
```

Formats a date with a format.

To format a large number of dates a pre instantiated formatter delivers best performance:

```
(let [fmt (time/formatter "yyyy-MM-dd'T'HH:mm:ss")]  
    (dotimes [n 100] (time/format (time/local-date-time) fmt)))
```

```
(time/format (time/local-date) "dd-MM-yyyy")  
=> "06-04-2024"
```

```
(time/format (time/local-date) (time/formatter "dd-MM-yyyy"))  
=> "06-04-2024"
```

```
(time/format (time/local-date) :iso)  
=> "2024-04-06"
```

```
(time/format (time/local-date-time) "yyyy-MM-dd'T'HH:mm:ss")  
=> "2024-04-06T08:47:32"
```

```
(time/format (time/local-date-time) (time/formatter "yyyy-MM-dd'T'HH:mm:ss"))
=> "2024-04-06T08:47:32"

(time/format (time/local-date-time) :iso)
=> "2024-04-06T08:47:32.107"

(time/format (time/zoned-date-time) "yyyy-MM-dd'T'HH:mm:ss.SSSz")
=> "2024-04-06T08:47:32.126CEST"

(time/format (time/zoned-date-time) :iso)
=> "2024-04-06T08:47:32.145+02:00"

(time/format (time/zoned-date-time) (time/formatter "yyyy-MM-dd'T'HH:mm:ss.SSSz"))
=> "2024-04-06T08:47:32.164CEST"
```

[top](#)

time/zoned-date-time-parse

```

(time/zoned-date-time-parse str format
(time/zoned-date-time-parse str format locale

```

Parses a zoned-date-time.

To parse a large number of dates a pre instantiated formatter delivers best performance:

```

(let [fmt (time/formatter "yyyy-MM-dd'T'HH:mm:ssz")]
  (dotimes [n 100] (time/zoned-date-time-parse "2018-12-01T14:20:01+01:00" fmt)))

```

```

(time/zoned-date-time-parse "2018-08-01T14:20:01+01:00" "yyyy-MM-dd'T'HH:mm:ssz")
=> 2018-08-01T14:20:01+01:00

(time/zoned-date-time-parse "2018-08-01T14:20:01.000+01:00" "yyyy-MM-dd'T'HH:mm:ss.SSSz")
=> 2018-08-01T14:20:01+01:00

```

```
(time/zoned-date-time-parse "2018-08-01T14:20:01.000+01:00" :iso)
=> 2018-08-01T14:20:01+01:00

(time/zoned-date-time-parse "2018-08-01 14:20:01.000 +01:00" "yyyy-MM-dd' 'HH:mm:ss.SSS' 'z")
=> 2018-08-01T14:20:01+01:00
```

[top](#)

time/zoned-date-time?

```
(time/zoned-date-time? date)
```

Returns true if date is a zoned-date-time ('java.time.ZonedDateTime') else false

```
(time/zoned-date-time? (time/zoned-date-time))
=> true
```

[top](#)

timeout-after

```
(timeout-after p time time-unit)
```

Returns a promise that timeouts after the specified time. The promise throws a TimeoutException.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                    (fn [v] (println (pr-str v)))))
    (deref))
"The quick brown fox"
=> nil

(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                    (fn [v] (println (pr-str v)))))
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                    (fn [v] (println (pr-str v)))))
    (deref 2000 :timeout))
=> :timeout

(-> (promise (fn [] (sleep 200) "The quick brown fox"))
    (apply-to-either (timeout-after 100 :milliseconds)
                     identity)
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

[then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

[then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

[then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

timing/elapsed

```
(timing/elapsed f)
```

Runs a function `f` and returns the elapsed time in milliseconds.

```
(timing/elapsed #(sleep 500))  
=> 505
```

SEE ALSO

[timing/run](#)

Runs a function `f` with printing the elapsed time. Returns the value that `f` has produced.

[top](#)

timing/run

```
(timing/run f)  
(timing/run f start-msg)
```

Runs a function `f` with printing the elapsed time. Returns the value that `f` has produced.

```
(timing/run #(sleep 500))  
Elapsed: 505ms  
=> nil
```

```
(timing/run #(sleep 500) "Sleeping...")
Sleeping...
Elapsed: 505ms
=> nil
```

SEE ALSO

[timing/elapsed](#)

Runs a function f and returns the elapsed time in milliseconds.

[top](#)

tomcat/create-servlet

```
(create-servlet handler-map)
```

Creates a servlet from a HTTP method handler map

```
;; minimal servlet
(tomcat/create-servlet
 { :doGet (fn [req res servlet] (tomcat/send-ok res "Hello World")) })

;; servlet with lifecycle and all HTTP methods
(tomcat/create-servlet
 { :init (fn [config] nil)
   :destroy (fn [servlet] nil)
   :doGet (fn [req res servlet] (tomcat/send-ok res "Hello World"))
   :doHead (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method HEAD"))
   :doPost (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method POST"))
   :doPut (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method PUT"))
   :delete (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method DELETE"))
   :getLastModified (fn [req] -1) })
```

[top](#)

tomcat/destroy

```
(destroy server)
```

Destroys a Tomcat server after having stopped it.

