

Cheat Sheet

Venice v1.12.64

Overview

Primitives	Literals	Number	String	Char	Boolean	Keyword	Symbol	Nil	Just		
Collections	List Array	Vector ByteBuf	Set	Map	LazySeq	Stack	Queue	DelayQueue	Deque	CircularBuffer	DAG
Custom Types	Types	Protocols									
Concepts	Recursion	Destructuring									
Core Functions	Functions	Macros	Special Forms		Transducers	Namespaces	Exceptions				
Concurrency	Atoms	Locks	Locking	Futures	Promises	Delay	Agents	Volatiles	Parallel		
Scheduler	JDK Scheduler	Cron Scheduler									
Threads	ThreadLocal	Threads									
System	System	System Vars	REPL	Sandbox	Load Paths						
Shell	Shell System	Shell	Shebang								
Java	Java Interop	Java	MBeans								
Util	Math	Time	StopWatch	Regex	INET	CIDR					
I/O	I/O	File	File Watcher	Zip/GZip	Inter Process Communication						
Documents	JSON	JSON Lines	PDF	PDF Tools	CSV	XML	Excel	Images			
Modules	Kira Templates Keystores Aviron Queue	Parsifal AsciiTable Aviron Cycler	Grep Matrix App	Configuration Shell Geo IP QR Ref	Component Mimetypes QR Bill	ZipVault Ansi QR Code	Fonts Logger Semver	Cryptography Aviron	Aviron Limiter		
Build Tools	Gradle Wrapper	Gradle	Maven	Installer							
Test & Debug	Test	Tracing	Tap	Hexdump	Timing	Benchmark					
Database	JDBC Core	JDBC PostgreSQL	Chinook Dataset								
Web	Http Client J8	Tomcat WebApp Server		Ring	Multipart	SSE					
LLM	OpenAI	JTokkit									
Docker	Docker	Cargo	Cargo/ArangoDB	Cargo/Qdrant	Cargo/PostgreSQL						
License	License										
Others	Embedding in Java	Venice Doc	Markdown								

Primitives

Literals

Nil	nil
Boolean	true, false
Integer	150I, 1_000_000I, 0x1FFI
Long	1500, 1_000_000, 0x00A055FF
Float	3.569F, 2.0E+5F
Double	3.569, 2.0E+10
BigDecimal	6.897M, 2.345E+10M
BigInteger	1000N, 1_000_000N
Char	#\A, #\π, #\u03C0 #\space, #\newline, #\return, #\tab, #\formfeed, #\backspace, #\lparen, #\rparen, #\quote
String	"abcd", "ab\"cd", "PI: \u03C0" """\{ "age": 42 }"""
String interpolation	"~{x}", ""~{x}""" "~(inc x)", ""~(inc x)"""

Numbers

Arithmetic	+ - * /
Convert	int long float double decimal bigint
Compare	== = not= < > <= >= compare
Test	zero? pos? neg? even? odd? number? int? long? float? double? decimal?
NaN/Infinite	nan? infinite?
BigDecimal	dec/add dec/sub dec/mul dec/div dec/scale

Strings

Create	str
Use	count compare empty-to-nil first last nth nfist nlst seq rest butlast reverse shuffle str/subs str/nfist str/nlast str/rest str/nrest str/butlast str/butnlst str/chars str/pos str/repeat str/reverse str/lorem-ipsum

Index

Collections

Collections

Generic	count compare empty-to-nil empty into into! cons conj conj! remove repeat repeatedly cycle replace range group-by sort sort-by frequencies get-in seq reverse shuffle
Tests	empty? not-empty? distinct? coll? sequential? list? vector? set? sorted-set? mutable-set? map? sequential? hash-map? ordered-map? sorted-map? mutable-map? bytebuf?
Process	map map-indexed filter reduce group-by sort sort-by keep flatten docoll mapv run!

Lists

Create	() list list* mutable-list
Access	first second third fourth nth last peek rest butlast nfist nlst index-of last-index-of sublist some
Modify	cons conj conj! rest pop into into! concat distinct dedupe partition partition-all partition-by partition-at interpose interleave cartesian-product combinations mapcat flatten sort sort-by take take-while take-last drop drop-while drop-last split-at split-with
Test	list? mutable-list? coll? sequential? every? not-every? any? not-any?

Vectors

Create	[] vector vector* mutable-vector mapv
Access	first second third nth last peek butlast rest nfist nlst index-of last-index-of subvec some
Modify	cons conj conj! rest pop into into! concatv distinct dedupe partition partition-by partition-at interpose interleave cartesian-product combinations mapcat flatten sort sort-by take take-while take-last drop drop-while drop-last update update! assoc assoc! split-with

	str/index-of str/index-of-char str/index-of-not-char str/last-index-of	Nested get-in assoc-in update-in dissoc-in
Split/Join	str/split str/split-at str/split-lines str/split-columns str/join	Test vector? mutable-vector? coll? sequential? contains? not-contains? every? not-every? any? not-any?
Replace	str/replace-first str/replace-last str/replace-all	Sets
Strip	str/strip-start str/strip-end str/strip-indent str/strip-margin	Create #{} set sorted-set mutable-set Modify into into! cons cons! conj conj! disj
Linefeed	str/platform-lf str/cr-lf str/crlf-to-lf	Algebra difference union intersection subset? superset?
Conversion	str/lower-case str/upper-case	Test set? sorted-set? mutable-set? coll? contains? not-contains? every? not-every? any? not-any?
Regex	match? not-match?	Maps
Trim	str/trim str/trim-to-empty str/trim-to-nil str/trim-left str/trim-right	Create {} hash-map ordered-map sorted-map mutable-map zipmap Access find get keys vals Modify cons conj conj! assoc assoc! update update! dissoc dissoc! into into! concat flatten filter-k filter-kv reduce-kv merge merge-with merge-deep map-invert map-keys mapVals select-keys
Format	str/format str/quote str/double-quote str/double-unquote str/align str/wrap str/expand str/truncate	Entries map-entry key val entries map-entry?
Hex	str/hex-to-bytebuf str/bytbuf-to-hex str/format-bytbuf	Nested get-in assoc-in update-in dissoc-in
Bytebuf	bytebuf-from-string bytebuf-to-string	Test map? hash-map? ordered-map? sorted-map? mutable-map? coll? contains? not-contains?
Encode/Decode	str/encode-base64 str/decode-base64 str/encode-url str/decode-url str/escape-html str/escape-xml	Stack
Test	string? empty? not-empty? str/blank? str/not-blank? str/starts-with? str/ends-with? str/contains? str>equals-ignore-case? str/quoted? str/double-quoted?	Create stack Access peek pop! push! into! conj! count Test empty? stack?
Test char	str/char? str/digit? str/hexdigit? str/letter? str/whitespace? str/linefeed? str/lower-case? str/upper-case?	Queue
UTF	str/normalize-utf	Create queue Access peek into! conj! count Sync put! take! Async offer! poll!
Validation	str/valid-email-addr?	Process docoll transduce reduce
Other	str/levenshtein	
Chars		
Use	char char? char-escaped char-literals	
Conversion	str str/lower-case str/upper-case	

Test char	str/char?	str/digit?	str/letter?
	str/whitespace?	str/linefeed?	
	str/lower-case?	str/upper-case?	

Booleans

Boolean	true	false	
	boolean	not	boolean?
	false?	true?	

Keywords

Keyword	:a	:blue	
	keyword?	keyword	

Symbols

Symbol	'a	'blue	
	symbol?	qualified-symbol?	symbol

Nil

Nil	nil	
	nil?	some?

Just

Just	just	just?	
------	------	-------	--

Byte Buffer

Create	bytebuf	bytebuf-allocate	
	bytebuf-allocate-random		
	bytebuf-byte-order!		
	bytebuf-byte-order	bytebuf-merge	

Capacity	bytebuf-capacity	bytebuf-remaining	
	bytebuf-limit		
	bytebuf-ensure-free-capacity!		
	bytebuf-limit!	count	

Search	bytebuf-index-of		
--------	------------------	--	--

String	bytebuf-from-string	bytebuf-to-string	
--------	---------------------	-------------------	--

Test	empty?	not-empty?	bytebuf?
------	--------	------------	----------

Use	bytebuf-to-list	bytebuf-sub	
	bytebuf-pos	bytebuf-pos!	

Read	bytebuf-get-byte	bytebuf-get-int	
	bytebuf-get-long	bytebuf-get-float	
	bytebuf-get-double	bytebuf-get-buf!	

Write	bytebuf-put-byte!	bytebuf-put-int!	
	bytebuf-put-long!	bytebuf-put-float!	
	bytebuf-put-double!	bytebuf-put-buf!	

Base64	str/encode-base64	str/decode-base64	
--------	-------------------	-------------------	--

Hex	str/hex-to-bytebuf	str/bytbuf-to-hex	
	str/format-bytebuf		

Test

empty?	queue?	
--------	--------	--

DelayQueue

Create	delay-queue	
--------	-------------	--

Access	peek	count
--------	------	-------

Sync	put!	take!
------	------	-------

Async	poll!	
-------	-------	--

Test	empty?	delay-queue?
------	--------	--------------

Deque

Create	deque	
--------	-------	--

Access	peek	into!	conj!	count
--------	------	-------	-------	-------

Sync	put!	take!	put-head!	take-tail!
------	------	-------	-----------	------------

Async	offer!	poll!	offer-head!	poll-tail!
-------	--------	-------	-------------	------------

Process	docoll	transduce	reduce	
---------	--------	-----------	--------	--

Test	empty?	deque?	
------	--------	--------	--

CircularBuffer

Create	circular-buffer	
--------	-----------------	--

Access	peek	poll!	offer!	take!	put!
	count	empty			

Test	empty?	circular-buffer?	
------	--------	------------------	--

DAG (directed acyclic graph)

Create	dag/dag	dag/add-edges	
	dag/add-nodes		

Access	dag/nodes	dag/edges	dag/roots	
	count			

Children	dag/children	dag/direct-children	
----------	--------------	---------------------	--

Parents	dag/parents	dag/direct-parents	
---------	-------------	--------------------	--

Sort	dag/topological-sort	dag/compare-fn	
------	----------------------	----------------	--

Test	dag/dag?	dag/node?	dag/edge?	
	dag/parent-of?	dag/child-of?		
	empty?			

Lazy Sequences

Create	lazy-seq	
--------	----------	--

Realize	doall	
---------	-------	--

Test	lazy-seq?	
------	-----------	--

Regex

General `regex/pattern` `regex/matcher`
 `regex/reset` `regex/matches?`
 `regex/matches-not?` `regex/matches`
 `regex/group` `regex/groups`
 `regex/count` `regex/find?` `regex/find`
 `regex/find-all` `regex/find+`
 `regex/find-all+`

Math

Arithmetic `inc` `dec` `min` `max` `clamp`
 `mod` `mod-floor` `abs` `sgn`
 `negate` `floor` `ceil` `sqrt`
 `square` `pow` `exp` `log` `log2`
 `log10`

Util `digits`

Random `rand-long` `rand-double`
 `rand-bignum` `rand-gaussian`

Trigonometry `math/to-radians` `math/to-degrees`
 `math/sin` `math/cos` `math/tan`
 `math/asin` `math/acos` `math/atan`

Statistics `math/mean` `math/median`
 `math/quartiles` `math/quantile`
 `math/standard-deviation`

Algorithms `math/softmax`

Constants

E `math/E`
PI `math/PI`

Transducers

Use `transduce`

Functions `map` `map-indexed` `filter` `drop`
 `drop-while` `drop-last` `take`
 `take-while` `take-last` `keep`
 `remove` `dedupe` `distinct` `sorted`
 `reverse` `flatten` `halt-when`

Reductions `rf-first` `rf-last` `rf-every?`
 `rf-any?`

Early `reduced` `reduced?` `deref` `deref?`

Functions

Create `fn` `defn` `defn-` `identity`
 `comp` `partial` `memoize` `juxt`
 `fnil` `trampoline` `complement`

Arrays

Create	<code>make-array</code>	<code>object-array</code>	<code>string-array</code>
	<code>int-array</code>	<code>long-array</code>	<code>float-array</code>
	<code>double-array</code>		
Use	<code>aget</code>	<code>aset</code>	<code>alength</code>
	<code>asub</code>	<code>acopy</code>	
	<code>amap</code>		

Concurrency

Atoms	<code>atom</code>	<code>atom?</code>	<code>deref</code>	<code>deref?</code>
	<code>reset!</code>	<code>swap!</code>	<code>swap-vals!</code>	
	<code>compare-and-set!</code>	<code>add-watch</code>		
	<code>remove-watch</code>			
Locks	<code>lock</code>	<code>lock?</code>	<code>acquire</code>	
	<code>try-acquire</code>	<code>release</code>	<code>locked</code>	<code>locked?</code>
Locking	<code>locking</code>			
Futures	<code>future</code>	<code>future-task</code>	<code>future?</code>	
	<code>futures-fork</code>	<code>futures-wait</code>		
	<code>futures-thread-pool-info</code>	<code>done</code>		
	<code>cancel</code>	<code>cancelled?</code>	<code>deref</code>	
	<code>deref?</code>	<code>realized?</code>		
Promises	<code>promise</code>	<code>promise?</code>	<code>deliver</code>	
	<code>deliver-ex</code>	<code>realized?</code>		
	<code>then-accept</code>	<code>then-accept-both</code>		
	<code>then-apply</code>	<code>then-combine</code>		
	<code>then-compose</code>	<code>when-complete</code>		
	<code>accept-either</code>	<code>apply-to-either</code>		
	<code>all-of</code>	<code>any-of</code>	<code>or-timeout</code>	
	<code>complete-on-timeout</code>	<code>timeout-after</code>		
	<code>done?</code>	<code>cancel</code>	<code>cancelled?</code>	
Delay	<code>delay</code>	<code>delay?</code>	<code>deref</code>	<code>deref?</code>
	<code>force</code>	<code>realized?</code>		
Agents	<code>agent</code>	<code>send</code>	<code>send-off</code>	
	<code>restart-agent</code>	<code>set-error-handler!</code>		
	<code>agent-error</code>	<code>await</code>	<code>await-for</code>	
	<code>shutdown-agents</code>	<code>shutdown-agents</code>		
	<code>await-termination-agents</code>			
	<code>await-termination-agents?</code>			
	<code>agent-send-thread-pool-info</code>			
	<code>agent-send-off-thread-pool-info</code>			
Volatiles	<code>volatile</code>	<code>volatile?</code>	<code>deref</code>	
	<code>deref?</code>	<code>reset!</code>	<code>swap!</code>	
ThreadLocal	<code>thread-local</code>	<code>thread-local?</code>		
	<code>thread-local-clear</code>			
	<code>thread-local-map</code>	<code>assoc</code>	<code>dissoc</code>	
	<code>get</code>	<code>binding</code>	<code>def-dynamic</code>	
Threads	<code>thread</code>	<code>thread-id</code>	<code>thread-name</code>	
	<code>thread-daemon?</code>	<code>thread-interrupted?</code>		
	<code>thread-interrupted</code>			
Parallel	<code>pcalls</code>	<code>pmap</code>	<code>preduce</code>

Modules

Kira

Templating system

```
(load-module :kira)

Kira      kira/eval    kira/fn
Escape     kira/escape-xml  kira/escape-html
```

Cryptography

```
(load-module :crypt)

Ciphers   crypt/ciphers   crypt/max-key-size
          crypt/provider?
          crypt/add-bouncy-castle-provider

Hashes    crypt/md5-hash   crypt/sha1-hash
          crypt/sha512-hash  crypt/pbkdf2-hash

Encrypt   crypt/encryptor-aes-256-gcm
          crypt/encryptor-chacha20
          crypt/encryptor-chacha20-bouncycastle

File hash crypt/hash-file
          crypt/verify-file-hash
```

Java Keystore

```
(load-module :keystores)

Load       keystores/load

Certificates  keystores/aliases
              keystores/certificate
              keystores/subject-dn
              keystores/issuer-dn
              keystores/parse-dn
              keystores/expiry-date
              keystores/expired?
```

JSON Lines

```
(load-module :jsonl)

read    jsonl/read-str  jsonl/slurp
       jsonl/lazy-seq-slurper

write   jsonl/write-str  jsonl/spit
       jsonl/spitln
```

Zip Vault

AES 256 encrypted and password protected zip file

Hexdump

```
(load-module :hexdump)

Hexdump    hexdump/dump
```

Semver

Semantic versioning

```
(load-module :semver)

Semver    semver/parse  semver/version
Validation semver/valid? semver/valid-format?
Test      semver/newer? semver/older?
          semver/equal? semver/cmp
```

Geo IP

Geolocation mapping for IP addresses

```
(load-module :geoip)

Lookup    geoip/ip-to-country-resolver
          geoip/ip-to-country-loc-resolver
          geoip/ip-to-city-loc-resolver
          geoip/ip-to-city-loc-resolver-mem-
          optimized

Databases geoip/download-google-country-db-to-
           csvfile
           geoip/download-maxmind-db-to-zipfile
           geoip/download-maxmind-db

DB Parser  geoip/parse-maxmind-country-ip-db
           geoip/parse-maxmind-city-ip-db
           geoip/parse-maxmind-country-db
           geoip/parse-maxmind-city-db

Util      geoip/build-maxmind-country-db-url
           geoip/build-maxmind-city-db-url
           geoip/map-location-to-numerics
           geoip/country-to-location-resolver
           geoip/addr-ranges->trie
```

Excel

Read/Write Excel files

Venice is compatible with Apache POI 5.x.

To use charts with Excel documents Apache POI 5.2.0 or newer is required.

```
(load-module :excel)
```

```
Create/Open  excel/create  excel/open
```

(load-module :zipvault)		
Create	zipvault/zip	zipvault/zip-folder
Add	zipvault/add-file	zipvault/add-files
	zipvault/add-folder	
	zipvault/add-empty-folder	
	zipvault/add-stream	
Remove	zipvault/remove-files	
Extract	zipvault/extract-file	
	zipvault/extract-all	
	zipvault/extract-file-data	
Util	zipvault/encrypted?	
	zipvault/valid-zip-file?

Gradle Wrapper

Uses the 'gradlew.sh' or 'gradlew.bat' shell scripts from a Gradle project to run Gradle commands on the project. For projects not based on the Gradle Wrapper use the :gradle module instead.

```
(load-module :gradlew)

Gradle  gradlew/version  gradlew/run
        gradlew/run*
```

Gradle

Uses the 'gradle.sh' or 'gradle.bat' shell scripts from a locally installed Gradle version to run Gradle commands on a project. For projects based on the Gradle Wrapper use the :gradlew module instead.

```
(load-module :gradle)

Gradle  gradle/with-home  gradle/version
        gradle/task
```

Maven

```
(load-module :maven)

Artifact  maven/parse-artifact
          maven/artifact-filename
          maven/artifact-uri

Download   maven/download  maven/get

Commands   maven/home-dir  maven/mvn
          maven/version  maven/dependencies

Install    maven/install   maven/uninstall
```

Docker

```
(load-module :docker)

Docker    docker/version  docker/cmd
          docker/debug

Images   docker/images   docker/image-pull
          docker/rmi      docker/image-rm
          docker/image-prune

Containers docker/run     docker/ps
           docker/start   docker/stop
           docker/exec   docker/exec&
           docker/rm     docker/prune  docker/cp
           docker/diff   docker/pause
           docker/unpause docker/wait
           docker/logs
```

Install the required Apache POI 5.x libraries:

```
(do
  (load-module :excel-install)
  (excel-install/install :dir (repl/libs-dir)
                        :silent false))
```

Fonts

True Type Fonts

```
(load-module :fonts)
```

```
Download  fonts/download-font-family
          fonts/download-demo-fonts
```

Test

```
(load-module :test)
```

Define	test/deftest
Fixture	test/use-fixtures
Run	test/run-tests test/run-test-var test/successful?
Assert	assert assert-false assert-eq assert-ne assert-throws assert-does-not-throw assert-throws-with-msg

Configuration

Manages configurations with system property & env var support

```

    docker/volume-list
    docker/volume-create
    docker/volume-inspect
    docker/volume-rm
    docker/volume-prune
    docker/volume-exists?

Utils      docker/images-query-by-repo
          docker/image-ready?
          docker/container-find-by-name
          docker/container-exists-with-name?
          docker/container-running-with-name?

          docker/container-image-info-by-name

```

Cargo

Docker Testcontainers

Greatly simplifies starting/stopping docker containers. Depending on the state of the container pulls a new image, starts or runs the container and checks the logs if it has successfully started up, all this in one single command.

It's the base module for cargo modules like Cargo/ArangoDB, Cargo/PostgreSQL, and Cargo/Qdrant.

```
(load-module :cargo)
```

Cargo	cargo/start	cargo/stop
	cargo/running?	cargo/purge

Cargo ArangoDB

ArangoDB Testcontainers

```
(load-module :cargo-arangodb)
```

Lifecycle	cargo-arangodb/start
	cargo-arangodb/stop
	cargo-arangodb/running?
	cargo-arangodb/logs
Backup	cargo-arangodb/db-dump
	cargo-arangodb/db-restore
	cargo-arangodb/exists-db-dump?
	cargo-arangodb/remove-db-dump
	cargo-arangodb/list-db-dumps
	cargo-arangodb/upload-db-dump
	cargo-arangodb/download-db-dump

Cargo Qdrant Vector DB

Qdrant Testcontainers

```
(load-module :cargo-qdrant)
```

<code>(load-module :config)</code>		
Build	config/build	
File	config/file	config/resource
Env	config/env-var	config/env
Properties	config/property-var	config/properties

Component

Managing lifecycle and dependencies of components

<code>(load-module :component)</code>		
Build	component/system-map	component/system-using
Protocol	component/Component	
Util	component/deps	component/dep
	component/id	

App

Venice application archive

<code>(load-module :app)</code>		
Build	app/build	
Manifest	app/manifest	

Benchmark

```
(load-module :benchmark)
```

Utils	benchmark/benchmark
-------	-------------------------------------

Timing

Timing

<code>(load-module :timing)</code>		
Timing	timing/run	timing/elapsed

Grep

Grep like search tool

<code>(load-module :grep)</code>		
Grep	grep/grep	grep/grep-zip

QR-Reference

Create, parse, and format QR references according to the Swiss payment standards.

Lifecycle

```
cargo-qdrant/start    cargo-qdrant/stop
cargo-qdrant/running?
cargo-qdrant/logs
```

```
(load-module :qrref)
QR Ref    qrref/create   qrref/format
          qrref/valid?   qrref/checksum
```

PostgreSQL DB

PostgreSQL Testcontainers

```
(load-module :cargo-postgresql)
Lifecycle  cargo-postgresql/start
           cargo-postgresql/stop
           cargo-postgresql/running?
           cargo-postgresql/logs
```

Tomcat

Embedded Tomcat WebApp Server

```
(load-module :tomcat)
Tomcat   tomcat/start    tomcat/stop
          tomcat/destroy   tomcat/shutdown
          tomcat/state
Servlet  tomcat/create-servlet
          tomcat/hello-world-servlet
Install Java 3rd party libraries:
(do
  (load-module :tomcat-install)
  (tomcat-install/install :dir (repl/libs-dir)
                         :silent false))
```

Ring

```
(load-module :ring)
Servlet  ring/create-servlet
Routing   ring/match-routes
Utils     ring-util/redirect
          ring-util/not-found-response
          ring-util/get-request-header
          ring-util/get-request-header-accept-
          mimetypes
          ring-util/get-request-parameters
          ring-util/get-request-parameter
          ring-util/get-request-long-parameter
          ring-util/html-request?
          ring-util/json-request?
          ring-util/parse-charset
          ring-util/debug?

Middleware ring-mw/mw-identity
           ring-mw/mw-debug
           ring-mw/mw-print-uri
```

QR-Bill

Create Swiss QR bills according to the Swiss payment standards.

```
(load-module :qrbill)
QR Bill   qrbill/address   qrbill/bill
          qrbill/write
```

Install Java 3rd party libraries:

```
(do
  (load-module :qrbill-install)
  (qrbill-install/install :dir (repl/libs-dir)
                         :silent false))
```

QR-Codes

Encode and decode QR code images.

```
(load-module :qrcode)
QR Code   qrcode/decode   qrcode/encode
```

Install Java 3rd party libraries:

```
(do
  (load-module :qrcode-install)
  (qrcode-install/install :dir (repl/libs-dir)
                         :silent false))
```

Ascii Table

Create and customize simple ASCII tables.

```
(load-module :ascii-table)
Render   ascii-table/render   ascii-table/print
```

Matrix

Simple matrix functions. To process large matrices use the "Efficient Java Matrix Library" (EJML) <http://ejml.org/wiki/> instead.

```
(load-module :matrix)
Matrix   matrix/validate   matrix/vector2d
          matrix/empty?   matrix/rows
          matrix/columns   matrix/row
          matrix/column
Format   matrix/format
Elements  matrix/element   matrix/assoc-element
Add      matrix/add-column-at-start
          matrix/add-column-at-end
          matrix/add-row-at-start
          matrix/add-row-at-end
```

	<code>ring-mw/mw-request-counter</code> <code>ring-mw/mw-dump-request</code> <code>ring-mw/mw-dump-response</code>
Session	<code>ring-session/session-invalidate</code> <code>ring-session/session-clear</code> <code>ring-session/session-id</code> <code>ring-session/session-get-value</code> <code>ring-session/session-remove-value</code> <code>ring-session/session-creation-time</code>
Multipart	<code>ring-multipart/multipart-request?</code> <code>ring-multipart/parts</code> <code>ring-multipart/parts-delete-all</code>

Tracing

Tracing functions

	<code>(load-module :trace)</code>
Tracing	<code>trace/trace</code> <code>trace/trace-var</code> <code>trace/untrace-var</code>
Test	<code>trace/traced?</code> <code>trace/traceable?</code>
Util	<code>trace/trace-str-limit</code>
Tee	<code>trace/tee-></code> <code>trace/tee->></code> <code>trace/tee</code>

Shell

Functions to deal with the operating system

	<code>(load-module :shell)</code>
Open	<code>shell/open</code> <code>shell/open-macos-app</code>
Process	<code>shell/kill</code> <code>shell/kill-forcibly</code> <code>shell/wait-for-process-exit</code> <code>shell/alive?</code> <code>shell/pid</code> <code>shell/nice</code> <code>shell/process-handle</code> <code>shell/process-handle?</code> <code>shell/process-info</code> <code>shell/processes</code> <code>shell/processes-info</code> <code>shell/descendant-processes</code> <code>shell/parent-process</code> <code>shell/get-process-pids</code> <code>shell/exists-process-with-pid?</code>
Util	<code>shell/diff</code>

JDBC Core

	<code>(load-module :jdbc-core)</code>
Create/Drop	<code>jdbc-core/create-database</code> <code>jdbc-core/drop-database</code>
Provider	<code>jdbc-core/postgresql?</code>
Meta Data	<code>jdbc-core/meta-data</code> <code>jdbc-core/features</code>

Remove	<code>matrix/remove-column</code> <code>matrix/remove-row</code>
LinAlg	<code>matrix/transpose</code>

Ansi

ANSI codes, styles, and colorization helper functions

	<code>(load-module :ansi)</code>
Colors	<code>ansi/fg-color</code> <code>ansi/bg-color</code>
Styles	<code>ansi/style</code> <code>ansi/ansi</code> <code>ansi/with-ansi</code> <code>ansi/without-ansi</code>
Cursor	<code>ansi/without-cursor</code>
Progress	<code>ansi/progress</code> <code>ansi/progress-bar</code>

Mimetypes

`(load-module :mimetypes)`

Mimetypes	<code>mimetypes/probe-content-type</code>
-----------	---

Multipart

`(load-module :multipart)`

Multipart	<code>multipart/render</code> <code>multipart/parse</code> <code>multipart/http-content-type-header</code>
-----------	---

SSE

Server Side Events

`(load-module :server-side-events)`

Render/Parse	<code>server-side-events/render</code> <code>server-side-events/parse</code>
Read	<code>server-side-events/read-event</code> <code>server-side-events/read-events</code>

HTTP Client J8

HTTP Client based on HttpURLConnection (Java 8+)

`(load-module :http-client-j8)`

HTTP Client	<code>http-client-j8/send</code> <code>http-client-j8/upload-file</code> <code>http-client-j8/upload-multipart</code>
Util	<code>http-client-j8/build-url</code> <code>http-client-j8/create-authorization-bearer</code>
Response	<code>http-client-j8/slurp-response</code>

Embedding in Java

Evaluation

```
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        final Venice venice = new Venice();

        final Long result = (Long)venice.eval("(+ 1 2)");
    }
}
```

Passing parameters

```
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        final Long result = (Long)venice.eval(
            "(+ x y 3)",
            Parameters.of("x", 6, "y", 3L));
    }
}
```

Dealing with Java objects

```
import java.awt.Point;
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        // returns a string: "Point=(x: 100.0, y: 200.0)"
        String ret = (String)venice.eval(
            "(let [x (:x point)
                  \n      y (:y point)]
                  \n      (str \"Point=(x: \" x \" , y: \" y \")\")",
            Parameters.of("point", new Point(100, 200)));

        // returns a java.awt.Point: [x=110,y=220]
        Point point = (Point)venice.eval(
            "(. :java.awt.Point :new (+ x 10) (+ y 20))",
            Parameters.of("x", 100, "y", 200));
    }
}
```

Precompiling

```
import com.github.jlangch.venice.IPreCompiled;
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;

public class Example {
```

```

public static void main(String[] args) {
    Venice venice = new Venice();

    IPreCompiled precompiled = venice.compile("example", "(+ 1 x)");

    for(int ii=0; ii<100; ii++) {
        venice.eval(precompiled, Parameters.of("x", ii));
    }
}
}

```

Java Interop

```

import java.time.ZonedDateTime;
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        Venice venice = new Venice();

        Long val = (Long)venice.eval("(.. :java.lang.Math :min 20 30)");

        ZonedDateTime ts = (ZonedDateTime)venice.eval(
            "(. (. :java.time.ZonedDateTime :now) :plusDays 5)");
    }
}

```

Sandbox

```

import com.github.jlangch.venice.SecurityException;
import com.github.jlangch.venice.Venice;
import com.github.jlangch.venice.javainterop.SandboxInterceptor;
import com.github.jlangch.venice.javainterop.SandboxRules;

public class SandboxExample {
    public static void main(final String[] args) {
        final SandboxInterceptor sandbox =
            new SandboxRules()
                // Venice functions: blacklist all unsafe functions
                .rejectAllUnsafeFunctions()

                // Venice functions: whitelist rules for print functions to offset
                // blacklist rules by individual functions
                .whitelistVeniceFunctions("*print*")

                .sandbox();

        final Venice venice = new Venice(sandbox);

        // => OK, 'println' is part of the unsafe functions, but enabled by the 2nd rule
        venice.eval("(println 100)");

        // => FAIL, 'read-line' is part of the unsafe functions
        try {
            venice.eval("(read-line)");
        }
        catch(SecurityException ex) {
            System.out.println("REJECTED: (read-line)");
        }
    }
}

```

Recursion

Recursion

Functional languages support **Tail Call Optimization (TCO)** to provide memory efficient recursion. Venice supports *automatic Tail Call Optimization* and *Self Recursion* through the `loop..recur` syntax. Self recursion is a way to mimic TCO.

In addition Venice provides the `trampoline` function for mutual recursion for more involved forms of recursion.

Self-Recursive Calls (`loop - recur`)

Venice self-recursive calls do not consume a new stack frame for every new recursion iteration and have a constant memory usage. It's the only non-stack-consuming looping construct in Venice. To make it work the `recur` expression must be in *tail position*. This way Venice can turn the recursive `loop..recur` construct behind the scene into a plain loop.

Definition: The tail position is a position which an expression would return a value from. There are no more forms evaluated after the form in the tail position is evaluated.

Remember: Venice offers various alternative solutions to recursion to solve loops like `(+ 1 2 3 4 5 6)` to sum up a list of numbers or the powerful `reduce` function: `(reduce + [1 2 3 4 5])`. Many Venice functions accept an arbitrary number of arguments to prevent you from writing loops.

Example 1: Recursively sum up the numbers 0..n:

```
;; Definition:  
;;   sum 0 -> 0  
;;   sum n -> n + sum (n - 1)  
(do  
  (defn sum [n]  
    ;; the transformed recursion uses an accumulator for intermediate results  
    (loop [cnt n, acc 0]  
      (if (zero? cnt)  
          acc  
          (recur (dec cnt) (+ acc cnt)))))  
  
(sum 100000) ; => 5000050000
```

Example 2: Recursively compute the factorial of a number:

```
;; Definition:  
;;   factorial 1 -> 1  
;;   factorial n -> n * factorial (n - 1)  
(do  
  (defn factorial [x]  
    ;; the transformed recursion uses an accumulator for intermediate results  
    (loop [n x, acc 1N]  
      (if (== n 1)  
          acc  
          (recur (dec n) (* acc n)))))  
  
(factorial 5)      ; => 120N  
(factorial 10000) ; => 284625968091...00000N (35661 digits)
```

Example 3: Recursively compute the Fibonacci numbers (0 1 1 2 3 5 8 ...):

```
;; Definition:  
;;   fib 0 -> 0  
;;   fib 1 -> 1  
;;   fib n -> fib (n - 2) + fib (n - 1)  
(do  
  (defn fib [x]  
    (loop [n x, a 0N, b 1N]  
      (case n  
        0 a  
        1 b  
        (recur (dec n) b (+ a b))))  
  
(fib 6)      ; => 8N  
(fib 100000) ; => 259740693472217...28746875N (20901 digits)
```

Recursion with lazy sequences

Example 1: Lazy Fibonacci number sequence computed by a recursive function:

```
(do  
  (defn fib  
    ([]      (fib 0N 1N))  
    ([a b]  (cons a #(fib b (+ a b)))))  
  
(doall (take 7 (fib)))) ; => (0 1 1 2 3 5 8)
```

Example 2: Factorial numbers:

```
(do  
  (defn factorial  
    ([]      (factorial 1 1N))  
    ([x]    (first (drop (dec x) (factorial))))  
    ([n acc] (cons acc #(factorial (inc n) (* acc (inc n))))))  
  
(factorial 5)      ; => 120N  
(factorial 10000) ; => 284625968091...00000N (35661 digits)
```

Mutually recursive calls (trampoline)

`trampoline` can be used to convert algorithms requiring mutual recursion without stack consumption. Calls `f`, if `f` returns a function, calls that function with no arguments, and continues to repeat, until the return value is not a function, then returns that non-function value.

The function `trampoline` is defined simplified as

```
(defn trampoline [f]  
  (loop [f f]  
    (let [ret (f)]  
      (if (fn? ret) (recur ret) ret))))
```

Examples:

```
(do
  (defn is-odd? [n]
    (if (zero? n) false #(is-even? (dec n)))

  (defn is-even? [n]
    (if (zero? n) true #(is-odd? (dec n)))

  (trampoline (is-odd? 10000)))
```

```
(do
  (defn factorial
    ([n] #(factorial n 1N))
    ([n acc] (if (< n 2)
                  acc
                  #(factorial (dec n) (* acc n)))))

  (trampoline (factorial 10000)))
```

Tail Call Optimization (TCO)

Venice has support for automatic *tail call optimization*. The recursive call must be in tail position.

```
(do
  (defn factorial
    ([n]      (factorial n 1N))
    ([n acc] (if (== n 1)
                  acc
                  (factorial (dec n) (* acc n)))))

  (factorial 5)      ; => 120N
  (factorial 10000)) ; => 284625968091...00000N (35661 digits)
```

Recursion vs Folding

Tail call recursive functions, can always be written in terms of a reducing (folding) function. E.g.:

```
(do
  (defn factorial [n]
    ;; reducing factorial
    (reduce * 1N (range 1 (inc n)))))

  (factorial 5)      ; => 120N
  (factorial 10000)) ; => 284625968091...00000N (35661 digits)
```

But not all recursive functions can be transformed into a tail recursive function and translated into a loop. The [Ackermann's function](#) is such an example of a non [primitive recursive function](#) that can not be de-reursed into loops.

Recursion and Memoization

For some recursive algorithms *memoization* can speed up computation dramatically:

```
(do
  (def fibonacci
```

```
(memoize (fn [n]
            (if (< n 2)
                (max n 0)
                (+ (fibonacci (- n 1)) (fibonacci (- n 2))))))

(fibonacci 30))
```

Please note that this naive memoization approach with recursive functions does **not** work as expected:

```
(do
  (defn fib-simple [n]
    (if (< n 2)
        (max n 0)
        (+ (fib-simple (- n 1)) (fib-simple (- n 2)))))

  (def fib-memoize (memoize fib-simple))

  (fib-memoize 30))
```

memoization is doing a good job in computing fibonacci numbers using simple recursion. It eliminates the recurring computation of the predecessors values.

Nevertheless there are recursive algorithms like the *Ackermann* function where memoization has to raise its arms.

Compare recursion efficiency

To see how efficient tail call optimization for recursion is we compare simple recursion with self recursion applied to computing Fibonacci numbers.

Note: all examples run with upfront macro expansion enabled.

```
(do
  (load-module :benchmark ['benchmark :as 'b])

  (defn fib-simple [n]
    (if (< n 2)
        n
        (+ (fib-simple (- n 1)) (fib-simple (- n 2)))))

  (defn fib-tco
    ([n]
     (fib-tco n 0N 1N))
    ([n a b]
     (case n
       0 a
       1 b
       (fib-tco (dec n) b (+ a b)))))

  (defn fib-loop-recur [x]
    (loop [n x, a 0N, b 1N]
      (case n
        0 a
        1 b
        (recur (dec n) b (+ a b)))))

  (def fib-memoize
    (memoize
      (fn [n]
        (if (< n 2)
            n
            (+ (fib-memoize (- n 1)) (fib-memoize (- n 2)))))))
```

```
;; (b/benchmark (fib-simple 30) 5 5)
;; (b/benchmark (fib-tco 30) 5000 1000)
;; (b/benchmark (fib-loop-recur 30) 5000 1000)
;; (time (fib-memoize 30))  ;; memoized functions can not be benchmarked

;; run on MacBook Air M2, with 'macroexpand' enabled
;; +-----+-----+
;; | (fib-simple 30)      | 1.171s |
;; | (fib-tco 30)        | 31.286µs |
;; | (fib-loop-recur 30) | 27.946µs |
;; | (fib-memoize 30)    | 2.540ms |
;; +-----+-----+
```

Destructuring

Destructuring

Sequential Destructuring

Sequential destructuring breaks up a sequential data structure as a Venice list or vector within a let binding

```
(do
  (let [[x y z] [1 2 3]]
    (println x y z))
  ;;=> 1 2 3

  ;; for strings, the elements are destructured by character.
  (let [[x y z] "abc"]
    (println x y z)))  ;;= > a b c
```

or within function parameters

```
(do
  (defn position [[x y]]
    (println "x:" x "y:" y))

  (position [1 2]))  ;;= > x: 1 y: 2
```

The destructured collection must not be of same size as the number of binding names

```
(do
  (let [[a b c d e f] '(1 2 3)]
    (println a b c d e f))  ;;= > 1 2 3 nil nil nil

  (let [[a b c] '(1 2 3 4 5 6 7 8 9)]
    (println a b c)))  ;;= > 1 2 3
```

Working with tail elements '&' and ignoring bindings '_'

```
(do
  (let [[a b c & z] '(1 2 3 4 5 6 7 8 9)]
    (println a b c z))  ;;= > 1 2 3 (4 5 6 7 8 9)

  (let [[a _ b _ c & z] '(1 2 3 4 5 6 7 8 9)]
    (println a b c z)))  ;;= > 1 3 5 (6 7 8 9)
```

Binding the entire collection with ':as'

```
(do
  (let [[a b c & z :as all] '(1 2 3 4 5 6 7 8 9)]
    (println a b c z all))
  ;;= > 1 2 3 (4 5 6 7 8 9) (1 2 3 4 5 6 7 8 9)
)
```

Nested bindings

```
(do
  (def line [[5 10] [10 20]])
  (let [[[x1 y1][x2 y2]] line]
    (printf "Line from (%d,%d) to (%d,%d)%n" x1 y1 x2 y2))
    ;; => "Line from (5,10) to (10,20)"
  )
```

:as or & can be used at any level

```
(do
  (def line [[5 10] [10 20]])
  (let [[[a b :as group1] [c d :as group2]] line]
    (println a b group1)      ;; => 5 10 [5 10]
    (println c d group2)))   ;; => 10 20 [10 20]
```

Associative Destructuring

Associative destructuring breaks up an associative (key/value) data structure as a Venice map within a let binding.

```
(do
  (let [{:a :a, :b :b, :c :c} {:a "A" :b "B" :d "D"}]
    (println a b c)))  ;; => A B nil
```

```
(do
  (def map_keyword {:a "A" :b "B" :c 3 :d 4})
  (def map_strings {"a" "A" "b" "B" "c" 3 "d" 4})

  (let [{:keys [a b c]} map_keyword]
    (println a b c))  ;; => A B 3

  (let [{:strs [a b c]} map_strings]
    (println a b c)))  ;; => A B 3
```

Binding the entire collection with `:as`

```
(do
  (def map_keyword {:a "A" :b "B" :c 3 :d 4})

  (let [{:keys [a b c] :as all} map_keyword]
    (println a b c all)))
  ;; => A B 3 {:a A :b B :c 3 :d 4}
```

Binding with defaults ':or'

```
(do
  (defn configure [options]
    (let [{:keys [port debug verbose] :or {port 8000, debug false, verbose false}} options]
      (println "port =" port " debug =" debug " verbose =" verbose)))
    ;; => port 8000, debug false, verbose false

  (configure {:debug true}))
```

Nested destructuring

Associative destructuring can be nested and combined with sequential destructuring

```
(do
  (def users
    {::peter {::role "clerk"
              ::branch "Zurich"
              ::age 40}

     ::magda {::role "head of HR"
               ::branch "Bern"
               ::age 45}

     ::kurt {::role "assistant"
             ::branch "Lucerne"
             ::age 32}})

  (let [{::keys [role branch]} ::peter] users]
    (println "Peter is a" role "located at" branch)))
  ;;= Peter is a clerk located at Zurich
```

Shebang

Shebang Scripts

With a little bit of sorcery a Venice script can be run as a Unix *Shebang* script.

REPL based Venice Shebang script

This *shebang* demo uses the Venice interpreter from an installed Venice REPL, giving the script access to all the 3rd party libraries installed within the REPL.

Prerequisites

1. The Venice REPL must be installed
2. The Venice version must be v1.12.26 or higher
3. MacOS or Linux operating systems

Example: shebang-demo.venice

```
#!/bin/sh

#_ """
# Venice Shebang demo script

# The "run-script.sh" is provided by the installed Venice REPL. It
# starts a Venice interpreter on the REPL environment and runs this
# script.

REPL_HOME=/Users/juerg/Desktop/venice/

exec ${REPL_HOME}/run-script.sh "$0" "$@"

"""

(printhn "Venice Shebang Demo")
(printhn)

(printhn "Args:" *ARGV*)

(printhn "Time:" (time/local-date-time))
```

Execution:

```
> chmod +x ./shebang-demo.venice
> ./shebang-demo.venice 1 2 3
Venice Shebang Demo

Args: (1 2 3)
Time: 2024-07-26T14:49:47.963
nil
```

Standalone Venice Shebang script

This *shebang* demo implicitly downloads the Venice library from the Maven repository when the script starts, provided the Venice library is not yet available in the installation directory.

Example: shebang-demo.venice

```

#!/bin/sh

#_ """
# Venice Shebang demo script

VERSION=1.12.64          # Venice version to use
DIR=/tmp/venice           # Install dir
REPO=https://repo1.maven.org/maven2 # Maven repository

JAR=venice-${VERSION}.jar

[ -d ${DIR} ] || mkdir ${DIR}

if [ ! -f ${DIR}/${JAR} ]; then
  echo "Downloading ${JAR} from ${REPO} to ${DIR} ..."
  curl -s "${REPO}/com/github/jlangch/venice/${VERSION}/${JAR}" --output ${DIR}/${JAR}
fi

exec java -server -jar "${DIR}/${JAR}" -file "$0" "$@"

"""
"""

(println "Venice Shebang Demo")
(println)

(println "Args:" *ARGV*)
(println "Time:" (time/local-date-time))

```

Execution:

```

> chmod +x ./shebang-demo.venice
> ./shebang-demo.venice 1 2 3
Venice Shebang Demo

Args: (1 2 3)
Time: 2024-07-26T14:49:47.963
nil

```

Running a Venice Shebang script as Unix cron job

Open the cron editor:

```

> export EDITOR=/bin/vi
> crontab -e

```

Add the following line to schedule the job:

```

30 23 * * Mon-Fri /bin/sh /home/foo/shebang-demo.venice 1 2 3

```

VeniceDoc

VeniceDoc

VeniceDoc is a documentation generator for the *Venice* language for generating API documentation in HTML format from *Venice* source code. It is used internally for generating the PDF and HTML cheatsheets. The function `doc` makes use of it to display the documentation for functions.