```
(do
 (load-module :tomcat ['tomcat :as 'tc])
 (let [server (tc/start (tc/hello-world-servlet)
                       {:await? false, :base-dir ".", :port 8080})]
   (tc/state server)
   (sleep 20_000)
   (tc/stop server)
   (tc/destroy server)))
```

SEE ALSO

[tomcat/start](#)

Start a Tomcat to serve given servlet with supplied options:

[tomcat/state](#)

Returns the state of a Tomcat server.

[tomcat/stop](#)

Stops a Tomcat server.

[tomcat/shutdown](#)

Shutdown a Tomcat server.

[top](#)

tomcat/hello-world-servlet

'Hello World' demo servlet

[top](#)

tomcat/shutdown

(shutdown server)

Shutdown a Tomcat server.

Shutdown effectively calls

- (stop server)
- (destroy server)

on the server

```
(do
  (load-module :tomcat ['tomcat :as 'tc])
  (let [server (tc/start (tc/hello-world-servlet)
                        {:await? false, :base-dir ".", :port 8080})]
    (tc/state server)
    (sleep 20_000)
    (tc/shutdown server)))
```

SEE ALSO

[tomcat/start](#)

Start a Tomcat to serve given servlet with supplied options:

[tomcat/state](#)

Returns the state of a Tomcat server.

[tomcat/stop](#)

Stops a Tomcat server.

[tomcat/destroy](#)

Destroys a Tomcat server after having stopped it.

[top](#)

tomcat/start

(start servlet options)

```
(start servlet context-path context-doc-base options)
```

Start a Tomcat to serve given servlet with supplied options:

Server options:

:base-dir	the server's base directory (default: ".")
:await?	block the thread until server get shutdown command (default: true)
:http?	create http connector (default: true)
:port	the port to listen on http connector (default: 8080)
:https?	create https connector (default: false)
:https-port	the port to listen on https connector (default: 8443)
:keystore	path to keystore file include server certificate
:key-pass	password of keystore file
:tls-hostname	hostname to listen for https connector (default: _default_)
:tls-protocol	list of SSL/TLS protocol to support for https connector (default: TLS)
:tls-ciphers	list of SSL/TLS ciphers to support for https connector
:executor?	use executor (default: true)
:executor-name	name of executor (default: tc-executor)
:max-threads	max number of threads in executor (default: 200)
:min-spare-threads	minimum number of spare threads in executor (default: 25)
:max-idle-time	max milliseconds before an idle thread shutdown (default: 60000)

Servlet options:

:name	the servlet's name (default: "venice-servlet")
:mapping	the servlet's mapping path (default: "/*")
:file-upload	if true configure as file-upload servlet (default: false)
:location	file-upload location (default: "")
:max-file-size	file-upload max file size in bytes (default: -1)
:max-request-size	file-upload max request size in bytes (default: -1)
:file-size-threshold	file-upload max file threshold in bytes (default: 0l)

```
;; Example 1:
;; start Tomcat with
;;   - a servlet
;;   - server options
(tomcat/start (tomcat/hello-world-servlet)
  {:await? false, :base-dir ".", :port 8080})

;; Example 2:
;; start Tomcat with
;;   - a servlet
;;   - web app context-path
;;   - web app context-doc-base
;;   - server options
(tomcat/start (tomcat/hello-world-servlet)
  ""
  "."
  {:await? false, :base-dir ".", :port 8080})

;; Example 3:
;; start Tomcat with
;;   - a single servlet with servlet options
```

```
;; - web app context-path
;; - web app context-doc-base
;; - server options
(tomcat/start [ [ (tomcat/hello-world-servlet)
                  {:name "hello-servlet" :mapping "/*"} ] ]
              """
              "."
              {:await? false, :base-dir ".", :port 8080}))

;; Example 4:
;; start Tomcat with
;; - a single fileupload servlet with servlet options
;; - web app context-path
;; - web app context-doc-base
;; - server options
(tomcat/start [ [ (upload-servlet)
                  {:name          "upload-servlet"
                   :mapping       "/upload"
                   :file-upload   true
                   :location      "/tmp"
                   :max-file-size 10485760
                   :max-request-size 10485760
                   :file-size-threshold -1} ] ]
              """
              "."
              {:await? false, :base-dir ".", :port 8080}))
```

trampoline

```
(trampoline f)
(trampoline f & args)
```

trampoline can be used to convert algorithms requiring mutual recursion without stack consumption. Calls f with supplied args, if any. If f returns a fn, calls that fn with no arguments, and continues to repeat, until the return value is not a fn, then returns that non-fn value.

Note that if you want to return a fn as a final value, you must wrap it in some data structure and unpack it after trampoline returns.

```
(do
  (defn factorial
    ([n] #(factorial n 1N))
    ([n acc] (if (< n 2)
                acc
                #(factorial (dec n) (* acc n)))))

  (trampoline (factorial 20)))
=> 2432902008176640000N
```

[top](#)

transduce

```
(transduce xform f coll)
(transduce xform f init coll)
```

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be a reducing step function that accepts both 1 and 2 arguments. Returns the result of applying (the transformed) xf to init and the first item in coll, then applying xf to that result and the 2nd item, etc. If coll contains no items, returns init and f is not called.

transduce can work with queues as collection, given that the end of the queue is marked by adding a nil element. Otherwise the transducer does not know when to stop reading elements from the queue.

Transformations		Reductions	Control
-----		-----	-----
map	map-indexed	rf-first	halt-when
filter	flatten	rf-last	
drop	drop-while	rf-any?	
drop-last	remove	rf-every?

[top](#)

try

```
(try expr*)
(try expr* (catch selector ex-sym expr*)*)
(try expr* (catch selector ex-sym expr*)* (finally expr*))
```

Exception handling: try - catch - finally

`(try)` without any expression returns `nil`.

The exception types

- `:java.lang.Exception`
- `:java.lang.RuntimeException`
- `:com.github.jlangch.venice.VncException`
- `:com.github.jlangch.venice.ValueException`

are imported implicitly so its alias `:Exception`, `:RuntimeException`, `:VncException`, and `:ValueException` can be used as selector without an import of the class.

Selectors

- a class: (e.g., `:RuntimeException`, `:java.text.ParseException`), matches any instance of that class
- a key-values vector: (e.g., `[key val & kvs]`), matches any instance of `:ValueException` where the exception's value meets the expression
(and `(= (get ex-value key) val) ...`)
- a predicate: (a function of one argument like `map?`, `set?`), matches any instance of `:ValueException` where the predicate applied to the exception's value returns true

Notes:

The finally block is just for side effects, like closing resources. It never returns a value!

All exceptions in Venice are *unchecked*. If *checked* exceptions are thrown in Venice they are immediately wrapped in a `:RuntimeException` before being thrown! If Venice catches a *checked* exception from a Java interop call it wraps it in a `:RuntimeException` before handling it by the catch block selectors.

Venice follows the Java rules when propagating exceptions:

1. exception from finally block

2. exception from catch block
3. exception from body block

```
(try
  (throw "test")
  (catch :ValueException e
    "caught ~(ex-value e)))
=> "caught test"

(try
  (throw 100)
  (catch :Exception e -100))
=> -100

(try
  (throw 100)
  (catch :ValueException e (ex-value e))
  (finally (println "...finally")))
...finally
=> 100

(try
  (throw (ex :RuntimeException "message"))
  (catch :RuntimeException e (ex-message e)))
=> "message"

;; exception type selector:
(try
  (throw [1 2 3])
  (catch :ValueException e (ex-value e))
  (catch :RuntimeException e "runtime ex")
  (finally (println "...finally")))
...finally
=> [1 2 3]

;; key-value selector:
(try
  (throw {:a 100, :b 200})
  (catch [:a 100] e
    (println "ValueException, value: ~(ex-value e)"))
  (catch [:a 100, :b 200] e
    (println "ValueException, value: ~(ex-value e)")))
ValueException, value: {:a 100 :b 200}
=> nil

;; key-value selector (exception cause):
(try
  (throw (ex :java.io.IOException "failure"))
  (catch [:cause-type :java.io.IOException] e
    (println "IOException, msg: ~(ex-message (ex-cause e))"))
  (catch :RuntimeException e
    (println "RuntimeException, msg: ~(ex-message e)")))
IOException, msg: failure
=> nil

;; predicate selector:
(try
  (throw {:a 100, :b 200})
  (catch long? e
    (println "ValueException, value: ~(ex-value e)"))
  (catch map? e
```

```

    (println "ValueException, value: ~(ex-value e)"))
  (catch #(and (map? %) (= 100 (:a %))) e
    (println "ValueException, value: ~(ex-value e)"))))
ValueException, value: {:a 100 :b 200}
=> nil

;; predicate selector with custom types:
(do
  (deftype :my-exception1 [message :string, position :long])
  (deftype :my-exception2 [message :string])

  (try
    (throw (my-exception1. "error" 100))
    (catch my-exception1? e
      (println (:value e)))
    (catch my-exception2? e
      (println (:value e)))))
{:custom-type* :user/my-exception1 :message error :position 100}
=> nil

```

SEE ALSO

[try-with](#)

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

[throw](#)

Throws an exception.

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[top](#)

try-acquire

```

(try-acquire lock)
(try-acquired lock timeout time-unit)

```

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

Returns `true` if the lock could be acquired within the given time else `false` .