Example

Define a function `add` with documentation:

```
(defn
  ^{:arglists '(
    "(add)", "(add x)", "(add x y)", "(add x y & more)"
    :doc
    """
      Returns the sum of the numbers.
      `(add)` returns 0.
    """
    :examples '(
      "(add)",
      "(add 1)",
      "(add 1 2)",
      "(add 1 2 3 4)")
    :see-also '(
      "+", "-", "*", "/")
  )}

add

([] 0)
([x] x)
([x y] (+ x y))
([x y & xs] (+ x y xs)))
```

Show its documentation from the REPL:

```
venice> (doc add)
```

REPL Output:

```
(add), (add x), (add x y), (add x y & more)

Returns the sum of the numbers. (add) returns 0.

EXAMPLES:
  (add)

  (add 1)

  (add 1 2)

  (add 1 2 3 4)
```

SEE ALSO:

[+](#), [-](#), [*](#), [/](#)

VeniceDoc Format

The documentation is defined as a Venice metadata `map`:

```
{ :arglists '("(add)", "(add x)")  
:doc "Returns the sum of the numbers."  
:examples '("(add 1)", "(add 1 2)")  
:see-also '("+" , "-") , "*" , "/" ) }
```

key	description
:arglist	the optional arglist, a list of variadic arg specs
:doc	the documentation in Venice markdown format
:examples	optional examples, a list of Venice scripts. Use triple quotes for multi-line scripts
:see-also	an optional list of cross referenced functions

Markdown

Venice Markdown

Headings

To create a heading, add one to four `#` symbols before the heading text. The number of `#` will determine the size of the heading.

```
# The largest heading  
## The second largest heading  
### The third largest heading  
#### The fourth largest heading
```

Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines (a line containing nothing but spaces or tabs).

Within a paragraph line breaks can be added by placing a `pilcrow`

```
Line 1¶Line 2¶  
Line 3
```

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines (a line containing nothing but spaces or tabs).

Within a paragraph line breaks can be added by placing a `pilcrow`

```
Line 1  
Line 2  
Line 3
```

Styling

Venice markdown supports *italic*, **bold**, and ***bold-italic*** styling

```
This is *italic*, **bold**, and ***bold-italic*** styled text.
```

This is *italic*, **bold**, and ***bold-italic*** styled text.

Lists

Unordered List

```
* item 1  
* item 2  
* item 3
```

- item 1
- item 2

- item 3

Ordered List

1. item 1
2. item 2
3. item 3

1. item 1
2. item 2
3. item 3

Multiline list items with explicit line breaks:

```
* item 1
* item 2
next line
next line
* item 3
```

- item 1
- item 2
- next line
- next line
- item 3

Multiline list items with auto line breaks:

```
* item 1
* Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod
tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim
veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex
ea commodo consequat. Duis aute irure dolor in reprehenderit in
voluptate velit esse cillum dolore eu fugiat nulla pariatur.
* item 3
```

- item 1
- Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur.
- item 3

Links

Links are created by wrapping link text in brackets [], and then wrapping the URL in parentheses ().

```
[Venice] (https://github.com/jlangch/venice)
```

Venice

Tables

A simple table

JAN	1
FEB	20
MAR	300

JAN 1
FEB 20
MAR 300

Column alignment

1	1	1
200	200	200
30000	30000	30000

1	1	1
200	200	200
30000	30000	30000

Width header

Col 1	Col 2	Col 3
1	1	1
200	200	200
30000	30000	30000

Col 1	Col 2	Col 3
1	1	1
200	200	200
30000	30000	30000

PDF rendered tables have always a width of 100%. In some use cases an additional left aligned column can trick the rendered table:

1	1	1
200	200	200
30000	30000	30000

Col 1	Col 2	Col 3
1	1	1
200	200	200
30000	30000	30000

Line breaks in cells

JAN	1	2	3
FEB	20		
MAR	300		

JAN	1	2
-----	---	---

```
3  
FEB 20  
MAR 300
```

Column format using CSS styles

The Venice markdown supports a few CSS styles

Text alignment:

- `text-align: left`
- `text-align: center`
- `text-align: right`

Column width:

- `width: 15%`
- `width: 15pm`
- `width: 15em`
- `width: auto`

```
| Col 1 | Col 2 |
| [[text-align: left; width: 6em]] | [[text-align: left; width: 6em]] |
| 1      | 1      |
| 200    | 200    |
| 30000 | 30000 |
```

Col 1	Col 2
1	1
200	200
30000	30000

Code

Code can be called out within a text by enclosing it with single backticks.

```
To open a namespace use `(ns name)`.
```

To open a namespace use `(ns name)`.

Code block are enclosed with three backticks:

```
```
(defn hello []
 (println "Hello stranger"))

(hello)
```
```

producing

```
(defn hello []
  (println "Hello stranger"))

(hello)
```

Function Details

top

#{} ()

Creates a set.

```
#{10 20 30}  
=> #{10 20 30}
```

top

()

Creates a list.

```
'(10 20 30)  
=> (10 20 30)
```

top

*

```
(*)  
(* x)  
(* x y)  
(* x y & more)
```

Returns the product of numbers. (*) returns 1

```
(*)  
=> 1  
  
(* 4)  
=> 4  
  
(* 4 3)  
=> 12  
  
(* 4 3 2)  
=> 24  
  
(* 4I 3I)  
=> 12I  
  
(* 6.0 2)  
=> 12.0
```

```
(* 6 1.5M)
=> 9.0M
```

SEE ALSO

`+`

Returns the sum of the numbers. `(+)` returns 0.

`-`

If one number is supplied, returns the negation, else subtracts the numbers from x and returns the result.

`/`

If no denominators are supplied, returns 1/numerator, else returns numerator divided by all of the denominators.

dec/add

Adds two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

dec/sub

Subtract y from x and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

dec/mul

Multiplies two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, ...

dec/div

Divides x by y and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

dec/scale

Scales a decimal. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF_DOWN, :HALF_EVEN, :HALF_UP, :UNNECESSARY, or :UP

[top](#)

ARGV

A list of the supplied command line arguments, or `nil` if the instantiator of the Venice instance decided not to make the command line arguments available.

```
*ARGV*
=> nil
```

[top](#)

ansi-term

`true` if Venice runs in an ANSI terminal, otherwise `false`

```
*ansi-term*
=> false
```

[top](#)

err

A `:java.io.PrintStream` object representing standard error for print operations.

Defaults to System.err, wrapped in an PrintStream.

err is a dynamic var. Any :java.io.PrintStream can be dynamically bound to it:

```
(binding [*err* print-stream]
  (println "text"))
```

SEE ALSO

with-err-str

Evaluates exprs in a context in which *err* is bound to a capturing output stream. Returns the string created by any nested printing ...

out

A :java.io.PrintStream object representing standard output for print operations.

in

A :java.io.Reader object representing standard input for read operations.

[top](#)

in

A :java.io.Reader object representing standard input for read operations.

Defaults to System.in, wrapped in an InputStreamReader.

in is a dynamic var. Any :java.io.Reader can be dynamically bound to it:

```
(binding [*in* reader]
  (read-line))
```

SEE ALSO

read-line

Without arg reads the next line from the stream that is the current value of *in*. With arg reads the next line from the passed stream ...

read-char

Without arg reads the next char from the stream that is the current value of *in*. With arg reads the next char from the passed stream ...

out

A :java.io.PrintStream object representing standard output for print operations.

err

A :java.io.PrintStream object representing standard error for print operations.

[top](#)

loaded-files

The loaded files

```
*loaded-files*
=> #{}  
;
```

[top](#)

loaded-modules

The loaded modules

```
*loaded-modules*
=> #{:tomcat :ring :ascii-canvas :csv :logger :jsonl :xchart :ring-multipart :ascii-table :java :xml :semver :

```

top

newline

The system newline

```
*newline*
=> "\n"
```

top

ns

The current namespace

```
*ns*
=> user

(do
  (ns test)
  *ns*)
=> test
```

top

out

A `:java.io.PrintStream` object representing standard output for print operations.

Defaults to System.out, wrapped in an PrintStream.

`*out*` is a dynamic var. Any `:java.io.PrintStream` can be dynamically bound to it:

```
(binding [*out* print-stream]
  (println "text"))
```

SEE ALSO

with-out-str

Evaluates exprs in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing ...

err

A `:java.io.PrintStream` object representing standard error for print operations.

in

A `:java.io.Reader` object representing standard input for read operations.

top

run-mode

The current run-mode one of `:repl`, `:script`, `:app`

```
*run-mode*
=> :script
```

top

version

The Venice version

```
*version*
=> "0.0.0"
```

top

+

```
(+)
(+ x)
(+ x y)
(+ x y & more)
```

Returns the sum of the numbers. (+) returns 0.

```
(+)
=> 0
```

```
(+ 1)
=> 1
```

```
(+ 1 2)
=> 3
```

```
(+ 1 2 3 4)

;; get class name
(. (. :java.io.File :new "/temp") :class)
=> class java.io.File
```

SEE ALSO

[import](#)

Imports one or multiple Java classes. Imports are bound to the current namespace.

[proxyf](#)

Proxies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

[java/as-runnable](#)

Wraps the function f in a java.lang.Runnable (<https://docs.oracle.com/javase/8/docs/api/java/lang/Runnable.html>)

[java/as-callable](#)

Wraps the function f in a java.util.concurrent.Callable (<https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/Callable.html>)

[top](#)

..

```
(.: type-name args*)
```

Instantiates a custom type.

Note: Venice implicitly creates a builder function suffixed with a dot:

```
(deftype :complex [real :long, imaginary :long])
(complex. 200 300)
```

For readability prefer `(complex. 200 300)` over `(.: :complex 100 200)`.

```
(do
  (ns foo)
  (deftype :complex [real :long, imaginary :long])
  (def x (.: :complex 100 200))
  [(:real x) (:imaginary x)])
=> [100 200]
```

SEE ALSO

[deftype](#)

Defines a new custom record type for the name with the fields.

[deftype?](#)

Returns true if type is a custom type else false.

[deftype-of](#)

Defines a new custom wrapper type based on a base type.

[deftype-or](#)

Defines a new custom choice type.

[deftype-describe](#)

Describes a custom type.

[top](#)

Object

Defines a protocol to customize the `toString` and/or the `compareTo` function of custom datatypes.

Definition:

```
(defprotocol Object
  (toString [this] (to-str false this))
  (compareTo [this other] (compare this other)))
```

`compareTo` returns a negative integer, zero, or a positive integer as *this* value is less than, equal to, or greater than the *other* value.

```
(do
  (deftype :point [x :long, y :long]
  Object
    (toString [this] (str/format "[%s %s]" (:x this) (:y this)))
    (compareTo [self other] (. (:x self) :compareTo (:x other)))))

  ; custom `toString`
  (println "toString:" (point. 1 2))

  ; custom `compareTo`: sort by 'x' ascending
  (println "compareTo:"
    (sort [(point. 2 100) (point. 3 101) (point. 1 102)])))
```

```
toString: [1 2]
compareTo: [[1 102] [2 100] [3 101]]
=> nil
```

SEE ALSO

`defprotocol`

Defines a new protocol with the supplied function specs.

`deftype`

Defines a new custom record type for the name with the fields.

[top](#)

[]

Creates a vector.

```
[10 20 30]
=> [10 20 30]
```

[top](#)

abs

```
(abs x)
```

Returns the absolute value of the number

```
(abs 10)
=> 10
```

```
(abs -10)
=> 10
```

```
(abs -10I)
=> 10I
```

```
(abs -10.1)
=> 10.1
```

```
(abs -10.12M)
=> 10.12M
```

SEE ALSO

`sgn`

sgn function for a number.

`negate`

Negates x

[top](#)

accept-either

```
(accept-either p p-other f)
```

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result as argument to the supplied function f.

```
(-> (promise (fn [] (sleep 200) 200))
      (accept-either (promise (fn [] (sleep 100) 100))
                     (fn [v] (println (+ v 1))))
      (deref))
101
=> nil
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

acopy

```
(acopy src src-pos dest dest-pos dest-len)
```

Copies an array from the src array, beginning at the specified position, to the specified position of the dest array. Returns the modified destination array

```
(acopy (long-array '(1 2 3 4 5)) 2 (long-array 20) 10 3)
=> [0, 0, 0, 0, 0, 0, 0, 0, 0, 3, 4, 5, 0, 0, 0, 0, 0, 0, 0]
```

[top](#)

acquire

```
(acquire lock)
```

Acquires a lock, blocking until the lock is available.

```
(let [l (lock)]
  (acquire l)
  ;; do something
  (release l))
=> nil
```

SEE ALSO

[lock](#)

Creates a new lock object.

[try-acquire](#)

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

[release](#)

Releases a lock.

[locked?](#)

Returns true if the lock is in use else false.

[top](#)

add-tap

```
(add-tap f)
```

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via `tap>`.

This function may (briefly) block, and will never impede calls to `tap>`, but blocking indefinitely may cause tap values to be dropped.

Remember f in order to `remove-tap`

```
(add-tap println)
=> nil
```

SEE ALSO

[remove-tap](#)

Remove f from the tap set.

[clear-taps](#)

Removes all tap sets.

[tap>](#)

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

[top](#)

add-watch

```
(add-watch ref key fn)
```

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

```
(do
  (def x (agent 10))
  (defn watcher [key ref old new]
    (println "watcher: " key))
  (add-watch x :test watcher))
=> nil
```

SEE ALSO

agent

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

agent

```
(agent state & options)
```

Creates and returns an agent with an initial value of state and zero or more options.

Options:

- :error-handler handler-fn
- :error-mode mode-keyword
- :validator validate-fn

The `handler-fn` is called if an action throws an exception. It's a function taking two args the agent and the exception. The `mode-keyword` may be either `:continue` (the default) or `:fail`. The `validate-fn` must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the `validate-fn` should return false or throw an exception.

```
(do
  (def x (agent 100))
  (send x + 5)
  (sleep 100)
  (deref x))
=> 105
```

SEE ALSO

send

Dispatch an action to an agent. Returns the agent immediately.

send-off

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

await

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

await-for

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout ...

deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

set-error-handler!

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

agent-error

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

[top](#)

agent-error

(agent-error agent)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns `nil` if the agent is not failed.

```
(do
  (def x (agent 100 :error-mode :fail))
  (send x (fn [n] (/ n 0)))
  (sleep 500)
  (agent-error x))
=> com.github.jlangch.venice.VncException: / by zero
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[set-error-handler!](#)

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

[agent-error-mode](#)

Returns the agent's error mode

[top](#)

agent-send-off-thread-pool-info

(agent-send-off-thread-pool-info)

Returns the thread pool info of the ThreadPoolExecutor serving agent send-off.

<i>core-pool-size</i>	the number of threads to keep in the pool, even if they are idle
<i>maximum-pool-size</i>	the maximum allowed number of threads
<i>current-pool-size</i>	the current number of threads in the pool
<i>largest-pool-size</i>	the largest number of threads that have ever simultaneously been in the pool
<i>active-thread-count</i>	the approximate number of threads that are actively executing tasks
<i>scheduled-task-count</i>	the approximate total number of tasks that have ever been scheduled for execution
<i>completed-task-count</i>	the approximate total number of tasks that have completed execution

(agent-send-off-thread-pool-info)

```
=> {:core-pool-size 0 :maximum-pool-size 2147483647 :current-pool-size 2 :largest-pool-size 2 :active-thread-count 0 :scheduled-task-count 10 :completed-task-count 10}
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

[top](#)

agent-send-thread-pool-info

```
(agent-send-thread-pool-info)
```

Returns the thread pool info of the ThreadPoolExecutor serving agent send.

<i>core-pool-size</i>	the number of threads to keep in the pool, even if they are idle
<i>maximum-pool-size</i>	the maximum allowed number of threads
<i>current-pool-size</i>	the current number of threads in the pool
<i>largest-pool-size</i>	the largest number of threads that have ever simultaneously been in the pool
<i>active-thread-count</i>	the approximate number of threads that are actively executing tasks
<i>scheduled-task-count</i>	the approximate total number of tasks that have ever been scheduled for execution
<i>completed-task-count</i>	the approximate total number of tasks that have completed execution

```
(agent-send-thread-pool-info)
```

```
=> {:core-pool-size 10 :maximum-pool-size 10 :current-pool-size 9 :largest-pool-size 9 :active-thread-count 0 :scheduled-task-count 9 :completed-task-count 9}
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send](#)

Dispatch an action to an agent. Returns the agent immediately.

[top](#)

aget

```
(aget array idx)
```

Returns the value at the index of an array of Java Objects

```
(aget (long-array '(1 2 3 4 5)) 1)
=> 2
```

[top](#)

alength

```
(alength array)
```

Returns the length of an array

```
(alength (long-array '(1 2 3 4 5)))
=> 5
```

[top](#)

all-of

```
(all-of p & ps)
```

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, then the returned promise also does so. Otherwise, the results, if any, of the given promises are not reflected in the returned promise, but may be obtained by inspecting them individually.

```
(-> (all-of (promise (fn [] (sleep 100) 1))
              (promise (fn [] (sleep 100) 2))
              (promise (fn [] (sleep 500) 3)))
      (deref))
=> nil
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[any-of](#)

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

[top](#)

alter-ns-meta!

```
(alter-ns-meta! n f & args)
```

Alters the metadata for a namespace. f must be free of side-effects.

```
(do
  (ns foo)
  (alter-ns-meta! foo assoc :a 1))
=> {:a 1}

(do
  (ns foo)
  (def n 'foo)
  (alter-ns-meta! (var-get n) assoc :a 1)
  (pr-str (ns-meta (var-get n))))
=> "{:a 1}"
```

SEE ALSO

[ns-meta](#)

Returns the meta data of the namespace n or nil if n is not an existing namespace

[reset-ns-meta!](#)

Resets the metadata for a namespace

[ns](#)

Opens a namespace.

[top](#)

amap

```
(amap f arr)
```

Applies f to each item in the array arr. Returns a new array with the mapped values.

```
(str (amap (fn [x] (+ 1 x)) (long-array 6 0)))
=> "[1, 1, 1, 1, 1, 1]"
```

top

and

```
(and x)
(and x & next)
```

Ands the predicate forms

```
(and true true)
=> true
```

```
(and true false)
=> false
```

```
(and)
=> true
```

SEE ALSO

or

Ors the predicate forms

not

Returns true if x is logical false, false otherwise.

top

ansi/ansi

```
(ansi style)
```

Output an ANSI escape code using a style key.

If `*use-ansi*` is bound to false, outputs an empty string instead of an ANSI code.

```
(println (str (ansi/ansi :blue) "foo"))

(println (str (ansi/ansi :underline) "foo"))

(println (str (ansi/ansi (ansi/fg-color 33)) "foo"))

(do
  (dotimes [n 10] (println ">>>" n))
  (sleep 1 :seconds)
  (println (ansi/ansi :clear-screen))
  (println "Hello"))
```

top

ansi/bg-color

(bg-color code)
(fg-color r g b)

Defines an extended background color from the 256-color extended color set. The code ranges from 0 to 255.

([ansi/bg-color 197](#))

SEE ALSO

[ansi/fg-color](#)

Defines an extended foreground color from the 256-color extended color set. The code ranges from 0 to 255.

[top](#)

ansi/fg-color

(fg-color code)
(fg-color r g b)

Defines an extended foreground color from the 256-color extended color set. The code ranges from 0 to 255.

The color range of a 256 color terminal consists of 4 parts in which case you actually get 258 colors:

- Color numbers 0 to 7 are the default terminal colors, the actual RGB value of which is not standardized and can often be configured.
- Color numbers 8 to 15 are the *bright* colors. Most of the time these are a lighter shade of the color with index - 8. They are also not standardized and can often be configured. Depending on terminal and shell, they are often used instead of or in conjunction with bold font faces.
- Color numbers 16 to 231 are RGB colors. These 216 colors are defined by 6 values on each of the three RGB axes. That is, instead of values 0 - 255, each color only ranges from 0 - 5.

The color number is then calculated like this

`number = 16 + 36 * r + 6 * g + b`

with `r`, `g` and `b` in the range 0 - 5.

- The color numbers 232 to 255 are grayscale with 24 shades of gray from dark to light.

([ansi/fg-color 197](#))

SEE ALSO

[ansi/bg-color](#)

Defines an extended background color from the 256-color extended color set. The code ranges from 0 to 255.

[top](#)

ansi/progress

(progress & options)

Returns a progress handler that renders the progress as a percentage string.

The returned progress handler takes two args:

- progress, a value 0..100 in :percent mode otherwise any value
- status , one of {:start :progress :end :failed}

E.g: Download: 54%

Progress options:

:caption txt	A caption text. Defaults to empty.
:start-msg msg	A start message. Defaults to "{caption} started".
:end-msg msg	An end message. Defaults to "{caption} ok".
:end-col col	An end message ansi color code.
:failed-msg msg	A failed message. Defaults to "{caption} failed".
:failed-col col	A failed message ansi color code.
:mode m	A mode {:percent, :custom}. Defaults to :percent.

```
(let [pb (ansi/progress :caption "Test:")]
  (pb 0 :start)
  (doseq [x (range 0 101 10)]
    (pb x :progress)
    (sleep 1 :seconds))
  (pb 100 :end))

(io/download "https://foo.org/image.png"
            :binary true
            :user-agent "Mozilla"
            :progress-fn (ansi/progress :caption "Download:"))
```

[top](#)

ansi/progress-bar

(progress-bar & options)

Returns a progress handler that renders a progress bar.

The returned progress handler takes two args:

- progress (0..100%)
- status {:start :progress :end :failed}

E.g:

- Download: [#####]
- Download: [#####] 70%

Progress bar options:

:caption txt	A caption text. Defaults to empty.
:width val	The width of the bar in chars. Defaults to 25.
:start-msg msg	A start message. Defaults to "{caption} started".
:end-msg msg	An end message. Defaults to "{caption} ok".
:end-col col	An end message ansi color code.
:failed-msg msg	A failed message. Defaults to "{caption} failed".
:failed-col col	A failed message ansi color code.
:show-percent bool	If true shows the percentage. Defaults to 'false'.

```
(let [pb (ansi/progress-bar
           :caption      "Test:"
           :width        20
           :show-percent true)]
```

```
(pb 0 :start)
(doseq [x (range 0 101 10)]
  (pb x :progress)
  (sleep 1 :seconds))
(pb 100 :end))

(io/download "https://foo.org/image.png"
  :binary true
  :user-agent "Mozilla"
  :progress-fn (ansi/progress-bar
    :caption      "Download:"
    :width        25
    :show-percent true))
```

top

ansi/style

```
(style text styles)
```

Applies ANSI color and style to a text string.

```
(println (ansi/style "foo" :green))

(println (ansi/style "foo" :green :underline))

(println (ansi/style "foo" :green :bg-yellow :underline))

(println (ansi/style "foo" (ansi/fg-color 21) (ansi/bg-color 221) :underline))

(println (ansi/style "foo" nil))
```

top

ansi/with-ansi

```
(with-ansi & forms)
```

Runs the given forms with the *use-ansi* variable temporarily bound to true, to enable the production of any ANSI color codes specified in the forms.

```
(ansi/with-ansi (println (ansi/style "foo" :green)))
```

top

ansi/without-ansi

```
(without-ansi & forms)
```

Runs the given forms with the *use-ansi* variable temporarily bound to false, to suppress the production of any ANSI color codes specified in the forms.

```
(ansi/without-ansi (println (ansi/style "foo" :green)))
```

top

ansi/without-cursor

```
(without-cursor & forms)
```

Runs the given forms with the cursor turned off.

top

any-of

```
(any-of p & ps)
```

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, the returned promise also does so.

```
(-> (any-of (promise (fn [] (sleep 300) 1))
              (promise (fn [] (sleep 100) 2))
              (promise (fn [] (sleep 500) 3)))
      (deref))
=> 2
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[all-of](#)

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

top

any-pred

```
(any-pred p1 & p)
```

Takes a set of predicates and returns a function f that returns the first logical true value returned by one of its composing predicates against any of its arguments, else it returns logical false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical true result against the original predicates.

```
((any-pred number?) 1)
=> true
```

```
((any-pred number?) 1 "a")
=> true
```

```
((any-pred number? string?) 2 "a")
=> true
```

any?

```
(any? pred coll)
```

Returns true if the predicate is true for at least one collection item, false otherwise.

```
(any? number? nil)
=> false
```

```
(any? number? [])
=> false
```

```
(any? number? [1 :a :b])
=> true
```

```
(any? number? [1 2 3])
=> true
```

```
(any? #(== % 10) [10 20 30])
=> true
```

```
(any? #(>= % 10) [1 5 10])
=> true
```

SEE ALSO

[every?](#)

Returns true if coll is a collection and the predicate is true for all collection items, false otherwise.

[not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

[not-every?](#)

Returns true if coll is a collection and the predicate is not true for all collection items, false otherwise.

app/build

```
(app/build name main-file file-map dest-dir)
```

Creates a Venice application archive that can be distributed and executed as a single file.

The archive is stored as: {dest-dir}/{name}.zip

Returns a map with information on the created archive:

```
{ "file"   "{dest-dir}/{name}.zip",
  "name"   "{name}" }
```

Build example:

```
/staging
  └── billing.venice
  └── utils
    └── util.venice
      └── render.venice
```

```
└── data
    ├── bill.template
    └── logo.jpg
```

With these staged files the archive is built as:

```
(app/build
  "billing"
  "billing.venice"
  { "billing.venice"      "/staging/billing.venice"
    "utils/util.venice"   "/staging/utils/util.venice"
    "utils/render.venice" "/staging/utils/render.venice"
    "data/bill.template"  "/staging/data/bill.template"
    "data/logo.jpg"       "/staging/data/logo.jpg" }
  ".")
```

Loading Venice files works relative to the application. You can only load files that are in the app archive. If for instance "billing.venice" in the above example requires "utils/render.venice" just add `(load-file "utils/render.venice")` to "billing.venice".

The app can be run from the command line as:

```
> java -jar venice-1.12.64.jar -app billing.zip
```

Venice reads the archive and loads the archive's main file.

Or with additional Java libraries (all JARs in 'libs' dir):

```
> java -cp "libs/*" com.github.jlangch.venice.Launcher -app billing.zip
```

[top](#)

app/manifest

```
(app/manifest app)
```

Returns the manifest of a Venice application archive as a map.

[top](#)

apply

```
(apply f args* coll)
```

Applies f to all arguments composed of args and coll

```
(apply + [1 2 3])
=> 6
```

```
(apply + 1 2 [3 4 5])
=> 15
```

```
(apply str [1 2 3 4 5])
=> "12345"
```

```
(apply inc [1])
=> 2
```

[top](#)

apply-to-either

```
(apply-to-either p p-other f)
```

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result as argument to the supplied function f.

```
(-> (promise (fn [] (sleep 200) 200))
  (apply-to-either (promise (fn [] (sleep 100) 100))
    (fn [v] (+ v 1)))
  (deref))
=> 101
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

as->

```
(as-> expr name & forms)
```

Binds name to expr, evaluates the first form in the lexical context of that binding, then binds name to that result, repeating for each successive form, returning the result of the last form. This allows a value to thread into any argument position.

```
; allows to use arbitrary positioning of the argument
(as-> [:foo :bar] v
  (map name v)
  (first v)
  (str/subs v 1))
=> "oo"
```

```
; allows the use of if statements in the thread
(as-> {:a 1 :b 2} m
  (update m :a #(+ % 10))
  (if true
    (update m :b #(+ % 10))
    m))
=> {:a 11 :b 12}
```

SEE ALSO

->

Threads the x through the forms. Inserts x as the second item in the first form, making a list of it if it is not a list already.

->>

Threads the x through the forms. Inserts x as the last item in the first form, making a list of it if it is not a list already.

-<>

Threads the x through the forms. Inserts x at position of the <> symbol of the first form, making a list of it if it is not a list already.

[top](#)

ascii-table/print

```
(ascii-table/print header data footer border padding)
(ascii-table/print columns data border padding)
```

Renders and prints an ascii table.

Actually does:

```
(println (ascii-table/render ...))
```

```
(do
  (load-module :ascii-table)
  (ascii-table/print ["head 1" "head 2"]
    [["1 1" "1 2"] ["2 1" "2 2"]]

[top](#)

assoc

```
(assoc coll key val)
(assoc coll key val & kvs)
```

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, returns a new vector that contains val at index. Note - index must be <= (count vector). When applied to a custom type, returns a new custom type with passed fields changed.

```
(assoc {}) :a 1 :b 2)
=> {:a 1 :b 2}

(assoc nil :a 1 :b 2)
=> {:a 1 :b 2}

(assoc [1 2 3] 0 10)
=> [10 2 3]

(assoc [1 2 3] 3 10)
=> [1 2 3 10]

(assoc [1 2 3] 6 10)
=> [1 2 3 10]

(do
  (deftype :complex [real :long, imaginary :long])
  (def x (complex. 100 200))
  (def y (assoc x :real 110))
  (pr-str y))
=> "{:custom-type* :user/complex :real 110 :imaginary 200}"
```

SEE ALSO

dissoc

Returns a new coll of the same type, that does not contain a mapping for key(s)

update

Updates a value in an associative structure, where k is a key and f is a function that will take the old value and any supplied fargs ...

[top](#)

assoc!

```
(assoc! coll key val)
(assoc! coll key val & kvs)
```

Associates key/vals with a mutable map, returns the map

```
(assoc! nil :a 1 :b 2)
=> {:a 1 :b 2}

(assoc! (mutable-map) :a 1 :b 2)
=> {:a 1 :b 2}

(assoc! (mutable-vector 1 2 3) 0 10)
=> [10 2 3]

(assoc! (mutable-vector 1 2 3) 3 10)
=> [1 2 3 10]

(assoc! (mutable-vector 1 2 3) 6 10)
=> [1 2 3 10]
```

SEE ALSO

=> [{:name "James" :age 26} {:name "John" :age 43} {:name "Jack" :age 19}]

(assoc-in [[1 2] [3 4]] [0 0] 9)
=> [[9 2] [3 4]]
```

[top](#)

asub

```
(asub array start len)
```

Returns a sub array

```
(asub (long-array '(1 2 3 4 5)) 2 3)
=> [3, 4, 5]
```

top

atom

```
(atom x)
(atom x & options)
```

Creates an atom with the initial value x.

Options:

```
:meta metadata-map
:validator validate-fn
```

If metadata-map is supplied, it will become the metadata on the atom. validate-fn must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the validate-fn should return false or throw an exception.

```
(do
  (def counter (atom 0))
  (swap! counter inc)
  (deref counter))
=> 1

(do
  (def counter (atom 0))
  (reset! counter 9)
  @counter)
=> 9
```

SEE ALSO

deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

reset!

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

swap!

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

compare-and-set!

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

add-watch

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

remove-watch

Removes a watch function from an agent/atom reference.

top

atom?

```
(atom? x)
```

Returns true if x is an atom, otherwise false

```
(do
  (def counter (atom 0))
  (atom? counter))
=> true
```

top

auto-run-jar

```
(auto-run-jar script-name script-version script save-to)
```

Turns any standalone Venice script into an executable Venice JAR.

The `auto-run-jar` command takes a Venice JAR and copies it to a new JAR with a modified JAR manifest that executes the script when running the JAR with: `java -jar xxxx.jar`

The created JAR name will be: {script-name}.jar

The command line parameters will be available as `*ARGV*` list in the script.

```
; run the created JAR: java -jar {path-to-jar}/example.jar
(let [script      """(println "sum:" (+ 1 2))"""
      script-name  "example"
      script-version "1.0"
      dir          "."
      ]
  (auto-run-jar script-name script-version script dir))

; run the created JAR: java -jar {path-to-jar}/example.jar 1 2
(let [script      """
      (println "sum:" (+ (long (first *ARGV*))
                           (long (second *ARGV*))))
      """
      script-name  "example"
      script-version "1.0"
      dir          "."
      ]
  (auto-run-jar script-name script-version script dir))

; create the executable JAR from a Venice script file:
;;   (io/spit "./example.venice"
;;             """(println "sum:" (+ 1 2))"""
;;             :encoding :utf-8)
;; run the created JAR: java -jar {path-to-jar}/example.jar
(let [script      (io/slurp "./example.venice" :encoding :utf-8)
      script-name  "example"
      script-version "1.0"
      dir          "."
      ]
  (auto-run-jar script-name script-version script dir))
```

top

aviron-cycler/create

```
(create root-dir)
(create root-dir state-file)
```

Create a DirCycler on a directory with an optional state file.

If the state file is given (it must not necessarily exist at construction time) the cycler saves its state automatically to this file.

If the state file exists at construction time the cycler loads the state from the file and proceeds where it has left off.

```
(do
  (load-module :aviron-cycler)
  (load-module :aviron-demo-filestore)
  (let [demo-fs      (aviron-demo-filestore/create)
        -           (aviron-demo-filestore/populate-with-demo-files demo-fs 3 5)
        filestore-dir (aviron-demo-filestore/root-dir demo-fs)]
    (aviron-cycler/create filestore-dir))

(do

[aviron-limiter/clamd-limit-for-timestamp](#)

Returns the limit for a given timestamp. If the timestamp is nil returns the limit for now.

[aviron-limiter/format-profiles-as-table-by-hour](#)

Returns the limiter's profile data as a string formatted table.

aviron-limiter/create-cpu-profile

```
(create-cpu-profile name data)
```

Create a named CPU profile.

```
(do
  (load-module :aviron-limiter)
  (aviron-limiter/create-cpu-profile
    "weekday"
    [ "00:00-05:59 @ 100%"
      "06:00-08:59 @ 50%"
      "09:00-17:59 @ 0%"
      "18:00-21:59 @ 50%"
      "22:00-23:59 @ 100%" ]))
```

The ClamAV client provides access to the ClamAV daemon (clamd) functions like file scanning, updating the daemon's ClamAV virus databases, ...

[aviron-limiter/get-cpu-profile-entries](#)

Returns the entries java CPU profile.

[aviron-limiter/get-cpu-profile-limit](#)

Returns the CPU limit defined by the profile for a given hour and minute.

[top](#)

aviron-limiter/create-dynamic-cpu-limiter

```
(create-dynamic-cpu-limiter)
(create-dynamic-cpu-limiter profiles)
(create-dynamic-cpu-limiter limit-fn)
```

Creates a new dynamic CPU limiter.

Without an argument creates a limiter with a default profile (100% CPU usage).

Otherwise creates a limiter with a list of explicit profiles for each day in the week (Mon to Sun) or a limiter based on a limiter function that computes the CPU limit for a timestamp.

```
;; [1] Limiter with default profile
(do
  (load-module :aviron-limiter)
  (let [limiter (aviron-limiter/create-dynamic-cpu-limiter)
        ts      (time/local-date-time 2025 7 21 12 0 0)]
    (aviron-limiter/compute-dynamic-cpu-limit limiter ts)))

;; [2] Limiter with profiles for each day in the week (Mon to Sun)
(do
  (load-module :aviron-limiter)
  (let [weekday (aviron-limiter/create-cpu-profile
                  "weekday"
                  [ "00:00-05:59 @ 100%"
                    "06:00-21:59 @ 0%"
                    "22:00-23:59 @ 100%" ])
        weekend (aviron-limiter/create-cpu-profile
                  "weekend"
                  [ "00:00-05:59 @ 100%" ])))
```

```

[ "00:00-05:59 @ 100%"

[top](#)

aviron-queue/capacity

(capacity queue)

Returns the capacity of the file queue

```
(do  
  (load-module :aviron-queue)  
  (let [q (aviron-queue/create)]  
    (aviron-queue/capacity q)))
```

SEE ALSO

[aviron-queue/create](#)

Create a new file queue with either the default capacity or an explicit capacity.

[aviron-queue/empty?](#)

Returns true if the file queue is empty else false

[aviron-queue/size](#)

Returns the size of the file queue

[aviron-queue/clear](#)

Clears the file queue

[aviron-queue/remove](#)

Removes a file form the queue.

[aviron-queue/push](#)

Push a new file to the tail of the queue

[aviron-queue/pop](#)

Pops the next or n next files from the head of the queue.

[top](#)

aviron-queue/clear

(clear queue)

Clears the file queue

```
(do
  (load-module :aviron-queue)
  (let [q (aviron-queue/create)]
    (aviron-queue/push q (io/file "/data/a.txt"))
    (aviron-queue/clear q)))
```

SEE ALSO

[aviron-queue/create](#)

Create a new file queue with either the default capacity or an explicit capacity.

[aviron-queue/capacity](#)

Returns the capacity of the file queue

[aviron-queue/empty?](#)

Returns true if the file queue is empty else false

[aviron-queue/size](#)

Returns the size of the file queue

[aviron-queue/clear](#)

Clears the file queue

[aviron-queue/push](#)

Push a new file to the tail of the queue

[aviron-queue/pop](#)

Pops the next or n next files from the head of the queue.

[top](#)

[aviron-queue/create](#)

```
(create)
(create capacity)
```

Create a new file queue with either the default capacity or an explicit capacity.

The file queue is buffering file watching events. It asynchronously decouples the event producing file watcher from the event consuming AV scanner client.

The queue never blocks and never grows beyond limits to protect the system! Therefore the queue is non blocking and has a fix capacity. As a consequence it must discard old events if overrun.

File watchers (like the Java `WatchService` or the `fswatch` tool) have the same behavior. If they get overrun with file change events they discard events and signal it by sending an 'OVERFLOW' event to their clients.

```
(do
  (load-module :aviron-queue)
  (aviron-queue/create))
```

```
(do
  (load-module :aviron-queue)
  (aviron-queue/create 5000))
```

SEE ALSO

[aviron-queue/capacity](#)

Returns the capacity of the file queue

[aviron-queue/empty?](#)

Returns true if the file queue is empty else false

[aviron-queue/size](#)

Returns the size of the file queue

[aviron-queue/clear](#)

Clears the file queue

[aviron-queue/remove](#)

Removes a file from the queue.

[aviron-queue/push](#)

Push a new file to the tail of the queue

[aviron-queue/pop](#)

Pops the next or n next files from the head of the queue.

[top](#)

aviron-queue/empty?

`(empty? queue)`

Returns `true` if the file queue is empty else `false`

```
(do
  (load-module :aviron-queue)
  (let [q (aviron-queue/create)]
    (aviron-queue/empty? q)))
```

SEE ALSO

(create-client & options)

The ClamAV client provides access to the ClamAV daemon (clamd) functions like file scanning, updating the daemon's ClamAV virus databases, or getting the scanning stats.

Options:

:server-hostname s	The ClamAV server hostname. Defaults to "localhost"
:server-port n	The ClamAV server port. Defaults to 3310
:server-file-separator k	The ClamAV server file separator, one of { :UNIX , :WINDOWS , :JVM_PLATFORM }. Defaults to :JVM_PLATFORM
:connection-timeout n	The connection timeout in milliseconds, 0 means indefinite. Defaults to 3'000ms
:read-timeout n	The read timeout in milliseconds, 0 means indefinite. Defaults to 20'000ms
:quarantine-dir f	A quarantine directory. If the quarantine action is :MOVE or :COPY infected files will be move/copied to the quarantine directory.
:quarantine-action e	A quarantine file action for infected, one of { :NONE , :MOVE , :COPY }. files. Defaults to :NONE

```
(do
  (load-module :aviron))
```

```
(let [client (aviron/create-client :server-hostname "localhost"
                                    :server-file-separator :UNIX)]

  (println (aviron/reachable? client))

  (println (aviron/clamav-version client))

  (let [result (aviron/scan-path client "/data/summary.docx")]
    (when (aviron/virus? result)
      (println (aviron/viruses result))))))
```

SEE ALSO

[aviron/scan-stream](#)

Scans a file's data passed in the 'is' stream. Uses a default chunk size of 2048 bytes.

[aviron/scan-path](#)

Scans a single file or directory (recursively). Stops by default after the first file with a detected virus.

[aviron/scan-parallel](#)

Scans a single file or directory (recursively) using multiple threads.

[aviron/shutdown-server](#)

Shutdown the ClamAV server and perform a clean exit.

[aviron/ping](#)

Sends a "PING" command to the ClamAV server.

[aviron/clamav-version](#)

Return the ClamAV version

[aviron/stats](#)

Returns the formatted statistics about the scan queue, contents of scan queue, and memory usage.

[aviron/reachable?](#)

Tests if the ClamAV server is reachable. Uses a default timeout of 3'000ms.

[aviron/wait-for-operational-clamd](#)

Wait for Clamd to get operational.

[aviron/reload-virus-databases](#)

Reload the virus databases.

[aviron/shutdown-server](#)

Shutdown the ClamAV server and perform a clean exit.

[aviron/last-command-run-details](#)

Returns the raw command string and the server's result for the last command sent to the ClamAV server.

[top](#)

[aviron/last-command-run-details](#)

```
(last-command-run-details client)
```

Returns the raw command string and the server's result for the last command sent to the ClamAV server.

This function is provided for debugging purposes

```
(do
  (load-module :aviron)
  (let [client (aviron/create-client)]
    (aviron/clamav-version client)
    (println (aviron/last-command-run-details client))))
```

SEE ALSO

[aviron/create-client](#)

The ClamAV client provides access to the ClamAV daemon (clamd) functions like file scanning, updating the daemon's ClamAV virus databases, ...

[top](#)

aviron/list-quarantine-files

(list-quarantine-files client)

Returns a list of the quarantine files.

```
(do
  (load-module :aviron)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

await-termination-agents?

```
(await-termination-agents?)
```

Returns true if all tasks have been completed following agent shut down

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (await-termination-agents 1000)
  (sleep 300)
  (await-termination-agents?))
```

SEE ALSO

agent

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

bases

```
(bases class)
```

Returns the immediate superclass and interfaces of class, if any.

```
(bases :java.util.ArrayList)
=> (:java.util.AbstractList :java.util.List :java.util.RandomAccess :java.lang.Cloneable :java.io.Serializable)
```

[top](#)

benchmark/benchmark

```
(benchmark expr warmup-iterations iterations & options)
```

Benchmarks the given expression.

Note: All macros in the expression are expanded before running running the benchmark phases.

Runs the benchmark in 4 phases:

1. Run the expression in a warm-up phase to allow the JIT compiler to do optimizations
2. Run the garbage collector to isolate timings from GC state prior to testing
3. Runs the expression benchmark
4. Analyzes and prints the benchmark statistics

Options:

:chart b	If true generates a chart and saves it to 'benchmark.png'. Defaults to false.
:steps n	the number of steps for the quantization, defaults to 100
:median b	show the median value in the chart {true/false}, defaults to false
:outlier b	show the outlier range in the chart {true/false}, defaults to false
:gc n	the number of GC runs

```
(do
  (load-module :benchmark ['benchmark :as 'b])

  (b/benchmark (+ 1 2) 120000 10000)

  (b/benchmark (+ 1 2) 120000 10000 :chart true :median true))
```

```
(b/benchmark (+ 1 2) 120000 10000 :chart true :outlier true)  
(b/benchmark (+ 1 2) 120000 10000 :chart true :steps 100))
```

top

bigint

```
(bigint x)
```

Converts to big integer.

```
(bigint 2000)
```

=> 2000N

```
(bigint 34897.65)
```

=> 34897N

```
(bigint 34897.65F)
```

=> 34897N

```
(bigint "5676000000000")
```

=> 5676000000000N

```
(bigint nil)
```

=> 0N

top

binding

```
(binding [bindings*] exprs*)
```

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

```
(do  
  (binding [x 100]  
    (println x)  
    (binding [x 200]  
      (println x))  
    (println x)))  
100  
200  
100  
=> nil
```

;; binding-introduced bindings are thread-locally mutable:

```
(binding [x 1]  
  (set! x 2)  
  x)  
=> 2
```

```
;; binding can use qualified names :  
(binding [user/x 1]  
  user/x)  
=> 1
```

SEE ALSO

[def-dynamic](#)

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[top](#)

boolean

```
(boolean x)
```

Converts to boolean. Everything except 'false' and 'nil' is true in boolean context.

```
(boolean false)  
=> false
```

```
(boolean true)  
=> true
```

```
(boolean nil)  
=> false
```

```
(boolean 100)  
=> true
```

[top](#)

boolean?

```
(boolean? n)
```

Returns true if n is a boolean

```
(boolean? true)  
=> true
```

```
(boolean? false)  
=> true
```

```
(boolean? nil)  
=> false
```

```
(boolean? 0)  
=> false
```

bound?

```
(bound? s)
```

Returns true if the symbol is bound to a value else false

```
(bound? 'test)
=> false
```

```
(let [test 100]
  (bound? 'test))
=> true
```

```
(do
  (def a 100)
  (bound? 'a))
=> true
```

SEE ALSO

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[def](#)

Creates a global variable.

[defonce](#)

Creates a global variable that can not be overwritten

butlast

```
(butlast coll)
```

Returns a collection with all but the last list element

```
(butlast nil)
=> nil
```

```
(butlast [])
=> []
```

```
(butlast [1 2 3])
=> [1 2]
```

```
(butlast '())
=> ()
```

```
(butlast '(1))
=> ()
```

```
(butlast '(1 2 3))  
=> (1 2)
```

```
(butlast "1234")  
=> (#\1 #\2 #\3)
```

SEE ALSO

[str/butlast](#)

Returns a possibly empty string of the characters without the last.

[top](#)

byte-order

```
(byte-order)
```

Returns the CPU's byte order.