```

(let [l (lock)]
  (when (try-acquire l)
    ;; do something
    (release l)))
=> nil

(let [l (lock)]
  (when (try-acquire l 3 :seconds)
    ;; do something
    (release l)))
=> nil

```

SEE ALSO

[lock](#)

Creates a new lock object.

[acquire](#)

Acquires a lock, blocking until the lock is available.

release

Releases a lock.

locked?

Returns true if the lock is in use else false.

[top](#)

try-with

```
(try-with [bindings*] expr*)
(try-with [bindings*] expr* (catch selector ex-sym expr*)*)
(try-with [bindings*] expr* (catch selector ex-sym expr*)* (finally expr))
```

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed after execution of that block. The resources declared must implement the `Closeable` or `AutoCloseable` interface.

Venice follows the Java rules when propagating exceptions:

1. exception from finally block
2. exception from catch block
3. exception from body block
4. exception from resource auto-close

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/spit file "123456789" :append true)
    (try-with [is (io/file-in-stream file)]
      (io/slurp-stream is :binary false))))
=> "123456789"
```

=> [0 4 2]
```

```
(update {:a 0 :b 1} :b * 4)  
=> {:a 0 :b 4}
```

SEE ALSO

[assoc](#)

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, ...

[dissoc](#)

Returns a new coll of the same type, that does not contain a mapping for key(s)

[top](#)

update!

```
(update! m k f & fargs)
```

Updates a value in a mutable associative structure, where `k` is a key and `f` is a function that will take the old value and any supplied fargs and return the new value. Returns a new structure.

If the key does not exist, `nil` is passed as the old value. The optional fargs are passed to the function `f` as `(f old-value arg1 arg2 ...)`.

```
(update! (mutable-vector) 0 (fn [x] 5))  
=> [5]
```

```
(update! (mutable-vector 0 1 2) 0 (fn [x] 5))  
=> [5 1 2]
```

```
(update! (mutable-vector 0 1 2) 0 (fn [x] (+ x 1)))  
=> [1 1 2]
```

```
(update! (mutable-map) :a (fn [x] 5))
=> {:a 5}

(update! (mutable-map :a 0) :b (fn [x] 5))
=> {:a 0 :b 5}

(update! (mutable-map :a 0 :b 1) :a (fn [x] 5))
=> {:a 5 :b 1}

(update! (mutable-vector 0 1 2) 0 + 4)
=> [4 1 2]

(update! (mutable-map :a 0 :b 1) :b * 4)
=> {:a 0 :b 4}
```

SEE ALSO

```

SEE ALSO

[var-get](#)

Returns a var's value.

[var-name](#)

Returns the unqualified name of the var's symbol.

[var-ns](#)

Returns the namespace of the var's symbol.

[var-global?](#)

Returns true if the var is global else false

[var-thread-local?](#)

Returns true if the var is thread-local else false

[bound?](#)

Returns true if the symbol is bound to a value else false

var-name

```
(var-name v)
```

Returns the unqualified name of the var's symbol.

The var must exist (bound with a value) otherwise nil is returned.

```
(var-name +)  
=> "+"
```

```
(var-name '+)  
=> "+"
```

```

  (name add))  
=> "+"
```

SEE ALSO

[name](#)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

[var-get](#)

Returns a var's value.

[var-sym](#)

Returns the var's symbol.

var-ns

Returns the namespace of the var's symbol.

var-sym-meta

Returns the var's symbol meta data.

var-local?

Returns true if the var is local else false

var-global?

Returns true if the var is global else false

var-thread-local?

Returns true if the var is thread-local else false

top

var-ns

```
(var-ns v)
```

Returns the namespace of the var's symbol.

The var must exist (bound with a value) otherwise nil is returned.

```
(var-ns +)
```

```
=> "core"
```

```
(var-ns '+)

```
(def add +)
(namespace add)
=> nil
```

SEE ALSO

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[var-get](#)

Returns a var's value.

[var-name](#)

Returns the unqualified name of the var's symbol.

[var-local?](#)

Returns true if the var is local else false

[var-global?](#)

Returns true if the var is global else false

[var-thread-local?](#)

Returns true if the var is thread-local else false

[top](#)

var-sym

```
(var-sym v)
```

Returns the var's symbol.

The var must exist (bound with a value) otherwise nil is returned.