```
(byte-order)  
=> :big-endian
```

[top](#)

bytebuf

```
(bytebuf x)
```

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, a string

```
(bytebuf [0 1 2])  
=> [0 1 2]
```

```
(bytebuf '(0 1 2))  
=> [0 1 2]
```

```
(bytebuf "abc")  
=> [97 98 99]
```

SEE ALSO

[io/bytebuf-out-stream](#)

Returns a new java.io.ByteArrayOutputStream.

[top](#)

bytebuf-allocate

```
(bytebuf-allocate length)  
(bytebuf-allocate length init-val)
```

Allocates a new bytebuf. The values will be all zero or preset with init-val id init-val is supplied.

The length can be specified as a number like 20000 or a number with a unit like :20KB or :20MB

top

bytebuf-allocate-random

(bytebuf-allocate-random length)

Allocates a new bytebuf. The buffer will be preset with random bytes.

The length can be specified as a number like `20000` or a number with a unit like `:20KB` or `:20MB`

```
(bytebuf-allocate-random 20)
=> [249 215 160 68 166 40 75 73 143 116 79 66 98 104 10 18 162 158 243 109]

```

SEE ALSO

[bytebuf-byte-order](#)

Returns the bytebuf's byte order.

[top](#)

bytebuf-capacity

```
(bytebuf-capacity buf)
```

Returns the capacity of a bytebuf.

```
(bytebuf-capacity (bytebuf-allocate 100))
=> 100
```

SEE ALSO

[bytebuf-remaining](#)

Returns the number of bytes between the current position and the limit.

[bytebuf-limit](#)

Returns the limit of a bytebuf.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

[bytebuf-limit!](#)

Set a new limit for the buffer. The new limit must not be larger than the capacity.

[top](#)

bytebuf-ensure-free-capacity!

```
(bytebuf-ensure-capacity! buf capacity)
```

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

SEE ALSO

bytebuf-remaining

Returns the number of bytes between the current position and the limit.

bytebuf-capacity

Returns the capacity of a bytebuf.

bytebuf-limit

Returns the limit of a bytebuf.

bytebuf-pos

Returns the buffer's current position.

bytebuf-limit!

Set a new limit for the buffer. The new limit must not be larger than the capacity.

top

bytebuf-from-string

```
(bytebuf-from-string s)
(bytebuf-from-string s encoding)
(bytebuf-from-string s encoding buf-length fillbyte)
```

Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-from-string "abcdef")  
=> [97 98 99 100 101 102]
```

```
(bytebuf-from-string "abcdef" :UTF-8)  
=> [97 98 99 100 101 102]
```

```
(bytebuf-from-string "abcdef" :UTF-8 16 0x00)  
=> [97 98 99 100 101 102 0 0 0 0 0 0 0 0 0]
```

SEE ALSO

bytebuf-to-string

Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8

top

bytebuf-get-byte

(bytebuf-get-byte buf)
(bytebuf-get-byte buf pos)

Reads a byte from the buffer. Without a pos reads from the current position and increments the position by one. With a position reads the byte from that position.

```
(-> (bytebuf-allocate 4)
     (bytebuf-put-byte! 1)
     (bytebuf-put-byte! 2)
     (bytebuf-get-byte 0))
=> 1I
```

top

bytebuf-get-double

```
(bytebuf-get-double buf)
(bytebuf-get-double buf pos)
```

Reads a double from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the double from that position.

```
(-> (bytebuf-allocate 16)
     (bytebuf-put-double! 20.0)
     (bytebuf-put-double! 40.0)
     (bytebuf-get-double 0))
=> 20.0
```

top

bytebuf-get-float

```
(bytebuf-get-float buf)
(bytebuf-get-float buf pos)
```

Reads a float from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the float from that position.

```
(-> (bytebuf-allocate 16)
     (bytebuf-put-float! 20.0)
     (bytebuf-put-float! 40.0)
     (bytebuf-get-float 0))
=> 20.0
```

top

bytebuf-get-int

```
(bytebuf-get-int buf)
(bytebuf-get-int buf pos)
```

Reads an integer from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the integer from that position.

```
(-> (bytebuf-allocate 8)
     (bytebuf-put-int! 1I)
     (bytebuf-put-int! 2I)
     (bytebuf-get-int 0))
=> 1I
```

[top](#)

bytebuf-get-long

```
(bytebuf-get-long buf)
(bytebuf-get-long buf pos)
```

Reads a long from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the long from that position.

```
(-> (bytebuf-allocate 16)
     (bytebuf-put-long! 20)
     (bytebuf-put-long! 40)
     (bytebuf-get-long 0))
=> 20
```

[top](#)

bytebuf-index-of

```
(bytebuf-index-of buf pattern)
(bytebuf-index-of buf pattern from-index)
(bytebuf-index-of buf pattern from-index to-index)
```

Returns the index within a byte buf of the first occurrence of the specified byte pattern.

The search is based on the Knuth-Morris-Pratt (KMP) pattern matching algorithm.

The KMP algorithm is an efficient method for finding the occurrence of a substring (a pattern) within a larger string (or in this case, a sequence of bytes)

```
(bytebuf-index-of (bytebuf [1 2 3 4 5]) (bytebuf [3 4]))
=> 2

(bytebuf-index-of (bytebuf [1 2 3 4 5 3 4]) (bytebuf [3 4])) 4
=> 5
```

SEE ALSO

[bytebuf](#)

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, a string

[top](#)

bytebuf-limit

```
(bytebuf-limit buf)
```

Returns the limit of a bytebuf.

```
(bytebuf-limit (bytebuf-allocate 100))
=> 100
```

SEE ALSO

[bytebuf-remaining](#)

Returns the number of bytes between the current position and the limit.

[bytebuf-capacity](#)

Returns the capacity of a bytebuf.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

[bytebuf-limit!](#)

Set a new limit for the buffer. The new limit must not be larger than the capacity.

[top](#)

[bytebuf-limit!](#)

`(bytebuf-limit! buf new-limit)`

Set a new limit for the buffer. The new limit must not be larger than the capacity.

Returns the new limit of a bytebuf.

`(bytebuf-limit! (bytebuf-allocate 100) 50)`

=> 50

SEE ALSO

[bytebuf-remaining](#)

Returns the number of bytes between the current position and the limit.

[bytebuf-capacity](#)

Returns the capacity of a bytebuf.

[bytebuf-limit](#)

Returns the limit of a bytebuf.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

[top](#)

[bytebuf-merge](#)

`(bytebuf-merge buffers)`

Merges bytebufs.

`(bytebuf-merge (bytebuf [1 2]) (bytebuf [3 4]))`

=> [1 2 3 4]

SEE ALSO

bytebuf

Converts x to bytebuf. x can be a bytebuf, a list/vector of longs, a string

top

bytebuf-pos

(bytebuf-pos buf)

Returns the buffer's current position.

(bytebuf-pos (bytebuf-allocate 10))

=> 0

SEE ALSO

bytebuf-capacity

Returns the capacity of a bytebuf.

bytebuf-remaining

Returns the number of bytes between the current position and the limit.

bytebuf-limit

Returns the limit of a bytebuf.

bytebuf-ensure-free-capacity!

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

bytebuf-limit!

Set a new limit for the buffer. The new limit must not be larger than the capacity.

top

bytebuf-pos!

(bytebuf-pos! buf pos)

Sets the buffer's position.

(-> (bytebuf-allocate 10)

 (bytebuf-pos! 4)

 (bytebuf-put-byte! 1)

 (bytebuf-pos! 8)

 (bytebuf-put-byte! 2))

=> [0 0 0 1 0 0 0 2 0]

top

bytebuf-put-buf!

(bytebuf-put-buf! dst src src-offset length)

This method transfers bytes from the src to the dst buffer at the current position, and then increments the position by length.

```
(-> (bytebuf-allocate 10)
     (bytebuf-pos! 4)
     (bytebuf-put-buf! (bytebuf [1 2 3]) 0 2))
=> [0 0 0 0 1 2 0 0 0 0]
```

top

bytebuf-put-byte!

```
(bytebuf-put-byte! buf b)
```

Writes a byte to the buffer at the current position, and then increments the position by one.

```
(-> (bytebuf-allocate 4)
     (bytebuf-put-byte! 1)
     (bytebuf-put-byte! 2))
=> [1 2 0 0]
```

top

bytebuf-put-double!

```
(bytebuf-put-double! buf d)
```

Writes a double (8 bytes) to buffer at the current position, and then increments the position by eight.

```
(-> (bytebuf-allocate 16)
     (bytebuf-put-double! 64.0)
     (bytebuf-put-double! 200.0))
=> [64 80 0 0 0 0 0 0 64 105 0 0 0 0 0 0]
```

top

bytebuf-put-float!

```
(bytebuf-put-float! buf d)
```

Writes a float (4 bytes) to buffer at the current position, and then increments the position by four.

```
(-> (bytebuf-allocate 8)
     (bytebuf-put-float! 64.0)
     (bytebuf-put-float! 200.0))
=> [66 128 0 0 67 72 0 0]
```

top

bytebuf-put-int!

```
(bytebuf-put-int! buf i)
```

Writes an integer (4 bytes) to buffer at the current position, and then increments the position by four.

```
(-> (bytebuf-allocate 8)
     (bytebuf-put-int! 4I)
     (bytebuf-put-int! 8I))
=> [0 0 0 4 0 0 0 8]
```

top

bytebuf-put-long!

```
(bytebuf-put-long! buf l)
```

Writes a long (8 bytes) to buffer at the current position, and then increments the position by eight.

```
(-> (bytebuf-allocate 16)
     (bytebuf-put-long! 4)
     (bytebuf-put-long! 8))
=> [0 0 0 0 0 0 0 4 0 0 0 0 0 0 0 8]
```

top

bytebuf-remaining

```
(bytebuf-remaining buf)
```

Returns the number of bytes between the current position and the limit.

```
(bytebuf-capacity (bytebuf-allocate 100))
=> 100
```

SEE ALSO

[bytebuf-capacity](#)

Returns the capacity of a bytebuf.

[bytebuf-limit](#)

Returns the limit of a bytebuf.

[bytebuf-pos](#)

Returns the buffer's current position.

[bytebuf-ensure-free-capacity!](#)

Ensure that the bytebuf has a free capacity. Returns the widened bytebuf.

[bytebuf-limit!](#)

Set a new limit for the buffer. The new limit must not be larger than the capacity.

top

bytebuf-sub

```
(bytebuf-sub x start) (bytebuf-sub x start end)
```

Returns a byte buffer of the items in buffer from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count bytebuffer)

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 2)
=> [3 4 5 6]
```

```
(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 4)
=> [5 6]
```

[top](#)

bytebuf-to-list

```
(bytebuf-to-list buf)
```

Returns the bytebuf as lazy list of integers

```
(doall (bytebuf-to-list (bytebuf [97 98 99])))
=> (97I 98I 99I)
```

[top](#)

bytebuf-to-string

```
(bytebuf-to-string buf)
(bytebuf-to-string buf encoding)
```

Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8

```
(bytebuf-to-string (bytebuf [97 98 99]) :UTF-8)
=> "abc"
```

SEE ALSO

[bytebuf-from-string](#)

Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8

[top](#)

bytebuf?

```
(bytebuf? x)
```

Returns true if x is a bytebuf

```
(bytebuf? (bytebuf [1 2]))
=> true
```

```
(bytebuf? [1 2])
=> false
```

```
(bytebuf? nil)
=> false
```

top

callstack

```
(callstack)
```

Returns the current callstack.

```
(do
  (defn f1 [x] (f2 x))
  (defn f2 [x] (f3 x))
  (defn f3 [x] (f4 x))
  (defn f4 [x] (callstack))
  (f1 100))
=> [{:fn-name "callstack" :file "example" :line 71 :col 18} {:fn-name "user/f4" :file "example" :line 70 :col 18} {:fn-name "user/f3" :file "example" :line 69 :col 18} {:fn-name "user/f2" :file "example" :line 68 :col 18} {:fn-name "user/f1" :file "example" :line 72 :col 5}]
```

top

cancel

```
(cancel f)
```

Cancels a future or a promise

```
(do
  (defn wait [f]
    (let [fn (future (fn [] (sleep 400) 100))]
      (future (cancel fn))
      (print "After 50ms: cancelled=%b\n" (cancelled? f)))
      (cancel fn)
      (print "After 150ms: cancelled=%b\n" (cancelled? f))))
  After 50ms: cancelled=false
  After 150ms: cancelled=true
=> nil
```

SEE ALSO

[future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[done?](#)

Returns true if the future or promise is done otherwise false

[cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

top

cancelled?

```
(cancelled? f)
```

Returns true if the future or promise is cancelled otherwise false

```
(cancelled? (future (fn [] 100)))
=> false
```

[done?](#)

Returns true if the future or promise is done otherwise false

[cancel](#)

Cancels a future or a promise

[top](#)

cargo-arangodb/db-dump

```
(cargo-arangodb/db-dump cname db-name db-user db-passwd dump-name log)
```

Dumps an ArangoDB database.

The DB dump is written to container's directory "/var/lib/arangodb3/{dump-name}". If the directory does not exist it is created automatically.

Example:

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  ;; (cargo-arangodb/exists-db-dump? "db-test" "dump-001")
  ;; (cargo-arangodb/remove-db-dump "db-test" "dump-001")

  ;; Dump the 'people' database to 'dump-001'
  (ca/db-dump "db-test" "people" "root" "xxx" "dump-001" nil))
```

Args:

cname	The container name
db-name	The name of the DB to dump
db-user	The DB user
db-passwd	The DB password
dump-name	The dump name. e.g "dump-001"
log	A log function, may be <i>nil</i> . E.g: (fn [s] (println "ArangoDB:" s))

Dumps an ArangoDB database using this commands on the container:

```
mkdir /var/lib/arangodb3/dump-001

arangodump
--output-directory /var/lib/arangodb3/dump-001
--overwrite true
```

```
--include-system-collections true  
--server.database "people"  
--server.endpoint tcp://127.0.0.1:8529  
--server.username "root"  
--server.password "xxx"
```

Open an interactive docker shell to check the dump:

```
docker exec -it {container-id} sh
```

ZIP a dump

```
docker exec -it {container-id}  
zip -r  
    /var/lib/arangodb3/dump-001.zip  
    /var/lib/arangodb3/dump-001
```

```
(do  
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])  
  
  (ca/db-dump "db-test" "people" "root" "xxx" "dump-001" nil))
```

SEE ALSO

[top](#)

[cargo-arangodb/db-restore](#)

```
(cargo-arangodb/db-restore cname db-name db-user db-passwd dump-name log)
```

Restores an ArangoDB database from a dump

The DB dump is read from container's directory "/var/lib/arangodb3/{dump-name}".

Example:

```
(do  
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])  
  
  ;; (cargo-arangodb/exists-db-dump? "db-test" "dump-001")  
  ;; (cargo-arangodb/remove-db-dump "db-test" "dump-001")  
  
  ;; Restore the 'people' database from 'dump-001'  
  (ca/db-restore "db-test" "people" "root" "xxx" "dump-001" nil))
```

Args:

cname The container name

db-name The name of the DB to dump

db-user The DB user

db-passwd	The DB password
dump-name	The dump name, e.g "dump-001"
log	A log function, may be <i>nil</i> . E.g: (fn [s] (println "ArangoDB:" s))

Restores an ArangoDB database using this command on the container:

```
arangorestore
--input-directory /var/lib/arangodb3/dump-001
--force-same-database
--create-database true
--include-system-collections true
--server.database "people"
--server.endpoint tcp://127.0.0.1:8529
--server.username "root"
--server.password "xxx"
```

Open an interactive docker shell to check the dump:

```
docker exec -it {container-id} sh
```

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])
  (ca/db-restore "db-test" "people" "root" "xxx" "dump-001" nil))
```

[top](#)

cargo-arangodb/start

```
(cargo-arangodb/start cname version mapped-port root-passwd memory cores log)
(cargo-arangodb/start cname version volumes mapped-port root-passwd memory cores log)
```

Starts an ArangoDB container.

Start rules:

- If a container with another version exists for the container name remove the container and the image
- Pull the image if not yet locally available
- If the container already runs - use it
- If the container is available but does not run - start it (`docker/start ...`)
- If the container is not available - run it (`docker/run ...`)

- Finally check for a successful startup. The container log must contain the string ".is ready for business. Have fun." on the last line.

Args:

cname	A unique container name
version	The ArangoDB version to use. E.g.: 3.11.4
mapped-port	The published (mapped) ArangoDB port on the host
root-passwd	The ArangoDB root password
memory	The detected memory ArangoDB is to use. E.g.: 8GB, 8000MB
cores	The detected number of cores ArangoDB is to use
log	A log function, may be <i>nil</i> . E.g: (fn [s] (println "ArangoDB:" s))

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  ;; Run an ArangoDB container labeled as "db-test"
  (ca/start "db-test" "3.11.4" 8500 "test" "8GB" 1 nil))
```

(cargo-arangodb/stop cname log)
```

Stops an ArangoDB container

Args:

cname	A unique container name
log	A log function, may be <i>nil</i> . E.g: (fn [s] (println "ArangoDB:" s))

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  ;; Stop the ArangoDB container labeled as "db-test"
  (ca/stop "db-test" nil))
```

SEE ALSO

[cargo-arangodb/start](#)

Starts an ArangoDB container.

[cargo-arangodb/running?](#)

Returns true if a container with the specified name is running.

[top](#)

cargo-arangodb/upload-db-dump

```
(cargo-arangodb/upload-db-dump cname dump-name import-dir log)
```

Uploads an existing DB dump with the name 'dump-name' from the local filesystem to the container. The import directory on local filesystem must be an existing non empty directory.

Args:

cname	The container name
dump-name	The dump name
import-dir	The import dir. E.g.: (io/file (io/user-home-dir) "dump"))
log	A log function, may be nil. E.g: (fn [s] (println "ArangoDB:" s))

```
(do
  (load-module :cargo-arangodb ['cargo-arangodb :as 'ca])

  ;; upload the dump to the container's filesystem
  (let [dir (io/file (io/user-home-dir) "dump-001")]
    (ca/upload-db-dump "db-test" "dump-001" dir nil))

  ;; restore the DB dump
  (ca/db-restore "db-test" "people" "root" "xxx" "dump-001" nil))
```

SEE ALSO

[cargo-arangodb/download-db-dump](#)

Downloads an existing the DB dump 'dump-name' from the container to the local filesystem. The export directory in the local filesystem ...

[cargo-arangodb/db-dump](#)

Dumps an ArangoDB database.

[cargo-arangodb/db-restore](#)

Restores an ArangoDB database from a dump

[cargo-arangodb/exists-db-dump?](#)

Returns true if the dump with the given name exists otherwise false.

[top](#)

cargo-postgresql/logs

```
(cargo-postgresql/logs cname)
(cargo-postgresql/logs cname lines)
```

Prints the PostgreSQL docker container logs

Args:

cname	A unique container name
lines	The number of tail lines

```
(do
  (load-module :cargo-postgresql ['cargo-postgresql :as 'pg])
  (pg/logs "postgres"))
```

```
(do
  (load-module :cargo-postgresql ['cargo-postgresql :as 'pg])
  (pg/logs "postgres" 100))
```

SEE ALSO

[cargo-postgresql/start](#)

Starts a PostgreSQL container.

[cargo-postgresql/running?](#)

Returns true if a container with the specified name is running.

[top](#)

[cargo-postgresql/running?](#)

```
(cargo-postgresql/running? cname)
```

Returns true if a container with the specified name is running.

Args:

cname A unique container name

```
;; Test if PostgreSQL container is running
(do
  (load-module :cargo-postgresql ['cargo-postgresql :as 'pg])
  (pg/running? "postgres"))
```

SEE ALSO

[cargo-postgresql/logs](#)

Prints the PostgreSQL docker container logs

[cargo-postgresql/start](#)

Starts a PostgreSQL container.

[cargo-postgresql/stop](#)

Stops a PostgreSQL container

[top](#)

[cargo-postgresql/start](#)

```
(cargo-postgresql/start cname version storage-dir)
(cargo-postgresql/start cname version storage-dir user password)
(cargo-postgresql/start cname version storage-dir user password log)
(cargo-postgresql/start cname version mapped-port storage-dir user password log)
```

Starts a PostgreSQL container.

Start rules:

- If a container with another version exists for the container name remove the container and the image
- Pull the image if not yet locally available
- If the container already runs - use it
- If the container is available but does not run - start it (`docker/start ...`)

- If the container is not available - run it (`docker/run ...`)
- Finally check for a successful startup. The container error log must contain the string "*database system is ready to accept connections.*" on the last few lines.

Args:

cname	A unique container name
version	The PostgreSQL version to use. E.g.: "16.2", "16"
mapped-port	The published (mapped) port on the host. Defaults to 5432
storage-dir	Directory where PostgreSQL persists all the data.
user	A user. Defaults to "postgres"
password	A password. Defaults to "postgres"
log	A log function, may be <i>nil</i> . E.g: <code>(fn [s] (println "PostgreSQL:" s))</code>

```
(do
  (load-module :cargo-postgresql ['cargo-postgresql :as 'pg])
  ;; Run a PostgreSQL container labeled as "postgres"
  (pg/start "postgres" "16.2" "./postgres-storage"))
```

Starts a PostgreSQL container.

[cargo-postgresql/running?](#)

Returns true if a container with the specified name is running.

[top](#)

cargo-qdrant/logs

```
(cargo-qdrant/logs cname)
(cargo-qdrant/logs cname lines)
```

Prints the Qdrant docker container logs

Args:

cname A unique container name
lines The number of tail lines

```
(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])
  (cq/logs "qdrant"))

(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])
  (cq/logs "qdrant" 100))
```

SEE ALSO

[cargo-qdrant/start](#)

Starts a Qdrant container.

[cargo-qdrant/running?](#)

Returns true if a container with the specified name is running.

[top](#)

cargo-qdrant/running?

```
(cargo-qdrant/running? cname)
```

Returns true if a container with the specified name is running.

Args:

cname A unique container name

```
;; Test if Qdrant container is running
(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])
  (cq/running? "qdrant"))
```

SEE ALSO

[cargo-qdrant/logs](#)

Prints the Qdrant docker container logs

[cargo-qdrant/start](#)

Starts a Qdrant container.

[cargo-qdrant/stop](#)

Stops a Qdrant container

[top](#)

cargo-qdrant/start

```
(cargo-qdrant/start cname version storage-dir)
(cargo-qdrant/start cname version storage-dir config-file log)
(cargo-qdrant/start cname version mapped-rest-port mapped-grpc-port storage-dir config-file log)
```

Starts a Qdrant container.

Qdrant is vector database often used for LLM embeddings.

Telemetry reporting is disabled by setting the env variable QDRANT_TELEMETRY_DISABLED to `true`.

Start rules:

- If a container with another version exists for the container name remove the container and the image
- Pull the image if not yet locally available
- If the container already runs - use it
- If the container is available but does not run - start it (`docker/start ...`)
- If the container is not available - run it (`docker/run ...`)
- Finally check for a successful startup. The container log must contain the string "*.Qdrant HTTP listening on.*" on the last line.

Args:

cname	A unique container name
version	The Qdrant version to use. E.g.: "1.8.3"
mapped-rest-port	The published (mapped) Qdrant REST port on the host. Defaults to 6333
mapped-grpc-port	The published (mapped) Qdrant GRPC port on the host. Defaults to 6334
storage-dir	Directory where Qdrant persists all the data.
config-file	An optional custom configuration yaml file
log	A log function, may be <i>nil</i> . E.g: <code>(fn [s] (println "Qdrant:" s))</code>

```
(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])
  ;; Run a Qdrant container labeled as "qdrant"
  (cq/start "qdrant" "1.8.3" "./qdrant-storage"))
```

SEE ALSO

[cargo-qdrant/stop](#)

Stops a Qdrant container

[cargo-qdrant/running?](#)

Returns true if a container with the specified name is running.

[cargo-qdrant/logs](#)

Prints the Qdrant docker container logs

[top](#)

cargo-qdrant/stop

```
(cargo-qdrant/stop cname)
(cargo-qdrant/stop cname log)
```

Stops a Qdrant container

Args:

cname A unique container name

```
(do
  (load-module :cargo-qdrant ['cargo-qdrant :as 'cq])
  ;; Stop the Qdrant container labeled as "qdrant"
  (cq/stop "qdrant"))
```

SEE ALSO

[cargo-qdrant/start](#)

Starts a Qdrant container.

[cargo-qdrant/running?](#)

Returns true if a container with the specified name is running.

[top](#)

cargo/purge

`(cargo/purge cname)`

Removes a container and its image. The container must not be running.

Args:

cname A unique container name

```
;; Purge an ArangoDB container
(cargo/purge "arangodb-test")
```

SEE ALSO

[cargo/start](#)

Starts a container.

[cargo/stop](#)

Stops a container

[cargo/running?](#)

Returns true if a container with the specified name is running.

[top](#)

cargo/running?

`(cargo/running? cname)`

Returns true if a container with the specified name is running.

Args:

cname A unique container name

```
;; Test if ArangoDB container is running
(cargo/running? "arangodb-test")
```

SEE ALSO

[cargo/start](#)

Starts a container.

[cargo/stop](#)

Stops a container

[cargo/purge](#)

Removes a container and its image. The container must not be running.

[top](#)

cargo/start

```
(cargo/start cname repo version publish envs args ready? log)
(cargo/start cname repo version publish envs args ready? log wait-after-start-secs ready-check-max-secs)
```

Starts a container.

Start rules:

- If a container with the passed name exists or is running in another version, stop that container and remove it together with the image
- Pull the image if it is not yet locally available
- If the container runs with the requested version already - use it
- If the container is available but does not run - start it using `(docker/start ...)`
- If the container is not available - run it using `(docker/run ...)`
- Finally check for a successful startup using the supplied `ready?` function. E.g.: `ready?` may scan the container logs for a successful startup message.

Args:

cname	A unique container name
repo	The image repository
version	The image version
publish	Publish a container's ports to the host. To expose port 8080 inside the container to port 3000 outside the container, pass <code>["3000:8080"]</code>
envs	A vector of env variables
vols	A vector of volume mounts
args	A vector of arguments for the process run in the container
ready?	A function to decide if the container is ready (may be <code>nil</code>). The function takes the unique container name as its single argument. It returns true if the container is ready else false
log	A log function (may be <code>nil</code>). The function takes a single string argument
wait-after-start-secs	Wait n seconds after starting the container (may be <code>nil</code>)
ready-check-max-secs	Try max n seconds for ready check (defaults to 30s if <code>nil</code>)

```
; Run an ArangoDB container
(cargo/start "arangodb-test"
            "arangodb/arangodb"
            "3.11.4"
            ["8500:8529"]
            ["ARANGO_ROOT_PASSWORD=test"
             "ARANGODB_OVERRIDE_DETECTED_TOTAL_MEMORY=8GB"
             "ARANGODB_OVERRIDE_DETECTED_NUMBER_OF_CORES=1"]
            []
            [--server.endpoint tcp://0.0.0.0:8529]
            (fn [cname]
              (-> (docker/container-logs cname :tail 1))
```

```
(str/trim)
  (match? #".*is ready for business. Have fun.*"))
  (fn [s] (println "ArangoDB:" s))
  3
  30)
```

SEE ALSO

[cargo/stop](#)

Stops a container

[cargo/running?](#)

Returns true if a container with the specified name is running.

[cargo/purge](#)

Removes a container and its image. The container must not be running.

[top](#)

cargo/stop

```
(cargo/stop cname log)
```

Stops a container

Args:

cname A unique container name

log A log function (may be *nil*). The function takes a single string argument

; Stop an ArangoDB container

```
(cargo/stop "arangodb-test"
            (fn [s] (println "ArangoDB:" s)))
```

SEE ALSO

[cargo/start](#)

Starts a container.

[cargo/running?](#)

Returns true if a container with the specified name is running.

[cargo/purge](#)

Removes a container and its image. The container must not be running.

[top](#)

cartesian-product

```
(cartesian-product coll1 coll2 coll*)
```

Returns the cartesian product of two or more collections.

Removes all duplicates items in the collections before computing the cartesian product.

```
(cartesian-product [1 2 3] [1 2 3])
=> ((1 1) (1 2) (1 3) (2 1) (2 2) (2 3) (3 1) (3 2) (3 3))
```

```
(cartesian-product [0 1] [0 1] [0 1])
=> ((0 0 0) (0 0 1) (0 1 0) (0 1 1) (1 0 0) (1 0 1) (1 1 0) (1 1 1))
```

SEE ALSO

combinations

All the unique ways of taking n different elements from the items in the collection

[top](#)

case

```
(case expr & clauses)
```

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

```
(case (+ 1 9)
  10 :ten
  20 :twenty
  30 :thirty
  :dont-know)
=> :ten
```

SEE ALSO

cond

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the ...

condp

Takes a binary predicate, an expression, and a set of clauses.

[top](#)

cast

```
(cast class object)
```

Casts a Java object to a specific type

Note: Casting a Java object will change the object's *formal type*. See the `formal-type` function for detailed information.

```
(do
  (import :java.awt.Point)
  (import :java.awt.geom.Point2D)

  ;; upcasting :java.awt.Point to :java.awt.geom.Point2D
  ;; Point2D does not define the translate method!
  (let [p1 (. :Point :new 1.0 1.0)
        p2 (cast :Point2D p1)]
    (println "p1 ->" p1)
    (println "p2 ->" p2)
    (println "Formal type p1 ->" (formal-type p1))
    (println "Formal type p2 ->" (formal-type p2))
    (println "p1' ->" (doto p1 (. :translate 2.0 2.0)))
    ;; the translate method is not defined by Point2D
    ;; and will fail with a JavaMethodInvocationException!
    ;; (doto p2 (. :translate 2.0 2.0))
```

```
)  
p1 -> java.awt.Point[x=1,y=1]  
p2 -> java.awt.Point[x=1,y=1]  
Formal type p1 -> :java.awt.Point  
Formal type p2 -> :java.awt.geom.Point2D  
p1' -> java.awt.Point[x=3,y=3]  
=> nil
```

SEE ALSO

[formal-type](#)

Returns the formal type of a Java object.

[remove-formal-type](#)

Removes the formal type from a Java object.

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

ceil

```
(ceil x)
```

Returns the largest integer that is greater than or equal to x

```
(ceil 1.4)  
=> 2.0
```

```
(ceil -1.4)  
=> -1.0
```

```
(ceil 1.23M)  
=> 2.00M
```

```
(ceil -1.23M)  
=> -1.00M
```

SEE ALSO

[floor](#)

Returns the largest integer that is less than or equal to x

[top](#)

char

```
(char c)
```

Converts a number or s single char string to a char.

```
(char 65)  
=> #\A
```

```
(char "A")
=> #\A

(long (char "A"))
=> 65

(str/join (map char [65 66 67 68]))
=> "ABCD"

(map #(- (long %) (long (char "0")))) (str/chars "123456"))
=> (1 2 3 4 5 6)
```

SEE ALSO

[char?](#)

Returns true if s is a char.

[top](#)

char-escaped

```
(char-escaped c)
```

Returns the ASCII escaped character for c.

- \` single quote
- \" double quote
- \\ backslash
- \n new line
- \r carriage return
- \t tab
- \b backspace
- \f form feed
- \0 null character
- in all other cases returns the character c

```
(char-escaped #\n)
=> #\newline
```

```
(char-escaped #\a)
=> #\a
```

SEE ALSO

[char](#)

Converts a number or s single char string to a char.

[char?](#)

Returns true if s is a char.

[top](#)

char-literals

```
(char-literals)
```

Returns all defined char literals.

Char Literal	Unicode	Char

[top](#)

chinook-postgresql/load-data

(load-data)

Load the Chinook dataset to a PostgreSQL database.

The data set is loaded from [GitHub/leroche](#)

[Data Model](#) published under the [License](#)

The Chinook sample database has 11 tables as follows:

employees	stores employee data such as id, last name, first name, etc. It also has a field named ReportsTo to specify who reports to whom
-----------	---

customers	stores customer data
invoices	stores invoice header data
invoice_items	stores the invoice line items data
artists	stores artist data. It is a simple table that contains the id and name
albums	stores data about a list of tracks. Each album belongs to one artist. However, one artist may have multiple albums
media_types	stores media types such as MPEG audio and AAC audio files
genres	stores music types such as rock, jazz, metal, etc.
tracks	stores the data of songs. Each track belongs to one album
playlists	stores data about playlists. Each playlist contains a list of tracks. Each track may belong to multiple playlists. The relationship between the playlists and tracks tables is many-to-many. The playlist_track table is used to reflect this relationship
playlist_track	reflect the many-to-many relationship between playlist and tracks

Start the PostgreSQL docker container:

```
(do
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
  (jdbp/start "postgres" "16.2" 5432 "./postgres-storage" "postgres" "postgres"))
```

Note: The storage directory (e.g. "./postgres-storage") must exist!

```
(do

    (cidr/lookup trie "192.16.10.15")))
=> "Germany"
```

top

circular-buffer

```
(circular-buffer capacity)
```

Creates a new circular buffer.

A circular buffer stores the N most recently inserted elements. If the circular buffer is already full, the oldest element (the head) will be evicted, and then the new element added at the tail.

The circular buffer does not permit `nil` elements.

```
(let [q (circular-buffer 20)]
  (put! q 1 100)
  (put! q 1 200)
  (take! q))
=> 1
```

SEE ALSO

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

[take!](#)

Retrieves and removes the head value of the queue or the deque, waiting if necessary until a value becomes available.

[poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

[empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

circular-buffer?

Returns true if coll is a circular buffer

[top](#)

circular-buffer?

(circular-buffer? coll)

Returns true if coll is a circular buffer

```
(circular-buffer? (circular-buffer 20))  
=> true
```

[top](#)

clamp

(clamp x min max)

Restricts a given value between a lower and upper bound. In this way, it acts like a combination of the `min` and `max` functions.

```
(clamp 1 10 20)  
=> 10
```

```
(clamp 1I 10I 20I)  
=> 10I
```

```
(clamp 1.0 10.0 20.0)  
=> 10.0
```

SEE ALSO

min

Returns the smallest of the values

max

Returns the greatest of the values

[top](#)

class

(class name)

Returns the Java class for the given name. Throws an exception if the class is not found.

```
(class :java.util.ArrayList)
=> class java.util.ArrayList
```

SEE ALSO

class-of

Returns the Java class of a value.

class-name

Returns the Java class name of a class.

class-version

Returns the major version of a Java class.

cast

Casts a Java object to a specific type

formal-type

Returns the formal type of a Java object.

remove-formal-type

Removes the formal type from a Java object.

[top](#)

class-name

```
(class-name class)
```

Returns the Java class name of a class.

```
(class-name (class :java.util.ArrayList))
=> "java.util.ArrayList"
```

SEE ALSO

class

Returns the Java class for the given name. Throws an exception if the class is not found.

class-of

Returns the Java class of a value.

class-version

Returns the major version of a Java class.

[top](#)

class-of

```
(class-of x)
```

Returns the Java class of a value.

```
(class-of 100)
=> class com.github.jlangch.venice.impl.types.VncLong
```

```
(class-of (. :java.awt.Point :new 10 10))
=> class java.awt.Point
```

SEE ALSO

`class`

Returns the Java class for the given name. Throws an exception if the class is not found.

`class-name`

Returns the Java class name of a class.

`class-version`

Returns the major version of a Java class.

[top](#)

class-version

`(class-version class)`

Returns the major version of a Java class.

Java major versions:

- Java 8 uses major version 52
- Java 9 uses major version 53
- Java 10 uses major version 54
- Java 11 uses major version 55
- Java 12 uses major version 56
- Java 13 uses major version 57
- Java 14 uses major version 58
- Java 15 uses major version 59

`(class-version :com.github.jlangch.venice.Venice)`

=> 52

SEE ALSO

`class`

Returns the Java class for the given name. Throws an exception if the class is not found.

`class-of`

Returns the Java class of a value.

`class-name`

Returns the Java class name of a class.

[top](#)

classloader

`(classloader)`

`(classloader type)`

Returns the classloader.

`;; Returns the current classloader`

`(classloader)`

`=> class sun.misc.Launcher$AppClassLoader`

```
;; Returns the system classloader
(classloader :system)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the classloader which loaded the Venice classes
(classloader :application)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the thread-context classloader
(classloader :thread-context)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[classloader-of](#)

Returns the classloader of a value or a Java class.

[top](#)

[classloader-of](#)

```
(classloader-of x)
```

Returns the classloader of a value or a Java class.

Note:

Some Java VM implementations may use 'null' to represent the bootstrap class loader. This method will return 'nil' in such implementations if this class was loaded by the bootstrap class loader.

```
(classloader-of (class :java.awt.Point))
=> nil

(classloader-of (. :java.awt.Point :new 10 10))
=> nil

(classloader-of (class-of "abcdef"))
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

(classloader-of "abcdef")
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[classloader](#)

Returns the classloader.

[top](#)

[clear-taps](#)

```
(clear-taps)
```

Removes all tap sets.

```
(do
  (add-tap prn)
  (clear-taps))
=> nil
```

SEE ALSO

[remove-tap](#)

Remove f from the tap set.

[add-tap](#)

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via tap>.

[tap>](#)

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

[top](#)

coalesce

```
(coalesce args*)
```

Returns nil if all of its arguments are nil, otherwise it returns the first non nil argument. The arguments are evaluated lazy.

```
(coalesce)
=> nil
```

```
(coalesce 2)
=> 2
```

```
(coalesce nil 1 2)
=> 1
```

[top](#)

coll?

```
(coll? coll)
```

Returns true if coll is a collection

```
(coll? {:a 1})
=> true
```

```
(coll? [1 2])
=> true
```

[top](#)

combinations

```
(combinations coll n)
```

All the unique ways of taking n different elements from the items in the collection

```
(combinations [0 1 2 3] 1)  
=> ([0] [1] [2] [3])
```

```
(combinations [0 1 2 3] 2)  
=> ([0 1] [0 2] [0 3] [1 2] [1 3] [2 3])
```

```
(combinations [0 1 2 3] 3)  
=> ([0 1 2] [0 1 3] [1 2 3])
```

```
(combinations [0 1 2 3] 4)  
=> ([0 1 2 3])
```

SEE ALSO

[cartesian-product](#)

Returns the cartesian product of two or more collections.

[top](#)

comment

```
(comment & body)
```

Ignores body, yields nil

```
(comment  
  (println 1)  
  (println 5))  
=> nil
```

[top](#)

comp

```
(comp f*)
```

Takes a set of functions and returns a function that is the composition of those functions. The returned function takes a variable number of args, applies the rightmost of the functions to the args, applies the next function (right-to-left) to the result, etc.

Functions composition builds complex functions by combining simpler ones. Functions are composed by passing the output of one function as the input to another.

```
h(x) = (g ° f)(x) = g(f(x))
```

The composition operator `°` can be understood as *after*. In other words, the function `g` is applied after the function `f` has been applied to `x`.

If you have two functions `f` and `g`, function composition allows you to create a new function `h` such that `h(x) = g(f(x))`.

```
((comp str +) 8 8 8)
=> "24"

(map (comp - (partial + 3) (partial * 2)) [1 2 3 4])
=> (-5 -7 -9 -11)

(reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100
=> 207

(filter (comp not zero?) [0 1 0 2 0 3 0 4])
=> (1 2 3 4)

(do
  (def fifth (comp first rest rest rest rest))
  (fifth [1 2 3 4 5]))
=> 5
```

top

compare

```
(compare x y)
```

Comparator. Returns -1, 0, or 1 when x is logically 'less than', 'equal to', or 'greater than' y. For list and vectors the longer sequence is always 'greater' regardless of its contents. For sets and maps only the size of the collection is compared.

```
(compare nil 0)
=> -1

(compare 0 nil)
=> 1

(compare 1 0)
=> 1

(compare 1 1)
=> 0

(compare 1M 2M)
=> -1

(compare 1 nil)
=> 1

(compare nil 1)
=> -1

(compare "aaa" "bbb")
=> -1

(compare [0 1 2] [0 1 2])
=> 0

(compare [0 1 2] [0 9 2])
=> -1
```

```
(compare [0 9 2] [0 1 2])
=> 1

(compare [1 2 3] [0 1 2 3])
=> -1

(compare [0 1 2] [3 4])
=> 1
```

top

compare-and-set!

```
(compare-and-set! atom oldval newval)
```

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set happened, else false.

```
(do
  (def counter (atom 2))
  (compare-and-set! counter 2 4)
  @counter)
=> 4
```

SEE ALSO

[atom](#)

Creates an atom with the initial value x.

top

complement

```
(complement f)
```

Takes a fn f and returns a fn that takes the same arguments as f, has the same effects, if any, and returns the opposite truth value.

```
(complement even?)
=> anonymous-cd6fe03c-ea4c-484c-8dd0-76c3e48a10a8

(filter (complement even?) '(1 2 3 4))
=> (1 3)
```

top

complete-on-timeout

```
(complete-on-timeout p value time time-unit)
```

Completes the promise with the given value if not otherwise completed before the given timeout.

```

(-> (promise (fn [] (sleep 100) "The quick brown fox"))
  (complete-on-timeout "The fox did not jump" 500 :milliseconds)
  (deref))
=> "The quick brown fox"

(-> (promise (fn [] (sleep 500) "The quick brown fox"))
  (complete-on-timeout "The fox did not jump" 100 :milliseconds)
  (deref))
=> "The fox did not jump"

(-> (promise (fn [] (sleep 500) "The quick brown fox"))
  (complete-on-timeout "The fox did not jump" 100 :milliseconds)
  (then-apply str/upper-case)
  (deref))
=> "THE FOX DID NOT JUMP"

(-> (promise (fn [] (sleep 50) 100))
  (complete-on-timeout 888 100 :milliseconds)
  (then-apply #(do (sleep 200) (* % 3)))
  (complete-on-timeout 999 220 :milliseconds)
  (deref))
=> 999

```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[top](#)

component/Component

Defines a protocol for components.

Definition:

```
(defprotocol Component
  (start [component] component)
  (stop [component] component))
```

Function `start`:

Begins operation of this component. Synchronous, does not return until the component is started. Returns an updated version of this component.

Function `stop`:

Ceases operation of this component. Synchronous, does not return until the component is stopped. Returns an updated version of this component.

[top](#)

component/dep

```
(dep c k)
```

Returns a dependency given by its key 'k' from the component 'c' dependencies.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server []
    c/Component
    (start [this] (println "Store: " (c/dep this :store)) this)
    (stop [this] this))

  (deftype :database []
    c/Component

[componentdeps](#)

Returns the dependencies of the component 'c' or nil if there aren't any dependencies.

[top](#)

component/system-map

```
(system-map name keyval*)
```

Returns a system constructed of components given as key/value pairs. The 'key' is a `keyword` (the component's id) referencing the component given as 'value'.

The system has default implementations of the Lifecycle 'start' and 'stop' methods which recursively starts/stops all components in the system.

Note:

`system-map` just creates a raw system without any dependencies between the components. Use `system-using` after creating the system map to establish the dependencies.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server [port :long]
    c/Component
    (start [this] (println "server started") this)
    (stop [this] (println "server stopped") this))

  (deftype :database [user      :string
                     password   :string]
    c/Component
    (start [this] (println "database started") this)
    (stop [this] (println "database stopped") this))

  (c/system-map
    "test"
    :server (server. 4600)
    :store (database. "foo" "123"))

nil)
```

SEE ALSO

[component/system-using](#)

Associates a component dependency graph with the 'system' that has been created through a call to `system-map`. 'dependency-map' is a ...

component/system-using

(system-using system dependency-map)

Associates a component dependency graph with the 'system' that has been created through a call to `system-map`. 'dependency-map' is a map of keys to maps or vectors specifying the dependencies of the component at that key in the system.

Throws an exception if a component dependency circle is detected.

The system is started and stopped calling the lifecycle `start` or `stop` method on the system component.

Upon successfully starting a component the flag `{:started true}` is added to the component's meta data. It's up to the components lifecycle `start` method to decide what to do with multiple start requests. The lifecycle `start` method can for instance simply return the unaltered component if it has already been started.

Upon successfully stopping a component the flag `{:started false}` is added to the component's meta data. It's up to the components lifecycle `stop` method to decide what to do with multiple stop requests. The lifecycle `stop` method can for instance simply return the unaltered component if it has not been started or has already been stopped.

```
(do
  (load-module :component ['component :as 'c])

  (deftype :server [port :long]
    c/Component

```
(concat "abc" "def")
=> (#\a #\b #\c #\d #\e #\f)
```

SEE ALSO

[concatv](#)

Returns a vector of the concatenation of the elements in the supplied collections.