```
(var-sym +)
=> core/+
```

```
(var-sym '+)
=> core/+
```

```
(var-sym (symbol "+"))
=> core/+

  (bar (vary-meta 100 assoc :foo 4)))
=> 4
```

SEE ALSO

[var-sym-meta](#)

Returns the var's symbol meta data.

[var-get](#)

Returns a var's value.

[var-sym](#)

Returns the var's symbol.

[var-name](#)

Returns the unqualified name of the var's symbol.

[bound?](#)

Returns true if the symbol is bound to a value else false

[top](#)

vary-meta

```
(vary-meta obj f & args)
```

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

```
(meta (vary-meta [1 2] assoc :foo 3))
=> {:foo 3 :line 42 :column 28 :file "example"}
```

SEE ALSO

[meta](#)

Returns the metadata of obj, returns nil if there is no metadata.

[with-meta](#)

Returns a copy of the object obj, with a map m as its metadata.

[var-val-meta](#)

Returns the var's value meta data.

[var-sym-meta](#)

Returns the var's symbol meta data.

[top](#)

vector

```
(vector & items)
```

Creates a new vector containing the items.

```
(vector)
=> []

(vector 1 2 3)
=> [1 2 3]

(vector 1 2 3 [:a :b])
=> [1 2 3 [:a :b]]

(vector "abc")
=> ["abc"]
```

[top](#)

vector*

```
(vector* args)
(vector* a args)
(vector* a b args)
(vector* a b c args)
(vector* a b c d & more)
```

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

```
(vector* 1 [2 3])
=> [1 2 3]

(vector* 1 2 3 [4])
=> [1 2 3 4]

(vector* 1 2 3 '(4 5))
=> [1 2 3 4 5]

(vector* '[1 2] 3 [4])
=> [[1 2] 3 4]

(vector* nil)
=> nil

(vector* nil [2 3])
=> [nil 2 3]

(vector* 1 2 nil)
=> (1 2)
```

SEE ALSO

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

list*

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

vector?

(vector? obj)

Returns true if obj is a vector

```
(vector? (vector 1 2))  
=> true
```

```
(vector? [1 2])  
=> true
```

[top](#)

version

(version)

Returns the Venice version.

```
(version)  
=> "0.0.0"
```

[top](#)

volatile

(volatile x)

Creates a volatile with the initial value x

```
(do  
  (def counter (volatile 0))  
  (swap! counter inc)  
  (deref counter))  
=> 1
```

```
(do  
  (def counter (volatile 0))  
  (reset! counter 9)  
  @counter)  
=> 9
```

SEE ALSO

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[reset!](#)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

[swap!](#)

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

[top](#)

volatile?

```
(volatile? x)
```

Returns true if x is a volatile, otherwise false

```
(do
  (def counter (volatile 0))
  (volatile? counter))
=> true
```

[top](#)

when

```
(when test & body)
```

Evaluates test. If logical true, evaluates body in an implicit do.

```
(when (== 1 1) true)
=> true
```

SEE ALSO

[when-not](#)

Evaluates test. If logical false, evaluates body in an implicit do.

[when-let](#)

bindings is a vector with 2 elements: binding-form test.

[if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-not](#)

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-let](#)

bindings is a vector with 2 elements: binding-form test.

[top](#)

when-complete

```
(when-complete p f)
```

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result value as first and a possible exception as second argument to the function. The asynchronous function f is called presumably for handling side effects.

```
(-> (promise (fn [] "The Quick Brown Fox"))
  (then-apply str/upper-case)
  (when-complete (fn [v,e] (println (pr-str {:value v :ex e}))))
  (then-apply str/lower-case)
  (deref))
{:value "THE QUICK BROWN FOX" :ex nil}
=> "the quick brown fox"
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and `set`, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

[then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

[then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

[then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

when-let

```
(when-let bindings & body)
```

`bindings` is a vector with 2 elements: binding-form test.

If test is true, evaluates the body expressions with binding-form bound to the value of test, if not, yields nil

```
(when-let [value (* 100 2)]
  (str "The expression is true. value=" value))
=> "The expression is true. value=200"
```

SEE ALSO

[if-let](#)

`bindings` is a vector with 2 elements: binding-form test.

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

when-not

```
(when-not test & body)
```

Evaluates test. If logical false, evaluates body in an implicit do.

```
(when-not (== 1 2) true)
=> true
```

SEE ALSO

[when](#)

Evaluates test. If logical true, evaluates body in an implicit do.

[when-let](#)

bindings is a vector with 2 elements: binding-form test.