[into](#)

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

concatv

```
(concatv coll)
(concatv coll & colls)
```

Returns a vector of the concatenation of the elements in the supplied collections.

```
(concatv [1 2])
=> [1 2]

(concatv [1 2] [4 5 6])
=> [1 2 4 5 6]

(concatv '(1 2))
=> [1 2]

(concatv '(1 2) [4 5 6])
=> [1 2 4 5 6]

(concatv {:a 1})
=> [{:a 1}]

(concatv {:a 1} {:b 2 :c 3})
=> [{:a 1} {:b 2} {:c 3}]

(concatv "abc")
=> [#\a #\b #\c]

(concatv "abc" "def")
=> [#\a #\b #\c #\d #\e #\f]
```

SEE ALSO

[concat](#)
 Returns a list of the concatenation of the elements in the supplied collections.

[into](#)
 Returns a new coll consisting of to coll with all of the items of from coll conjoined.

[merge](#)
 Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

cond

```
(cond & clauses)
```

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the value of the corresponding expr and doesn't evaluate any of the other tests or exprs. (cond) returns nil .

```
(let [n 5]
  (cond
    (< n 0) "negative"
    (> n 0) "positive"
    :else "zero"))
=> "positive"
```

SEE ALSO

condp

Takes a binary predicate, an expression, and a set of clauses.

case

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

[top](#)

cond->

```
(cond-> expr & clauses)
```

Takes an expression and a set of test/form pairs. Threads expr (via `->`) through each form for which the corresponding test expression is true. Note that, unlike cond branching, `cond->` threading does not short circuit after the first true test expression.

It is useful in situations where you want selectively assoc, update, or dissoc something from a map.

```
(cond-> m
  (some-pred? q) (assoc :key :value))
```

```
(cond-> 1      ; we start with 1
  true inc      ; the condition is true so (inc 1) => 2
  false (* 42)  ; the condition is false so the operation is skipped
  (= 2 2) (* 3)) ; (= 2 2) is true so (* 2 3) => 6
=> 6
```

cond->>

Takes an expression and a set of test/form pairs. Threads expr (via `->>`) through each form for which the corresponding test expression ...

[top](#)

cond->>

```
(cond->> expr & clauses)
```

Takes an expression and a set of test/form pairs. Threads expr (via `->>`) through each form for which the corresponding test expression is true. Note that, unlike cond branching, `cond->>` threading does not short circuit after the first true test expression.

```
(cond->> 1      ; we start with 1
  true inc      ; the condition is true so (inc 1) => 2
  false (* 42)  ; the condition is false so the operation is skipped
  (= 2 2) (* 3)) ; (= 2 2) is true so (* 3 2) => 6
=> 6
```

SEE ALSO

cond->

Takes an expression and a set of test/form pairs. Threads expr (via ->) through each form for which the corresponding test expression ...

top

condp

```
(condp pred expr & clauses)
```

Takes a binary predicate, an expression, and a set of clauses.

Each clause can take the form of either:

```
test-expr result-expr
test-expr :>> result-fn
```

Note `:>>` is an ordinary keyword.

For each clause, (pred test-expr expr) is evaluated. If it returns logical true, the clause is a match. If a binary clause matches, the result-expr is returned, if a ternary clause matches, its result-fn, which must be a unary function, is called with the result of the predicate as its argument, the result of that call being the return value of condp. A single default expression can follow the clauses, and its value will be returned if no clause matches. If no default expression is provided and no clause matches, a VncException is thrown.

```
(condp some [1 2 3 4]
  #{0 6 7} :>> inc
  #{4 5 9} :>> dec
  #{1 2 3} :>> #(* % 10))
=> 3
```

```
(condp some [-10 -20 0 10]
  pos? 1
  neg? -1
  (constantly true) 0)
=> 1
```

SEE ALSO

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the ...

case

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

top

config/build

```
(build & parts)
```

Merges given configuration parts and returns it as a map.

Configuration parts:

- JSON classpath resource file
- JSON file
- Environment variables
- System properties

Example:

```

(do
  (load-module :config)

  (def cfg (config/build
              (config/env "java")
              (config/env-var "SERVER_PORT" [:http :port] "8080")))

  (println "home:" (-> cfg :11 :zulu :home))
  ; => home: /Library/Java/JavaVirtualMachines/zulu-11.jdk/Contents/Home

  (println "port:" (-> cfg :http :port)))
  ; => port: 8080

;; -----
;; Example I) Configuration builder
(do
  (load-module :config ['config :as 'cfg])

  (cfg/build
    (cfg/resource "config-defaults.json" :key-fn keyword)
    (cfg/file "./config-local.json" :key-fn keyword)
    (cfg/env-var "SERVER_PORT" [:http :port])
    (cfg/env-var "SERVER_THREADS" [:http :threads])
    (cfg/property-var "MASTER_PWD" [:app :master-pwd])))

;; -----
;; Example II) Using configurations with the component module
(do
  (load-module :config ['config :as 'cfg])
  (load-module :component ['component :as 'cmp]))

;; define the server component
(deftype :server []
  cmp/Component
  (start [this]
    (let [config (cmp/dep this :config)
          port   (get-in config [:server :port])]
      (println (cmp/id this) "started at port" port)
      this))
  (stop [this]
    (println (cmp/id this) "stopped")
    this))

;; note that the configuration is a plain vanilla Venice map and
;; does not implement the protocol 'Component'
(defn create-system []
  (-> (cmp/system-map
        "test"
        :config (cfg/build
                  (cfg/env-var "SERVER_PORT" [:server :port] "8800"))
        :server (server.))
        (cmp/system-using
          {:server [:config]})))

  (-> (create-system)
        (cmp/start)
        (cmp/stop))

  nil)

```

=> (1 2 3 4 5)

(conj '(1 2 3) '(4 5))
=> (1 2 3 (4 5))

(conj (set 1 2 3) 4)
=> #{1 2 3 4}

(conj {:a 1 :b 2} [:c 3])
=> {:a 1 :b 2 :c 3}

(conj {:a 1 :b 2} {:c 3})
=> {:a 1 :b 2 :c 3}

(conj {:a 1 :b 2} (map-entry :c 3))
=> {:a 1 :b 2 :c 3}

(conj)
=> []
```

```
(conj 4)
=> 4
```

SEE ALSO

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[into](#)

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[list*](#)

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

[vector*](#)

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

conj!

```
(conj!)  
(conj! x)  
(conj! coll x)  
(conj! coll x & xs)
```

Returns a new mutable collection with the x, xs 'added'. `(conj! nil item)` returns `(item)` and `(conj! item)` returns `item`.

For mutable ordered collections like lists the value is added at the end. For all other mutable collections the position is undefined.

```
(conj! (mutable-list 1 2 3) 4)  
=> (1 2 3 4)  
  
(conj! (mutable-list 1 2 3) 4 5)  
=> (1 2 3 4 5)

=> {:a 1 :b 2 :c 3}

(cons (map-entry :c 3) {:a 1 :b 2})
=> {:a 1 :b 2 :c 3}

; cons a value to a lazy sequence
(-> (cons -1 (lazy-seq 0 #(+ % 1)))
     (take 5)
     (doall))
=> (-1 0 1 2 3)

; recursive lazy sequence (fibonacci example)
(do
  (defn fib
    ([] (fib 1 1))
    ([a b] (cons a (fn [] (fib b (+ a b))))))

  (doall (take 6 (fib))))
=> (1 1 2 3 5 8))
```

SEE ALSO

`conj`

Returns a new collection with the x, xs 'added'. (`conj` nil item) returns (item) and (`conj` item) returns item.

`list*`

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

`vector*`

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

cons!

```
(cons! x coll)
```

Adds x to the mutable collection coll.

For mutable ordered collections like lists the value is added at the beginning. For all other mutable collections the position is undefined.

```
(cons! 1 (mutable-list 2 3))
=> (1 2 3)

(cons! 3 (mutable-set 1 2))
=> #{1 2 3}

(cons! {:c 3} (mutable-map :a 1 :b 2))
=> {:a 1 :b 2 :c 3}
```

```
(cons! (map-entry :c 3) (mutable-map :a 1 :b 2))
=> {:a 1 :b 2 :c 3}

(cons! 1 (stack))
=> (1)

(cons! 1 (queue))
=> (1)
```

top

constantly

```
(constantly x)
```

Returns a function that takes any number of arguments and returns always the value x.

```
(do
  (def fix (constantly 10))
  (fix 1 2 3)
  (fix 1)
  (fix ))
=> 10
```

SEE ALSO

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

top

contains?

```
(contains? coll key)
```

Returns true if key is present in the given collection, otherwise returns false.

Note: To test if a value is in a vector or list use `any?`

```
(contains? #{:a :b} :a)
=> true

(contains? {:a 1 :b 2} :a)
=> true

(contains? [10 11 12] 1)
=> true
```

```
(contains? [10 11 12] 5)
=> false

(contains? "abc" 1)
=> true

(contains? "abc" 5)
=> false
```

SEE ALSO

[not-contains?](#)

Returns true if key is not present in the given collection, otherwise returns false.

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[top](#)

count

```
(count coll)
```

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

```
(count {:a 1 :b 2})
=> 2

(count [1 2])
=> 2

(count "abc")
=> 3
```

[top](#)

cpus

```
(cpus)
```

Returns the number of available processors or number of hyperthreads if the CPU supports hyperthreads.

```
(cpus)
=> 8
```

[top](#)

cron/schedule-at

```
(schedule-at-round-times-in-day fn sync-period schedule-at)
```

Creates and executes a one-shot scheduled task that becomes enabled at a given time.

This scheduled task is not prone to clock shifts.

Returns a future. `(deref f)`, `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future.

This function is built on the [CronScheduler](#) project.

```
(let [sync-period      (. :java.time.Duration :ofMinutes 10)
      at               (time/plus (time/local-date-time) :seconds 2)
      task              (fn [] (println "Task:" (time/local-date-time)) 100)
      sched             (cron/schedule-at task sync-period at)]
  (deref sched))
```

SEE ALSO

[cron/schedule-at-fixed-rate](#)

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period.

[cron/schedule-at-round-times-in-day](#)

Submits a periodic task that becomes enabled at round clock times within a day, with the given period.

[top](#)

[cron/schedule-at-fixed-rate](#)

```
(schedule-at-fixed-rate fn sync-period initial-delay period time-unit)
(schedule-at-fixed-rate fn sync-period initial-delay period time-unit skipping-to-latest)
```

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period.

This scheduled task is not prone to clock shifts.

Returns a future. `(deref f)`, `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future.

This function is built on the [CronScheduler](#) project.

```
(let [sync-period (. :java.time.Duration :ofMinutes 10)
      task         (fn [] (println "Task:" (time/local-date-time)))
      sched         (cron/schedule-at-fixed-rate task sync-period 1 2 :seconds)]
  (sleep 16 :seconds)
  (cancel sched))
```

SEE ALSO

[crypt/add-bouncy-castle-provider](#)

`(crypt/add-bouncy-castle-provider)`

Adds the BouncyCastle provider to the Java security.

```
(do
  (load-module :crypt)
  (crypt/add-bouncy-castle-provider))
```

SEE ALSO

[crypt/provider?](#)

Returns true if the Java security provider with name exists, else false.

[top](#)

[crypt/ciphers](#)

`(crypt/ciphers)`

`(crypt/ciphers opt)`

Returns a list of the ciphers the Java VM supports

Argument opt

:default returns the names of the cipher suites which are enabled by default.

:available returns the names of the cipher suites which could be enabled for use on an SSL connection created by this
SSLServerSocketFactory .

```
(do
  (load-module :crypt)
  (crypt/ciphers :default))
```

```
(do
  (load-module :crypt)
  (crypt/ciphers :available))

(do
  (load-module :crypt)
  (docoll println (crypt/ciphers :available)))
```

top

crypt/encryptor-aes-256-gcm

(crypt/encryptor-aes-256-gcm passphrase & opts)

Returns an encryptor function for AES 256 GCM encrypting/decrypting binary buffers or files.

Options:

:key-salt arr	An optional salt to generate the key. E.g.: (bytebuf [43 195 99 118 231 225 142 76 132 194 129 237 158 12 12 203])
:key-iterations n	An optional iteration count to generate the key. Defaults to 3000.
:efficient-mem-use b	If <code>true</code> efficiently use memory in encryption (less memory allocation). Defaults to <code>false</code> .

/V is random and unique for every call of the encryptor function.

While encrypting data the random /V is written to the start of the encrypted data and read before decrypting the data

```
AES256-GCM
AES/GCM/NoPadding
+-----+
|   iv  (12)   |
+-----+
|   data (n)   |
+-----+
```

```
;; File
(do
  (load-module :crypt)
  (load-module :hexdump)
  (let [file-in      (io/temp-file "test-", ".data")
        file-encoded (io/temp-file "test-", ".data.enc")
        file-decoded (io/temp-file "test-", ".data.dec")
        encryptor    (crypt/encryptor-aes-256-gcm "secret")]
    (io/delete-file-on-exit file-in file-encoded file-decoded)
    (io/spit file-in "1234567890")
    (encryptor :encrypt file-in file-encoded true)
    (encryptor :decrypt file-encoded file-decoded true)
    (println (hexdump/dump (io/slurp file-encoded :binary true)))))

;; Byte buffer
(do
  (load-module :crypt)
  (let [buf-in      (bytebuf-from-string "1234567890")
        encryptor   (crypt/encryptor-aes-256-gcm "secret")
        buf-encoded (encryptor :encrypt buf-in)
        buf-decoded (encryptor :decrypt buf-encoded)]
    (println (bytebuf-to-string buf-decoded))))
```

```
;; Text (Base64 encoded as either :Standard or :UrlSafe)
(do
  (load-module :crypt)
  (let [text      "1234567890"
        encryptor (crypt/encryptor-aes-256-gcm "secret")

        decoded    (encryptor :decrypt encoded :Standard)]
  (println decoded)))
```

SEE ALSO

[crypt/encryptor-chacha20-bouncycastle](#)

Returns an encryptor function for ChaCha20 BouncyCastle encrypting/decrypting binary buffers or files.

[crypt/encryptor-chacha20](#)

Returns an encryptor function for ChaCha20 encrypting/decrypting binary buffers or files.

[top](#)

[crypt/encryptor-chacha20](#)

```
(crypt/encryptor-chacha20 passphrase & opts)
```

Returns an encryptor function for ChaCha20 encrypting/decrypting binary buffers or files.

Requires Java11+.

Options:

:key-salt arr	An optional salt to generate the key. E.g.: (bytebuf [43 195 99 118 231 225 142 76 132 194 129 237 158 12 12 203])
:key-iterations n	An optional iteration count to generate the key. Defaults to 3000.

Warning: files encrypted with ChaCha20 BouncyCastle cannot be decrypted by ChaCha20 from the Java VM (and vice versa) due to different initial counter handling and IV sizes

The ChaCha family of ciphers are an order of magnitude more efficient on servers that do not provide hardware acceleration. Apple Silicon does not seem to have AES hardware acceleration probably due to its RISC nature.

IV, Nonce and/or *Counter* are random and unique for every call of the encryptor function.

While encrypting a file the *IV, Nonce* and *Counter* are written to the start of the encrypted data and read before decrypting the data:

```
ChaCha20
+-----+
|     iv (12)   |
+-----+
|     nonce (12) |
+-----+
|     counter (4)|
+-----+
|     data (n)   |
+-----+
```

```
;; File
(do
  (load-module :crypt)
  (load-module :hexdump)
  (let [file-in      (io/temp-file "test-", ".data")
        file-encoded (io/temp-file "test-", ".data.enc")
        file-decoded (io/temp-file "test-", ".data.dec")
        encryptor   (crypt/encryptor-chacha20 "secret")]
```

```

[top](#)

crypt/hash-file

(crypt/hash-file algorithm salt file)

Computes a hash for a file. The hash is used together with the function `crypt/verify-file-hash` to detect file modifications.

Returns the hash Base64 encoded.

The functions uses the fast MD5 hash algorithm.

The arg 'file' may be a:

- string file path, e.g: "/temp/foo.json"
- bytebuf
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`

Supported hash algorithms:

- MD5 (default)
- SHA-1
- SHA-512

MD5 is the fastest hash algorithm and precise enough to detect file changes.

```
(do
  (load-module :crypt)
  (let [file (io/temp-file "test-", ".data")
        data (bytebuf-allocate-random 1000)]
    (io/delete-file-on-exit file)
    (io/spit file data)
    (crypt/hash-file "SHA-256" "-salt-" file)))
```

SEE ALSO

[crypt/verify-file-hash](#)

Verifies a file against a hash (Base64 encoded). Returns true if the file's actual hash is equal to the given hash otherwise false.

[top](#)

[crypt/max-key-size](#)

```
(crypt/max-key-size algorithm)
```

Returns the max allowed key size

```
(do
  (load-module :crypt)
  (crypt/max-key-size "AES"))
```

[top](#)

[crypt/md5-hash](#)

```
(crypt/md5-hash data)
(crypt/md5-hash data salt)
```

Hashes a string or a bytebuf using MD5 with an optional salt.

Note: MD5 is not safe any more use PBKDF2 to hash passwords!

```
(do
  (load-module :crypt)
  (-> (crypt/md5-hash "hello world")
       (str/bytbuf-to-hex :upper)))
=> "5EB63BBBE01EEED093CB22BB8F5ACDC3"

Hashes a string or a bytebuf using MD5 with an optional salt.

[crypt/sha1–hash](#)

Hashes a string or a bytebuf using SHA1 with an optional salt.

[crypt/pbkdf2–hash](#)

Hashes a string using PBKDF2. iterations defaults to 1000, key-length defaults to 256.

[top](#)

[crypt/verify–file–hash](#)

```
(crypt/verify–file–hash algorithm salt file hash)
```

Verifies a file against a hash (Base64 encoded). Returns true if the file's actual hash is equal to the given hash otherwise false.

The arg 'file' may be a:

- string file path, e.g: "/temp/foo.json"

- `bytebuf`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`

Supported hash algorithms:

- MD5
- SHA-1
- SHA-512

Warning: The MD5 hash function's security is considered to be severely compromised. Collisions can be found within seconds, and they can be used for malicious purposes.

```
(do
  (load-module :crypt)
  (let [file (io/temp-file "test-", ".data")
        data (bytebuf-allocate-random 1000)
        salt "salt"]
    (io/delete-file-on-exit file)
    (io/spit file data)

```

SEE ALSO

[crypt/hash-file](#)

Computes a hash for a file. The hash is used together with the function crypt/verify-file-hash to detect file modifications.

[top](#)

csv/read

```
(csv/read source & options)
```

Reads CSV-data from a source.

The source may be a:

- `string`
- `bytebuf`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`,
- `java.io.InputStream`
- `java.io.Reader`

Options:

<code>:encoding</code>	<code>enc</code>	used when reading from a binary data source e.g <code>:encoding :utf-8</code> , defaults to <code>:utf-8</code>
<code>:separator</code>	<code>val</code>	e.g. <code>" "</code> , defaults to a comma
<code>:quote</code>	<code>val</code>	e.g. <code>""</code> , defaults to a double quote

```
(csv/read """1,"ab",false""")
=> (("1" "ab" "false"))
```

```
(csv/read "1||'ab'|false" :separator "|" :quote "'")
=> ((1 nil nil "ab" "false"))
```

csv/write

```
(csv/write sink records & options)
```

Spits data to a sink in CSV format.

The sink may be a:

- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.OutputStream`
- `java.io.Writer`

Options:

<code>:separator val</code>	e.g. <code>"</code> , defaults to a comma
<code>:quote val</code>	e.g. <code>""</code> , defaults to a double quote
<code>:newline val</code>	<code>:lf</code> (default) or <code>:cr+lf</code>
<code>:encoding enc</code>	used when writing to a binary data sink. e.g <code>:encoding :utf-8</code> , defaults to <code>:utf-8</code>

```
(csv/write (io/file "test.csv") [[1 "AC" false] [2 "WS" true]])
```

csv/write-str

```
(csv/write-str records & options)
```

Writes data to a string in CSV format.

All fields containing a quote char, a separator char or a newline are quoted.

Options:

<code>:separator val</code>	e.g. <code>"</code> , defaults to a comma
<code>:quote val</code>	e.g. <code>""</code> , defaults to a double quote
<code>:newline val</code>	<code>:lf</code> (default) or <code>:cr+lf</code>

```
(csv/write-str [[1 "AC" false] [2 "WS" true]])
=> "1,AC,false\n2,WS,true"
```

```
(csv/write-str [[1 "AC" false] [2 "WS, '-1'" true]]
  :quote """
  :separator ","
  :newline :cr+lf)
=> "1,AC,false\r\n2,'WS, '-1''',true"
```

current-time-millis

```
(current-time-millis)
```

Returns the current time in milliseconds.

```
(current-time-millis)  
=> 1763892940557
```

SEE ALSO

[nano-time](#)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

[top](#)

cycle

```
(cycle coll)
```

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

```
(doall (take 5 (cycle [1 2])))  
=> (1 2 1 2 1)
```

SEE ALSO

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

dag/add-edges

```
(add-edges edges*)
```

Add edges to a DAG. Returns a new DAG with added edges.

An edge is a vector of two nodes forming a parent/child relationship. Any *Venice* value can be used for a node.

Note: The graph is reconstructed after adding edges. To have best performance pass the edges with a single `add-edges` call to the DAG.

```
(dag/add-edges (dag/dag) ["A" "B"] ["B" "C"])  
=> ([["A" "B"] ["B" "C"]])
```

SEE ALSO

[dag/dag](#)

Creates a new DAG (directed acyclic graph) built from edges

Creates a new DAG (directed acyclic graph) built from edges

[dag/topological-sort](#)

Topological sort of a DAG using Kahn's algorithm (https://en.wikipedia.org/wiki/Topological_sorting)

dag/child-of?

```
(child-of? dag c v)
```

Returns `true` if `c` is a transitive child of `v`

```
(-> (dag/dag ["A", "B"] ; A E
              ["B", "C"] ; | |
              ["C", "D"] ; B F
              ["E", "F"] ; | / \
              ["F", "C"] ; C G
              ["F", "G"] ; \ /
              ["G", "D"]) ; D
  (dag/child-of? "G" "E"))
=> true
```

SEE ALSO

[dag/dag](#)

Creates a new DAG (directed acyclic graph) built from edges

[dag/children](#)

Returns the transitive child nodes

[dag/parent-of?](#)

Returns true if p is a transitive parent of v

[top](#)

[dag/children](#)

(`children dag node`)

Returns the transitive child nodes

```
(dag/children (dag/dag ["A" "B"] ["B" "C"]) "A")
=> ("B" "C")
```

```
(-> (dag/dag ["A", "B"] ; A E
           ["B", "C"] ; | |
           ["C", "D"] ; B F
           ["E", "F"] ; | / \
           ["F", "C"] ; C G
           ["F", "G"] ; \ /
           ["G", "D"])) ; D
(dag/children "F"))
=> ("C" "G" "D")
```

SEE ALSO

[dag/dag](#)

Creates a new DAG (directed acyclic graph) built from edges

[dag/direct-children](#)

Returns the direct child nodes

[dag/parents](#)

Returns the transitive parent nodes

[dag/direct-parents](#)

Returns the direct parent nodes

[dag/roots](#)

Returns the root nodes of a DAG

[top](#)

[dag/compare-fn](#)

(`compare-fn dag`)

Returns a comparator fn which produces a topological sort based on the dependencies in the graph. Nodes not present in the graph will sort after nodes in the graph.

```
(let [g (dag/dag ["A", "B"] ; A E
                  ["B", "C"] ; | |
                  ["C", "D"] ; B F
                  ["E", "F"] ; | / \
                  ["F", "C"] ; C G
                  ["F", "G"] ; \ /
```

```
[ "G", "D" ]) ] ;      D
(sort (dag/compare-fn g) [ "D" "F" "A" "Z" ])
=> [ "F" "A" "D" "Z" ]
```

Creates a new DAG (directed acyclic graph) built from edges

[dag/topological-sort](#)

Topological sort of a DAG using Kahn's algorithm (https://en.wikipedia.org/wiki/Topological_sorting)

[top](#)

[dag/dag](#)

```
(dag)
(dag edges*)
```

Creates a new DAG (directed acyclic graph) built from edges

An edge is a vector of two nodes forming a parent/child relationship.

```
(dag/dag)
=> ()
```

```
(dag/dag [ "A" "B" ] [ "B" "C" ])
=> ( [ "A" "B" ] [ "B" "C" ] )
```

```
(dag/dag [ "A", "B" ] ; A E
          [ "B", "C" ] ; | |
          [ "C", "D" ] ; B F
          [ "E", "F" ] ; | / \
          [ "F", "C" ] ; C   G
          [ "F", "G" ] ; \ /
          [ "G", "D" ] ) ; D
=> ( [ "A" "B" ] [ "B" "C" ] [ "C" "D" ] [ "E" "F" ] [ "F" "C" ] [ "F" "G" ] [ "G" "D" ] )
```

SEE ALSO

[dag/dag?](#)

Returns true if coll is a DAG

[dag/add-edges](#)

Add edges to a DAG. Returns a new DAG with added edges.

[dag/add-nodes](#)

Add nodes to a DAG. Returns a new DAG with added nodes.

[dag/topological-sort](#)

Topological sort of a DAG using Kahn's algorithm (https://en.wikipedia.org/wiki/Topological_sorting)

[dag/edges](#)

Returns the edges of a DAG

[dag/edge?](#)

Returns true if the edge given by its parent and child node is part of the DAG

[dag/nodes](#)

Returns the nodes of a DAG

[dag/node?](#)

Returns true if v is a node in the DAG

[dag/roots](#)

Returns the root nodes of a DAG

[dag/children](#)

Returns the transitive child nodes

[dag/direct-children](#)

Returns the direct child nodes

[dag/child-of?](#)

Returns true if c is a transitive child of v

[dag/parents](#)

Returns the transitive parent nodes

[dag/direct-parents](#)

Returns the direct parent nodes

[dag/parent-of?](#)

Returns true if p is a transitive parent of v

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

[dag/dag?](#)

`(dag? coll)`

Returns true if coll is a DAG

`(dag/dag? (dag/dag))`

`=> true`

[top](#)

[dag/direct-children](#)

`(direct-children dag node)`

Returns the direct child nodes

```
(-> (dag/dag ["A", "B"] ; A E
              ["B", "C"] ; | |
              ["C", "D"] ; B F

```

SEE ALSO

[distinct](#)

Returns a collection with all duplicates removed.

[top](#)

def

(def name expr)

Creates a global variable.

```
(def x 5)  
=> user/x
```

```
(def sum (fn [x y] (+ x y)))  
=> user/sum
```

```
(def ^{:private true} x 100)  
=> user/x
```

SEE ALSO

[def](#)

Creates a global variable.

[def-](#)

Same as def, yielding non-public def

[defonce](#)

Creates a global variable that can not be overwritten

[def-dynamic](#)

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[set!](#)

Sets a global or thread-local variable to the value of the expression.

[top](#)

def-

```
(def- name expr)
```

Same as `def`, yielding non-public `def`

```
(def- x 100)
```

```
(do
  (ns foo)
  (def- x 100)
  (ns bar)
  foo/x) ; Illegal access of private symbol
```

SEE ALSO

`def`

Creates a global variable.

[top](#)

def-dynamic

```
(def-dynamic name expr)
```

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

```
(do
  (def-dynamic x 100)
  (println x)
  (binding [x 200]
    (println x))
  (println x)))
```

```
100
200
100
=> nil
```

```
(def-dynamic ^{:private true} x 100)
=> user/x
```

SEE ALSO

`binding`

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

`def`

Creates a global variable.

`defonce`

Creates a global variable that can not be overwritten

`set!`

Sets a global or thread-local variable to the value of the expression.

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[top](#)

defprotocol

```
(defprotocol protocol fn-spec*)
```

Defines a new protocol with the supplied function specs.

Formats:

- `(defprotocol P (foo [x]))`
- `(defprotocol P (foo [x] [x y]))`
- `(defprotocol P (foo [x] [x y] nil))`
- `(defprotocol P (foo [x] [x y] 100))`
- `(defprotocol P (foo [x]) (bar [x] [x y]))`

```
(do
  (ns foo)
  (deftype :complex [re :long, im :long])
  (defprotocol XMath (+ [x y])
    (- [x y]))
  (extend :foo/complex XMath
    (+ [x y] (complex. (core/+ (:re x) (:re y))
                         (core/+ (:im x) (:im y))))
    (- [x y] (complex. (core/- (:re x) (:re y))
                         (core/- (:im x) (:im y)))))
  (extend :core/long XMath
    (+ [x y] (core/+ x y))
    (- [x y] (core/- x y)))
  (foo/+ (complex. 1 1) (complex. 4 5)))
=> {:custom-type* :foo/complex :re 5 :im 6}

(do
  (ns foo)
  (defprotocol Lifecycle (start [c]) (stop [c]))
  (deftype :component [name :string]
    Lifecycle (start [c] (println "'~(:name c)' started"))
               (stop [c] (println "'~(:name c)' stopped")))
  (let [c (component. "test")]
    lifecycle? (extends? (type c) Lifecycle)]
  (println "'~(:name c)' extends Lifecycle protocol: ~{lifecycle?}")
  (start c)
  (stop c))
'test' extends Lifecycle protocol: true
'test' started
'test' stopped
=> nil
```

SEE ALSO

[extend](#)

Extends protocol for type with the supplied functions.

[extends?](#)

Returns true if the type extends the protocol.

[defmulti](#)

Creates a new multimethod with the associated dispatch function.

[top](#)

deftype

```
(deftype name fields)
```

```
(deftype name fields validator)
```

Defines a new custom *record* type for the name with the fields.

The optional validator is a single arg function receiving the value as the argument and throwing an exception if the value is not valid.

Venice implicitly creates a builder and a type check function suffixed with a dot and a question mark:

```
(deftype :point [x :long, y :long])  
  
(point. 200 300) ; builder  
(point? (point. 200 300)) ; type check
```

The builder accepts values of any subtype of the field's type.

Validation example:

```
(deftype :point  
  [x :long, y :long]  
  (fn [t]  
    (assert (pos? (:x t)) "x must be positive!")))
```

```
(do  
  (ns foo)  
  (deftype :point [x :long, y :long])  
  ; explicitly creating a custom type value  
  (def x (.: :point 100 200))  
  ; Venice implicitly creates a builder function  
  ; suffixed with a '.'  
  (def y (point. 200 300))  
  ; ... and a type check function  
  (point? y)  
  y)  
=> {:custom-type* :foo/point :x 200 :y 300}
```

```
(do  
  (ns foo)  
  (deftype :point [x :long, y :long])  
  (def x (point. 100 200))  
  (type x))  
=> :foo/point
```

```
(do  
  (ns foo)  
  (deftype :point [x :long, y :long]  
    (fn [p]  
      (assert (pos? (:x p)) "x must be positive")  
      (assert (pos? (:y p)) "y must be positive"))))  
  (def p (point. 100 200))  
  [(:x p) (:y p)])  
=> [100 200]
```

```
(do  
  (ns foo)  
  (deftype :named [name :string, value :any])  
  (def x (named. "count" 200))  
  (def y (named. "seq" [1 2]))  
  [x y])  
=> [{:custom-type* :foo/named :name "count" :value 200} {:custom-type* :foo/named :name "seq" :value [1 2]}]
```

; modifying a custom type field

```
(do  
  (deftype :point [x :long, y :long])  
  (def p (point. 0 0))  
  (def q (assoc p :x 1 :y 2)) ; q is a 'point'
```

```
(pr-str q))
=> "{:custom-type* :user/point :x 1 :y 2}"

;; removing a custom type field
(do
  (deftype :point [x :long, y :long])
  (def p (point. 100 200))
  (def q (dissoc p :x)) ; q is just a map now
  (pr-str q))
=> "{:y 200}"
```

SEE ALSO

[top](#)

[delay](#)

`(delay & body)`

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with `force` or `deref` / `@`), and will cache the result and return it on all subsequent force calls.

```
(do
  (def x (delay (println "working...") 100))
  (deref x))
working...
=> 100
```

SEE ALSO

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[force](#)

If x is a delay, returns its value, else returns x

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[delay?](#)

Returns true if x is a Delay created with delay

[memoize](#)

Returns a memoized version of a referentially transparent function.

[top](#)

[delay-queue](#)

`(delay-queue)`

Creates a new delay queue.

A delay-queue is an unbounded blocking queue of delayed elements, in which an element can only be taken when its delay has expired. The head of the queue is that delayed element whose delay expired furthest in the past. If no delay has expired there is no head and `poll!` will return nil. Unexpired elements cannot be removed using `take!` or `poll!`, they are otherwise treated as normal elements. For example, the `count` method returns the count of both expired and unexpired elements. This queue does not permit `nil` elements.

Example rate limiter:

```
(do
  (defprotocol RateLimiter (init [x]) (aquire [x]))

  (deftype :rate-limiter [queue           :core/delay-queue
                           limit-for-period   :long
                           limit-refresh-period :long]
    RateLimiter
      (init [this]  (let [q (:queue this)
                           n (:limit-for-period this)]
                      (empty q)
                      (repeatedly n #(put! q :token 0))
                      this))
      (aquire [this] (let [q (:queue this)
                           p (:limit-refresh-period this)]
                      (take! q)
                      (put! q :token p))))
    ;; create a limiter with a limit of 5 actions within a 2s period
    (def limiter (init (rate-limiter. (delay-queue) 5 2000)))

    ;; test the limiter
    (doseq [x (range 1 26)]
      (aquire limiter)
      (printf "%s: run %2d%n" (time/local-date-time) x))

  (let [q (delay-queue)]
    (put! q 1 100)
    (put! q 1 200)
    (take! q))
  => 1
```

SEE ALSO

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[put!](#)

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

[take!](#)

Retrieves and removes the head value of the queue or the deque, waiting if necessary until a value becomes available.

[poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

[empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[delay-queue?](#)

Returns true if coll is a delay-queue

delay-queue?

```
(delay-queue? coll)
```

realized?

Returns true if a value has been produced for a promise, delay, or future.

[top](#)

deque

(deque)
(deque capacity)

Creates a new mutable threadsafe bounded or unbounded deque.

The deque can be turned into a synchronous deque when using the functions `put!` and `take! . put!`. `put!` waits until the value be added and `'take!` waits until a value is available from queue thus synchronizing the producer and consumer.

```
; unbounded deque
(let [q (deque)]
  (offer! q 1)
  (offer! q 2)
  (offer! q 3)
  (poll! q)
  q)
=> (2 3)
```

```
; unbounded deque
(let [q (conj! (dequeue) 1 2 3)]
  (offer! q 4)
  (poll! q))
```

```

q)
=> (2 3 4)

; bounded deque
(let [q (deque 10)]
  (offer! q 1000 1)
  (offer! q 1000 2)
  (offer! q 1000 3)
  (poll! q 1000)
q)
=> (2 3)

; bounded deque
(let [q (conj! (deque 10) 1 2 3)]
  (offer! q 4)
  (poll! q)
q)
=> (2 3 4)

; synchronous unbounded deque
(let [q (deque)]
  (put! q 1)
  (put! q 2)
  (put! q 3)
  (take! q)
q)
=> (2 3)

; synchronous bounded deque
(let [q (deque 10)]
  (put! q 1)
  (put! q 2)
  (put! q 3)
  (take! q)
q)
=> (2 3)

```

[poll!](#)

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

[put-head!](#)

Puts an item to the head of a deque. The operation is synchronous, it waits indefinitely until the value can be placed on the queue.

[take-tail!](#)

Retrieves and removes the tail value of the deque, waiting if necessary until a value becomes available.

[offer-head!](#)

Offers an item to the head of a deque with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

[poll-tail!](#)

Polls an item from the tail of a deque with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

[empty](#)

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[deque?](#)

Returns true if coll is a deque

[reduce](#)

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

[transduce](#)

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be ...

[dcoll](#)

Applies f to the items of the collection presumably for side effects. Returns nil.

[into!](#)

Adds all of the items of 'from' conjoined to the mutable 'to' collection

[conj!](#)

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

[top](#)

[deque?](#)

`(deque? coll)`

Returns true if coll is a deque

```
(deque? (deque))
=> true
```

[top](#)

[deref](#)

`(deref x)
(deref x timeout-ms timeout-val)`

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will block if computation is not complete. The variant taking a timeout can be used for futures and will return `timeout-val` if the timeout (in milliseconds) is reached before a value is available. If a future is deref'd and the waiting thread is interrupted the futures are cancelled.

```
(do
  (def counter (atom 10))
  (deref counter))
=> 10
```

```
(do
  (def counter (atom 10))
  @counter)
=> 10
```

(deref? (just 100))
=> true
```

[top](#)

difference

```
(difference s1)
(difference s1 s2)
(difference s1 s2 & sets)
```

Return a set that is the first set without elements of the remaining sets

```
(difference (set 1 2 3))
=> #{1 2 3}

(difference (set 1 2) (set 2 3))
=> #{1}

(difference (set 1 2) (set 1) (set 1 4) (set 3))
=> #{2}
```

SEE ALSO

[union](#)

Return a set that is the union of the input sets

[intersection](#)

Return a set that is the intersection of the input sets

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[disj](#)

Returns a new set with the x, xs removed.

[top](#)

digits

```
(digits x)
```

Returns the number of digits of x. The number x must be of type integer, long, or bigint

```
(digits 124)
=> 3

(digits -10)
=> 2

(digits 11111111111111111111111111111111N)
=> 32
```

top

disj

```
(disj set x)
(disj set x & xs)
```

Returns a new set with the x, xs removed.

```
(disj (set 1 2 3) 3)
=> #{1 2}
```

top

dissoc

```
(dissoc coll key)
(dissoc coll key & ks)
```

Returns a new coll of the same type, that does not contain a mapping for key(s)

```
(dissoc {:a 1 :b 2 :c 3} :b)
=> {:a 1 :c 3}
```

```
(dissoc {:a 1 :b 2 :c 3} :c :b)
=> {:a 1}
```

```
(dissoc [1 2 3] 0)
=> [2 3]
```

```
(do
  (deftype :complex [real :long, imaginary :long])
  (def x (complex. 100 200))
  (def y (dissoc x :real))
  (pr-str y))
=> "{:imaginary 200}"
```

SEE ALSO

[assoc](#)

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, ...

[update](#)

Updates a value in an associative structure, where k is a key and f is a function that will take the old value and any supplied fargs ...

dissoc!

```
(dissoc! coll key)
(dissoc! coll key & ks)
```

Dissociates keys from a mutable map, returns the map

```
(dissoc! (mutable-map :a 1 :b 2 :c 3) :b)
=> {:a 1 :c 3}
```

```
(dissoc! (mutable-map :a 1 :b 2 :c 3) :c :b)
=> {:a 1}
```

```
(dissoc! (mutable-vector 1 2 3) 0)
=> [2 3]
```

SEE ALSO

[assoc!](#)

Associates key/vals with a mutable map, returns the map

[update!](#)

Updates a value in a mutable associative structure, where k is a key and f is a function that will take the old value and any supplied ...

dissoc-in

```
(dissoc-in m ks)
```

Dissociates an entrye in a nested associative structure, where ks is a sequence of keys and returns a new nested structure.

```
(do
  (def users [ {:name "James" :age 26}
              {:name "John" :age 43} ])
  (dissoc-in users [1]))
=> [{:name "James" :age 26}]
```

```
(do
  (def users [ {:name "James" :age 26}
              {:name "John" :age 43} ])
  (dissoc-in users [1 :age]))
=> [{:name "James" :age 26} {:name "John"}]
```

distinct

```
(distinct coll)
```

Returns a collection with all duplicates removed.
Returns a stateful transducer when no collection is provided.

```
(distinct [1 2 3 4 2 3 4])
=> [1 2 3 4]
```

```
(distinct '(1 2 3 4 2 3 4))
=> (1 2 3 4)
```

SEE ALSO

[dedupe](#)

Returns a collection with all consecutive duplicates removed.

[distinct?](#)

Returns true if no two of the arguments are equal

[top](#)

distinct?

```
(distinct? x) (distinct? x y) (distinct? x y & more)
```

Returns true if no two of the arguments are equal

```
(distinct? 1 2 3)
=> true
```

```
(distinct? 1 2 3 3)
=> false
```

```
(distinct? 1 2 3 1)
=> false
```

SEE ALSO

[distinct](#)

Returns a collection with all duplicates removed.

[top](#)

do

```
(do exprs)
```

Evaluates the expressions in order and returns the value of the last.

```
(do (println "Test...") (+ 1 1))
Test...
=> 2
```

[top](#)

doall

(doall coll)
(doall n coll)

When lazy sequences are produced `doall` can be used to force any effects and realize the lazy sequence. Returns the realized items in a list!

```
(-> (lazy-seq #(rand-long 100))
     (take 4)
     (doall))
=> (61 49 77 43)
```

```
(->> (lazy-seq #(rand-long 100))
        (doall 4))
=> (18 47 16 2)
```

SEE ALSO

lazy-seq

Creates a new lazy sequence.

cycle

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

repeat

Returns a lazy sequence of x values or a collection with the value x repeated n times.

cons

Returns a new collection where x is the first element and coll is the rest.

top

dobench

```
(dobench iterations expr)
(dobench warm-up-iterations gc-runs iterations expr)
```

Runs the expr iterations times in the most effective way and returns a list of elapsed nanoseconds for each invocation. It's main purpose is supporting benchmark tests.

Note: For best performance enable `macroexpand-on-load` !

top

doc

(doc)

```
(doc x)
```

Prints documentation for a var or special form given `x` as its name. Prints the definition of custom types.

Displays the source of a module if `x` is a module: `(doc :ansi)`

If the var could not be found, searches for a similiar var with the **Levenshtein distance 1**.

E.g:

```
> (doc dac)
Symbol 'dac' not found!
```

```
Did you mean?
dag/dag
dec
```

```
;; documentation of function '+'
```

```
(doc +)
```

```
;; documentation of special form 'def'
```

```
(doc def)
```

```
;; source code of module ':ascii-table'
```

```
(doc :ascii-table)
```

```
;; definition/structure of a complex type
```

```
(do
  (deftype :complex [real :long, imaginary :long])
  (doc :complex))
```

SEE ALSO

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[modules](#)

Lists the available Venice modules

[finder](#)

Finds symbols that match one or more glob patterns or regular expressions.

[top](#)

docker/cmd

```
(docker/cmd & args)
```

Runs any Docker command.

```
(println (docker/cmd "ps" "--all"))
```

```
;; a single string argument works as well
```

```
(println (docker/cmd "ps --all"))
```

```
;; run a command with JSON output and parse the JSON output into
```

```
;; Venice data
```

```
;; use `apply` to apply a vector of arguments
```

```
(-> (apply docker/cmd ["ps" "--all" "--format" "json"])
     (:out <>)
     (str/split-lines <>))
```

```
(str/join "," <>)
(str "[" <> "]")
(json/read-str <>))
```

top

docker/container-exec-by-name

```
(docker/container-exec-by-name name command)
```

Execute a command in the running container with the specified name (always in non detached mode).

Returns the captured stdout text if the command succeeds.

Throws `ShellException` if the command fails. The exception carries the exit code and the captured stderr text.

```
(docker/container-exec-by-name "myapp" "touch /tmp/execWorks")
```

SEE ALSO

[docker/container-exec-by-name&](#)

Execute a command in the running container with the specified name (always in detached mode).

[docker/run](#)

Create and run a new container from an image.

[docker/container-running-with-name?](#)

Checks if there is container with the specified name in 'running' state.

[docker/container-exec-by-name](#)

Execute a command in the running container with the specified name (always in non detached mode).

[docker/container-logs](#)

Returns the container logs.

top

docker/container-exec-by-name&

```
(docker/container-exec-by-name& name command)
```

Execute a command in the running container with the specified name (always in detached mode).

Returns always an empty string because the command is run in detached mode. To get the commands captured stdout text use `docker/container-exec-by-name` instead.

Throws a `ShellException` if the command fails. The `ShellException` carries the exit code, stdout, and stderr text.

```
(docker/container-exec-by-name& "myapp" "touch /tmp/execWorks")
```

SEE ALSO

[docker/container-exec-by-name](#)

Execute a command in the running container with the specified name (always in non detached mode).

[docker/run](#)

Create and run a new container from an image.

[docker/container-running-with-name?](#)

Checks if there is container with the specified name in 'running' state.

[docker/container-exec-by-name](#)

Execute a command in the running container with the specified name (always in non detached mode).

[docker/container-logs](#)

Returns the container logs.

[top](#)

[docker/container-exists-with-name?](#)

([docker/container-exists-with-name?](#) name)

Returns true if there is container with the specified name else false.

([docker/container-exists-with-name?](#) "myapp")

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-find-by-name](#)

Find all containers with a specified name

[top](#)

[docker/container-find-by-name](#)

([docker/container-find-by-name](#) name)

Find all containers with a specified name

([docker/container-find-by-name](#) "myapp")

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-exists-with-name?](#)

Returns true if there is container with the specified name else false.

[top](#)

[docker/container-image-info-by-name](#)

([docker/container-image-info-by-name](#) name)

Returns the image info for a container given by its name.

Returns a map (e.g.): { :image "arangodb/arangodb:3.10.10" :repo "arangodb/arangodb" :tag "3.10.10" }

([docker/container-image-info-by-name](#) "myapp")

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-find-by-name](#)

Find all containers with a specified name

[docker/container-exists-with-name?](#)

Returns true if there is container with the specified name else false.

[docker/container-status-by-name](#)

Returns the status of container with the specified name.

[top](#)

docker/container-logs

([docker/container-logs](#) name & options)

Returns the container logs.

Options:

:tail n	Number of lines to show from the end of the logs
:since ts	Show logs since timestamp or relative (e.g. "42m" for 42 minutes)
:until ts	Show logs until timestamp or relative (e.g. "42m" for 42 minutes)
:follow {true, false}	Follow log output
:details {true, false}	Show extra details provided to logs

([docker/container-logs](#) "myapp")

([docker/container-logs](#) "myapp" :since "2m")

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/logs](#)

Get the logs of a container

[docker/container-running-with-name?](#)

Checks if there is container with the specified name in 'running' state.

[top](#)

docker/container-purge-by-name

([docker/container-purge-by-name](#) name)

Removes a container and its image.

([docker/container-purge-by-name](#) "myapp")

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-find-by-name](#)

Find all containers with a specified name

[docker/container-exists-with-name?](#)

Returns true if there is container with the specified name else false.

[docker/container-status-by-name](#)

Returns the status of container with the specified name.

[top](#)

[docker/container-remove-by-name](#)

`(docker/container-remove-by-name name)`

Removes a container with the specified name.

`(docker/container-remove-by-name "myapp")`

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-find-by-name](#)

Find all containers with a specified name

[docker/container-exists-with-name?](#)

Returns true if there is container with the specified name else false.

[docker/container-status-by-name](#)

Returns the status of container with the specified name.

[top](#)

[docker/container-running-with-name?](#)

`(docker/container-running-with-name? name)`

Checks if there is container with the specified name in 'running' state.

Returns true if running else false.

`(docker/container-running-with-name? "myapp")`

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-start-by-name](#)

Starts a container with the specified name.

[docker/container-stop-by-name](#)

Stops a container with the specified name.

[docker/container-start-by-name](#)

(`docker/container-start-by-name name`)

Starts a container with the specified name.

(`docker/container-start-by-name "myapp"`)

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-running-with-name?](#)

Checks if there is container with the specified name in 'running' state.

[docker/container-stop-by-name](#)

Stops a container with the specified name.

[docker/container-remove-by-name](#)

Removes a container with the specified name.

[docker/container-status-by-name](#)

Returns the status of container with the specified name.

[docker/container-logs](#)

Returns the container logs.

[docker/container-status-by-name](#)

(`docker/container-status-by-name name`)

Returns the status of container with the specified name.

(`docker/container-status-by-name "myapp"`)

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-find-by-name](#)

Find all containers with a specified name

[docker/container-exists-with-name?](#)

Returns true if there is container with the specified name else false.

[docker/container-remove-by-name](#)

Removes a container with the specified name.

[docker/container-stop-by-name](#)

```
(docker/container-stop-by-name name)
(docker/container-stop-by-name name time)
```

Stops a container with the specified name.

```
(docker/container-stop-by-name "myapp")
```

SEE ALSO

[docker/run](#)

Create and run a new container from an image.

[docker/container-running-with-name?](#)

Checks if there is container with the specified name in 'running' state.

[docker/container-stop-by-name](#)

Stops a container with the specified name.

[docker/container-remove-by-name](#)

Removes a container with the specified name.

[docker/container-status-by-name](#)

Returns the status of container with the specified name.

[docker/container-logs](#)

Returns the container logs.

[top](#)

docker/cp

```
(docker/cp src-path dst-path & options)
```

Copy files/folders between a container and the local filesystem

Options:

:archive {true, false}	Archive mode (copy all uid/gid information)
:follow-link {true, false}	Always follow symbol link in SRC_PATH
:quiet {true, false}	Suppress progress output during copy. Progress output is automatically suppressed if no terminal is attached

```
; Copy file from host to docker container
```

```
(docker/cp "data.txt" "74789744g489:/data.txt")
```

```
; Copy file from docker container to host
```

```
(docker/cp "74789744g489:/data.txt" "data.txt")
```

```
; Copy a folder from host to docker container
```

```
(docker/cp "Desktop/images" "74789744g489:/root/img_files/car_photos/images")
```

```
; Copy a folder from docker container to host
```

```
(docker/cp "74789744g489:/root/img_files/car_photos/images Desktop/images")
```

SEE ALSO

[docker/diff](#)

Inspect changes to files or directories on a container's filesystem.

[docker/ps](#)

List containers.

docker/run

Create and run a new container from an image.

[top](#)

docker/debug

(`docker/debug mode`)

Sets the debugging mode.

Without argument returns the current debug mode.

Mode:

:off	No debug output
:on	Prints the raw docker command line to the current stdout channel ahead of running the command
:on-no-exec	Prints the raw docker command line to the current stdout channel without running the command

(`docker/debug :on`)

(`docker/debug :on-no-exec`)

(`docker/debug :off`)

[top](#)

docker/diff

(`docker/diff container & options`)

Inspect changes to files or directories on a container's filesystem.

Options:

:format {:string, :json} Returns the output either as a string or as JSON data

(`println (docker/diff "74789744g489")`)

(`docker/diff "74789744g4892" :format :json`)

SEE ALSO

docker/cp

Copy files/folders between a container and the local filesystem

docker/ps

List containers.

docker/run

Create and run a new container from an image.

[top](#)

docker/exec

(docker/exec container command args)

Execute a command in a running container (always in non detached mode).

Returns the captured stdout text if the command succeeds.

Throws `ShellException` if the command fails. The exception carries the exit code and the captured stderr text.

(`docker/exec "74789744g489" "touch" "/tmp/execWorks"`)

(`println (docker/exec "74789744g489" "ls" "-la" "/var")`)

SEE ALSO

Execute a command in a running container (always in non detached mode).

[docker/ps](#)

List containers.

[docker/run](#)

Create and run a new container from an image.

[top](#)

docker/image-prune

```
(docker/image-prune & options)
```

Remove unused images.

If `:all true` is specified, will also remove all images not referenced by any container. This is what you usually expect

Returns the stdout text from the command.

Options:

`:all {true, false}` Remove all unused images, not just dangling ones

```
(println (docker/image-prune))
```

```
(println (docker/image-prune :all true))
```

SEE ALSO

[docker/images](#)

[docker/prune](#)

Remove all stopped containers.

[docker/ps](#)

List containers.

[docker/run](#)

Create and run a new container from an image.

[top](#)

[docker/rmi](#)

([docker/rmi](#) image & options)

Remove an image.

Images can be removed by name, name and tag, or image id

Options:

- | | |
|-------------------------|--------------------------------|
| :force {true, false} | Force removal of the image |
| :no-prune {true, false} | Do not delete untagged parents |

(`println (docker/rmi "arangodb/arangodb:3.10.10" :force true))`)

SEE ALSO

[docker/images](#)

List images.

[docker/image-pull](#)

Download an image from a registry.

[docker/image-rm](#)

Remove an image.

[docker/image-prune](#)

Remove unused images.

[top](#)

docker/run

([docker/run](#) image & options)

Create and run a new container from an image.

Images can be run by name, name and tag, or image id

Options:

:detach {true, false}	Run container in background and return container ID
:attach s	Attach to STDIN, STDOUT or STDERR. Use one of {:stdin, :stdout, :stderr}
:publish port	Publish a container's port to the host. To expose port 8080 inside the container to port 3000 outside the container, pass "3000:8080"
:envs vars	Set environment variable (a sequence of env var defs)
:memory limit	Memory limit
:name name	Assign a name to the container
:quiet {true, false}	Suppress the pull output
:volumes vol	Bind mount a volume (a sequence of volume defs)
:workdir dir	Working directory inside the container
:args args	Arguments passed to container process (a sequence of args or a string)

See also [cargo/start](#) / [cargo/stop](#) for a smarter way to start/stop a container.

```
;; Run an ArangoDB container (use bind mounts, very slow on macOS)
(docker/run "arangodb/arangodb:3.10.10"
  :name "myapp"
  :publish [ "8529:8529" ]
  :detach true
  :envs ["ARANGO_ROOT_PASSWORD=xxxxxx"
    "ARANGODB_OVERRIDE_DETECTED_TOTAL_MEMORY=8G"
    "ARANGODB_OVERRIDE_DETECTED_NUMBER_OF_CORES=1"]
  :volumes ["/Users/foo/arangodb/db:/var/lib/arangodb3"
    "/Users/foo/arangodb/apps:/var/lib/arangodb3-apps"])

;; Run an ArangoDB container (use docker volume, faster than bind mount)
(do
  (docker/volume-create "arangodb-db")
  (docker/volume-create "arangodb-apps")
  (docker/run "arangodb/arangodb:3.10.10"
    :name "myapp"
    :publish [ "8529:8529" ]
    :detach true
    :envs ["ARANGO_ROOT_PASSWORD=xxxxxx"
      "ARANGODB_OVERRIDE_DETECTED_TOTAL_MEMORY=8G"
      "ARANGODB_OVERRIDE_DETECTED_NUMBER_OF_CORES=1"]
    :volumes ["arangodb-db:/var/lib/arangodb3"
      "arangodb-apps:/var/lib/arangodb3-apps"]
    :args ["--database.auto-upgrade"]))
```

SEE ALSO

[cargo/start](#)

Starts a container.

[docker/images](#)

List images.

docker/ps

List containers.

docker/start

Start a stopped container.

docker/stop

Stop a container.

docker/rm

Remove a container.

docker/prune

Remove all stopped containers.

docker/exec

Execute a command in a running container (always in non detached mode).

docker/cp

Copy files/folders between a container and the local filesystem

docker/diff

Inspect changes to files or directories on a container's filesystem.

docker/pause

Pause all processes within a container

docker/unpause

Unpause all processes within a container

docker/cp

Copy files/folders between a container and the local filesystem

docker/logs

Get the logs of a container

docker/container-find-by-name

Find all containers with a specified name

docker/container-exists-with-name?

Returns true if there is container with the specified name else false.

docker/container-running-with-name?

Checks if there is container with the specified name in 'running' state.

docker/container-start-by-name

Starts a container with the specified name.

docker/container-stop-by-name

Stops a container with the specified name.

docker/container-remove-by-name

Removes a container with the specified name.

docker/container-status-by-name

Returns the status of container with the specified name.

docker/container-exec-by-name

Execute a command in the running container with the specified name (always in non detached mode).

docker/container-logs

Returns the container logs.

docker/container-purge-by-name

Removes a container and its image.

docker/container-image-info-by-name

Returns the image info for a container given by its name.

docker/start

(`docker/start` container & options)

Start a stopped container.

Options:

`:attach {true, false}` Attach STDOUT/STDERR and forward signals

See also `cargo/start` / `cargo/stop` for a smarter way to start/stop a container.

([docker/start "74789744g489"](#))

[docker/run](#)

Create and run a new container from an image.

[top](#)

docoll

```
(docoll f coll)
```

Applies f to the items of the collection presumably for side effects. Returns nil.

If coll is a lazy sequence, `docoll` iterates over the lazy sequence and realizes value by value while calling function f on the realized values.

```
(docoll #(println %) [1 2 3 4])
1
2
3
4
=> nil

(docoll (fn [[k v]] (println (pr-str k v)))
  {:a 1 :b 2 :c 3 :d 4})
:a 1
:b 2
:c 3
:d 4
=> nil

;; docoll all elements of a queue. calls (take! queue) to get the
;; elements of the queue.
;; note: use nil to mark the end of the queue otherwise docoll will
;;       block forever!
(let [q (conj! (queue) 1 2 3 nil)]
  (docoll println q))
1
2
3
=> nil

;; lazy sequence
(let [q (conj! (queue) 1 2 3 nil)]
  (defn f []
    (let [v (poll! q)]
      (println "Producing " v)
      v))
  (docoll #(println "Collecting" %)
    (lazy-seq f)))
Producing 1
Collecting 1
Producing 2
```

```
Collecting 2
Producing 3
Collecting 3
Producing nil
=> nil
```

SEE ALSO

mapv

Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of ...

[top](#)

done?

```
(done? f)
```

Returns true if the future or promise is done otherwise false

```
(do
  (def wait (fn [] (sleep 200) 100))
  (let [f (future wait)]
    (sleep 50)
    (printf "After 50ms: done=%b\n" (done? f))
    (sleep 300)
    (printf "After 300ms: done=%b\n" (done? f))))
After 50ms: done=false
After 300ms: done=true
=> nil
```

SEE ALSO

future

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

realized?

Returns true if a value has been produced for a promise, delay, or future.

cancel

Cancels a future or a promise

cancelled?

Returns true if the future or promise is cancelled otherwise false

[top](#)

dorun

```
(dorun count expr)
```

Runs the expr count times in the most effective way. It's main purpose is supporting benchmark tests. Returns the expression result of the last invocation.

Note:

For best performance enable `macroexpand-on-load!`! The expression is evaluated for every run. Alternatively a zero or one arg function referenced by a symbol can be passed:

```
(let [f (fn [] (+ 1 1))]
  (dorun 10 f))
```

When passing a one arg function `dorun` passes the incrementing counter value (0..N) to the function:

```
(let [f (fn [x] (+ x 1))]
  (dorun 10 f))
```

```
(dorun 10 (+ 1 1))
=> 2
```

top

doseq

```
(doseq seq-exprs & body)
```

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by `list-comp`. Does not retain the head of the sequence. Returns `nil`.

Supported modifiers are: `:when` predicate

```
(doseq [x (range 10)] (print x))
0123456789
=> nil
```

```
(doseq [x (range 10)] (print x) (print "-"))
0-1-2-3-4-5-6-7-8-9-
=> nil
```

```
(doseq [x (range 5)] (print (* x 2)))
02468
=> nil
```

```
(doseq [x (range 10) :when (odd? x)] (print x))
13579
=> nil
```

```
(doseq [x (range 10) :when (odd? x)] (print (* x 2)))
26101418
=> nil
```

```
(doseq [x [1 2 3] y [1 2 3]] (println [x y]))
[1 1]
[1 2]
[1 3]
[2 1]
[2 2]
[2 3]
[3 1]
[3 2]
[3 3]
=> nil
```

```
(doseq [[x y] [[0 1] [1 2]]] (println [x y]))
[0 1]
[1 2]
=> nil
```

```
(doseq [[k v] {:a 1 :b 2}] (println [k v]))  
[:a 1]  
[:b 2]  
=> nil  
  
(doseq [[c vals] (group-by count ["a" "as" "asd" "aa" "asdf" "qwer"])]  
  (println c vals))  
1 [a]  
2 [as aa]  
3 [asd]  
4 [asdf qwer]  
=> nil
```

SEE ALSO

[list-comp](#)

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and ...

[top](#)

do

```
(do x & forms)
```

Evaluates x then calls all of the methods and functions with the value of x supplied at the front of the given arguments. The forms are evaluated in order. Returns x.

```
(doto (. :java.util.HashMap :new)
  (. :put :a 1)
  (. :put :b 2))
=> {"a" 1 "b" 2}
```

[top](#)

double

```
(double x)
```

Converts to double

```
(double 1)
=> 1.0
```

```
(double nil)
=> 0.0
```

```
(double false)
=> 0.0
```

```
(double true)
=> 1.0

(double "1.2")
=> 1.2
```

[top](#)

double-array

```
(double-array coll)
(double-array len)
(double-array len init-val)
```

Returns an array of Java primitive doubles containing the contents of coll or returns an array with the given length and optional init value.

To create an array of :java.lang.Double use:

```
(make-array :java.lang.Long 3)
```

```
(double-array '(1.0 2.0 3.0))
=> [1.0, 2.0, 3.0]

(double-array '(1I 2 3.2 3.56M))
=> [1.0, 2.0, 3.2, 3.56]

(double-array 10)
=> [0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0]

(double-array 10 42.0)
=> [42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0]
```

SEE ALSO

[java-double-list](#)
Converts a Venice list/vector to a Java Double list

[top](#)

double?

```
(double? n)
```

Returns true if n is a double

```
(double? 4.0)
=> true
```

```
(double? 4.0F)
=> false
```

```
(double? 3)
=> false
```

```
(double? 3I)
=> false
```

```
(double? 3.0M)
=> false
```

```
(double? true)
=> false
```

```
(double? nil)
=> false
```

```
(double? {})
=> false
```

[top](#)

drop

```
(drop n coll)
```

Returns a collection of all but the first n items in coll.
Returns a stateful transducer when no collection is provided.

```
(drop 3 [1 2 3 4 5])  
=> [4 5]
```

```
(drop 10 [1 2 3 4 5])  
=> []
```

[top](#)

drop-last

```
(drop-last n coll)
```

Return a sequence of all but the last n items in coll.
Returns a stateful transducer when no collection is provided.

```
(drop-last 3 [1 2 3 4 5])  
=> [1 2]
```

```
(drop-last 10 [1 2 3 4 5])  
=> []
```

[top](#)

drop-while

```
(drop-while predicate coll)
```

Returns a list of the items in coll starting from the first item for which `(predicate item)` returns logical false.
Returns a stateful transducer when no collection is provided.

```
(drop-while neg? [-2 -1 0 1 2 3])  
=> [0 1 2 3]
```

[top](#)

empty

```
(empty coll)
```

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection and returns the emptied collection.

```
(empty {:a 1})  
=> {}
```

```
(empty [1 2])  
=> []
```

```
(empty '(1 2))  
=> ()
```

top

empty-to-nil

```
(empty-to-nil x)
```

Returns nil if x is empty

```
(empty-to-nil "")  
=> nil
```

```
(empty-to-nil [])  
=> nil
```

```
(empty-to-nil '())  
=> nil
```

```
(empty-to-nil {})  
=> nil
```

top

empty?

```
(empty? x)
```

Returns true if x is empty. Accepts strings, collections and bytebufs.

```
(empty? {})  
=> true
```

```
(empty? [])  
=> true
```

```
(empty? '())  
=> true
```

```
(empty? nil)  
=> true
```

```
(empty? "")  
=> true
```

SEE ALSO

[not-empty?](#)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

top

entries

```
(entries m)
```

Returns a collection of the map's entries.

```
(entries {:a 1 :b 2 :c 3})  
=> ([:a 1] [:b 2] [:c 3])  
  
(let [e (entries {:a 1 :b 2 :c 3})]  
  (println (map key e))  
  (println (map val e)))  
(:a :b :c)  
(1 2 3)  
=> nil  
  
;; compare to 'into'  
(let [e (into [] {:a 1 :b 2 :c 3})]  
  (println (map first e))  
  (println (map second e)))  
(:a :b :c)  
(1 2 3)  
=> nil
```

SEE ALSO

[map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

[key](#)

Returns the key of the map entry.

[val](#)

Returns the val of the map entry.

[keys](#)

Returns a collection of the map's keys.

[vals](#)

Returns a collection of the map's values.

[map-entry](#)

Creates a new map entry

[top](#)

enum?

```
(enum? class)
```

Returns true if class is a Java *enum*.

Get all values of a Java *enum*:

```
(. :java.time.Month :values)
```

Get a Java *enum* value:

```
(let [jan (. :java.time.Month :JANUARY)]  
  (. :java.time.LocalDate :of 1994 jan 21))
```

This can be simplified to:

```
(. :java.time.LocalDate :of 1994 :JANUARY 21)

(enum? :java.time.Month)
=> true
```

[top](#)

eval

`(eval form)`

Evaluates the form data structure (not text!) and returns the result.

```
(eval '(let [a 10] (+ 3 4 a)))
=> 17

(eval (list + 1 2 3))
=> 6

(eval (read-string "(+ 1 2)"))
=> 3

(let [s "(+ 2 x)" x 10]
  (eval (read-string s)))
=> 12
```

SEE ALSO

[read-string](#)

Reads Venice source from a string and transforms its content into a Venice data structure, following the rules of the Venice syntax.

[top](#)

even?

`(even? n)`

Returns true if n is even, throws an exception if n is not an integer

```
(even? 4)
=> true

(even? 3)
=> false

(even? 31)
=> false
```

SEE ALSO

[odd?](#)

Returns true if n is odd, throws an exception if n is not an integer

every-pred

```
(every-pred p1 & p)
```

Takes a set of predicates and returns a function f that returns true if all of its composing predicates return a logical true value against all of its arguments, else it returns false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical false result against the original predicates.

```
((every-pred number?) 1)
=> true
```

```
((every-pred number?) 1 2)
=> true
```

```
((every-pred number? even?) 2 4 6)
=> true
```

every?

```
(every? pred coll)
```

Returns true if coll is a collection and the predicate is true for all collection items, false otherwise.

```
(every? number? nil)
=> false
```

```
(every? number? [])
=> true
```

```
(every? number? [1 2 3 4])
=> true
```

```
(every? number? [1 2 3 :a])
=> false
```

```
(every? #(≥ % 10) [10 11 12])
=> true
```

SEE ALSO

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

[not-every?](#)

Returns true if coll is a collection and the predicate is not true for all collection items, false otherwise.

ex

```
(ex class)
(ex class args*)
```

Creates an exception of type *class* with optional *args*. The *class* must be a subclass of :java.lang.Exception

The exception types:

- :java.lang.Exception
- :java.lang.RuntimeException
- :com.github.jlangch.venice.VncException
- :com.github.jlangch.venice.ValueException

are imported implicitly so its alias :Exception, :RuntimeException, :VncException, and :ValueException can be used.

Checked vs unchecked exceptions

All exceptions in Venice are *unchecked*.

If *checked* exceptions are thrown in Venice they are immediately wrapped in a :RuntimeException before being thrown!

If Venice catches a *checked* exception from a Java Interop call it wraps it in a :RuntimeException before handling it by the catch block selectors.

```
(try
  (throw (ex :VncException))
  (catch :VncException e "caught :VncException"))
=> "caught :VncException"

(try
  (throw (ex :RuntimeException "#test"))
  (catch :Exception e
    "msg: ~(ex-message e)"))
=> "msg: #test"

(try
  (throw (ex :ValueException 100))
  (catch :ValueException e
    "value: ~(ex-value e)"))
=> "value: 100"

(do
  (defn throw-ex-with-cause []
    (try
      (throw (ex :java.io.IOException "I/O failure"))
      (catch :Exception e
        (throw (ex :VncException "failure" (ex-cause e))))))
    (try
      (throw-ex-with-cause)
      (catch :Exception e
        "msg: ~(ex-message e), cause: ~(ex-message (ex-cause e))")))
  => "msg: failure, cause: I/O failure"
```

SEE ALSO

throw

Throws an exception.

try

Exception handling: try - catch - finally

try-with

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

ex?

Returns true if x is an instance of :java.lang.Throwable

ex-venice?

Returns true if x is an instance of :VncException

[top](#)

ex-cause

(ex-cause x)

Returns the exception cause or nil

```
(ex-cause (ex :VncException "a message" (ex :RuntimeException "...cause...")))
=> java.lang.RuntimeException: ...cause...
```

```
(ex-cause (ex :VncException "a message"))
=> nil
```

SEE ALSO

ex

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

ex-message

Returns the message of the exception

ex-value

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

[top](#)

ex-java-stacktrace

(ex-java-stacktrace x)
(ex-java-stacktrace x format)

Returns the Java stacktrace for an exception.

The optional format (:string or :list) controls the format of the returned stacktrace. The default format is :string.

```
(println (ex-java-stacktrace (ex :RuntimeException "message")))
```

```
(println (ex-java-stacktrace (ex :VncException "message") :list))
```

SEE ALSO

ex

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

ex-venice-stacktrace

Returns the Venice stacktrace for an exception or nil if the exception is not a venice exception.

[top](#)

ex-message

```
(ex-message x)
```

Returns the message of the exception

```
(ex-message (ex :VncException "a message"))
=> "a message"
```

```
(ex-message (ex :RuntimeException))
=> nil
```

SEE ALSO

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[ex-cause](#)

Returns the exception cause or nil

[ex-value](#)

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

[top](#)

ex-value

```
(ex-value x)
```

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

```
(ex-value (ex :ValueException [10 20]))
=> (10 20)
```

```
(ex-value (ex :RuntimeException))
=> nil
```

SEE ALSO

excel/add-area-chart

```
(add-area-chart sheet chart-title
                chart-addr-range
                legend-position
                category-axis-title
                category-axis-position
                value-axis-title
                value-axis-position
                three-dimensional?
                categories-addr-range
                series)
```

Adds an area chart.

Arguments:

chart-title	The chart title
chart-addr-range	The chart position in the Excel
legend-position	The legend position: :TOP , :TOP_RIGHT , :RIGHT , :BOTTOM , :LEFT
category-axis-title	The category axis title
category-axis-position	The category axis position: :TOP , :TOP_RIGHT , :RIGHT , :BOTTOM , :LEFT
value-axis-title	The value axis title
value-axis-position	The value axis position: :TOP , :TOP_RIGHT , :RIGHT , :BOTTOM , :LEFT
three-dimensional?	Render in 3D: true or false
categories-addr-range	The category names in the Excel
series	The value series data. 1 to N series

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")
        data [{"Year"    "Bears"  "Dolphins" "Whales"]

excel/add-column

```
(add-column sheet title)
(add-column sheet title options)
```

Defines a column with optional attributes on the sheet.

Note: The column cell value is just read from the passed tabular dataset. If there is any mapping or conversion needed it has to be applied to the dataset before writing it to the sheet!

Options:

:id id	a column id
:field f	a field, e.g. :first-name
:width n	width in points, e.g. 100
:skip s	skip column, e.g. true, false
:header-style r	style name for header row, e.g. :header
:body-style r	style name for body rows, e.g. :body
:footer-style r	style name for footer row, e.g. :footer
:footer-value v	explicit text or numeric value for the column's footer cell, e.g. "done", 10000.00M, nil
:footer-aggregate e	aggregation mode for the column's footer cell value, e.g. {:min, :max, :avg, :sum, :none}

```
(do
  (load-module :excel)
  (let [data  [ {:first "John"  :last "Doe"   :weight 70.5 }
          {:first "Sue"    :last "Ford"  :weight 54.2 } ]
    wbook (excel/create :xlsx))
  (excel/add-font wbook :header { :bold true })
  (excel/add-style wbook :header { :font :header
                                    :bg-color :GREY_25_PERCENT
                                    :h-align :center })
  (excel/add-style wbook :weight { :format, "#,##0.0"

      (excel/add-column sheet "Last Name" { :field :last })
      (excel/add-column sheet "Age" { :field :age }))
```

```
(excel/write-items sheet data)
(excel/auto-size-columns sheet)
(excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/add-style](#)

Add a style with optional attributes to an Excel.

[excel/add-sheet](#)

Adds a sheet with optional attributes to an Excel.

[top](#)

[excel/add-image](#)

```
(add-image sheet row col data type)
(add-image sheet row col data type scale-X scale-Y)
```

Adds an image given by its binary data (a `bytebuf`) to a specific anchor cell given by its row and col. Optionally the image can be scaled by an X and Y axis factor. The image types `:PNG` and `:JPEG` are supported.

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")
        image "com/github/jlangch/venice/images/venice.png"
        data (io/load-classpath-resource image)]
    (excel/add-image sheet 2 2 data :PNG)
    (excel/write->file wbook "sample.xlsx")))
```

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")

        data (io/load-classpath-resource image)]
    (excel/add-image sheet 2 2 data :PNG 0.5 0.5)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

excel/add-line-chart

```
(add-line-chart sheet chart-title

  legend-position
  category-axis-title
  category-axis-position
  value-axis-title
  value-axis-position
  three-dimensional?
  vary-colors?
  categories-addr-range
  series)
```

Adds a line chart.

Arguments:

chart-title	The chart title
chart-addr-range	The chart position in the Excel
legend-position	The legend position: :TOP , :TOP_RIGHT , :RIGHT , :BOTTOM , :LEFT
category-axis-title	The category axis title
category-axis-position	The category axis position: :TOP , :TOP_RIGHT , :RIGHT , :BOTTOM , :LEFT
value-axis-title	The value axis title
value-axis-position	The value axis position: :TOP , :TOP_RIGHT , :RIGHT , :BOTTOM , :LEFT
three-dimensional?	Render in 3D: true or false
vary-colors?	Vary the colors: true or false
categories-addr-range	The category names in the Excel
series	The value series data. 1 to N series

```
(do
  (load-module :excel)

excel/add-sheet

```
(add-sheet wbook title)
(add-sheet wbook title options)
```

Adds a sheet with optional attributes to an Excel.

Options:

:no-header-row b	without header row, e.g. true, false
:default-column-width n	default column width in points, e.g. 100
:default-header-style s	default header style, e.g. :header
:default-body-style s	default body style, e.g. :body
:default-footer-style s	default footer style, e.g. :footer
:merged-region r	merged region [row-from row-to col-from col-to], e.g. [1 1 4 10]
:display-zeros b	display zeros, e.g. true, false. Defines if a cell should show 0 (zero) when containing zero value. When false, cells with zero value appear blank instead of showing the number zero.

```

Add a merge region to the sheet.

[top](#)

excel/add-style

```
(add-style wbook style-id)
(add-style wbook style-id options)
```

Add a style with optional attributes to an Excel.

Options:

:format s	cell format, e.g. "#0"
	Default formats:
	- long: "#,##0"
	- integer: "#,##0"
	- float: "#,##0.00"
	- double: "#,##0.00"
	- date: "d.m.yyyy"
	- datetime: "d.m.yyyy hh:mm:ss"
:font r	font name, e.g. :header
:bg-color c	background color, either an Excel indexed color or a HTML color, e.g. :PLUM, "#00FF00"
	Note: only XLSX supports 24 bit colors
:wrap-text b	wrap text, e.g. true, false
:h-align e	horizontal alignment {:left, :center, :right}
:v-align e	vertical alignment {:top, :middle, :bottom}
:rotation r	rotation angle [degree], e.g. 45
:border-top s	border top style, e.g. :thin
:border-right s	border right style, e.g. :none
:border-bottom s	border bottom style, e.g. :thin
:border-left s	border left style, e.g. :none

Available border styles:

:none	:dotted	:medium-dashed	:medium-dash-dot-dot
:thin	:thick	:dash-dot	:slanted-dash-dot
:medium	:double	:medium-dash-dot	
:dashed	:hair	:dash-dot-dot

[excel/write-value](#)

Writes a value with an optional to a specific cell given by its row and col.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

[excel/bar-data-series](#)

```
(bar-data-series title data-address-range)
```

Build a bar chart data series

Arguments:

title The series title

data-address-range The series data in the Excel

```
(excel/bar-data-series "Countries" (excel/cell-address-range 2 2 1 5))
```

SEE ALSO

[excel/cell-address-range](#)

Build a cell address range

[top](#)

[excel/bg-color](#)

```
(bg-color sheet row col color)
(bg-color sheet row col-start col-end color)
(bg-color sheet row-start row-end col-start col-end color & colors)
```

Sets a background color for a single cell, a range of columns within a row, or region of cells.

```

(do

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

[excel/copy-row](#)

```
(copy-row sheet row-from row-to)
(copy-row sheet row-from row-to copy-value copy-style)
```

Copies a specific row in a sheet.

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/write-values sheet 1 1 "John" "Doe" 28)
    (excel/write-values sheet 2 1 "Sue" "Ford" 26)
    (excel/copy-row sheet 1 2)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/clear-row](#)

Clears the values and/or styles in a specific row in a sheet.

[excel/delete-row](#)

Deletes a specific row from a sheet.

[excel/copy-row-to-end](#)

Copies a specific row from a sheet to end of the sheet.

[excel/insert-empty-row](#)

Inserts an empty row or multiple empty rows to a sheet.

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

[excel/copy-row-to-end](#)

```
(copy-row-to-end sheet row)
(copy-row-to-end sheet row copy-value copy-style)
```

Copies a specific row from a sheet to end of the sheet.

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/write-values sheet 1 1 "John" "Doe" 28)
    (excel/write-values sheet 2 1 "Sue" "Ford" 26)
    (excel/copy-row-to-end sheet 1)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/clear-row](#)

Clears the values and/or styles in a specific row in a sheet.

[excel/delete-row](#)

Deletes a specific row from a sheet.

[excel/copy-row](#)

Copies a specific row in a sheet.

[excel/insert-empty-row](#)

Inserts an empty row or multiple empty rows to a sheet.

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

[excel/create](#)

```
(create type)
```

Creates a new Excel for the given type :xls or :xlsx.

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/write-values sheet 1 1 "John" "Doe" 28)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/open](#)

Opens an existing Excel for reading or modifying.

[excel/add-sheet](#)

Adds a sheet with optional attributes to an Excel.

[excel/add-font](#)

Add font with optional attributes to an Excel.

[excel/add-style](#)

Add a style with optional attributes to an Excel.

[excel/write->file](#)

Writes the excel to a file.

[excel/write->stream](#)

Writes the excel to a Java :OutputStream.

[excel/write->bytebuf](#)

Writes the excel to a bytebuf. Returns the bytebuf.

[excel/evaluate-formulas](#)

Evaluate all formulas in a workbook or a sheet.

[top](#)

excel/delete-row

```
(delete-row sheet row)
```

Deletes a specific row from a sheet.

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/write-values sheet 1 1 "John" "Doe" 28)
    (excel/write-values sheet 2 1 "Sue" "Ford" 26)
    (excel/delete-row sheet 1)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/clear-row](#)

Clears the values and/or styles in a specific row in a sheet.

[excel/copy-row](#)

Copies a specific row in a sheet.

[excel/copy-row-to-end](#)

Copies a specific row from a sheet to end of the sheet.

[excel/insert-empty-row](#)

Inserts an empty row or multiple empty rows to a sheet.

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

[excel/display-grid-lines](#)

(display-grid-lines sheet display?)

If `true` displays grid lines in the Excel else omits them.

To control grid lines for printed Excels see the function `excel/print-layout`.

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Data")]
    (excel/write-values sheet 1 1 "John" "Doe" 28)
    (excel/write-values sheet 2 1 "Sue" "Ford" 26)
    (excel/auto-size-columns sheet)
    (excel/display-grid-lines sheet false)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/print-layout](#)

Sets the sheet's print layout

[excel/page-margins](#)

Sets the sheet's page margins (in inches)

[excel/header-margin](#)

Sets the sheet's header margin (in inches)

[excel/footer-margin](#)

Sets the sheet's footer margin (in inches)

[excel/header](#)

Sets the sheet's header text at position (:LEFT, :CENTER, :RIGHT) with a given font-size (in points) and bold style

[excel/footer](#)

Sets the sheet's footer text at position (:LEFT, :CENTER, :RIGHT) with a given font-size (in points) and bold style

excel/evaluate-formula

```
(evaluate-formula sheet row col)
```

Evaluate the formula a sheet cell.

```
(do
  (load-module :excel)
  (let [data [ {:a 100 :b 200}
            {:a 101 :b 201}
            {:a 102 :b 202} ]
    wbook (excel/create :xlsx)
    sheet (excel/add-sheet wbook "Sheet 1" { :no-header-row true })]
  (excel/add-column sheet "A" { :field :a })
  (excel/add-column sheet "B" { :field :b })
  (excel/add-column sheet "C" { :field :c })
  (excel/write-items sheet data)
  (excel/cell-formula sheet 1 3 "SUM(A1,B1)")
  (excel/cell-formula sheet 2 3 "SUM(A2,B2)")
  (excel/cell-formula sheet 3 3 "SUM(A3,B3)")
  (excel/evaluate-formula sheet 1 3)
  (excel/evaluate-formula sheet 2 3)
  (excel/evaluate-formula sheet 3 3)
  (excel/auto-size-columns sheet)
  (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/evaluate-formulas](#)

Evaluate all formulas in a workbook or a sheet.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/remove-formula](#)

Remove a cell formula

excel/evaluate-formulas

```
(evaluate-formulas wbook-or-sheet)
```

Evaluate all formulas in a workbook or a sheet.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/create :xlsx)
          sheet (excel/add-sheet wbook "Data")]

    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/clear-row](#)

Clears the values and/or styles in a specific row in a sheet.

[excel/delete-row](#)

Deletes a specific row from a sheet.

[excel/copy-row](#)

Copies a specific row in a sheet.

[excel/copy-row-to-end](#)

Copies a specific row from a sheet to end of the sheet.

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-item](#)

Render a single data item to the sheet

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

excel/auto-size-columns

Auto size the width of all columns in the sheet.

excel/auto-size-column

Auto size the width of column col (1..n) in the sheet.

excel/row-height

Set the height of a row (1..n) in the sheet.

top

excel/line-data-series

(line-data-series title smooth? marker data-address-range)

Build a line chart data series

Arguments:

title	The series title
smooth?	Smooth rendering (splines): true or false
marker	The marker type: :CIRCLE, :DASH, :DIAMOND, :DOT, :NONE, :PLUS, :SQUARE, :STAR, :TRIANGLE
data-address-range	The series data in the Excel

```
(excel/line-data-series "Countries"
  false
  :SQUARE
  (excel/cell-address-range 2 2 1 5))
```

SEE ALSO

excel/cell-address-range

Build a cell address range

top

excel/open

(open source)

Opens an existing Excel for reading or modifying.

Supported sources are *string file path*, *bytebuf*, *:java.io.File*, or *:java.io.InputStream*.

- *string file path*-> (excel/open "/Users/foo/data/test.xlsx")
- *classpath*-> (excel/open (io/load-classpath-resource "org/foo/data/test.xlsx"))

    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/page-margins](#)

Sets the sheet's page margins (in inches)

[excel/header-margin](#)

Sets the sheet's header margin (in inches)

[excel/footer-margin](#)

Sets the sheet's footer margin (in inches)

[excel/header](#)

Sets the sheet's header text at position (:LEFT, :CENTER, :RIGHT) with a given font-size (in points) and bold style

[excel/footer](#)

Sets the sheet's footer text at position (:LEFT, :CENTER, :RIGHT) with a given font-size (in points) and bold style

[excel/display-grid-lines](#)

If true displays grid lines in the Excel else omits them.

[top](#)

[excel/protect-sheet](#)

(protect-sheet sheet password)

Protect the sheet.

This will ensure that locked cells remain locked and unlocked cells are editable.

```
(do
  (load-module :excel)

  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/write-values sheet 1 1 "John" "Doe" 28)
    (excel/auto-size-columns sheet)
    (excel/protect-sheet sheet "password")
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/add-sheet](#)

Adds a sheet with optional attributes to an Excel.

[top](#)

[excel/read-boolean-val](#)

(read-boolean-val sheet row col)

Returns the sheet cell value as boolean.

```
(do
  (load-module :excel)

  (defn test-xls []
    (let [wbook (excel/create :xlsx)
          sheet (excel/add-sheet wbook "Data")]
      (excel/write-data sheet [[100 true 102]]))

```

SEE ALSO

[excel/write->stream](#)

Writes the excel to a Java :OutputStream.

[excel/write->bytebuf](#)

Writes the excel to a bytebuf. Returns the bytebuf.

excel/write-item

```
(write-item sheet item)
```

Render a single data item to the sheet

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-item sheet { :first "John" :last "Doe" :age 28 }))
```

```
(excel/write-item sheet {:first "Sue" :last "Ford" :age 26})
(excel/auto-size-columns sheet)
(excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/write-items](#)

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

[excel/write-value](#)

Writes a value with an optional to a specific cell given by its row and col.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

[top](#)

[excel/write-items](#)

```
(write-items sheet items)
```

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :age 28}
          {:first "Sue" :last "Ford" :age 26} ]
    wbook (excel/create :xlsx)
    sheet (excel/add-sheet wbook "Sheet 1")]
    (excel/add-column sheet "First Name" { :field :first })
    (excel/add-column sheet "Last Name" { :field :last })
    (excel/add-column sheet "Age" { :field :age })
    (excel/write-items sheet data)
    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

[excel/write-item](#)

Render a single data item to the sheet

[excel/write-value](#)

Writes a value with an optional to a specific cell given by its row and col.

[excel/cell-formula](#)

Set a formula for a specific cell given by its row and col.

[excel/auto-size-columns](#)

Auto size the width of all columns in the sheet.

[excel/auto-size-column](#)

Auto size the width of column col (1..n) in the sheet.

[excel/row-height](#)

Set the height of a row (1..n) in the sheet.

excel/write-value

```
(write-value sheet row col val)
(write-value sheet row col val style)
```

Writes a value with an optional to a specific cell given by its row and col.

If style is not passed or is `nil` uses a default style to render the value according to its data type:

- string: no format
- boolean: no format
- integer: #,##0
- double: #,##0.00
- date: dd.mm.yyyy
- datetime: dd.mm.yyyy hh:mm:ss

To use the existing cell's style without changing it when modifying the cell's value pass `:keep-style` as style!

```
(do
  (load-module :excel)
  (let [wbook (excel/create :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]

Returns true if x is true, false otherwise

[not](#)

Returns true if x is logical false, false otherwise.

[top](#)

filter

(`filter predicate coll`)

Returns a collection of the items in coll for which (`predicate item`) returns logical true.

Returns a transducer when no collection is provided.

```
(filter even? [1 2 3 4 5 6 7])
=> (2 4 6)
```

```
(filter #(even? (val %)) {:_ 1 :_ 2})
=> ([:_ 2])
```

```
(filter even? #{1 2 3})
=> (2)
```

SEE ALSO

[map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

[reduce](#)

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

[top](#)

filter-k

(`filter-k f map`)

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

```
(filter-k #(= % :a) {:_ 1 :_ 2 :_ 3})
=> {:_ 1}
```

SEE ALSO

[filter-kv](#)

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

[top](#)

filter-kv

(`filter-kv f map`)

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

```
(filter-kv (fn [k v] (= k :a)) {:a 1 :b 2 :c 3})  
=> {:a 1}
```

```
(filter-kv (fn [k v] (= v 2)) {:a 1 :b 2 :c 3})  
=> {:b 2}
```

SEE ALSO

[filter-k](#)

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

[top](#)

find

```
(find map key)
```

Returns the map entry for key, or nil if key not present.

```
(find {:a 1 :b 2} :b)  
=> [:b 2]
```

```
(find {:a 1 :b 2} :z)  
=> nil
```

[top](#)

finder

```
(finder & args)
```

Finds symbols that match one more glob patterns or regular expressions.

Filters the symbol names by 0 to n glob patterns or regular expressions.

Glob patterns and regular expressions are ANDed, flags are ORed.

Flags:

:function	filter functions
:macro	filter macros
:special-form	filter special forms
:protocol	filter protocols
:value	filter values
:machine	return the result as Venice data otherwise print it in table format

=> nil
```

SEE ALSO

doc

Prints documentation for a var or special form given x as its name. Prints the definition of custom types.

ns-list

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

modules

Lists the available Venice modules

[top](#)

first

```
(first coll)
```

Returns the first element of coll or nil if coll is nil or empty.

```
(first nil)
=> nil
```

```
(first [])
=> nil
```

```
(first [1 2 3])
=> 1
```

```
(first '())
=> nil
```

```
(first '(1 2 3))
=> 1
```

```
(first "abc")
=> #\a
```

[top](#)

flatten

```
(flatten coll)
```

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. `(flatten nil)` returns an empty list.

Returns a transducer when no collection is provided.

```
(flatten [])
```

```
=> []
```

```
(flatten [[1 2 3] [4 [5 6]] [7 [8 [9]]]])
```

```
=> [1 2 3 4 5 6 7 8 9]
```

```
(flatten [1 2 {:a 3 :b [4 5 6]}])
```

```
=> [1 2 {:a 3 :b [4 5 6]}]
```

```
(flatten (seq {:a 1 :b 2}))
```

```
=> (:a 1 :b 2)
```

SEE ALSO

[mapcat](#)

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

[top](#)

float

```
(float x)
```

Converts x to `:java.lang.Float`.

Note: Venice does not have a built-in float type!

```
(float 1.2F)
```

```
=> 1.2F
```

```
(float 1)
```

```
=> 1.0F
```

```
(float nil)
```

```
=> 0.0F
```

```
(float false)
```

```
=> 0.0F
```

```
(float true)
```

```
=> 1.0F
```

```
(float 1.2)
```

```
=> 1.2F
```

```
(float 1.2M)
```

```
=> 1.2F
```

```
(float "1.2")
```

```
=> 1.2F
```

float-array

```
(float-array coll)
(float-array len)
(float-array len init-val)
```

Returns an array of Java primitive floats containing the contents of coll or returns an array with the given length and optional init value.

To create an array of :java.lang.Float use:

```
(make-array :java.lang.Long 3)

(float-array '(1.0F 2.0F 3.0F))
=> [1.0, 2.0, 3.0]

(float-array '(1I 2 3.2 3.56M))
=> [1.0, 2.0, 3.2, 3.56]

(float-array 10)
=> [0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0]

(float-array 10 42.0F)
=> [42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0, 42.0]
```

SEE ALSO

[java-float-list](#)

Converts a Venice list/vector to a Java Float list

float?