[if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-not](#)

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-let](#)

bindings is a vector with 2 elements: binding-form test.

while

```
(while test & body)
```

Repeatedly executes body while test expression is true. Presumes some side-effect will cause test to become false/nil. Returns nil.

```
(do
  (def a (atom 5))
  (while (pos? @a)
    (println @a)
    (swap! a dec)))
5
4
3
2
1
=> nil
```

with-err-str

```
(with-err-str & forms)
```

Evaluates exprs in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing calls. `with-err-str` can be nested.

```
(with-err-str (println *err* "a string"))  
=> "a string\n"
```

SEE ALSO

[with-out-str](#)

Evaluates exprs in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[top](#)

with-meta

```
(with-meta obj m)
```

Returns a copy of the object `obj`, with a map `m` as its metadata.

```
(meta (with-meta [1 2] {:foo 3}))  
=> {:foo 3}
```

SEE ALSO

[meta](#)

Returns the metadata of `obj`, returns nil if there is no metadata.

[vary-meta](#)

Returns a copy of the object `obj`, with `(apply f (meta obj) args)` as its metadata.

[var-val-meta](#)

Returns the var's value meta data.

[var-sym-meta](#)

Returns the var's symbol meta data.

[top](#)

with-out-str

```
(with-out-str & forms)
```

Evaluates exprs in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing calls. `with-out-str` can be nested.

```
(with-out-str (println "a string"))  
=> "a string\n"
```

SEE ALSO

[with-err-str](#)

Evaluates exprs in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[top](#)

with-sh-dir

```
(with-sh-dir dir & forms)
```

Sets the directory for use with `sh`, see `sh` for details.

```
(with-sh-dir "/tmp" (sh "ls" "-l"))
```

SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-env](#)

Sets the environment for use with `sh`.

[with-sh-throw](#)

Shell commands executed within a `with-sh-throw` context throw an exception if the spawned shell process returns an exit code other than 0.

[top](#)

with-sh-env

```
(with-sh-env env & forms)
```

Sets the environment for use with `sh`.

```
(with-sh-env {"NAME" "foo"} (sh "ls" "-l"))
```

SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-dir](#)

Sets the directory for use with `sh`, see `sh` for details.

[with-sh-throw](#)

Shell commands executed within a `with-sh-throw` context throw an exception if the spawned shell process returns an exit code other than 0.

[top](#)

with-sh-throw

```
(with-sh-throw forms)
```

Shell commands executed within a `with-sh-throw` context throw an exception if the spawned shell process returns an exit code other than 0.

For use with `sh`, see `sh` for details. `with-sh-throw` can be nested.

```
(with-sh-throw (sh "ls" "-l"))
```

SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-env](#)

Sets the environment for use with sh.

[with-sh-dir](#)

Sets the directory for use with sh, see sh for details.

[top](#)

xml/children

(xml/children nodes)

Returns the children of the XML nodes collection

```
(do
  (load-module :xml)
  (xml/children
    (list (xml/parse-str "<a><b>B</b></a>"))))
=> ({:content ["B"] :tag "b"})
```

[top](#)

xml/parse

(xml/parse s)
(xml/parse s handler)

Parses and loads the XML from the source s with the parser XMLHandler handler. The source may be an InputSource or an InputStream.

Returns a tree of XML element maps with the keys :tag, :attrs, and :content.

[top](#)

xml/parse-str

(xml/parse-str s)
(xml/parse-str s handler)

Parses an XML from the string s. Returns a tree of XML element maps with the keys :tag, :attrs, and :content.

```
(do
  (load-module :xml)
  (xml/parse-str "<a><b>B</b></a>"))
=> {:content [{:content ["B"] :tag "b"}] :tag "a"}
```

[top](#)

xml/path->

```
(xml/path-> path nodes)
```

Applies the path to a node or a collection of nodes

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b><c>C</c></b></a>")
        path [(xml/tag= "b")
              (xml/tag= "c")
              xml/text
              first]]
    (xml/path-> path nodes)))
=> "C"
```

[top](#)

xml/text

```
(xml/text nodes)
```

Returns a list of text contents of the XML nodes collection

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b>B</b></a>")
        path [(xml/tag= "b")
              xml/text]]
    (xml/path-> path nodes)))
=> ("B")
```

[top](#)

zero?

```
(zero? x)
```

Returns true if x zero else false

```
(zero? 0)
=> true
```

```
(zero? 2)
=> false
```

```
(zero? (int 0))
=> true
```

```
(zero? 0.0)
=> true
```

```
(zero? 0.0M)
=> true
```

SEE ALSO

[neg?](#)

Returns true if x smaller than zero else false

[pos?](#)

Returns true if x greater than zero else false

[top](#)

zipmap

```
(zipmap keys vals)
```

Returns a map with the keys mapped to the corresponding vals.