```
(float? n)
```

Returns true if n is a float

```
(float? 4.0F)
=> true

(float? 4.0)
=> false

(float? 3)
=> false

(float? 3I)
=> false

(float? 3.0M)
=> false
```

```
(float? true)
```

```
=> false
```

```
(float? nil)
```

```
=> false
```

```
(float? {})
```

```
=> false
```

[top](#)

floor

```
(floor x)
```

Returns the largest integer that is less than or equal to x

```
(floor 1.4)
```

```
=> 1.0
```

```
(floor -1.4)
```

```
=> -2.0
```

```
(floor 1.23M)
```

```
=> 1.00M
```

```
(floor -1.23M)
```

```
=> -2.00M
```

SEE ALSO

[ceil](#)

Returns the largest integer that is greater than or equal to x

[top](#)

flush

```
(flush)
```

```
(flush os)
```

Without arg flushes the output stream that is the current value of `*out*`. With arg flushes the passed stream that must be a subclass of either `:java.io.OutputStream` or `:java.io.Writer`.

Returns `nil`.

```
(flush)
```

```
=> nil
```

```
(flush *out*)
```

```
=> nil
```

```
(flush *err*)
```

```
=> nil
```

SEE ALSO

io/flush

Flushes a `:java.io.OutputStream` or a `:java.io.Writer`.

io/close

Closes a `:java.io.InputStream`, `:java.io.OutputStream`, `:java.io.Reader`, or a `:java.io.Writer`.

[top](#)

fn

```
(fn name? [params*] condition-map? expr*)
```

Defines an anonymous function.

```
(do
  (def sum (fn [x y] (+ x y)))
  (sum 2 3))
=> 5

;; multi-arity anonymous function
(let [f (fn ([x] x) ([x y] (+ x y)))]
  [(f 1) (f 4 6)])
=> [1 10]

(map (fn double [x] (* 2 x)) (range 1 5))
=> (2 4 6 8)

(map #(* 2 %) (range 1 5))
=> (2 4 6 8)

(map #(* 2 %1) (range 1 5))
=> (2 4 6 8)

;; anonymous function with two params, the second is destructured
(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})
=> {1 :a 2 :b 3 :c}

;; defining a pre-condition
(do
  (def square-root
    (fn [x]
      { :pre [(>= x 0)] }
      (. :java.lang.Math :sqrt x)))
  (square-root 4))
=> 2.0

;; closures
(do
  (defn pow [n]
    (fn [x] (apply * (repeat n x)))) ; closes over n

  ;; n is provided here as 2 and 3, then n goes out of scope
  (def square (pow 2))
  (def cubic (pow 3))
  (square 4))
=> 16
```

```
;; higher-order function
(do
(def discount
  (fn [percentage]
    { :pre [(and (>= percentage 0) (<= percentage 100))]}
    (fn [price] (- price (* price percentage 0.01)))))

((discount 50) 300))
=> 150.0
```

SEE ALSO

[defn](#)

Same as (def name (fn name [args*] condition-map? expr*)) or (def name (fn name ([args*] condition-map? expr*+)))

[defn-](#)

Same as defn, yielding non-public def

[def](#)

Creates a global variable.

[top](#)

fn-about

```
(fn-about f)
```

Returns the meta information about a function

```
(fn-about and)
=> {:name "and" :ns "core" :type :macro :visibility :public :native false :class :VncMultiArityFunction :source
{:file "core" :line 482 :column 3}}

(fn-about println)
=> {:name "println" :ns "core" :type :function :visibility :public :native false :class :VncMultiArityFunction :source
{:file "core" :line 1673 :column 3}}

(fn-about +)
=> {:name "+" :ns "core" :type :function :visibility :public :native true :class :VncFunction :source {}}
```

SEE ALSO

[fn-name](#)

Returns the qualified name of a function or macro

[fn-body](#)

Returns the body (a list of forms) of a function.

[fn-args](#)

Returns the argument list of a function.

[fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

fn-args

```
(fn-args fn)
```

Returns the argument list of a function.

Returns `nil` if fn is not a function or if fn is a native function.

```
;; single arity
(do
  (defn sum [x y]
    (+ x y))
  (fn-args (var-get sum)))
=> {:params ["x" "y"] :variadic false}

;; single arity, vargs
(do
  (defn sum [x & z]
    (apply + x z))
  (fn-args (var-get sum)))
=> {:params ["x"] :variadic true :variadic-name "z"})

;; multi arity
(do
  (defn sum
    ([x] x)
    ([x y] (+ x y)))
  (fn-args (var-get sum)))
=> {:params ["x"] :variadic false} {:params ["x" "y"] :variadic false})
```

SEE ALSO

[fn-name](#)

Returns the qualified name of a function or macro

[fn-about](#)

Returns the meta information about a function

[fn-body](#)

Returns the body (a list of forms) of a function.

[fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

fn-body

```
(fn-body fn)
(fn-body fn arity)
```

Returns the body (a list of forms) of a function.

Returns `nil` if fn is not a function or if fn is a native function.

```
(do
  (defn calc [& x]
    (->> x
      (filter even?)
      (map #(* % 10))))
  (fn-body (var-get calc)))
=> (((->> x (filter even?) (map (fn [%] (* % 10)))))
```

SEE ALSO

[fn-name](#)

Returns the qualified name of a function or macro

[fn-about](#)

Returns the meta information about a function

[fn-args](#)

Returns the argument list of a function.

[fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

[fn-name](#)

`(fn-name f)`

Returns the qualified name of a function or macro

```
(fn-name (fn sum [x y] (+ x y)))
=> "user/sum"
```

```
(let [f str/digit?]
  (fn-name f))
=> "str/digit?"
```

SEE ALSO

[name](#)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[fn-about](#)

Returns the meta information about a function

[fn-body](#)

Returns the body (a list of forms) of a function.

[fn-pre-conditions](#)

Returns the pre-conditions (a vector of forms) of a function.

[top](#)

[fn-pre-conditions](#)

`(fn-pre-conditions fn)
 (fn-pre-conditions fn arity)`

Returns the pre-conditions (a vector of forms) of a function.

Returns `nil` if fn is not a function.

```
(do
```

```
  (defn sum [x y]
```

```
{ :pre [(> x 0) (> y 0)] }
(+ x y))
(fn-pre-conditions (var-get sum))
=> [(> x 0) (> y 0)]
```

SEE ALSO

[fn-name](#)

Returns the qualified name of a function or macro

[fn-about](#)

Returns the meta information about a function

[fn-body](#)

Returns the body (a list of forms) of a function.

[top](#)

fn?

```
(fn? x)
```

Returns true if x is a function

```
(do
  (def sum (fn [x] (+ 1 x)))
  (fn? sum))
=> true
```

[top](#)

fnil

```
(fnil f x)
(fnil f x y)
(fnil f x y z)
```

Takes a function f, and returns a function that calls f, replacing a nil first argument to f with the supplied value x. Higher arity versions can replace arguments in the second and third positions (y, z). Note that the function f can take any number of arguments, not just the one(s) being nil-patched.

```
;; e.g.: change the `str/lower-case` handling of nil arguments by
;; returning an empty string instead of nil.
((fnil str/lower-case "") nil)
=> ""

((fnil + 10) nil)
=> 10

((fnil + 10) nil 1)
=> 11

((fnil + 10) nil 1 2)
=> 13
```

```
((fnil + 10) 20 1 2)
=> 23

((fnil + 10) nil 1 2 3 4)
=> 20

((fnil + 1000 100) nil nil)
=> 1100

((fnil + 1000 100) 2000 nil 1)
=> 2101

((fnil + 1000 100) nil 200 1 2)
=> 1203

((fnil + 1000 100) nil nil 1 2 3 4)
=> 1110
```

[top](#)

for

```
(for seq-exprs body-expr)
```

List comprehension. Takes a vector of one or more binding-form/collection-expr pairs, each followed by zero or more modifiers, and yields a sequence of evaluations of expr.

Collections are iterated in a nested fashion, rightmost fastest, and nested coll-exprs can refer to bindings created in prior binding-forms.

Supported modifiers are: :let [binding-form expr ...], :while test, :when test.

List comprehensions are used when multiple lists have to be processed down to a single list and some filtering has to be applied.

```
(for [x (range 10)] x)
=> [0 1 2 3 4 5 6 7 8 9]

(for [x (range 5)] (* x 2))
=> [0 2 4 6 8]

(for [x (range 10) :when (odd? x) :let [x (* x 2)]] x)
=> [2 6 10 14 18]

(for [x (range 10) :when (odd? x) :let [y (* x 2)]] [x y])
=> [[1 2] [3 6] [5 10] [7 14] [9 18]]

(for [x [1 2 3] :when (odd? x) y [1 2 3 4] :when (even? y)] [x y])
=> [[1 2] [1 4] [3 2] [3 4]]

(for [x (range 10) :while (< x 4) y (range 2)] [x y])
=> [[0 0] [0 1] [1 0] [1 1] [2 0] [2 1] [3 0] [3 1]]

(for [x (range 10) :while (< x 4) y (range 6) :while (< y 6) :when (even? y)] [x y])
=> [[0 0] [0 2] [0 4] [1 0] [1 2] [1 4] [2 0] [2 2] [2 4] [3 0] [3 2] [3 4]]
```

SEE ALSO

[mapcat](#)

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

[doseq](#)

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[top](#)

force

`(force x)`

If x is a delay, returns its value, else returns x

```
(do
  (def x (delay (println "working...") 100))
  (force x))
working...
=> 100

(force (+ 1 2))
=> 3
```

SEE ALSO

[delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

formal-type

```
(formal-type object)
```

Returns the *formal type* of a Java object.

The *formal type* of an object is defined as the explicit Java return type given by the function's definition. The *formal type* may differ from the real type of the returned Java object. A type cast will also change the object's formal type and set it to the cast type.

Venice must honor Java's static type system while interacting with Java objects. Therefore Venice adheres to *formal types* strictly when calling methods of Java objects.

Venice

```
;; The Circle constructor returns an object of type Circle
(let [c (. :Circle :new 1.5)]
  (. c :area)      ;; OK    Circle::area()
  (. c :radius))   ;; OK    Circle::radius()

;; Builder::circle returns an object of the formal type Shape
(let [c (. :Builder :circle 1.5)]
  (. c :area)      ;; OK    Shape::area()
  (. c :radius))   ;; FAIL  Shape::radius(), undefined method
```

Java

```
public class Builder {
    public static Shape circle(double radius) {
        return new Circle(radius);
    }
}

public interface Shape {
    double area();
}

public class Circle implements Shape {
    public Circle(double radius) {...}
    public double area() {...}
    public double radius() {...}
}

(do
  (import :java.awt.Point)
  (import :java.awt.geom.Point2D)

  ;; upcasting :java.awt.Point to :java.awt.geom.Point2D
  ;; Point2D does not define the translate method!
  (let [p1 (. :Point :new 1.0 1.0)
        p2 (cast :Point2D p1)]
    (println "p1 ->" p1)
    (println "p2 ->" p2)
    (println "Formal type p1 ->" (formal-type p1))
    (println "Formal type p2 ->" (formal-type p2))
    (println "p1' ->" (doto p1 (. :translate 2.0 2.0)))
    ;; the translate method is not defined by Point2D
    ;; and will fail with a JavaMethodInvocationException!
    ;; (doto p2 (. :translate 2.0 2.0))

  )
  p1 -> java.awt.Point[x=1,y=1]
  p2 -> java.awt.Point[x=1,y=1]
```

```
Formal type p1 -> :java.awt.Point
Formal type p2 -> :java.awt.geom.Point2D
p1' -> java.awt.Point[x=3,y=3]
=> nil
```

SEE ALSO

[remove-formal-type](#)

Removes the formal type from a Java object.

[cast](#)

Casts a Java object to a specific type

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

format-micro-time

```
(format-micro-time time)

SEE ALSO

[format-milli-time](#)

Formats a time given in milliseconds as long or double.

[format-micro-time](#)

Formats a time given in microseconds as long or double.

[nano-time](#)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

[top](#)

fourth

```
(fourth coll)
```

Returns the fourth element of coll.

```
(fourth nil)
=> nil

(fourth [])
=> nil

(fourth [1 2 3 4 5])
=> 4

(fourth '())
=> nil

(fourth '(1 2 3 4 5))
=> 4
```

[top](#)

frequencies

```
(frequencies coll)
```

Returns a map from distinct items in coll to the number of times they appear.

```
(frequencies [:a :b :a :a])
=> {:a 3 :b 1}
```

```
;; Turn a frequency map back into a coll.  
(mapcat (fn [[x n]] (repeat n x)) {:a 2 :b 1 :c 3})  
=> (:a :a :b :c :c :c)
```

top

future

```
(future fn)
```

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result and return it on all subsequent calls to deref. If the computation has not yet finished, calls to deref will block, unless the variant of deref with timeout is used.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
(do  
  (defn wait [] (sleep 300) 100)  
  (let [f (future wait)]  
    (deref f)))  
=> 100  
  
(let [f (future #(do (sleep 300) 100))]  
  (deref f))  
=> 100  
  
(do  
  (defn wait [x] (sleep 300) (+ x 100))  
  (let [f (future (partial wait 10))]  
    (deref f)))  
=> 110  
  
(do  
  (defn sum [x y] (+ x y))  
  (let [f (future (partial sum 3 4))]  
    (deref f)))  
=> 7  
  
;; demonstrates the use of thread locals with futures  
(do  
  ;; parent thread locals  
  (binding [a 10 b 20]  
    ;; future with child thread locals  
    (let [f (future (fn [] (binding [b 90] {:a a :b b})))]  
      {:child @f :parent {:a a :b b}})))  
=> {:parent {:a 10 :b 20} :child {:a 10 :b 90}}
```

SEE ALSO

deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

realized?

Returns true if a value has been produced for a promise, delay, or future.

done?

Returns true if the future or promise is done otherwise false

cancel

Cancels a future or a promise

cancelled?

Returns true if the future or promise is cancelled otherwise false

future-task

Takes a function f without arguments and yields a future object that will invoke the function in another thread.

promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

futures-fork

Creates a list of count futures. The worker factory is single argument function that gets the worker index (0..count-1) as argument ...

futures-wait

Waits for all futures to get terminated. If the waiting thread is interrupted the futures are cancelled.

top

future-task

```
(future-task f completed-fn)
(future-task f sucess-fn failure-fn)
```

Takes a function f without arguments and yields a future object that will invoke the function in another thread.

If a single completed function is passed it will be called with the future as its argument as soon as the future has completed. If a success and a failure function are passed either the success or failure function will be called as soon as the future has completed. Upon success the success function will be called with the future's result as its argument, upon failure the failure function will be called with the exception as its argument.

In combination with a queue a completion service can be built. The tasks appear in the queue in the order they have completed.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
;; building a completion service
;; CompletionService = incoming worker queue + worker threads + output data queue
(do
  (def q (queue 10))
  (defn process [s v] (sleep s) v)
  (defn failure [s m] (sleep s) (throw (ex :VncException m)))
  (future-task (partial process 200 2) #(offer! q %) #(offer! q %))
  (future-task (partial process 400 4) #(offer! q %) #(offer! q %))
  (future-task (partial process 100 1) #(offer! q %) #(offer! q %))

geoip/ip-to-city-loc-resolver

(geoip/ip-to-city-loc-resolver geoip-zip)

Returns a resolve function that resolves an IP address to its associated city and latitude/longitude location. The resolve function returns the city and the latitude/longitude or nil if no data is found.

The MindMax city geoip-zip may be a bytebuf, a file, a string (file path) or an InputStream.

The resolver loads the MindMax IPv4 and IPv6 city database and caches the data for IP address resolves.

As of July 2020 the MaxMind city database has:

2'917'097 IPv4 blocks
459'294 IPv6 blocks
118'189 cities

Note:

The MaxMind city IPv4 and IPv6 databases have 220MB of size on disk. It takes considerable time to load the data. Preprocessed and ready to work in the GEO IP modules ~3GB of memory is required.

Once the resolver has loaded the data the lookups are very fast.

```
;;      :country-iso "US"
;;      :region "California"
;;      :city "San Francisco"}]
```

Downloads the MaxMind country or city GEO IP database to the given ZIP file. The type is either :country or :city.

geoip/parse-maxmind-city-db

Parses the MaxMind city-location CSV file. Returns a map with the city geoname-id as key and the city/country data as value.

[top](#)

geoip/parse-maxmind-country-ip-db

(geoip/parse-maxmind-country-ip-db ip-type zip maxmind-countries)

Parses the MaxMind country IP blocks database. Expects a Maxmind country IP database zip. ip-type is either :IPv4 or :IPv6. The zip may be a bytebuf, a file, a string (file path) or an InputStream.

The maxmind-countries are optional and map the geoname-id to country data.

Returns a trie datastructure with the CIDR address as the key and a map with country data as the value.

maxmind-countries:

```
{ "49518" {:country-iso "RW" :country-name "Rwanda"}  
 "51537" {:country-iso "SO" :country-name "Somalia"} }
```

Return:

```

```

Sets the Gradle home and the project directory for all subsequent forms.

```
(gradle/with-home "/Users/foo/Documents/Tools/gradle-5.6.2"  
                  "/Users/foo/Documents/Projects/my-project"  
(gradle/version))
```

[top](#)

gradlew/run

```
(gradlew/run proj-home out-fn err-fn & args)
```

Runs one or more Gradle tasks.

Note: Use this module only for projects based on the Gradle wrapper

Arguments:

proj-home	The project directory
out-fn	a function with a single string argument that receives line by line from the process' stdout.
err-fn	a function with a single string argument that receives line by line from the process' stderr.
args	Any number of task names and Gradle options

```
(do  
  (load-module :gradlew)  
  (let [java-home (system-env :JAVA_11_HOME)]  
    (gradlew/run "/Users/foo/projects/bar"  
                println  
                println  
                ;; tasks  
                "clean"  
                "build"  
                ;; options  
                "--warning-mode=all"  
                "--console=plain"  
                "--stacktrace"  
                (str "-Dorg.gradle.java.home=\"\" java-home \"\")))
```

[top](#)

gradlew/run*

```
(gradlew/run* proj-home out-fn err-fn & args)
```

Runs one or more Gradle tasks and prints a list of the tasks and the options taken from the passed arguments.

Note: Use this module only for projects based on the Gradle wrapper

Apart from printing the passed tasks and options the function is identical to `gradlew/run`.

Arguments:

proj-home	The project directory
out-fn	a function with a single string argument that receives line by line from the process' stdout. May be nil.
err-fn	a function with a single string argument that receives line by line from the process' stderr. May be nil.
args	Any number of task names and Gradle options

```
(do

  (gradlew/version "/Users/foo/projects/bar"))
```

top

grep/grep

```
(grep dir file-glob line-pattern & options)
```

Search for lines that match a regular expression in text files. The search starts from a base directory and chooses all files that match a globbing pattern.

Options:

:print b e.g.:print false, defaults to true

With the print option :print true , grep prints the matches to stdout in a human readable form, one line per match in the format
"{{filename}}:{{lineno}}:{{line}}".

With the print option :print false , grep returns the matches as a list of tuples [{{filename}}, {{lineno}}, {{line}}].

```
(do
  (load-module :grep)
  (grep/grep "/Users/foo/logs" "*.log" ".*Error.*"))
```

SEE ALSO

[grep/grep-zip](#)

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match ...

[io/file-matches-glob?](#)

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

[top](#)

grep/grep-zip

(grep/grep-zip dir zipfile-glob file-glob line-pattern & options)

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match a globbing pattern. The search starts from a base directory and chooses all ZIP files that match the zipfile globbing pattern.

Options:

:print b e.g :print false, defaults to true

With the print option :print true , grep-zip prints the matches to stdout in a human readable form, one line per match in the format "{{zipfile}}!{{filename}}:{{lineno}}:{{line}}".

With the print option :print false , grep returns the matches as a list of tuples [{{zipname}}, {{filename}}, {{lineno}}, {{line}}] .

```
(do
  (load-module :grep)
  (grep/grep-zip "/Users/foo/logs" "logs*.zip" "**/*.*log" ".*Error.*"))
```

SEE ALSO

[grep/grep](#)

Search for lines that match a regular expression in text files. The search starts from a base directory and chooses all files that ...

[io/file-matches-glob?](#)

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

[top](#)

group-by

(group-by f coll)

Returns a map of the elements of coll keyed by the result of f on each element. The value at each key will be a vector of the corresponding elements, in the order they appeared in coll.

```
(group-by count ["a" "as" "asd" "aa" "asdf" "qwer"])
=> {1 ["a"] 2 ["as" "aa"] 3 ["asd"] 4 ["asdf" "qwer"]}

(group-by odd? (range 10))
=> {false [0 2 4 6 8] true [1 3 5 7 9]}

(group-by identity (seq "abracadabra"))
=> {#\a [#\a #\a #\a #\a] #\b [#\b #\b] #\r [#\r #\r] #\c [#\c] #\d [#\d]}
```

[top](#)

halt-when

(halt-when pred)

```
(halt-when pred retf)
```

Returns a transducer that ends transduction when pred returns true for an input. When retf is supplied it must be a fn of 2 arguments - it will be passed the (completed) result so far and the input that triggered the predicate, and its return value (if it does not throw an exception) will be the return value of the transducer. If retf is not supplied, the input that triggered the predicate will be returned. If the predicate never returns true the transduction is unaffected.

```
(do
  (def xf (comp (halt-when #(== % 10)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> [1 3 5 7 9]
```

```
(do
  (def xf (comp (halt-when #(> % 5)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> 6
```

[top](#)

hash-map

```
(hash-map & keyvals)
(hash-map map)
```

Creates a new hash map containing the items.

```
(hash-map :a 1 :b 2)
=> {:a 1 :b 2}

(hash-map (sorted-map :a 1 :b 2))
=> {:a 1 :b 2}
```

[top](#)

hash-map?

```
(hash-map? obj)
```

Returns true if obj is a hash map

```
(hash-map? (hash-map :a 1 :b 2))
=> true
```

[top](#)

hexdump/dump

```
(dump s & opts)
```

Prints a hexdump of the given argument to `*out*`. Optionally supply byte offset (`:offset`, default: 0) and size (`:size`, default: `:all`) arguments. Can create hexdump from a collection of values, a bytebuf, a java.io.File, or a string representing a path to a file.

```

Example: (hexdump/dump (range 100))

00000000: 0001 0203 0405 0607 0809 0a0b 0c0d 0e0f ..... .
00000010: 1011 1213 1415 1617 1819 1a1b 1c1d 1e1f ..... .
00000020: 2021 2223 2425 2627 2829 2a2b 2c2d 2e2f !"#$%&'()*+,-./
00000030: 3031 3233 3435 3637 3839 3a3b 3c3d 3e3f 0123456789:;<=>?
00000040: 4041 4243 4445 4647 4849 4a4b 4c4d 4e4f @ABCDEFGHIJKLMNO

Builds an url

top

http-client-j8/process-server-side-events

(process-server-side-events response handler)

Processes server side events (SSE) and calls for every event the handler 'handler'.

Note: The response must be of the mimetype "text/event-stream" otherwise the processor throws an exception!

The event handler is a three argument function:

```
(defn handler [type event event-count] ...)

type      the notification type:
          :opened - streaming started
          :data   - streamed event
          :closed - streaming closed by the server
event     the streamed event, available only if the notification type is :data , else nil
event-count the streamed event count, starting with 1 and incremented with every event sent
```

If the event handler returns the value :stop the processer stops handling any further events and closes the data stream to signal the server not to send any further events and close the server side stream as well.

If the event handler throws an exception while processing a data event the event processing will be stopped.

The handler blocks until the stream is either closed by the server or by the client. The timeout can be controlled via the connections' :read-timeout parameter.

Server side events are passed as maps to the handler. E.g. :

```
{ :id    "1"
  :event "score"
  :data  [ "GOAL Liverpool 1 - 1 Arsenal"
          "GOAL Manchester United 3 - 3 Manchester City" ] }
```

Warning:

When not used over HTTP/2, SSE suffers from a limitation to the maximum number of open connections, which can be especially painful when opening multiple tabs, as the limit is per browser and is set to a very low number (6). The issue has been marked as "Won't fix" in Chrome and Firefox. This limit is per browser + domain, which means that you can open 6 SSE connections across all of the tabs.

When using HTTP/2, the maximum number of simultaneous HTTP streams is negotiated between the server and the client (defaults to 100).

The Java 8 Http Client does not support HTTP/2!

```
(do
  (load-module :http-client-j8 ['http-client-j8 :as 'hc])

  (let [response (hc/send :get
                         "http://localhost:8080/events"
                         :headers { "Accept"        "text/event-stream"
                                    "Cache-Control" "no-cache"
                                    "Connection"    "keep-alive" }
                         :conn-timeout 0
                         :read-timeout 0
                         :debug true)]
    (println "Status:" (:http-status response))

    ;; process the first 10 events and close the stream
    (hc/process-server-side-events
      response))
```

```
(fn [type event event-count]
  (case type
    :opened (do (println "\nStreaming started")
                :ok)
    :data   (do (println "Event: " (pr-str event))
                ;; only process 10 events
                (if (< event-count 10) :ok :stop))
    :closed (do (println "Streaming closed")
                 :ok)))))
```

SEE ALSO

[http-client-j8/slurp-response](#)

Slurps the response data from the response' input stream.

[http-client-j8/send](#)

Send a request

[top](#)

http-client-j8/send

(send method uri & options)

Send a request

Request Options:

:url-query-params	A map of url query parameters (name/value). The names and values will be appropriately encoded.
:url-fragment	An url fragment. The fragment will be appropriately encoded.
:headers	A map of request headers. Headers can be single- or multi-value (comma separated): {"X-Header-1" "value1" "X-Header-2" "value1, value2, value3"}
:body	An optional body to send with the request The body may be of type <code>string</code> , <code>bytebuf</code> , <code>:java.io.InputStream</code>
:conn-timeout	An optional connection timeout in milliseconds
:read-timeout	An optional read timeout in milliseconds
:follow-redirects	Sets wether HTTP redirects (requests with response code 3xx) should be automatically followed.
:hostname-verifier	Sets the hostname verifier. An object of type <code>:javax.net.ssl.HostnameVerifier</code> . Use only for HTTPS requests
:ssl-socket-factory	Sets the SSL socket factory. An object of type <code>:javax.net.ssl.SSLSocketFactory</code> . Use only for HTTPS requests
:use-caches	A boolean indicating wether or not to allow caching. Defaults to false
:user-agent	User agent. Defaults to "Venice HTTP client (legacy)"
:debug	Debug true/false. Defaults to false. In debug mode prints the HTTP request and response data

Returns a map with the response fields:

:http-status	The HTTP status (a long)
:content-type	The content type. E.g.: "text/plain; charset=utf8"
:content-type-mimetype	The content type's mimetype. E.g.: "text/plain"
:content-type-charset	The content type's charset. E.g.: :utf-8
:content-encoding	The content transfer encoding (a keyword), if available else nil. E.g.: <code>:gzip</code> or <code>:deflate</code>

```

:content-length           The content length (a long), if available else -1
:headers                 A map of headers. key: header name, value: list of header values
:data-stream              The response data input stream.
                           If the response content encoding is 'gzip' due to a request header "Accept-Encoding: gzip" wrap the data stream
                           with a gzip input stream:
                           (io/wrap-is-with-gzip-input-stream (:data-stream response))
                           to uncompress the data.
                           See http-client-j8/slurp-response to painlessly process responses.

Create a base64 encoded bearer token for an 'Authorization' HTTP header.

[top](#)

http-client-j8/slurp-response

(slurp-response response & options)

Slurps the response data from the response' input stream.

Returns the data according to the mimetype and charset of the 'Content-Type' response header.

Handles a 'Content-Encoding' transparently. Supports the encodings 'gzip' and 'deflate'. Other encodings are rejected with an exception.

application/xml Returns a string according to the content type charset

application/json Returns the JSON response according to the content type charset.

Depending on the option `:json-parse-mode` returns the JSON parsed to a Venice map, as a JSON pretty printed string, or as a raw JSON string

text/plain Returns a string according to the content type charset

text/html Returns a string according to the content type charset

text/xml Returns a string according to the content type charset

text/csv Returns a string according to the content type charset

text/css Returns a string according to the content type charset

text/json Returns the JSON response according to the content type charset.

Depending on the option `:json-parse-mode` returns the JSON parsed to a Venice map, as a JSON pretty printed string, or as a raw JSON string

text/event-stream Throws an exception. An event stream can not be slurped. Use the function `process-server-side-events` instead!

else Returns the response data as a byte buffer

Options:

:json-parse-mode	The option is used with JSON mimetypes. :data - parse the response to a Venice data map :raw - return the response as received :pretty-print - return a pretty print JSON string Defaults to :data
:json-key-fn	A single argument function that transforms JSON property names. This option is only available in :data parse mode E.g.: :json-key-fn keyword

```

[top](#)

[http-client-j8/upload-file](#)

`(upload-file file uri & options)`

Upload a file.

Sets an implicit "Content-Type" header that is derived from the files's mimetype.

Request Options:

<code>:url-query-params</code>	A map of url query parameters (name/value). The names and values will be appropriately encoded.
<code>:url-fragment</code>	An url fragment. The fragment will be appropriately encoded.
<code>:headers</code>	A map of request headers. Headers can be single- or multi-value (comma separated): <code>{"X-Header-1" "value1" "X-Header-2" "value1, value2, value3"}</code>
<code>:conn-timeout</code>	An optional connection timeout in milliseconds
<code>:read-timeout</code>	An optional read timeout in milliseconds
<code>:follow-redirects</code>	Sets wether HTTP redirects (requests with response code 3xx) should be automatically followed.
<code>:hostname-verifier</code>	Sets the hostname verifier. An object of type <code>:javax.net.ssl.HostnameVerifier</code> . Use only for HTTPS requests
<code>:ssl-socket-factory</code>	Sets the SSL socket factory. An object of type <code>:javax.net.ssl.SSLSocketFactory</code> . Use only for HTTPS requests
<code>:use-caches</code>	A boolean indicating wether or not to allow caching. Defaults to false
<code>:user-agent</code>	User agent. Defaults to "Venice HTTP client (legacy)"
<code>:debug</code>	Debug true/false. Defaults to false. In debug mode prints the HTTP request and response data and info on the uploaded file

Returns a map with the response fields:

<code>:http-status</code>	The HTTP status (a long)
<code>:content-type-mimetype</code>	The content type's mimetype. E.g.: "text/plain"
<code>:content-type-charset</code>	The content type's charset. E.g.: :utf-8
<code>:content-encoding</code>	The content transfer encoding (a keyword), if available else nil. E.g.: <code>:gzip</code> or <code>:deflate</code>
<code>:content-length</code>	The content length (a long), if available else -1
<code>:headers</code>	A map of headers. key: header name, value: list of header values
<code>:data-stream</code>	The response data input stream. See <code>http-client-j8/slurp-response</code> to painlessly process responses.

```
(do
  (load-module :http-client-j8 ['http-client-j8 :as 'hc])
```

```
(let [response (hc/upload-file
  (io/file "/Users/foo/image.png")
  "http://localhost:8080/upload"
  :headers { "Accept" "text/plain" }
  :debug true)
  status (:http-status response)]
  (println "Status:" status)))
```

SEE ALSO

[http-client-j8/send](#)

Send a request

[http-client-j8/upload-multipart](#)

Upload multiple parts.

Create a base64 encoded bearer token for an 'Authorization' HTTP header.

[top](#)

http-client-j8/upload-multipart

(upload-multipart parts uri & options)

Upload multiple parts.

The upload supports string parts, file parts, and generic parts. Any number of parts can be uploaded.

Sets the "Content-Type" header to "multipart/form-data".

The parts are passed as a map of part data:

```
{ ;; a string part
"Part-1" "xxxxxxxxxxxx"

;; a file part
"Part-2" (io/file "/Users/juerg/Desktop/image.png")

;; a x-www-form-urlencoded (generic) part
"Part-3" { :mimetype "application/x-www-form-urlencoded"
           :charset :utf-8
           :data    "color=blue" }

;; a generic part
;; The charset of a generic part is only required for text based
;; data. When passing binary data the charset can be left out.
"Part-4" { :filename "data.xml"
           :mimetype "application/xml"
           :charset :utf-8
           :data    "<user><name>foo</name></user>" }}}
```

Request Options:

:url-query-params	A map of url query parameters (name/value). The names and values will be appropriately encoded.
:url-fragment	An url fragment. The fragment will be appropriately encoded.
:headers	A map of request headers. Headers can be single- or multi-value (comma separated): {"X-Header-1" "value1" "X-Header-2" "value1, value2, value3"}

:conn-timeout	An optional connection timeout in milliseconds
:read-timeout	An optional read timeout in milliseconds
:follow-redirects	Sets whether HTTP redirects (requests with response code 3xx) should be automatically followed.
:hostname-verifier	Sets the hostname verifier. An object of type <code>:javax.net.ssl.HostnameVerifier</code> . Use only for HTTPS requests
:ssl-socket-factory	Sets the SSL socket factory. An object of type <code>:javax.net.ssl.SSLSocketFactory</code> . Use only for HTTPS requests
:use-caches	A boolean indicating whether or not to allow caching. Defaults to false
:user-agent	User agent. Defaults to "Venice HTTP client (legacy)"
:debug	Debug true/false. Defaults to false. In debug mode prints the HTTP request (multipart data included) and the response data

Returns a map with the response fields:

:http-status	The HTTP status (a long)
:content-type-mimetype	The content type's mimetype. E.g.: "text/plain"
:content-type-charset	The content type's charset. E.g.: :utf-8
:content-encoding	The content transfer encoding (a keyword), if available else nil. E.g.: <code>:gzip</code> or <code>:deflate</code>
:content-length	The content length (a long), if available else -1
:headers	A map of headers. key: header name, value: list of header values
:data-stream	The response data input stream. See <code>http-client-j8/slurp-response</code> to painlessly process responses.

```
(do
  (load-module :http-client-j8 ['http-client-j8 :as 'hc])

  (let [response (hc/upload-multipart
                  { "image1" (io/file "/Users/foo/image1.png")

SEE ALSO

[images/create](#)

Creates a new `:java.awt.image.BufferedImage` with the given width, height, and type.

[images/g2d](#)

Creates a Graphics2D context from an image.

[images/dispose](#)

Disposes of this graphics context and releases any system resources that it is using.

[images/stroke](#)

Sets a new stroke on the graphics context

[images/fg-color](#)

Sets the foreground color on the graphics context.

[images/bg-color](#)

Sets the background color on the graphics context.

[images/set-clip](#)

Sets the current clip to the rectangle specified by the given coordinates.

[images/get-clip](#)

Returns the current clip shape.

[images/get-clip-bounds](#)

Returns the current clip bounds as a `:java.awt.Rectangle`.

images/apply-ops

```
(apply-ops img ops)
```

Applies one or multiple image operators (:java.awt.image.BufferedImageOp) to the image. Returns a new image.

Examples for image operators:

```
(import :java.awt.color.ColorSpace
        :java.awt.image.ColorConvertOp
        :java.awt.image.ConvolveOp
        :java.awt.image.Kernel
        :java.awt.image.RescaleOp)

(def convolve-op-antialias (. :ConvolveOp
                               :new
                               (. :Kernel :new 3 3
                                   [ 0.00F, 0.08F, 0.00F,
                                     0.08F, 0.68F, 0.08F,
                                     0.00F, 0.08F, 0.00F ])
                               (. :ConvolveOp :EDGE_NO_OP)
                               nil))

(def rescale-op-darker (. :RescaleOp :new 0.9F 0 nil))

(def rescale-op-brighter (. :RescaleOp :new 1.1F 0 nil))

  (-> (images/create 400 200 images/TYPE_INT_ARGB images/white)
       (images/save :png (io/file "/Users/foo/Desktop/test.png"))))
```

SEE ALSO

[images/load](#)

Loads an image from a `:java.io.File`, a `:java.io.InputStream`, or a `:java.net.URL`.

[images/save](#)

Saves an image to '`:java.io.File`' or an '`:java.io.OutputStream`'.

[images/copy](#)

Creates a copy of `:java.awt.image.BufferedImage`.

[images/g2d](#)

Creates a `Graphics2D` context from an image.

[top](#)

images/crop

```
(crop img x y width height)
```

Crops an image. Returns a new image.

```
(do
  (load-module :images)
  (-> (images/load (io/file "/Users/foo/Desktop/Pink-Forest.jpg"))
       (images/crop 1000 1000 400 200)
       (images/save "jpg" (io/file "/Users/foo/Desktop/Pink-Forest-1.jpg"))))
```

[top](#)

images/dimension

```
(dimension f)
```

Returns the images dimensions as a vector [width height]. 'f' may be a `:java.io.File` or a `:java.awt.Image`.

Note: Do not load a file first to get the dimension, passing a `:java.io.File` is much faster!

```
(do

Creates a new `:java.awt.image.BufferedImage` with the given width, height, and type.

[images/g2d](#)

Creates a `Graphics2D` context from an image.

[images/anti-alias](#)

Turns anti-alias on/off on the `Graphics2D` context

[images/stroke](#)

Sets a new stroke on the graphics context

[images/draw-circle](#)

Draws a circle.

[images/draw-oval](#)

Draws an oval.

[images/draw-rect](#)

Draws a rectangle.

[images/draw-round-rect](#)

Draws a rounded rectangle.

[images/draw-polygon](#)

Draws a polygon.

[images/draw-line](#)

Draws a line.

[images/draw-image](#)

Draws an image to the position x,y in the graphics context.

[top](#)

images/fg-color

```
(fg-color g2d color)
```

Sets the foreground color on the graphics context.

```
(do
  (load-module :images)

  (let [img (images/create 400 200 images/TYPE_INT_ARGB)
        g   (images/g2d img)]

    (images/save img :png (io/file "/Users/foo/Desktop/test.png"))))
```

SEE ALSO

images/create

Creates a new `:java.awt.image.BufferedImage` with the given width, height, and type.

images/g2d

Creates a `Graphics2D` context from an image.

images/dispose

Disposes of this graphics context and releases any system resources that it is using.

images/anti-alias

Turns anti-alias on/off on the `Graphics2D` context

images/stroke

Sets a new stroke on the graphics context

images/fg-color

Sets the foreground color on the graphics context.

images/set-clip

Sets the current clip to the rectangle specified by the given coordinates.

images/get-clip

Returns the current clip shape.

images/get-clip-bounds

Returns the current clip bounds as a `:java.awt.Rectangle`.

top

images/fill-circle

```
(fill-circle g2d x y radius)
```

Draws a filled circle.

```
(do
  (load-module :images)

  (let [img (images/create 400 200 images/TYPE_INT_ARGB)

    (images/save img :png (io/file "/Users/foo/Desktop/test.png"))))
```

SEE ALSO

[images/create](#)

Creates a new `:java.awt.image.BufferedImage` with the given width, height, and type.

[images/g2d](#)

Creates a Graphics2D context from an image.

[images/set-transform](#)

Overwrites the Transform in the Graphics2D context. 'tx' may be nil.

[images/transform](#)

Add an affine transformer to the Graphics2D context.

[images/tx-identity](#)

Create identity transformer.

[images/tx-translate](#)

Create a translate transformer.

[images/tx-scale](#)

Create a scale transformer.

[images/tx-rotate](#)

Create a rotate transformer.

[images/tx-shear](#)

Create a shear transformer.

[top](#)

images/hexagon-poly

```
(hexagon-poly)
```

Creates a normalized (center at (0,0), radius 1) hexagon polygon point list.

```
(do
  (load-module :images)
  (images/hexagon-poly))
```

top

images/load

```
(load file)
```

Loads an image from a `:java.io.File`, a `:java.io.InputStream`, or a `:java.net.URL`.

```
(do
  (load-module :images)
  (images/load (io/file "/Users/foo/Desktop/Pink-Forest.jpg")))
```

SEE ALSO

[images/save](#)

Saves an image to 'java.io.File' or an ':java.io.OutputStream'.

[images/create](#)

Creates a new `:java.awt.image.BufferedImage` with the given width, height, and type.

[images/copy](#)

Creates a copy of `:java.awt.image.BufferedImage`.

[images/g2d](#)

Creates a `Graphics2D` context from an image.

top

images/pad

```
(pad img padding color)
(pad img pad-top pad-right pad-bottom pad-left color)
```

Pads an image. Returns a new image.

```
(do
  (load-module :images)
  (import :java.awt.Color)
  (-> (images/load (io/file "/Users/foo/Desktop/Pink-Forest.jpg"))
    (images/pad 200 images/white)
    (images/save "jpg" (io/file "/Users/foo/Desktop/Pink-Forest-1.jpg"))))
```

top

images/point

```
(point x y)
```

Creates a `:java.awt.Point`

```
(do
  (load-module :images)
  (images/point 0 0))
```

top

images/polygon

```
(polygon points)
```

Creates a `:java.awt.Polygon`

```
(do
  (load-module :images)
  (images/polygon [[0 0] [0 100] [100 100] [100 0] [0 0]]))
```

top

images/rectangle

```
(rectangle x y width height)
```

Creates a `:java.awt.Rectangle`

```
(do
  (load-module :images)
  (images/rectangle 0 0 200 100))
```

top

images/rectangle-poly

```
(rectangle-poly x y width height)
```

Creates a rectangle polygon point list.

```
(do
  (load-module :images)
  (images/rectangle-poly 0 0 200 100))
```

top

images/resize

```
(resize img width height)
(resize img width height resize-mode)
```

Resizes an image to a new width and height.

Resize modes:

:resize-auto	(default) chooses best mode
:resize-performance	resize for best performance
:resize-balanced	balance between performance and quality
:resize-quality	resize for quality
:resize-high-quality	resize for high quality

Returns a new image.

```
(do
  (load-module :images)
  (let [src (io/file "/Users/foo/Desktop/Pink-Forest.jpg")
        dst (io/file "/Users/foo/Desktop/Pink-Forest-1.jpg")]
    (-> (images/load src)
         (images/resize 500 200 :resize-balanced)
         (images/save "jpg" dst))

    (println (io/file-name src) ":" (images/dimension src))
    (println (io/file-name dst) ":" (images/dimension dst))))
```

SEE ALSO

images/resize-fit

Resizes an image to a new size, a square of width and height the image should fit within the size.

[top](#)

images/resize-fit

```
(resize-fit img size fit-mode)
(resize img size fit-mode resize-mode)
```

Resizes an image to a new size, a square of width and height the image should fit within the size.

Resize modes:

:fit-best	(default), fit within a square box of size 'size', keeps width / height ratio
:fit-exact	fit exactly to a square of size 'size', causes distortions
:fit-width	fit to width, keeps width / height ratio
:fit-height	fit to height, keeps width / height ratio

Resize modes:

:resize-auto	(default) chooses best mode
:resize-performance	resize for best performance
:resize-balanced	balance between performance and quality
:resize-quality	resize for quality
:resize-high-quality	resize for high quality

Returns a new image.

```
(do
  (load-module :images)
  (let [src (io/file "/Users/foo/Desktop/Pink-Forest.jpg")
        dst (io/file "/Users/foo/Desktop/Pink-Forest-1.jpg")]
    (-> (images/load src)
         (images/resize-fit 500 :fit-best :resize-balanced)
         (images/save "jpg" dst))

  (println (io/file-name src) ":" (images/dimension src))
  (println (io/file-name dst) ":" (images/dimension dst))))
```

SEE ALSO

[images/resize](#)

Resizes an image to a new width and height.

[top](#)

images/rotate

```
(rotate img angle)
```

Rotates an image by 0°, 90°, 180°, or 270° clockwise. Returns a new image.

```
(do
  (load-module :images)
  (-> (images/load (io/file "/Users/foo/Desktop/Pink-Forest.jpg"))
       (images/rotate 90)
       (images/save "jpg" (io/file "/Users/foo/Desktop/Pink-Forest-1.jpg"))))
```

[top](#)

images/rotate-points

```
(rotate-points angle points)
(rotate-points angle anchor-x anchor-y points)
```

Rotate the points of a polygon point list with an angle in degrees [0..360] around an anchor point. The default anchor point is (0,0)

```
(do
  (load-module :images)
  (->> (images/rectangle-poly 0 0 200 100)
        (images/rotate-points 45 (square-poly 100 100 100 100))))
```

[top](#)

images/save

```
(save img format-name f)
```

Saves an image to 'java.io.File' or an ':java.io.OutputStream'.

Supported formats: "png", "jpg", "jpeg", "gif", "bmp", ...

```
(do
  (load-module :images)
  (-> (images/load (io/file "/Users/foo/Desktop/Pink-Forest.jpg"))
       (images/save img :png (io/file "/Users/foo/Desktop/Pink-Forest.png"))))
```

SEE ALSO

[images/load](#)

Loads an image from a `java.io.File`, a `java.io.InputStream`, or a `java.net.URL`.

[images/create](#)

Creates a new `:java.awt.image.BufferedImage` with the given width, height, and type.

[images/copy](#)

Creates a copy of `:java.awt.image.BufferedImage`.

[images/g2d](#)

Creates a `Graphics2D` context from an image.

[images/format-names](#)

Returns a list of format that the image writer supports.

[top](#)

[images/scale-points](#)

```
(scale-points factor points)
(scale-points factor-x factor-y points)
```

Scales the points of a polygon point list with factor.

```
(do
  (load-module :images)
  (->> (images/rectangle-poly 0 0 200 100)
        (images/scale-points 4.0 100 50)))
```

[top](#)

[images/set-clip](#)

```
(set-clip g2d shape)
(set-clip g2d x y width height)
```

Sets the current clip to the rectangle specified by the given coordinates.

A shape can be `nil` to remove any clipping.

```
(do
  (load-module :images)

  (let [img (images/create 400 200 images/TYPE_INT_ARGB images/white)
        g   (images/g2d img)]

```

SEE ALSO

[images/create](#)

Creates a new `:java.awt.image.BufferedImage` with the given width, height, and type.

[images/g2d](#)

Creates a `Graphics2D` context from an image.

[images/dispose](#)

Disposes of this graphics context and releases any system resources that it is using.

[images/anti-alias](#)

Turns anti-alias on/off on the `Graphics2D` context

[images/fg-color](#)

Sets the foreground color on the graphics context.

[images/bg-color](#)

Sets the background color on the graphics context.

[images/set-clip](#)

Sets the current clip to the rectangle specified by the given coordinates.

[images/get-clip](#)

Returns the current clip shape.

[images/get-clip-bounds](#)

Returns the current clip bounds as a `:java.awt.Rectangle`.

[top](#)

[images/transform](#)

```
(transform g2d tx)
```

Add an affine transformer to the Graphics2D context.

Note: The last specified transform on the graphics context is applied first!

```
(do
  (load-module :images)

  (let [img      (images/create 400 200 images/TYPE_INT_ARGB images/white)
        g       (images/g2d img)
        square [[[-1 -1] [1 -1] [1 1] [-1 1]]]
        (images/fg-color g images/blue)
        (images/anti-alias g true)    ;; enable anti-alias
        (images/stroke g 5.0 images/cap-round images/join-miter)
        (images/transform g (images/tx-translate 200 100))
        (images/transform g (images/tx-scale 15))
        (images/draw-polygon g (images/polygon square))

        (images/dispose g)
        (images/save img :png (io/file "/Users/foo/Desktop/test.png"))))
```

SEE ALSO

[images/create](#)

Creates a new :java.awt.image.BufferedImage with the given width, height, and type.

[images/g2d](#)

Creates a Graphics2D context from an image.

[images/set-transform](#)

Overwrites the Transform in the Graphics2D context. 'tx' may be nil.

[images/get-transform](#)

Returns a copy of the current Transform in the Graphics2D context.

[images/tx-identity](#)

Create identity transformer.

[images/tx-translate](#)

Create a translate transformer.

[images/tx-scale](#)

Create a scale transformer.

[images/tx-rotate](#)

Create a rotate transformer.

[images/tx-shear](#)

Create a shear transformer.

[top](#)

[images/translate](#)

```
(translate img x y)
(translate img x y color)
```

Translates from (0, 0) to the current (x, y) position. Returns a new image.

```
(do
  (load-module :images)
  (-> (images/load (io/file "/Users/foo/Desktop/Pink-Forest.jpg"))

[top](#)

import

```
(import class & classes)
(import class :as alias)
```

Imports one or multiple Java classes. Imports are bound to the current namespace.

Example

Without import

```
(. :java.lang.Math :max 2 10)
```

With import

```
(do
  (import :java.lang.Math)
  (. :Math :max 2 10))
```

Aliases

Aliases are helpful if Java classes have the same name but different packages like `java.util.Date` and `java.sql.Date`:

```
(do
  (import :java.util.Date)
  (import :java.sql.Date :as :SqlDate)

  (println (. :Date :new))
  (println (. :SqlDate :valueOf "2022-06-24")))
```

Static nested classes

Venice

```
(do
  (import :foo.OuterClass)
  (import :foo.OuterClass$NestedStaticClass)

  (-> (. :OuterClass :new)
    (. :message))
  (-> (. :OuterClass$NestedStaticClass :new)
    (. :message)))
```

Java

```
package foo;
public class OuterClass {
  public String message() {
    return "OuterClass::message()";
  }

  public static class NestedStaticClass {
    public String message() {
      return "NestedStaticClass::message()";
    }
  }
}
```

```
(do
  (import :java.lang.Math)
  (. :Math :max 2 10))
=> 10
```

```
(do
  (import :java.awt.Point
          :java.lang.Math)
  (. :Math :max 2 10))
=> 10
```

```
(do
  (import :java.awt.Color :as :AwtColor)
  (. :AwtColor :new 200I 230I 255I 180I))
=> java.awt.Color[r=200,g=230,b=255]
```

```
(do
  (ns util)
  (defn import? [clazz ns_]
    (any? #(== % clazz) (map first (imports ns_)))))

  (ns alpha)
  (import :java.lang.Math)
  (println "alpha:" (util/import? :java.lang.Math 'alpha))

  (ns beta)
  (println "beta:" (util/import? :java.lang.Math 'beta))

  (ns alpha)
  (println "alpha:" (util/import? :java.lang.Math 'alpha))
```

```
)  
alpha: true  
beta: false  
alpha: true  
=> nil
```

index-of

(index-of sequence val)
(index-of comparefn sequence val)

Returns the first index of the sequence value that is equal to val or -1 if not found.

If no compare function is supplied, uses the natural compare to compare the sequence values to the supplied value. The compare function takes two arguments and returns -1, 0, or 1.

```
(index-of [1 2 2 3] 2)  
=> 1
```

```
(index-of [1 2 3] 6)  
=> -1
```

```
(index-of [1 2 3] nil)  
=> -1
```

```
(index-of [1 nil 3] nil)  
=> 1
```

```
(index-of nil 7)
=> -1

(index-of compare [1 2 2 3] 2)
=> 1

(index-of #(if (== %1 %2) 0 1) [1 2 2 3] 2)
=> 1
```

SEE ALSO

[last-index-of](#)

Returns the last index of the sequence value that is equal to val or -1 if not found.

[top](#)

inet/inet-addr

```
(inet/inet-addr addr)
```

Converts a stringified IPv4 or IPv6 to a Java InetAddress.

```
(inet/inet-addr "222.192.0.0")
=> /222.192.0.0

(inet/inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")

inet/linklocal-addr?

```
(inet/linklocal-addr? addr)
```

Returns true if addr is a link local address.

```
(inet/linklocal-addr? "169.254.0.0")
=> true

(inet/linklocal-addr? (inet/inet-addr "169.254.0.0"))
=> true
```

[top](#)

inet/multicast-addr?

```
(inet/multicast-addr? addr)
```

Returns true if addr is a multicast address.

```
(inet/multicast-addr? "224.0.0.1")
=> true
```

```
(inet/multicast-addr? (inet/inet-addr "224.0.0.1"))
=> true
```

[top](#)

inet/reachable?

```
(inet/reachable? addr timeout)
```

Test whether that address is reachable. Best effort is made by the implementation to try to reach the host, but firewalls and server configuration may block requests resulting in a unreachable status while some specific ports may be accessible. A typical implementation will use ICMP ECHO REQUESTs if the privilege can be obtained, otherwise it will try to establish a TCP connection on port 7 (Echo) of the destination host.

The timeout value, in milliseconds, indicates the maximum amount of time the try should take. If the operation times out before getting an answer, the host is deemed unreachable.

```
(inet/reachable? "google.com" 500)
=> false
```

```
(inet/reachable? "74.125.193.113" 500)
=> false
```

[top](#)

inet/sitelocal-addr?

```
(inet/sitelocal-addr? addr)
```

Returns true if addr is a site local address.

```
(inet/sitelocal-addr? "192.168.0.0")
=> true
```

```
(inet/sitelocal-addr? (inet/inet-addr "192.168.0.0"))
=> true
```

[top](#)

infinite?

```
(infinite? x)
```

Returns true if x is infinite else false. x must be a double!

```
(infinite? 1.0E300)  
=> false
```

```
(infinite? (* 1.0E300 1.0E100))  
=> true
```

```
(infinite? (/ 1.0 0))  
=> true
```

```
(pr (/ 4.1 0))  
:Infinite  
=> nil
```

SEE ALSO

[nan?](#)

Returns true if x is a NaN else false. x must be a double!

[double](#)

Converts to double

[top](#)

installer/clean

```
(clean dir)
```

Remove Java libraries (except any Jansi library) and TTF font files from the specified directory.

The removal does NOT recursively traverse the directory tree.

```

                      :dir (repl/libs-dir)
                      :silent false))
```

SEE ALSO

[installer/install-libs](#)

Install Java libraries (artifacts). Does not install the library's dependencies!

[installer/install-module](#)

Install the 3rdparty libraries for a Venice extension module.

[installer/clean](#)

Remove Java libraries (except any Jansi library) and TTF font files from the specified directory.

[top](#)

installer/install-demo

`(install-demo options*)`

Install all demo fonts and the 3rdparty libraries for all Venice extension modules that require Java libraries:

- :jansi
- :bouncycastle
- :docx4j-8
- :excel
- :jtokkit
- :langchain
- :pdf
- :postgresql-jdbc
- :qdrant-client
- :qrbill
- :qrcode
- :tomcat
- :xchart
- :yaml
- :postgresql-jdbc

Options:

- :dir path download dir, defaults to "." except when run in a REPL where it defaults to the value of `(repl/libs-dir)`
- :silent {true,false} if silent is true does not show a progress bar, defaults to true
- :clean {true,false} if clean is true cleans the install dir before installing, defaults to false
- :force {true,false} if force is true download the artifact even if it exist already on the download dir, else skip the download if it exists.

Defaults to true.

In the REPL run:

```
venice> (load-module :installer)
venice> (installer/install-demo)
venice> !restart
```

The installed libraries and fonts can be cleaned with:

```
(installer/clean (repl/libs-dir))
```

This removes all JAR lib and the fonts, except the JAnsi and the Venice libs.

```
;; install the demo modules
(do
  (load-module :installer)
  (installer/install-demo :dir (repl/libs-dir) :silent false))

;; clean install dir before installing the demo modules
(do
  (load-module :installer)
  (installer/install-demo :dir (repl/libs-dir) :silent false :clean true))
```

Remove Java libraries (except any Jansi library) and TTF font files from the specified directory.

[top](#)

instance-of?

```
(instance-of? type x)
```

Returns true if x is an instance of the given type

```
(instance-of? :long 500)  
=> true
```

```
(instance-of? :java.math.BigInteger 500)  
=> false
```

SEE ALSO

[type](#)

Returns the type of x.

[supertype](#)

Returns the super type of x.

[supertypes](#)

Returns the super types of x.

[top](#)

int

```
(int x)
```

Converts to int

```
(int 1)  
=> 1I
```

```
(int nil)
=> 0I

(int false)
=> 0I

(int true)
=> 1I

(int 1.2)
=> 1I

(int 1.2F)
=> 1I

=> 1I

(int "1")
=> 1I

(int (char "A"))
=> 65I
```

top

int-array

```
(int-array coll)
(int-array len)
(int-array len init-val)
```

Returns an array of Java primitive ints containing the contents of coll or returns an array with the given length and optional init value.

To create an array of :java.lang.Integer use:

```
(make-array :java.lang.Integer 3)
```

```
(int-array '(1I 2I 3I))
=> [1, 2, 3]

(int-array '(1I 2 3.2 3.56M))
=> [1, 2, 3, 3]

(int-array 10)
=> [0, 0, 0, 0, 0, 0, 0, 0, 0, 0]

(int-array 10 42I)
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

SEE ALSO

[java-int-list](#)

Converts a Venice list/vector to a Java Integer list

top

int?

```
(int? n)
```

Returns true if n is an int

```
(int? 4I)  
=> true
```

```
(int? 4)  
=> false
```

```
(int? 3.1)  
=> false
```

```

```

```
(int? {})  
=> false
```

[top](#)

interleave

```
(interleave c1 c2)  
(interleave c1 c2 & colls)
```

Returns a collection of the first item in each coll, then the second etc.

Supports lazy sequences as long at least one collection is not a lazy sequence.

```
(interleave [:a :b :c] [1 2])  
=> (:a 1 :b 2)
```

```
(interleave [:a :b :c] (lazy-seq 1 inc))  
=> (:a 1 :b 2 :c 3)
```

```
(interleave (lazy-seq (constantly :v)) [1 2 3])  
=> (:v 1 :v 2 :v 3)
```

[top](#)

interpose

```
(interpose sep coll)
```

Returns a collection of the elements of coll separated by sep.

```
(interpose ", " [1 2 3])
=> (1 ", " 2 ", " 3)

(apply str (interpose ", " [1 2 3]))
=> "1, 2, 3"
```

top

intersection

```
(intersection s1)
(intersection s1 s2)
(intersection s1 s2 & sets)
```

Return a set that is the intersection of the input sets

```
(intersection (set 1))
=> #{1}

(intersection (set 1 2) (set 2 3))
=> #{2}

(intersection (set 1 2) (set 3 4))
=> #{}  
SEE ALSO
```

[union](#)

Return a set that is the union of the input sets

[difference](#)

Return a set that is the first set without elements of the remaining sets

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[disj](#)

Returns a new set with the x, xs removed.

top

into

```
(into)
(into to)
(into to from)
```

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

```
(into (sorted-map) [ [:a 1] [:c 3] [:b 2] ])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) [ {:a 1} {:c 3} {:b 2} ])
=> {:a 1 :b 2 :c 3}
```

```
(into (sorted-map) [(map-entry :b 2) (map-entry :c 3) (map-entry :a 1)])
=> {:a 1 :b 2 :c 3}

(into (sorted-map) {:b 2 :c 3 :a 1})
=> {:a 1 :b 2 :c 3}

(into [] {:a 1, :b 2})
=> [{:a 1} {:b 2}]

(into [] '(1 2 3))
=> [1 2 3]

(into '() '(1 2 3))
=> (3 2 1)

(into [1 2 3] '(4 5 6))
=> [1 2 3 4 5 6]

(into '(1 2 3) '(4 5 6))
=> (6 5 4 1 2 3)

(into [] (bytebuf [0 1 2]))
=> [0 1 2]

(into '() (bytebuf [0 1 2]))
=> (0 1 2)

(into [] "abc")
=> [#\a #\b #\c]

(into '() "abc")
=> (#\a #\b #\c)
```

SEE ALSO

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[top](#)

into!

```
(into!)
(into! to)
(into! to from)
```

Adds all of the items of 'from' conjoined to the mutable 'to' collection

```
(into! (queue) [1 2 3 4])
=> (1 2 3 4)
```

```
(into! (stack) [1 2 3 4])
=> (4 3 2 1)
```

```
(do
  (into! (. :java.util.concurrent.CopyOnWriteArrayList :new)

  (into! (. :java.util.concurrent.CopyOnWriteArrayList :new)
    '(3 4)))
=> (3 4)
```

SEE ALSO

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[top](#)

io/->path

```
(io/->path f)
```

Converts to a :java.nio.Path. f must be a file or a string (file path).

```
(io/->path "some.txt")
=> some.txt
```

```
(io/->path "/tmp/test/some.txt")
=> /tmp/test/some.txt
```

```
(io/->path (io/file "/tmp/test/some"))
=> /tmp/test/some
```

SEE ALSO

[io/path?](#)

Returns true if f is a :java.nio.Path.

[top](#)

io/->uri

```
(io/->uri s)
(io/->uri scheme user-info host port path)
(io/->uri scheme user-info host port path query)
(io/->uri scheme user-info host port path query fragment)
```

Converts s to an URI or builds an URI from its spec elements.

s may be:

- a string (a spec string to be parsed as a URI.)

- a `java.io.File`
- a `java.nio.file.Path`
- a `java.net.URL`

Arguments:

scheme Scheme name
userInfo User name and authorization information
host Host name
port Port number
path Path
query Query
fragment Fragment

```
(io/->uri "file:/tmp/test.txt")
=> file:/tmp/test.txt

(io/->uri (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt

(io/->uri (io/->url (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt

(str (io/->uri (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"

;; to create an URL from spec details:
(io/->uri "http" nil "foo.org" 8080 "/info.html" nil nil)
=> http://foo.org:8080/info.html
```

SEE ALSO

`io/file`

Returns a `java.io.File` from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

`io/->url`

Converts s to an URL or builds an URL from its spec elements.

[top](#)

io/->url

```
(io/->url s)
(io/->url protocol host port file)
```

Converts s to an URL or builds an URL from its spec elements.

s may be:

- a string (a spec string to be parsed as a URL.)
- a `java.io.File`
- a `java.nio.file.Path`
- a `java.net.URI`

Arguments:

protocol the name of the protocol to use.
host the name of the host.
port the port number on the host.
file the file on the host

```
(io/->url "file:/tmp/test.txt")
=> file:/tmp/test.txt

(io/->url (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt

(io/->url (io/->uri (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt

(str (io/->url (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"

;; to create an URL from spec details:
(io/->url "http" "foo.org" 8080 "/info.html")
=> http://foo.org:8080/info.html
```

SEE ALSO

io/file

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

io/->uri

Converts s to an URI or builds an URI from its spec elements.

[top](#)

io/await-for

```
(io/await-for timeout time-unit file & modes)
```

Blocks the current thread until the file has been created, deleted, or modified according to the passed modes {:created, :deleted, :modified}, or the timeout has elapsed. Returns logical false if returning due to timeout, logical true otherwise.

Supported time units are: {:milliseconds, :seconds, :minutes, :hours, :days}

```
(io/await-for 10 :seconds "/tmp/data.json" :created)
```

SEE ALSO

io/watch-dir

Watch a directory for changes, and call the function event-fn when it does. Calls the optional failure-fn if errors occur. On closing ...

[top](#)

io/buffered-reader

```
(io/buffered-reader f & options)
```

Create a `java.io.Reader` from f.

f may be a:

- string
- bytebuffer
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.file.Path`

- `java.io.InputStream`
- `java.io.Reader`
- `java.net.URL`
- `java.net.URI`

Options:

`:encoding enc` e.g.: `:encoding :utf-8`, defaults to `:utf-8`

`io/buffered-reader` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the reader!

```
(let [data (bytebuf [108 105 110 101 32 49 10 108 105 110 101 32 50])]
  (try-with [rd (io/buffered-reader data :encoding :utf-8)]
    (println (read-line rd))
    (println (read-line rd))))
line 1
line 2
=> nil

(try-with [rd (io/buffered-reader "1\n2\n3\n4")]
  (println (read-line rd))
  (println (read-line rd)))
1
2
=> nil
```

SEE ALSO

[read-line](#)

Without arg reads the next line from the stream that is the current value of `*in*`. With arg reads the next line from the passed stream ...

[io/string-reader](#)

Creates a `java.io.StringReader` from a string.

[io/buffered-writer](#)

Creates a `java.io.Writer` for f.

[top](#)

io/buffered-writer

`(io/buffered-writer f & options)`

Creates a `java.io.Writer` for f.

f may be a:

- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.file.Path`
- `java.io.OutputStream`
- `java.io.Writer` Options:

`:append true/false` e.g.: `:append true`, defaults to `false`

`:encoding enc` e.g.: `:encoding :utf-8`, defaults to `:utf-8`

`io/buffered-writer` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

SEE ALSO

[println](#)

Prints the values xs to the stream that is the current value of *out* or to the passed output stream os if given followed by a (newline).

[io/string-writer](#)

Creates a java.io.StringWriter.

[io/buffered-reader](#)

Create a java.io.Reader from f.

[top](#)

io/bytbuf-in-stream

(io/bytbuf-in-stream buf)

Returns a `java.io.InputStream` from a bytebuf.

Note: The caller is responsible for closing the stream!

```
(try-with [is (io/bytbuf-in-stream (bytbuf [97 98 99]))]
  ; do something with is
)
```

SEE ALSO

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` is. Supports the option :binary to either slurp binary or string data. For ...

[io/file-in-stream](#)

Returns a `java.io.InputStream` for the file f.

[io/string-in-stream](#)

Returns a `java.io.InputStream` for the string s.

[top](#)

io/bytbuf-out-stream

(io/bytbuf-out-stream)

Returns a new `java.io.ByteArrayOutputStream`.

Dereferencing a `:ByteArrayOutputStream` returns the captured bytebuf.

Note: The caller is responsible for closing the stream!

```
(try-with [os (io/bytbuf-out-stream)]
  (io/spit-stream os (bytbuf [97 98 99]) :flush true)
  (str/format-bytbuf @os ", " :prefix0x))
=> "0x61, 0x62, 0x63"
```

SEE ALSO

[io/slurp-stream](#)

Slurps binary or string data from a `java.io.InputStream` is. Supports the option :binary to either slurp binary or string data. For ...

[io/file-in-stream](#)

Returns a java.io.InputStream for the file f.

io/string-in-stream

Returns a java.io.InputStream for the string s.

[top](#)

io/capturing-print-stream

([io/capturing-print-stream](#))

Creates a new capturing print stream.

Dereferencing a capturing print stream returns the captured string.

Note: The caller is responsible for closing the stream!

```
(try-with [ps (io/capturing-print-stream)]
  (binding [*out* ps]
    (println 100)
    (println 200)
    (flush)
    @ps))
=> "100\n200\n"

(try-with [ps (io/capturing-print-stream)]
  (println ps 100)
  (println ps 200)
  (flush ps)
  @ps)
=> "100\n200\n"
```

[top](#)

io/classpath-resource?

([io/classpath-resource?](#) name)

Returns true if the classpath resource exists otherwise false.

```
(io/classpath-resource? "com/github/jlangch/venice/images/venice.png")
=> true
```

SEE ALSO

[io/load-classpath-resource](#)

Loads a classpath resource. Returns a bytebuf

[top](#)

io/close

([io/close](#) s)

```
Closes a :java.io.InputStream, :java.io.OutputStream, :java.io.Reader, or a :java.io.Writer.
```

Often it is more elegant to use try-with to let Venice implicitly close the stream when its leaves the scope:

```
(let [file (io/file "foo.txt")]
  (try-with [is (io/file-in-stream file)]
    (io/slurp-stream is :binary false)))
```

SEE ALSO

[io/flush](#)

Flushes a :java.io.OutputStream or a :java.io.Writer.

[top](#)

io/close-watcher

```
(io/close-watcher watcher)
```

Closes a watcher created from 'io/watch-dir'.

SEE ALSO

[io/watch-dir](#)

Watch a directory for changes, and call the function event-fn when it does. Calls the optional failure-fn if errors occur. On closing ...

[io/registered-watch-dirs](#)

Returns the registered watch directories of a watcher.

[top](#)

io/copy-file

```
(io/copy-file source dest & options)
```

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a string (file path), or an :java.io.OutputStream.

Options:

:replace true/false e.g.: if true replace an existing file, defaults to false

:copy-attributes true/false e.g.: if true copy attributes to the new file, defaults to false

:no-follow-links true/false e.g.: if true do not follow symbolic links, defaults to false

SEE ALSO

io/copy-files-glob

(io/copy-files-glob src-dir dst-dir glob & options)

Copies all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

Options:

- | | |
|-----------------------------|--|
| :replace true/false | e.g.: if true replace an existing file, defaults to false |
| :copy-attributes true/false | e.g.: if true copy attributes to the new file, defaults to false |
| :no-follow-links true/false | e.g.: if true do not follow symbolic links, defaults to false |

Globbing patterns

<code>*.txt</code>	Matches a path that represents a file name ending in .txt
<code>*.*</code>	Matches file names containing a dot
<code>*.{txt,xml}</code>	Matches file names ending with .txt or .xml

<code>foo.[xy]</code>	Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character
<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\\\foo</code> and <code>C:\\\\bar</code> on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumeric strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

[\(io/copy-files-glob "from" "to" "*.log"\)](#)

SEE ALSO

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

[io/copy-file-tree](#)

Copies a file tree from source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must ...

[io/move-files-glob](#)

Move all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

[top](#)

io/copy-stream

[\(io/copy-stream in-stream out-stream\)](#)

Copies the input stream to the output stream. Returns `nil` on sucess or throws a VncException on failure. Input and output must be a `java.io.InputStream` and `java.io.OutputStream`.

SEE ALSO

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

[top](#)

io/create-hard-link

```
(io/create-hard-link link target)
```

Creates a hard link to a target. link and target must be a file or a string (file path).

```
(io/create-hard-link "/tmp/hard-link" "/tmp/test.txt")
```

SEE ALSO

[io/create-symbolic-link](#)

Creates a symbolic link to a target. link and target must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

[top](#)

io/create-symbolic-link

```
(io/create-symbolic-link link target)
```

Creates a symbolic link to a target. link and target must be a file or a string (file path).

```
(io/create-symbolic-link "/tmp/sym-link" "/tmp/test.txt")
```

SEE ALSO

[io/create-hard-link](#)

Creates a hard link to a target. link and target must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

[top](#)

io/default-charset

```
(io/default-charset)
```

Returns the default charset.

[top](#)

io/deflate

```
(io/deflate bytebuf)
```

deflates (compresses) a bytebuf using ZLIB compression.

```
(-> (bytebuf-from-string "abcdef" :utf-8)
     (io/deflate))
=> [120 156 75 76 74 78 73 77 3 0 8 30 2 86]
```

SEE ALSO

[io/inflate](#)

inflates (decompresses) a bytebuf using ZLIB compression.

[top](#)

io/delete-file

```
(io/delete-file f & files)
```

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f must be a file or a string (file path).

SEE ALSO

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

Requests that the files or directories be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse ...

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

[io/move-file](#)

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

[top](#)

io/delete-file-on-exit

```
(io/delete-file-on-exit f & fs)
```

Requests that the files or directories be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse order that they are registered. Invoking this method to delete a file or directory that is already registered for deletion has no effect. Deletion will be attempted only for normal termination of the virtual machine, as defined by the Java Language Specification.

f must be a file or a string (file path).

```
(let [file1 (io/temp-file "test-", ".data")
      file2 (io/temp-file "test-", ".data")]
  (io/delete-file-on-exit file1 file2)
  (io/spit file1 "123")
  (io/spit file2 "ABC"))
```

top

io/delete-files-glob

(io/delete-files-glob dir glob)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

Globbing patterns

*.txt	Matches a path that represents a file name ending in .txt
.	Matches file names containing a dot
*.{txt,xml}	Matches file names ending with .txt or .xml
foo.? [xy]	Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character
/home/*/*	Matches /home/gus/data on UNIX platforms
/home/**	Matches /home/gus and /home/gus/data on UNIX platforms
C:*	Matches C:\\\\foo and C:\\\\bar on the Windows platform

Ranges

The pattern [A-E] would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumeric strings are matched by [A-Za-z0-9]. This would match the following:

- [A-Z] All uppercase letters from A to Z
- [a-z] All lowercase letters from a to z
- [0-9] All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks (!) and backslashes (\).

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `![CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'[]'`, so that they can be used in patterns.

```
(io/delete-files-glob "." "*.log")
```

SEE ALSO

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

[io/delete-file-tree](#)

Deletes a file or a directory with all its content. Silently skips delete if the file or directory does not exist. f must be a file ...

[io/move-files-glob](#)

Move all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

[io/copy-files-glob](#)

Copies all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string ...

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

[top](#)

io/download

```
(io/download uri & options)
```

Downloads the content from the uri and reads it as text (string) or binary (bytebuf). Supports http and https protocols!

Options:

:binary b	e.g.: :binary true , defaults to false
:user-agent agent	e.g.: :user-agent "Mozilla" , defaults to nil
:encoding enc	e.g.: :encoding :utf-8, defaults to :utf-8
:user u	optional user for basic authentication
:password p	optional password for basic authentication
:follow-redirects b	e.g.: :follow-redirects true , defaults to false
:conn-timeout val	e.g.: :conn-timeout 10000 , connection timeout in milliseconds. 0 is interpreted as an infinite timeout.
:read-timeout val	e.g.: :read-timeout 10000 , read timeout in milliseconds. 0 is interpreted as an infinite timeout.
:progress-fn fn	an optional progress function that takes 2 args [1] progress (0..100%) [2] status {:start :progress :end :failed}
:debug-fn fn	an optional debug function that takes a message as argument

Note:

If the server returns the HTTP response status code 403 (*Access Denied*) sending a user agent like "Mozilla" may fool the website and solve the problem.

To debug pass a printing function like: `(io/download https://foo.org/bar :debug-fn println)`

```
(-> "https://live.staticflickr.com/65535/51007202541_ea453871d8_o_d.jpg"
  (io/download <> :binary true :user-agent "Mozilla")
  (io/spit "space-x.jpg" <>))
```

```
(do
  (load-module :ansi)
  (-> "https://live.staticflickr.com/65535/51007202541_ea453871d8_o_d.jpg"
       (io/download <> :binary true
                  :user-agent "Mozilla"
                  :progress-fn (ansi/progress :caption "Download:"))
  (io/spit "space-x.jpg" <>)))
```

top

io/exists-dir?

```
(io/exists-dir? f)
```

Returns true if the file f exists and is a directory. f must be a file or a string (file path).

```
(io/exists-dir? (io/file "/temp"))
=> false
```

SEE ALSO

[io/exists-file?](#)

Returns true if the file f exists and is a file. f must be a file or a string (file path).

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

io/file-absolute

Returns the absolute path of the file f. f must be a file or a string (file path).

io/file basename

(`io/file basename f`)

Returns the base name (file name without file extension) of the file `f` as a string. `f` must be a file or a string (file path).

```
(io/file basename (io/file "/tmp/test/x.txt"))
=> "x"
```

SEE ALSO

[io/file-name](#)

Returns the name of the file `f` as a string. `f` must be a file or a string (file path).

[io/file-parent](#)

Returns the parent file of the file `f`. `f` must be a file or a string (file path).

[io/file-ext](#)

Returns the file extension of a file. `f` must be a file or a string (file path).

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[str/normalize-utf](#)

Normalizes an UTF string.

io/file can-execute?

(`io/file-can-execute? f`)

Returns true if the file or directory `f` exists and can be executed. `f` must be a file or a string (file path).

```
(io/file-can-execute? "/tmp/test.txt")
```

SEE ALSO

[io/file-set-executable](#)

Set the owner's execute permission to the file or directory `f`. `f` must be a file or a string (file path).

[io/file-can-read?](#)

Returns true if the file or directory `f` exists and can be read. `f` must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory `f` exists and can be written. `f` must be a file or a string (file path).

[io/file-hidden?](#)

Returns true if the file or directory `f` exists and is hidden. `f` must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file `f` exists and is a symbolic link. `f` must be a file or a string (file path).

io/file-can-read?

```
(io/file-can-read? f)
```

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

```
(io/file-can-read? "/tmp/test.txt")
```

SEE ALSO

[io/file-set-readable](#)

Set the owner's read permission to the file or directory f. f must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

[io/file-hidden?](#)

Returns true if the file or directory f exists and is hidden. f must be a file or a string (file path).

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

[io/symbolic-link?](#)

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

[top](#)

io/file-in-stream

```
(io/file-in-stream f)
```

Returns a `java.io.InputStream` for the file f.

f may be a:

- string file path, e.g: "/temp/foo.json"
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

`io/file-in-stream` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the stream!

SEE ALSO

[io/slurp](#)

Reads the content of file f as text (string) or binary (bytebuf).

[io/slurp-stream](#)

Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...

io/string-in-stream

Returns a java.io.InputStream for the string s.

io/bytbuf-in-stream

Returns a java.io.InputStream from a bytebuf.

loadpath/paths

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

top

io/file-last-modified

(io/file-last-modified f)

Returns the last modification time (a Java LocalDateTime) of f or nil if f does not exist. f must be a file or a string (file path).

(io/file-last-modified "/tmp/test.txt")

SEE ALSO

io/file-can-read?

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

io/file-can-write?

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

io/file-can-execute?

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

top

io/file-matches-glob?

(io/file-matches-glob? glob f)

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

Globbing patterns

*.txt	Matches a path that represents a file name ending in .txt
.	Matches file names containing a dot
*.{txt,xml}	Matches file names ending with .txt or .xml
foo.? [xy]	Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character
/home/*/*	Matches /home/gus/data on UNIX platforms
/home/**	Matches /home/gus and /home/gus/data on UNIX platforms
C:**	Matches C:\\foo and C:\\bar on the Windows platform

Ranges

The pattern [A-E] would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumeric strings are matched by [A-Za-z0-9]. This would match the following:

- [A-Z] All uppercase letters from A to Z
- [a-z] All lowercase letters from a to z

- [0-9] All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks (!) and backslashes (\).

The exclamation mark can negate a pattern that it is put in front of. As [CBR]at matches Cat, Bat, or Rat the negated pattern [!CBR]at matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters '?' , '*' , and '[' , so that they can be used in patterns.

```
(io/file-matches-glob? "*.log" "file.log")
=> true

(io/file-matches-glob? "**/*.log" "x/y/file.log")
=> true

(io/file-matches-glob? "**/*.log" "file.log") ; take care, doesn't match!
=> false

(io/file-matches-glob? (io/glob-path-matcher "*.log") (io/file "file.log"))
=> true

(io/file-matches-glob? (io/glob-path-matcher "**/*.log") (io/file "x/y/file.log"))
=> true
```

SEE ALSO

[io/glob-path-matcher](#)

Returns a file matcher for glob file patterns.

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

[top](#)

io/file-name

```
(io/file-name f)
```

Returns the name of the file f as a string. f must be a file or a string (file path).

```
(io/file-name (io/file "/tmp/test/x.txt"))
=> "x.txt"
```

SEE ALSO

[io/file-basename](#)

Returns the base name (file name without file extension) of the file f as a string. f must be a file or a string (file path).

[io/file-parent](#)

Returns the parent file of the file f. f must be a file or a string (file path).

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[str/normalize-utf](#)

Normalizes an UTF string.

io/file-normalize-utf

```
(io/file-normalize-utf file)
(io/file-normalize-utf file form)
```

Normalizes the UTF string of a file path.

On MacOS file names with umlauts like ä are just encoded as 'a' plus the combining diaresis character. Therefore an 'ä' (\u00FC) and an 'ä' (a + \u0308) from a MacOS file name are different! Under normal circumstances this not problem. But as soon as some file name processing is in place (comparing, matching, ...) this can result in strange behaviour due of the two different technical representations of umlaut characters.

The *form* argument defaults to :NFC and is one of:

- :NFD Canonical decomposition
- :NFC Canonical decomposition, followed by canonical composition
- :NFKD Compatibility decomposition
- :NFKC Compatibility decomposition, followed by canonical composition

Returns an UTF normalized java.io.File from a file path

See the function `str/normalize-utf` for details on UTF normalization.

```
(io/file-normalize-utf "/tmp/test_u\u0308.txt")
```

```
(io/file-normalize-utf (io/file "/tmp/test_u\u0308.txt"))
```

SEE ALSO

[str/normalize-utf](#)

Normalizes an UTF string.

io/file-out-stream

```
(io/file-out-stream f options)
```

Returns a `java.io.OutputStream` for the file *f*.

f may be a:

- string file path, e.g: "/temp/foo.json"
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`

Options:

:append true/false e.g.: `:append true`, defaults to false

:encoding enc e.g.: `:encoding :utf-8`, defaults to :utf-8

`io/file-out-stream` supports load paths. See the `loadpath(paths)` doc for a description of the *load path* feature.

Note: The caller is responsible for closing the stream!

SEE ALSO

[io/slurp](#)

Reads the content of file *f* as text (string) or binary (bytebuf).

[io/slurp-stream](#)

Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...

[io/string-in-stream](#)

Returns a java.io.InputStream for the string s.

[io/bytbuf-in-stream](#)

Returns a java.io.InputStream from a bytebuf.

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

[io/file-parent](#)

`(io/file-parent f)`

Returns the parent file of the file f. f must be a file or a string (file path).

```
(io/file-path (io/file-parent (io/file "/tmp/test/x.txt")))
=> "/tmp/test"
```

SEE ALSO

[io/file-name](#)

Returns the name of the file f as a string. f must be a file or a string (file path).

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[top](#)

[io/file-path](#)

`(io/file-path f)`

Returns the path of the file f as a string. f must be a file or a string (file path).

```
(io/file-path (io/file "/tmp/test/x.txt"))
=> "/tmp/test/x.txt"
```

SEE ALSO

[io/file-absolute](#)

Returns the absolute path of the file f. f must be a file or a string (file path).

[io/file-canonical](#)

Returns the canonical path of the file f. f must be a file or a string (file path).

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

[str/normalize-utf](#)

Normalizes an UTF string.

[top](#)

io/file-path-slashify

```
(io/file-path-slashify f)
```

Returns the path of the file f as a string, turns backslashes into slashes.

f must be a file or a string (file path).

```
C:\Users\foo\image.png -> C:/Users/foo/image.png
```

Note: Windows only. On other OSs works identical to 'io/file-path'.

```
(io/file-path-slashify (io/file "C:" "Users" "foo" "image.png"))
=> "C:/Users/foo/image.png"
```

SEE ALSO

[io/file-path](#)

Returns the path of the file f as a string. f must be a file or a string (file path).

[top](#)

io/file-set-executable

```
(io/file-set-executable f executable owner-only)
```

Set the owner's execute permission to the file or directory f. f must be a file or a string (file path).

Returns true if and only if the operation succeeded. The operation will fail if the user does not have permission to change the access permissions of this abstract pathname. If 'readable' is false and the underlying file system does not implement a read permission, then the operation will fail.

If 'executable' is true sets the access permission to allow execute operations; if false to disallow execute operations.

If 'owner-only' is true the execute permission applies only to the owner's execute permission; otherwise, it applies to everybody. If the underlying file system can not distinguish the owner's execute permission from that of others, then the permission will apply to everybody, regardless of this value.

```
(io/file-set-executable "/tmp/test.txt" true true)
```

SEE ALSO

[io/file-can-execute?](#)

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

[io/file-set-readable](#)

Set the owner's read permission to the file or directory f. f must be a file or a string (file path).

[io/file-set-writable](#)

Set the owner's write permission to the file or directory f. f must be a file or a string (file path).

[top](#)

io/file-set-readable

```
(io/file-set-readable f readable owner-only)
```

Set the owner's read permission to the file or directory f. f must be a file or a string (file path).

Returns true if and only if the operation succeeded. The operation will fail if the user does not have permission to change the access permissions of this abstract pathname. If 'readable' is false and the underlying file system does not implement a read permission, then the operation will fail.

If 'readable' is true sets the access permission to allow read operations; if false to disallow read operations.

If 'owner-only' is true the read permission applies only to the owner's read permission; otherwise, it applies to everybody. If the underlying file system can not distinguish the owner's read permission from that of others, then the permission will apply to everybody, regardless of this value.

```
(io/file-set-readable "/tmp/test.txt" true true)
```

SEE ALSO

[io/file-can-read?](#)

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

[io/file-set-writable](#)

Set the owner's write permission to the file or directory f. f must be a file or a string (file path).

[io/file-set-executable](#)

Set the owner's execute permission to the file or directory f. f must be a file or a string (file path).

[top](#)

io/file-set-writable

```
(io/file-set-writable f writable owner-only)
```

Set the owner's write permission to the file or directory f. f must be a file or a string (file path).

Returns true if and only if the operation succeeded. The operation will fail if the user does not have permission to change the access permissions of this abstract pathname. If 'writable' is false and the underlying file system does not implement a read permission, then the operation will fail.

If 'writable' is true sets the access permission to allow write operations; if false to disallow write operations.

If 'owner-only' is true the write permission applies only to the owner's write permission; otherwise, it applies to everybody. If the underlying file system can not distinguish the owner's write permission from that of others, then the permission will apply to everybody, regardless of this value.

```
(io/file-set-writable "/tmp/test.txt" true true)
```

SEE ALSO

[io/file-can-write?](#)

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

[io/file-set-readable](#)

Set the owner's read permission to the file or directory f. f must be a file or a string (file path).

[io/file-set-executable](#)

Set the owner's execute permission to the file or directory f. f must be a file or a string (file path).

[top](#)

io/file-size

```
(io/file-size f)
```

Returns the size of the file f. f must be a file or a string (file path).

```
(io/file-size "/tmp/test.txt")
```

SEE ALSO

([io/filesystem-usable-space](#))

SEE ALSO

[io/filesystem-total-space](#)

Returns the total disk space in bytes. With no args returns the total disk space of the current working directory's file store. With ...

[top](#)

io/flush

([io/flush s](#))

Flushes a `:java.io.OutputStream` or a `:java.io.Writer`.

SEE ALSO

[io/close](#)

Closes a `:java.io.InputStream`, `:java.io.OutputStream`, `:java.io.Reader`, or a `:java.io.Writer`.

[top](#)

io/glob-path-matcher

([io/glob-path-matcher pattern](#))

Returns a file matcher for glob file patterns.

Globbing patterns

`*.txt` Matches a path that represents a file name ending in `.txt`

`*.*` Matches file names containing a dot

`*.{txt,xml}` Matches file names ending with `.txt` or `.xml`

`foo.? [xy]` Matches file names starting with `foo`. and a single character extension followed by a '`x`' or '`y`' character

<code>/home/*/*</code>	Matches <code>/home/gus/data</code> on UNIX platforms
<code>/home/**</code>	Matches <code>/home/gus</code> and <code>/home/gus/data</code> on UNIX platforms
<code>C:*</code>	Matches <code>C:\\\\foo</code> and <code>C:\\\\bar</code> on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `\`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'['`, so that they can be used in patterns.

```
(io/glob-path-matcher "*.log")
```

```
(io/glob-path-matcher "**/*.log")
```

SEE ALSO

[io/file-matches-glob?](#)

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

[top](#)

io/gzip

```
(io/gzip f)
```

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

```
(-> (io/gzip "a.txt")
     (io/spit "a.gz"))
```

```
(io/gzip (bytebuf-from-string "abcdef" :utf-8))
```

SEE ALSO

[io/gzip?](#)

Returns true if f is a gzipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

[io/ungzip](#)

ungzips f. f may be a file, a string (file path), a bytebuf, or an InputStream. Returns a bytebuf.

[io/zip](#)

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

[io/spit](#)

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

top

io/gzip-to-stream

```
(io/gzip f os)
```

gzips f to the OutputStream os. f may be a file, a string (file path), a bytebuf, or an InputStream.

```
(do
  (import :java.io.ByteArrayOutputStream)
  (try-with [os (. :ByteArrayOutputStream :new)]
    (-> (bytebuf-from-string "abcdef" :utf-8)
        (io/gzip-to-stream os))
    (-> (. os :toByteArray)
        (io/ungzip)

Returns true if the classpath resource exists otherwise false.

[top](#)

io/log

```
(io/log logger-name level message)
(io/log logger-name level message exception)
```

Logs a message at a given level to a Java Util Logger (JUL).

```
(do
;; note: define the log filehandler just once at app startup!
(io/log-filehandler "venice"
                    "/var/log/myapp/venice_%g.log"
                    16_000_000
                    8)

(io/log "venice" :info    "message 1")
(io/log "venice" :warning "message 2")
(io/log "venice" :severe  "message 3" (ex :VncException "test")))
```

SEE ALSO

[io/log-filehandler](#)

Creates a file handler for a Java Util Logger (JUL).

[top](#)

io/log-filehandler

```
(io/log-filehandler logger-name file-name-pattern)
(io/log-filehandler logger-name file-name-pattern file-size-limit)
(io/log-filehandler logger-name file-name-pattern file-size-limit max-file-count)
(io/log-filehandler logger-name file-name-pattern file-size-limit max-file-count, formatter)
```

Creates a file handler for a Java Util Logger (JUL).

The file name pattern determines the output file location and naming scheme:

- %t = system temp directory
- %h = user home directory
- %u = unique number to resolve conflicts
- %g = generation number for rotated logs
- %% = escapes the % character

If no "%g" field has been specified and the file count is greater than one, then the generation number will be added to the end of the generated filename, after a dot. Thus for example a pattern of "%t/java%g.log" with a count of 2 would typically cause log files to be written on Linux to /var/tmp/java0.log and /var/tmp/java1.log whereas on Windows they would be typically written to C:\TEMP\java0.log and C:\TEMP\java1.log

Generation numbers follow the sequence 0, 1, 2, etc.

Normally the "%u" unique field is set to 0. However, if the FileHandler tries to open the filename and finds the file is currently in use by another process it will increment the unique number field and try again. This will be repeated until FileHandler finds a file name that is not currently in use. If there is a conflict and no "%u" field has been specified, it will be added at the end of the filename after a dot. (This will be after any automatically added generation number.)

Thus if three processes were all trying to log to fred%u.%g.txt then they might end up using fred0.0.txt, fred1.0.txt, fred2.0.txt as the first file in their rotating sequences.

Note that the use of unique ids to avoid conflicts is only guaranteed to work reliably when using a local disk file system.