To create a list of tuples from two or more lists use

```
(map list '(1 2 3) '(4 5 6)) .
```

```
(zipmap [:a :b :c :d :e] [1 2 3 4 5])  
=> {:a 1 :b 2 :c 3 :d 4 :e 5}
```

```
(zipmap [:a :b :c] [1 2 3 4 5])  
=> {:a 1 :b 2 :c 3}
```

[top](#)

zipvault/add-files

```
(zipvault/add-files zip passphrase & files)
```

Adds a list of files to the zip.

```
(do  
  (load-module :zipvault)  
  
  (let [zip (io/file "vault.zip")  
        tmp-1 (io/file (io/tmp-dir) "a1.txt")  
        tmp-2 (io/file (io/tmp-dir) "a2.txt")]  
    (io/spit tmp-1 "1234")  
    (io/spit tmp-2 "2345")  
    (io/delete-file-on-exit tmp-1)  
    (io/delete-file-on-exit tmp-2)  
  
    (zipvault/zip zip "pwd" "a.txt" "A")  
    (zipvault/add-files zip "pwd" tmp-1 tmp-2)))
```

SEE ALSO

[zipvault/zip](#)

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

[zipvault/add-folder](#)

Adds a folder to the zip file.

[zipvault/add-stream](#)

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

[zipvault/remove-files](#)

Removes all files from the zip file that match the names in the input list.

zipvault/add-folder

```
(zipvault/add-folder zip passphrase folder)
(zipvault/add-folder zip passphrase folder include-root-folder)
(zipvault/add-folder zip passphrase folder include-root-folder exclude-fn)
```

Adds a folder to the zip file.

If 'include-root-folder' (default true) is true the root folder name will be added to the entry name as folder.

The 'exclude-fn' filters the files in the folder that are to be excluded from the zip. 'exclude-fn' is a single argument function that receives a file and returns true if the files is to be excluded otherwise it returns false.

```
(do
  (load-module :zipvault)

  (let [zip      (io/file "vault.zip")
        tmp-folder (io/file (io/tmp-dir) "ziptest")

        tmp-2      (io/file tmp-folder "a2.txt")]
    (io/mkdir tmp-folder)
    (io/spit tmp-1 "1234")
    (io/spit tmp-2 "2345")
    (io/delete-file-on-exit tmp-folder)

    (zipvault/zip zip "pwd" "a.txt" "A")
    (zipvault/add-folder zip "pwd" tmp-folder)))

(do
  (load-module :zipvault)

  (defn exclude-fn [file] (io/file-ext? file "log"))

  (let [zip      (io/file "vault.zip")
        tmp-folder (io/file (io/tmp-dir) "ziptest")
        tmp-1      (io/file tmp-folder "a.txt")
        tmp-2      (io/file tmp-folder "b.txt")
        tmp-3      (io/file tmp-folder "c.log")]
    (io/mkdir tmp-folder)
    (io/spit tmp-1 "12")
    (io/spit tmp-2 "23")
    (io/spit tmp-3 "34")
    (io/delete-file-on-exit tmp-folder)

    (zipvault/zip zip "pwd")
    (zipvault/add-folder zip "pwd" tmp-folder true exclude-fn)))
```

SEE ALSO

[zipvault/zip](#)

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

[zipvault/add-files](#)

Adds a list of files to the zip.

[zipvault/add-stream](#)

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

[zipvault/remove-files](#)

Removes all files from the zip file that match the names in the input list.

zipvault/add-stream

```
(zipvault/add-stream zip passphrase name is)
```

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

```
(do
  (load-module :zipvault)

  (let [zip (io/file "vault.zip")
        is  (io/string-in-stream "abc")]
    (zipvault/zip zip "pwd" "a.txt" "A")
    (zipvault/add-stream zip "pwd" "a.txt" is)))
```

SEE ALSO

[zipvault/zip](#)

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

[zipvault/add-files](#)

Adds a list of files to the zip.

[zipvault/add-folder](#)

Adds a folder to the zip file.

[zipvault/remove-files](#)

Removes all files from the zip file that match the names in the input list.

zipvault/encrypted?

```
(zipvault/encrypted? zip)
```

Extracts a specific file from the zip file to the destination path.

```
(do
  (load-module :zipvault)

  (zipvault/zip (io/file "vault.zip") "pwd" "a.txt" "abc")
  (zipvault/encrypted? (io/file "vault.zip")))
```

zipvault/entropy

```
(zipvault/entropy passphrase)
```

Returns the passphrase's entropy in bits.

The password entropy using the formula: **E = log₂(RL)**

- **E** stands for password entropy, measured in bits
- **Log2** is a mathematical formula that converts the total number of possible character combinations to bits
- **R** stands for the range of characters
- **L** stands for the number of characters in a password

The entropy is calculated based on 26 lower and upper case letters, 10 digits, and 24 symbols like `°+*%&/()=?'`^:~.-$£!#~;`

Note: The function just calculates the entropy. A strong passphrase does not rely on the entropy solely. Avoid passphrases containing words from the dictionary ("admin_passw0rd"), dates (birthdate, ...), repetitions ("aaaaa"), or sequences ("123456")!

```
(do
  (load-module :zipvault)
  (zipvault/entropy "uibsd6b38hs7b_La'sdgg898wbver"))
=> 186.36167788636087
```

  (zipvault/zip (io/file "vault.zip") "pwd" "a.txt" "abc")
  (zipvault/valid-zip-file? (io/file "vault.zip")))
```

zipvault/zip

(zipvault/zip out passphrase & entries)

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

An entry is given by a name and data. The entry data may be nil, a bytebuf, a string, a file, an input stream, or a producer function. An entry name with a trailing '/' creates a directory.

Entry value types:

nil	an empty file is written to the zip entry
bytebuf	the bytes are written to the zip entry
string	the string is written to the zip entry
file	the content of the file is written to the zip entry
input stream	the slurped input stream data is written to the zip entry
function	a producer function with a single output stream argument. All data written to the stream is written to the zip entry. The stream can be flushed but must not be closed!

Passphrases:

The AES-256 algorithm requires a 256-bit key as input. One should use a passphrase with at least 128 bits of entropy (that's roughly a 20-character passphrase of random upper/lower/digits/symbols). Less is dropping below general limits of safety, and more than 256 bits won't accomplish anything.

See function: `zipvault/entropy`

```
(do
  (load-module :zipvault)
  (zipvault/zip (io/file "vault.zip") "pwd")) ; empty zip

(do
  (load-module :zipvault)
  (zipvault/zip (io/file "vault.zip") "pwd" "a.txt" "abc"))

(do
  (load-module :zipvault)
  (zipvault/zip (io/file-out-stream "vault.zip")
    "pwd"
    "a.txt"      "abc"
    "b.txt"      (bytebuf [100 101 102])))

(do
  (load-module :zipvault)

  (let [file (io/file (io/tmp-dir) "c.txt")]
    (io/spit file "1234")
    (io/delete-file-on-exit c-tmp)

    ;; create "vault.zip"
    ;;   └─ a.txt
    ;;   └─ b.txt
    ;;   └─ c.txt
    ;;   └─ d.txt
    ;;   └─ e.txt
    ;;   └─ empty.txt
    ;;   └─ xx
    ;;   └─ g.txt
```

```
(zipvault/zip
  (io/file "vault.zip")
  "pwd"
  "a.txt"      "abc"
  "b.txt"      (bytebuf "def")
  file         file ; equivalent: (io/file-basename file) file
  "d.txt"      (io/string-in-stream "ghi")
  "e.txt"      (fn [os]
                (let [wr (io/wrap-os-with-buffered-writer os)]
                  (println wr "200")
                  (flush wr))))
  "empty.txt"  nil
  "xx/g.txt"   "jkl"))
```

SEE ALSO

[zipvault/zip-folder](#)

Creates an AES-256 encrypted and password protected zip from the folder.

[zipvault/entries](#)

Returns a list of the entry names in the zip.

[zipvault/add-files](#)

Adds a list of files to the zip.

[zipvault/add-folder](#)

Adds a folder to the zip file.

[zipvault/add-stream](#)

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

[zipvault/remove-files](#)

Removes all files from the zip file that match the names in the input list.

[zipvault/extract-file](#)

Extracts a specific file or folder from the zip file to the destination path.

[zipvault/extract-all](#)

Extracts all files from the zip file to the destination path.

[zipvault/extract-file-data](#)

Extracts a specific file from the zip file and returns it as binary data. in may be a file or an input stream.

[zipvault/entropy](#)

Returns the passphrase's entropy in bits.

[top](#)

zipvault/zip-folder

```
(zipvault/zip-folder out passphrase folder)
(zipvault/zip-folder out passphrase folder include-root-folder)
(zipvault/zip-folder out passphrase folder include-root-folder exclude-fn)
```

Creates an AES-256 encrypted and password protected zip from the folder.

If 'include-root-folder' (default true) is true the root folder name will be added to the entry name as folder.

The 'exclude-fn' filters the files in the folder that are to be excluded from the zip. 'exclude-fn' is a single argument function that receives a file and returns true if the files is to be excluded otherwise it returns false.

```
(do
  (load-module :zipvault))
```

```

(let [zip      (io/file "vault.zip")
      tmp-folder (io/file (io/tmp-dir) "ziptest")