Examples:

- /var/log/myapp/app.log
- /var/log/myapp/app_%g.log
- %t/app_%g.log
- %h/app_%g.log

```
(do
;; note: define the log filehandler just once at app startup!
(io/log-filehandler "venice"
  "/var/log/myapp/venice_%g.log"
  16_000_000

[top](#)

io/mkdirs

(`io/mkdirs dir`)

Creates the directory including any necessary but nonexistent parent directories. dir must be a file or a string (file path).

SEE ALSO

[io/mkdir](#)

Creates the directory. dir must be a file or a string (file path).

[top](#)

io/move-file

(`io/move-file source target & options`)

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

Options:

:replace true/false e.g.: if true replace an existing file, defaults to false

:atomic-move true/false e.g.: if true move the file as an atomic file system operation, defaults to false

SEE ALSO

[io/copy-file](#)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

[io/touch-file](#)

Updates the lastModifiedTime of the file to the current time, or creates a new empty file if the file doesn't already exist. File must ...

[top](#)

io/move-files-glob

([io/move-files-glob](#) src-dir dst-dir glob & options)

Move all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

Options:

:replace true/false e.g.: if true replace an existing file, defaults to false

:atomic-move true/false e.g.: if true move the file as an atomic file system operation, defaults to false

Globbing patterns

`*.txt` Matches a path that represents a file name ending in .txt

`.*` Matches file names containing a dot

`*.{txt,xml}` Matches file names ending with .txt or .xml

`foo.? [xy]` Matches file names starting with foo. and a single character extension followed by a 'x' or 'y' character

`/home/**/*` Matches `/home/gus/data` on UNIX platforms

`/home/**` Matches `/home/gus` and `/home/gus/data` on UNIX platforms

`c:*` Matches `C:\\foo` and `C:\\bar` on the Windows platform

Ranges

The pattern `[A-E]` would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by `[A-Za-z0-9]`. This would match the following:

- `[A-Z]` All uppercase letters from A to Z
- `[a-z]` All lowercase letters from a to z
- `[0-9]` All numbers from 0 to 9

Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks `(!)` and backslashes `(\)`.

The exclamation mark can negate a pattern that it is put in front of. As `[CBR]at` matches Cat, Bat, or Rat the negated pattern `[!CBR]at` matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters `'?'`, `'*'`, and `'[]'`, so that they can be used in patterns.

([io/move-files-glob](#) "from" "to" "*.*")

SEE ALSO

[io/move-file](#)

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

[io/move-files-glob](#)

Move all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string (file path).

[io/copy-files-glob](#)

Copies all files that match the glob pattern from a source to a destination directory. src-dir and dst-dir must be a file or a string ...

[io/delete-files-glob](#)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

[io/list-files-glob](#)

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

[top](#)

io/out-stream?

```
(io/out-stream? os)
```

Returns true if 'os' is a `java.io.OutputStream`

```
(try-with [os (io/bytebuf-out-stream)]
         (io/out-stream? os))
=> true
```

SEE ALSO

[io/in-stream?](#)

Returns true if 'is' is a `java.io.InputStream`

[top](#)

io/path?

```
(io/path f)
```

Returns true if f is a `:java.nio.Path`.

```
(io/path? (io/->path "some.txt"))
=> true
```

SEE ALSO

[io/->path](#)

Converts to a `:java.nio.Path`. f must be a file or a string (file path).

[top](#)

io/print

```
(io/print os s)
```

Prints a string s to an output stream. The output stream may be a `:java.io.Writer` or a `:java.io.PrintStream`!

[top](#)

io/print-line

```
(io/print-line os)
(io/print-line os s)
```

Prints a string s to an output stream. The output stream may be a `:java.io.Writer` or a `:java.io.PrintStream`!

[top](#)

io/read-char

```
(io/read-char is)
```

With arg reads the next char from the passed stream that must be a subclass of `:java.io.Reader`.

Returns `nil` if the end of the stream is reached.

SEE ALSO

[io/read-line](#)

Reads the next line from the passed stream that must be a subclass of `:java.io.BufferedReader`.

[top](#)

io/read-line

```
(io/read-line is)
```

Reads the next line from the passed stream that must be a subclass of `:java.io.BufferedReader`.

Returns `nil` if the end of the stream is reached.

SEE ALSO

[io/read-char](#)

With arg reads the next char from the passed stream that must be a subclass of `:java.io.Reader`.

[top](#)

io/reader?

```
(io/reader? rd)
```

Returns true if 'rd' is a `java.io.Reader`

```
(try-with [rd (io/string-reader "123")]
          (io/reader? rd))
=> true
```

SEE ALSO

[io/writer?](#)

Returns true if 'rd' is a `java.io.Writer`

[top](#)

io/registered-watch-dirs

```
(io/registered-watch-dirs watcher)
```

Returns the registered watch directories of a watcher.

SEE ALSO

[io/watch-dir](#)

Watch a directory for changes, and call the function event-fn when it does. Calls the optional failure-fn if errors occur. On closing ...

[io/close-watcher](#)

Closes a watcher created from 'io/watch-dir'.

[top](#)

io/slurp

```
(io/slurp f & options)
```

Reads the content of file f as text (string) or binary (bytebuf).

f may be a:

- string file path, e.g: "/temp/foo.json"
- bytebuffer
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`
- `java.io.Reader`
- `java.nio.file.Path`
- `java.net.URL`
- `java.net.URI`

Returns a `bytebuf` or string depending on the passed :binary option.

Options:

:binary true/false e.g.: `:binary true`, defaults to false

:encoding enc e.g.: `:encoding :utf-8`, defaults to :utf-8

`io/slurp` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

Note: For HTTP and HTTPS downloads prefer to use `io/download`.

SEE ALSO

[io/slurp-lines](#)

Read all lines from f.

[io/slurp-stream](#)

Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...

[io/slurp-reader](#)

Slurps string data from a java.io.Reader rd. Note:

[io/spit](#)

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

[io/download](#)

Downloads the content from the uri and reads it as text (string) or binary (bytebuf). Supports http and https protocols!

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

io/slurp-lines

`(io/slurp-lines f & options)`

Read all lines from f.

f may be a:

- string file path, e.g: "/temp/foo.json"
- bytebuffer
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.io.InputStream`
- `java.io.Reader`
- `java.nio.file.Path`
- `java.net.URL`
- `java.net.URI`

Returns the a list of strings.

Options:

`:encoding enc` e.g.: `:encoding :utf-8`, defaults to :utf-8

`io/slurp-lines` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(-> "1\n2\n3"  
     io/string-in-stream  
     io/slurp-lines)  
=> ("1" "2" "3")
```

SEE ALSO

[str/split-lines](#)

Splits s into lines.

[io/slurp](#)

Reads the content of file f as text (string) or binary (bytebuf).

[io/slurp-stream](#)

Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...

io/spit

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

io/string-in-stream

Returns a java.io.InputStream for the string s.

loadpath/paths

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

io/slurp-reader

(io/slurp-reader rd)

Slurps string data from a `java.io.Reader` rd. Note:

`io/slurp-reader` offers the same functionality as `io/slurp` but it opens more flexibility with sandbox configuration. `io/slurp` can be blacklisted to prevent reading data from the filesystem and still having `io/slurp-reader` for readers input available!

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/delete-file-on-exit file)
    (io/spit file "123456789" :append true)
    (try-with [rd (io/buffered-reader file :encoding :utf-8)]
      (io/slurp-reader rd)))
)
=> "123456789"
```

SEE ALSO

io/slurp-stream

Slurps binary or string data from a `java.io.InputStream` is. Supports the option :binary to either slurp binary or string data. For ...

io/slurp

Reads the content of file f as text (string) or binary (bytebuf).

io/slurp-lines

Read all lines from f.

io/spit

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

io/uri-stream

Returns a `java.io.InputStream` from the uri.

io/file-in-stream

Returns a `java.io.InputStream` for the file f.

io/string-in-stream

Returns a `java.io.InputStream` for the string s.

io/bytebuf-in-stream

Returns a `java.io.InputStream` from a bytebuf.

[top](#)

io/slurp-stream

(io/slurp-stream is & options)

Slurps binary or string data from a `java.io.InputStream` is. Supports the option :binary to either slurp binary or string data. For string data an optional encoding can be specified.

Returns the result as a `bytebuf` or string depending on the passed :binary option.

Options:

:binary true/false e.g.: `:binary true`, defaults to false
:encoding enc e.g.: `:encoding :utf-8`, defaults to :utf-8

Note:

`io/slurp-stream` offers the same functionality as `io/slurp` but it opens more flexibility with sandbox configuration. `io/slurp` can be blacklisted to prevent reading data from the filesystem and still having `io/slurp-stream` for stream input available!

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/delete-file-on-exit file)
    (io/spit file "123456789" :append true)
    (try-with [is (io/file-in-stream file)]
      (io/slurp-stream is :binary false)))
)
=> "123456789"
```

SEE ALSO

=> nil
```

SEE ALSO

[read-line](#)

Without arg reads the next line from the stream that is the current value of `*in*`. With arg reads the next line from the passed stream ...

[io/buffered-reader](#)

Create a `java.io.Reader` from f.

[io/string-writer](#)

Creates a `java.io.StringWriter`.

[top](#)

io/string-writer

`(io/string-writer)`

Creates a `java.io.StringWriter`.

Dereferencing a string writer returns the captured string.

Note: The caller is responsible for closing the writer!

```
(try-with [sw (io/string-writer)]
  (print sw 100)
  (print sw "-")
  (print sw 200)
  (flush sw)
  (println @sw))
100-200
=> nil
```

SEE ALSO

[println](#)

Prints the values xs to the stream that is the current value of `*out*` or to the passed output stream os if given followed by a (newline).

[io/buffered-writer](#)

Creates a `java.io.Writer` for f.

[io/buffered-reader](#)

Create a java.io.Reader from f.

[top](#)

[io/symbolic-link?](#)

([io/symbolic-link?](#) f)

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

([io/symbolic-link?](#) "/tmp/test.txt")

SEE ALSO

[io/file-hidden?](#)

Returns true if the file or directory f exists and is hidden. f must be a file or a string (file path).

[io/file-can-read?](#)

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

[io/file-can-write?](#)

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

[io/file-can-execute?](#)

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

[top](#)

[io/temp-dir](#)

([io/temp-dir](#) prefix)

Creates a new temp directory with prefix. Returns a :java.io.File.

([io/temp-dir](#) "test-")

=> /var/folders/q0/gg9f6pqx5079cfvp9g5lqbzh0000gn/T/test-7692570601917169588

SEE ALSO

[io/tmp-dir](#)

Returns the tmp dir as a java.io.File.

[io/temp-file](#)

Creates an empty temp file with the given prefix and suffix. Returns a :java.io.File.

[top](#)

[io/temp-file](#)

([io/temp-file](#) prefix suffix)

Creates an empty temp file with the given prefix and suffix. Returns a :java.io.File.

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/spit file "123456789" :append true)
    (io/slurp file :binary false :remove true)))
)
=> "123456789"
```

SEE ALSO

[io/temp-dir](#)

Creates a new temp directory with prefix. Returns a `:java.io.File`.

[io/delete-file-on-exit](#)

Requests that the files or directories be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse ...

[top](#)

io/tmp-dir

```
(io/tmp-dir)
```

Returns the tmp dir as a `java.io.File`.

[\(io/tmp-dir\)](#)

```
=> /var/folders/q0/gg9f6pqx5079cfvp9g5lqbzh0000gn/T
```

SEE ALSO

[io/user-dir](#)

Returns the user dir (current working dir) as a `java.io.File`.

[io/user-home-dir](#)

Returns the user's home dir as a `java.io.File`.

[io/temp-dir](#)

Creates a new temp directory with prefix. Returns a `:java.io.File`.

[top](#)

io/touch-file

```
(io-touch-file file)
```

Updates the *lastModifiedTime* of the file to the current time, or creates a new empty file if the file doesn't already exist. File must be a file or a string (file path). Returns the file

SEE ALSO

[io/move-file](#)

Moves source to target. Returns nil or throws a `VncException`. Source and target must be a file or a string (file path).

[io/copy-file](#)

Copies source to dest. Returns nil or throws a `VncException`. Source must be a file or a string (file path), dest must be a file, a ...

[io/delete-file](#)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

io/truncate-from-start-keep-lines

```
(io/truncate-from-start-keep-lines f max-size)
```

Truncates a text file to the given max size beginning at the start, honoring complete lines.

The ideal `cutoff` position is `file-size - max-size`. If there is no newline found after cutoff, the tail is a single (too long) line; to keep line integrity and size limit, keep nothing. If there is a newline found after cutoff, the effective cutoff will be the character position after the newline. `f` must be a file or a string (file path).

```
(io/truncate-from-start-keep-lines "/tmp/test.txt" 1_000_000)
```

SEE ALSO

[io/file](#)

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

io/ungzip

```
(io/ungzip f)
```

ungzips `f`. `f` may be a file, a string (file path), a bytebuf, or an InputStream. Returns a bytebuf.

```
(-> (bytebuf-from-string "abcdef" :utf-8)
     (io/gzip)
     (io/ungzip))
=> [97 98 99 100 101 102]
```

SEE ALSO

[io/gzip](#)

gzips `f`. `f` may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

[io/gzip?](#)

Returns true if `f` is a gzipped file. `f` may be a file, a string (file path), a bytebuf, or an InputStream

[io/ungzip-to-stream](#)

ungzips a bytebuf returning an InputStream to read the deflated data from.

io/ungzip-to-stream

```
(io/ungzip-to-stream buf)
```

ungzips a bytebuf returning an InputStream to read the deflated data from.

```
(-> (bytebuf-from-string "abcdef" :utf-8)
     (io/gzip)
     (io/ungzip-to-stream))
```

```
(io/slurp-stream :binary false :encoding :utf-8))  
=> "abcdef"
```

SEE ALSO

io/gzip

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

top

io/unzip

```
(io/unzip f entry-name)
```

Unzips an entry from zip f the entry's data as a bytebuf. f may be a bytebuf, a file, a string (file path) or an InputStream.

```
(-> (io/zip "a.txt" (bytebuf-from-string "abcdef" :utf-8))  
     (io/unzip "a.txt"))  
=> [97 98 99 100 101 102]
```

SEE ALSO

io/zip

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

io/zip?

Returns true if f is a zipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

top

io/unzip-all

```
(io/unzip-all f)  
(io/unzip-all glob f)
```

Unzips all entries of the zip f returning a map with the entry names as key and the entry data as bytebuf values. f may be a bytebuf, a file, a string (file path) or an InputStream.

An optional globbing pattern can be passed to filter the files to be unzipped.

Note: globbing patterns with unzip are always relative. E.g. static/**/*.*

Globbing patterns:

*.txt	Matches a path that represents a file name ending in .txt
.	Matches file names containing a dot
*.{txt,xml}	Matches file names ending with .txt or .xml
foo.?	Matches file names starting with foo. and a single character extension
/home/**/*	Matches /home/gus/data on UNIX platforms
/home/**	Matches /home/gus and /home/gus/data on UNIX platforms
C:*	Matches C:\\\\foo and C:\\\\bar on the Windows platform

```
(-> (io/zip "a.txt" (bytebuf-from-string "abc" :utf-8)  
            "b.txt" (bytebuf-from-string "def" :utf-8)  
            "c.txt" (bytebuf-from-string "ghi" :utf-8))  
     (io/unzip-all))  
=> {"a.txt" [97 98 99] "b.txt" [100 101 102] "c.txt" [103 104 105]}
```

```
(-> (io/zip "foo/a.txt" (bytebuf-from-string "abc" :utf-8)
            "bar/b.txt" (bytebuf-from-string "def" :utf-8)

[top](#)

io/watch-dir

```
(io/watch-dir dir & options)
```

Watch a directory for changes, and call the function `event-fn` when it does. Calls the optional `failure-fn` if errors occur. On closing the watcher `termination-fn` is called.

Options:

<code>:include-all-subdirs true/false</code>	If <code>true</code> includes in addition to the main dir recursively all subdirs. If <code>false</code> just watches on the main dir. Defaults to <code>false</code> .
<code>:file-fn fn</code>	A four argument function that receives the 'path', a dir? (true if path is a dir), a file? (true if path is a file), and an 'action' {: <code>:created</code> , <code>:deleted</code> , <code>:modified</code> } of the changed file. Defaults to <code>nil</code> .
<code>:error-fn fn</code>	A two argument function called in error case that receives the watch path and the failure exception. Defaults to <code>nil</code> .
<code>:termination-fn fn</code>	A one argument function called when the watcher terminates. It receives the main watch dir. Defaults to <code>nil</code> .

Specific MacOS options (fswatch):

<code>:fswatch-monitor m</code>	An optional platform dependent monitor { <code>:fsevents_monitor</code> , <code>:kqueue_monitor</code> , <code>:poll_monitor</code> } to use with <code>fswatch</code> . Pass <code>nil</code> to let <code>fswatch</code> choose the optimal platform. Defaults to <code>nil</code> . Run <code>fswatch --list-monitors</code> to get list of the available platform monitors.
<code>:fswatch-program p</code>	An optional path to the <code>fswatch</code> program, e.g.: <code>"fswatch"</code> , <code>"/opt/homebrew/bin/fswatch"</code> . Defaults to <code>"/opt/homebrew/bin/fswatch"</code> .

Important

The `watcher` is a resource that **must be closed** with either `(io/close-watcher w)` or by using a `(try-with [w (io/watch-dir ... resource protection statement!]`

Linux

On Linux the Java WatchService is used to watch dirs for file changes!

MacOS

The Java WatchService doesn't run properly on MacOS due to limitations in the Java WatchService implementation! As a workaround on MacOS the file watcher is implemented on top of the `fswatch` tool. The required `fswatch` tool can be installed from *Homebrew*.

```
$ brew install fswatch
```

Documentation:

[top](#)

io/zip-file

```
(io/zip-file options* zip-file & files)
```

Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file my be a file, a string (file path) or an OutputStream.

Options:

:filter-fn fn	a predicate function that filters the files to be added to the zip.
:mapper-fn fn	a mapper function that can map the file content of a file before it gets zipped. Returns nil or a :java.io.InputStream. The real file is used when nil is returned.
:silent b	if false prints the added entries to <i>out</i> , defaults to false

Example:

```
venice> (io/zip-file :silent false "test.zip" "dirA" "dirB")
Output:
  adding: dirA/
  adding: dirA/a1.png
  adding: dirA/a2.png
  adding: dirB/
  adding: dirB/b1.png
```

```
; zip files
(io/zip-file "test.zip" "a.txt" "x/b.txt")
```

```
; zip all files from a directory
(io/zip-file "test.zip" "dir")
```

```
; zip all files in from two directories
(io/zip-file "test.zip" "dirA" "dirB")
```

```
; zip all files in from two directories and print the added entries
(io/zip-file :silent false "test.zip" "dirA" "dirB")

; zip all *.txt files from a directory
(io/zip-file :filter-fn (fn [dir name] (str/ends-with? name ".txt")))
  "test.zip"
  "dir")
```

ipc/binary-message

```
(ipc/binary-message topic mimetype data)
(ipc/binary-message request-id topic mimetype data)
(ipc/binary-message request-id topic mimetype data expires-at)
(ipc/binary-message request-id topic mimetype data expires-val expires-unit)
```

Creates a binary message.

Arguments:

request-id r	A request ID (string, may be <code>nil</code>). May be used for idempotency checks by the receiver
topic t	A topic (string)
mimetype m	The mimetype of the payload data. A string like 'application/octet-stream', 'image/png'

data d	The message payload binary data (a bytebuf)
expires-at t	Message expiration time in millis since epoch (may be <code>nil</code>)
expires-val v	Message expiration duration. E.g.: 2
expires-unit u	Message expiration time unit. Units: {:years :months :weeks :days :hours :minutes :seconds :milliseconds}

```
(-> (ipc/binary-message "test"
                         "application/octet-stream"
                         (bytebuf [0 1 2 3 4 5 6 7]))
    (ipc/message->map)
    (println))

(-> (ipc/binary-message "100" "test"
                         "application/octet-stream"
                         (bytebuf [0 1 2 3 4 5 6 7]))
    (ipc/message->map)
    (println))

(-> (ipc/binary-message "100" "test"

Creates a venice message.

[ipc/message->map](#)

Converts a message to a Venice map.

[ipc/message->json](#)

Converts message to a Json string with optional pretty printing.

[ipc/oneway?](#)

Returns true if the message is one-way else false.

[ipc/response-ok?](#)

Returns true if the message response status is :OK else false.

[ipc/response-err?](#)

Returns true if the message has a response error status else false.

ipc/client

```
(ipc/client port)
(ipc/client host port & options)
```

Create a new client connecting to a server on the specified host and port.

Arguments:

port p The server's TCP/IP port

host h The server's TCP/IP host

Options:

:max-message-size n The max size of the message payload. Defaults to `200MB`.

The max size can be specified as a number like `20000` or a number with a unit like `:20KB` or `:20MB`

:compress-cutoff-size n The compression cutoff size for payload messages.

With a negative cutoff size payload messages will not be compressed. If the payload message size is greater than the cutoff size it will be compressed.

Defaults to -1 (no compression)

The cutoff size can be specified as a number like `1000` or a number with a unit like `:1KB` or `:2MB`

:encrypt b

If `true` encrypt the payload data of all messages exchanged between this client and its associated server.

The data is AES-256-GCM encrypted using a secret that is created and exchanged using the Diffie-Hellman key exchange algorithm.

The client is NOT thread safe!

The client must be closed after use!

See Inter-Process-Communication

```
(do
  (defn echo-handler [m]
    (println "REQUEST: " (ipc/message->map m))
    m)

  (defn send [client msg]

ipc/running?

Return true if the server or client is running else false

[top](#)

ipc/create-queue

```
(ipc/create-queue server name capacity)
(ipc/create-queue server name capacity type)
```

Creates a named queue on the server. Messages can be exchanged asynchronously between two clients using a queue. Each message is delivered to exactly one client. 1 to N clients can *offer* / *poll* messages *from* / *to* the queue.

A queue can be bounded or circular. Bounded queues block when offering new messages and the queue is full. Circular queues never block but just keep the last 'capacity' messages. The oldest messages get discarded if the buffer is full and new messages are offered to the queue.

Use `ipc/offer` to offer a new message to a queue.

Use `ipc/poll` to poll a message from a queue.

Returns always `nil` or throws an exception if the named queue already exists.

Arguments:

server s	A server
name n	A queue name (string)
capacity t	The queue's capacity (max number of messages)
type t	Optional queue type <code>bounded</code> or <code>circular</code> . Defaults to <code>bounded</code> .

```
(do
  (defn echo-handler [m] m)

  (try-with [server (ipc/server 33333 echo-handler)
            client1 (ipc/client "localhost" 33333)

ipc/message-field

(ipc/message-field message field)

Returns a specific field from the message.

Message	Originator
ID	send, publish/subscribe method
Message Type	send, publish/subscribe method
Oneway	client or framework method
Response Status	server response processor
Timestamp	message creator
ExpiresAt	client (may be null)
Request ID	client (may be used for idempotency checks the receiver)
Topic	client
Queue Name	client (offer/poll, else null)
ReplyTo Queue Name	client (offer/poll, may be null)
Payload Mimetype	client
Payload Charset	client if payload data is a string else null
Payload data	client

Supported field names:

- `:id` - the message's technical ID
- `:type` - the message type (request, response, ..)
- `:oneway?` - true if one-way message else false
- `:response-status` - the response status (ok, bad request, ...)
- `:timestamp` - the message's creation timestamp in milliseconds since epoch
- `:expires-at` - the message's expiry timestamp in milliseconds since epoch (may be nil)
- `:request-id` - the request ID (may be nil)
- `:topic` - the topic
- `:queue-name` - the queue name
- `:reply-to-queue-name` - the reply to queue name
- `:payload-mimetype` - the payload data mimetype
- `:payload-charset` - the payload data charset (if payload is a text form)
- `:payload-text` - the payload converted to text data if payload is textual data else error
- `:payload-binary` - the payload binary data (the raw message binary data)
- `:payload-venice` - the payload converted venice data if mimetype is 'application/json' else error

Message type:

- `:REQUEST` - a request message
- `:PUBLISH` - a publish message

- `:SUBSCRIBE` - a subscribe message
- `:UNSUBSCRIBE` - an unsubscribe message
- `:OFFER` - an offer message for a queue
- `:POLL` - a poll message from a queue
- `:RESPONSE` - a response to a request message
- `:NULL` - a message with yet undefined type

Response status:

- `:OK` - a response message for a successfully processed request
- `:SERVER_ERROR` - a response indicating a server side error while processing the request
- `:BAD_REQUEST` - invalid request
- `:HANDLER_ERROR` - a server handler error in the server's request processing
- `:QUEUE_NOT_FOUND` - the required queue does not exist
- `:QUEUE_EMPTY` - the addressed queue in a poll request is empty
- `:QUEUE_FULL` - the addressed queue in offer request is full
- `:NULL` - a message with yet undefined status

```

top

ipc/offer

```
(ipc/offer client queue-name queue-offer-timeout message)
(ipc/offer client queue-name reply-to-queue-name queue-offer-timeout message)
```

Offers a message to the named queue.

Returns the server's response message.

Arguments:

client c	A client to send the offer message from
queue-name q	A queue name to offer the message to
reply-to-queue-name q	An optional reply-to queue name where replies are sent to
queue-offer-timeout t	The maximum time in milliseconds the server waits offering the message to the queue. A timeout of -1 means wait as long as it takes.
message m	The offer request message

The server returns a response message with one of these status:

- :OK - message added to the queue
- :SERVER_ERROR - indicates a server while offering the message to the queue
- :BAD_REQUEST - invalid request, details in the payload
- :QUEUE_NOT_FOUND - the queue does not exist
- :QUEUE_FULL - the queue is full, offer rejected

```
(do
;; thread-safe printing
(defn println [& msg] (locking println (apply core/println msg)))
```

```

ipc/offer-async

```
(ipc/offer client queue-name queue-offer-timeout message)
```

```
(ipc/offer client queue-name reply-to-queue-name queue-offer-timeout message)
```

Offers a message to the named queue.

Returns a future with the server's response message.

Arguments:

client c	A client to send the offer message from
queue-name q	A queue name to offer the message to
reply-to-queue-name q	An optional reply-to queue name where replies are sent to
queue-offer-timeout t	The maximum time in milliseconds the server waits offering the message to the queue. A timeout of -1 means wait as long as it takes.
message m	The offer request message

The server returns a response message with one of these status:

- :OK - message added to the queue
- :SERVER_ERROR - indicates a server while offering the message to the queue
- :BAD_REQUEST - invalid request, details in the payload
- :QUEUE_NOT_FOUND - the queue does not exist
- :QUEUE_FULL - the queue is full, offer rejected

Create a new client connecting to a server on the specified host and port.

[ipc/server](#)

Create a new server on the specified port.

[ipc/close](#)

Closes a server or client

[top](#)

[ipc/send](#)

(ipc/send client message)

Sends a message to the server the client is associated with.

Returns the server's response message or `nil` if the message is declared as one-way message. Throws a timeout exception if the response is not received within the timeout time.

The response message has one of these status:

- `:OK` - request handled successfully and response holds the data
- `:SERVER_ERROR` - indicates a server side error while processing the request

- `:BAD_REQUEST` - invalid request, details in the payload
- `:HANDLER_ERROR` - an error in the server's request processing handler

Arguments:

`client c` A client to send the message from
`message m` The message to send

Note

If the server's handler function takes more than a couple of 10 milliseconds to process the request, consider to use `offer/poll` with a reply queue to improve the system throughput!

```
;; echo handler
;; request: "hello" => echo => response: "hello"
(do
  (defn echo-handler [m] m)
  (try-with [server (ipc/server 33333 echo-handler)
            client (ipc/client "localhost" 33333)]
    (-> (ipc/plain-text-message "test" "hello")
         (ipc/send client)
         (ipc/message->map)
         (println)))

;; handler processing JSON message data
;; request: {"x": 100, "y": 200} => add => response: {"z": 300}
(do
  (defn handler [m]
    (let [data   (json/read-str (. m :getText))
          result (json/write-str { "z" (+ (get data "x") (get data "y"))})]
      (ipc/text-message (. m :getTopic)
                       "application/json" :UTF-8
                       result)))

Return true if the server or client is running else false

ipc/text-message

Creates a text message

ipc/plain-text-message

Creates a plain text message with mimetype text/plain and charset :UTF-8.

ipc/venice-message

Creates a venice message.

ipc/binary-message

Creates a binary message.

ipc/message->map

Converts a message to a Venice map.

[top](#)

ipc/send-async

(ipc/send-async client message)

Sends a message to the server the client is associated with.

Returns a future with the server's response message. The response message is `nil` if the message is declared as one-way message.

The response message has one of these status:

- `:OK` - request handled successfully and response holds the data
- `:SERVER_ERROR` - indicates a server side error while processing the request
- `:BAD_REQUEST` - invalid request, details in the payload
- `:HANDLER_ERROR` - an error in the server's request processing handler

Arguments:

client c A client to send the message from

message m The message to send

Note

If the server's handler function takes more than a couple of 10 milliseconds to process the request, consider to use `offer/poll` with a reply queue to improve the system throughput!

```
;; echo handler
;; request: "hello" => echo => response: "hello"
(do
  (defn echo-handler [m] m)
  (try-with [server (ipc/server 33333 echo-handler)
            client (ipc/client "localhost" 33333)]
  (-> (ipc/plain-text-message "test" "hello")
       (ipc/send-async client <>))
```

```

(deref <> 1_000 :timeout)
(ipc/message->map <>)
(pr println <>)))

;; handler processing JSON message data
;; request: {"x": 100, "y": 200} => add => response: {"z": 300}
(do
(defn handler [m]
  (let [data (json/read-str (. m :getText))
        result (json/write-str { "z" (+ (get data "x") (get data "y"))})]
    (ipc/text-message (. m :getTopic)
                     "application/json" :UTF-8
                     result)))
(try-with [server (ipc/server 33333 handler)
           client (ipc/client "localhost" 33333)]
  (-> (ipc/text-message "test"
                        "application/json" :UTF-8
                        (json/write-str {"x" 100 "y" 200}))
       (ipc/send-async client <>)
       (deref <> 1_000 :timeout)
       (ipc/message->map <>)
       (pr println <>)))

;; handler with remote code execution
;; request: "(+ 1 2)" => exec => response: "3"
(do
(defn handler [m]
  (let [cmd (. m :getText)
        result (str (eval (read-string cmd)))]
    (ipc/plain-text-message (. m :getTopic)
                           result)))
(try-with [server (ipc/server 33333 handler)
           client (ipc/client "localhost" 33333)]
  (-> (ipc/plain-text-message "exec" "(+ 1 2)")
       (ipc/send-async client <>)
       (deref <> 1_000 :timeout)
       (ipc/message->map <>)
       (pr println <>)))

```

SEE ALSO

[ipc/send](#)

Sends a message to the server the client is associated with.

[ipc/send-oneway](#)

Sends a one-way message to the server the client is associated with.

[ipc/client](#)

Create a new client connecting to a server on the specified host and port.

[ipc/server](#)

Create a new server on the specified port.

[ipc/close](#)

Closes a server or client

[ipc/running?](#)

Return true if the server or client is running else false

[ipc/text-message](#)

Creates a text message

[ipc/plain-text-message](#)

Creates a plain text message with mimetype text/plain and charset :UTF-8.

[ipc/venice-message](#)

Creates a venice message.

[ipc/binary-message](#)

Creates a binary message.

[ipc/message->map](#)

Converts a message to a Venice map.

[top](#)

[ipc/send-oneway](#)

([ipc/send-oneway](#) client message)

Sends a one-way message to the server the client is associated with.

Does not wait for a response and returns always `nil`.

```
(do
  ;; thread-safe printing
  (defn println [& msg] (locking println (apply core/println msg)))

  (defn handler [m]
    (println "REQUEST:" (ipc/message->json true m))
    nil)

  (try-with [server (ipc/server 33333 handler)
            client (ipc/client "localhost" 33333)]
    ;; send a plain text messages:
    ;;   requestId="1" and "2", topic="test", payload="hello"
    (ipc/send-oneway client (ipc/plain-text-message "1" "test" "hello"))
    (ipc/send-oneway client (ipc/plain-text-message "2" "test" "hello"))))
```

SEE ALSO

[ipc/send](#)

Sends a message to the server the client is associated with.

[ipc/send-async](#)

Sends a message to the server the client is associated with.

[ipc/client](#)

Create a new client connecting to a server on the specified host and port.

[ipc/server](#)

Create a new server on the specified port.

[ipc/close](#)

Closes a server or client

[ipc/running?](#)

Return true if the server or client is running else false

[ipc/text-message](#)

Creates a text message

[ipc/plain-text-message](#)

Creates a plain text message with mimetype text/plain and charset :UTF-8.

[ipc/venice-message](#)

Creates a venice message.

[ipc/binary-message](#)

Creates a binary message.

ipc/message->map

Converts a message to a Venice map.

[top](#)

ipc/server

```
(ipc/server port & options)
(ipc/server port handler & options)
```

Create a new server on the specified port.

Arguments:

port p The TCP/IP port

handler h A single argument handler function.

E.g.: a simple echo handler: (fn [m] m) .

The handler receives the request message and returns a response message. In case of a one-way request message the server discards the handler's response if it is not nil .

A handler is only required for send/receive message passing style. It is not required for offer/poll and publish/subscribe!

Options:

:max-connections n The number of the max connections the server can handle in parallel. Defaults to 20.

:max-message-size n The max size of the message payload. Defaults to 200MB .

The max size can be specified as a number like 20000 or a number with a unit like :20KB or :20MB

:compress-cutoff-size n The compression cutoff size for payload messages.

With a negative cutoff size payload messages will not be compressed. If the payload message size is greater than the cutoff size it will be compressed.

Defaults to -1 (no compression)

The cutoff size can be specified as a number like 1000 or a number with a unit like :1KB or :2MB

The server must be closed after use!

[See Inter-Process-Communication](#)

```
(do
  (defn echo-handler [m]
    (println "REQUEST: " (ipc/message->map m))
    m)

  (try-with [server (ipc/server 33333 echo-handler)
            client (ipc/client "localhost" 33333)]
    (-> (ipc/plain-text-message "test" "hello")
        (ipc/send client)
        (ipc/message->map)
        (println "RESPONSE: "))))
```

SEE ALSO

ipc/client

Create a new client connecting to a server on the specified host and port.

ipc/close

Closes a server or client

ipc/running?

Return true if the server or client is running else false

ipc/send

Sends a message to the server the client is associated with.

ipc/send-oneway

Sends a one-way message to the server the client is associated with.

ipc/publish

Publishes a messages to all clients that have subscribed to the message's topic.

ipc/subscribe

Subscribe to a topic.

ipc/text-message

Creates a text message

ipc/plain-text-message

Creates a plain text message with mimetype text/plain and charset :UTF-8.

ipc/binary-message

Creates a binary message.

ipc/message->map

Converts a message to a Venice map.

ipc/message->json

Converts message to a Json string with optional pretty printing.

ipc/create-queue

Creates a named queue on the server. Messages can be exchanged asynchronously between two clients using a queue. Each message is delivered ...

ipc/remove-queue

Removes a named queue from the server.

ipc/server-status

Returns the status and statistics of the server the client is connected to.

ipc/server-thread-pool-statistics

Returns the server's thread pool statistics the client is connected to.

[top](#)

ipc/server-status

(ipc/server-status client)

Returns the status and statistics of the server the client is connected to.

(do

```
(defn echo-handler [m] m)
(try-with [server (ipc/server 33333 echo-handler)
          client (ipc/client "localhost" 33333)]
  (-> (ipc/plain-text-message "test" "hello")
       (ipc/send client))
  (println "STATUS:" (ipc/server-status client))))
```

SEE ALSO

ipc/server-thread-pool-statistics

Returns the server's thread pool statistics the client is connected to.

ipc/server

Create a new server on the specified port.

ipc/close

Closes a server or client

ipc/running?

Return true if the server or client is running else false

ipc/server-thread-pool-statistics

(`ipc/server-thread-pool-statistics client`)

Returns the server's thread pool statistics the client is connected to.

```
(do
  (defn echo-handler [m] m)
  (try-with [server (ipc/server 33333 echo-handler)
            client (ipc/client "localhost" 33333)]
    (-> (ipc/plain-text-message "test" "hello")
         (ipc/send client))
    (println "STATS:" (ipc/server-thread-pool-statistics client))))
```

SEE ALSO

[ipc/server-status](#)

Returns the status and statistics of the server the client is connected to.

[ipc/server](#)

Create a new server on the specified port.

[ipc/client](#)

Create a new client connecting to a server on the specified host and port.

[ipc/close](#)

Closes a server or client

[ipc/running?](#)

Return true if the server or client is running else false

ipc/subscribe

(`ipc/subscribe client topic msg-handler`)

Subscribe to a topic.

Puts this client into subscription mode and listens for messages of the specified topic.

To unsubscribe from the topics just close the client.

Returns the server's response message.

The response message has one of these status:

- `:OK` - subscription added. Subscribed messages will be delivered through the 'msg-handler'
- `:SERVER_ERROR` - indicates a server side error while processing the request
- `:BAD_REQUEST` - invalid request, details in the payload

```
(do
  ;; thread-safe printing
  (defn println [& msg] (locking println (apply core/println msg)))

  (defn client-subscribe-handler [m]
```

```

  (println "SUBSCRIBED:" (ipc/message->json true m))

  (try-with [server (ipc/server 33333)
            client1 (ipc/client "localhost" 33333)
            client2 (ipc/client "localhost" 33333)]

    ;; client1 subscribes to messages with topic 'test'
    (ipc/subscribe client1 "test" client-subscribe-handler)

    ;; client2 publishes a plain text message:
    ;;   requestId="1", topic="test", payload="hello"
    (let [m (ipc/plain-text-message "1" "test" "hello")]
      (println "PUBLISHED:" (ipc/message->json true m))
      (ipc/publish client2 m))

    (sleep 300)))

```

SEE ALSO

[ipc/publish](#)

Publishes a messages to all clients that have subscribed to the message's topic.

[ipc/publish-async](#)

Publishes a messages to all clients that have subscribed to the message's topic.

[ipc/client](#)

Create a new client connecting to a server on the specified host and port.

[ipc/server](#)

Create a new server on the specified port.

[ipc/text-message](#)

Creates a text message

[ipc/plain-text-message](#)

Creates a plain text message with mimetype text/plain and charset :UTF-8.

[ipc/venice-message](#)

Creates a venice message.

[ipc/binary-message](#)

Creates a binary message.

[ipc/message->map](#)

Converts a message to a Venice map.

[top](#)

ipc/text-message

```

(ipc/text-message topic mimetype charset text)
(ipc/text-message request-id topic mimetype charset text)
(ipc/text-message request-id topic mimetype charset text expires-at)
(ipc/text-message request-id topic mimetype charset text expires-val expires-unit)

```

Creates a text message

Arguments:

request-id r	A request ID (string, may be <code>nil</code>). May be used for idempotency checks by the receiver
topic t	A topic (string)
mimetype m	The mimetype of the payload text. A string like 'text/plain'
charset c	The charset of the payload text. A keyword like <code>:UTF-8</code>

	The message payload text (a string)
text t	
expires-at t	Message expiration time in millis since epoch (may be <code>nil</code>)
expires-val v	Message expiration duration. E.g.: 2
expires-unit u	Message expiration time unit. Units: {:years :months :weeks :days :hours :minutes :seconds :milliseconds}

```
(-> (ipc/text-message "test" "text/plain" :UTF-8 "hello")
  (ipc/message->map)
  (println))

(-> (ipc/text-message "100" "test" "text/plain" :UTF-8 "hello")
  (ipc/message->map)
  (println))

(-> (ipc/text-message "100" "test" "text/plain" :UTF-8 "hello"
  (-> (time/local-date-time)
    (time/plus :hours 2)
    (time/to-millis)))
  (ipc/message->map)
  (println))

(-> (ipc/text-message "100" "test" "text/plain" :UTF-8 "hello" 2 :hours)
  (ipc/message->map)
  (println))
```

SEE ALSO

[ipc/server](#)

Create a new server on the specified port.

[ipc/client](#)

Create a new client connecting to a server on the specified host and port.

[ipc/plain-text-message](#)

Creates a plain text message with mimetype text/plain and charset :UTF-8.

[ipc/venice-message](#)

Creates a venice message.

[ipc/binary-message](#)

Creates a binary message.

[ipc/message->map](#)

Converts a message to a Venice map.

[ipc/message->json](#)

Converts message to a Json string with optional pretty printing.

[ipc/oneway?](#)

Returns true if the message is one-way else false.

[ipc/response-ok?](#)

Returns true if the message response status is :OK else false.

[ipc/response-err?](#)

Returns true if the message has a response error status else false.

[top](#)

ipc/venice-message

```
(ipc/venice-message topic data)
```

```
(ipc/venice-message request-id topic data)
(ipc/venice-message request-id topic data expires-at)
(ipc/venice-message request-id topic data expires-val expires-unit)
```

Creates a venice message.

The Venice data is serialized as JSON (mimetype: 'application/json') for transport within the message.

Arguments:

request-id r	A request ID (string, may be <code>nil</code>). May be used for idempotency checks by the receiver
topic t	A topic (string)
data d	The message payload Venice data (e.g.: a map, list, ...)
expires-at t	Message expiration time in millis since epoch (may be <code>nil</code>)
expires-val v	Message expiration duration. E.g.: 2
expires-unit u	Message expiration time unit. Units: {years :months :weeks :days :hours :minutes :seconds :milliseconds}

```
(-> (ipc/venice-message "test" {:a 100, :b 200})
     (ipc/message->map)
     (println))

(-> (ipc/venice-message "100" "test" {:a 100, :b 200})
     (ipc/message->map)
     (println))

(-> (ipc/venice-message "100" "test"
                         {:a 100, :b 200}
                         (-> (time/local-date-time)
                               (time/plus :hours 2)
                               (time/to-millis)))
     (ipc/message->map)
     (println))

(-> (ipc/venice-message "100" "test" {:a 100, :b 200} 2 :hours)
     (ipc/message->map)
     (println))
```

Converts a message to a Venice map.

[ipc/message->json](#)

Converts message to a json string with optional pretty printing.

[ipc/oneway?](#)

Returns true if the message is one-way else false.

[ipc/response-ok?](#)

Returns true if the message response status is :OK else false.

[ipc/response-err?](#)

Returns true if the message has a response error status else false.

[top](#)

jansi-version

(jansi-version)

Returns the Jansi version or nil if not available.

[top](#)

jar-maven-manifest-version

(jar-maven-manifest-version group-id artefact-id)

Returns the Maven version for a loaded JAR's manifest or nil if there is no Maven manifest.

Reads the version from the JAR's Maven 'pom.properties' file at:
/META-INF/maven/{group-id}/{artefact-id}/pom.properties

A 'pom.properties' may look like:

- artifactId=xchart
- groupId=org.knowm.xchart
- version=3.8.0

(jar-maven-manifest-version :com.github.librepdf :openpdf)
=> "1.3.35"

SEE ALSO

[java-package-version](#)

Returns version information for a Java package or nil if the package does not exist or is not visible.

[top](#)

java-double-list

(java-double-list l)

Converts a Venice list/vector to a Java `Double` list

(java-double-list '(1.0 2.0 3.0))
=> [1.0, 2.0, 3.0]

(java-double-list '(1I 2 3.2 3.56M))
=> [1.0, 2.0, 3.2, 3.56]

SEE ALSO

[java-float-list](#)

Converts a Venice list/vector to a Java Float list

[double-array](#)

Returns an array of Java primitive doubles containing the contents of coll or returns an array with the given length and optional init value.

[top](#)

[java-enumeration-to-list](#)

(`java-enumeration-to-list e`)

Converts a Java enumeration to a list

[top](#)

[java-float-list](#)

(`java-float-list l`)

Converts a Venice list/vector to a Java `Float` list

(`java-float-list '(1.0F 2.0F 3.0F)`)
=> [1.0, 2.0, 3.0]

(`java-float-list '(1I 2 3.2 3.56M)`)
=> [1.0, 2.0, 3.2, 3.56]

SEE ALSO

[java-double-list](#)

Converts a Venice list/vector to a Java Double list

[float-array](#)

Returns an array of Java primitive floats containing the contents of coll or returns an array with the given length and optional init value.

[top](#)

[java-int-list](#)

(`java-int-list l`)

Converts a Venice list/vector to a Java `Integer` list

(`java-int-list '(1I 2I 3I)`)
=> [1, 2, 3]

(`java-int-list '(1I 2 3.2 3.56M)`)
=> [1, 2, 3, 3]

SEE ALSO

[int-array](#)

Returns an array of Java primitive ints containing the contents of coll or returns an array with the given length and optional init value.

java-iterator-to-list

(java-iterator-to-list e)

Converts a Java iterator to a list

[top](#)

java-long-list

(java-long-list l)

Converts a Venice list/vector to a Java `Long` list

(java-long-list '(1 2 3))
=> [1, 2, 3]

(java-long-list '(1I 2 3.2 3.56M))
=> [1, 2, 3, 3]

SEE ALSO

[long-array](#)

Returns an array of Java primitive longs containing the contents of coll or returns an array with the given length and optional init value.

[top](#)

java-major-version

(java-major-version)

Returns the Java major version (8, 9, 11, ...).

(java-major-version)
=> 8

SEE ALSO

[java-version](#)

Returns the Java VM version (1.8.0_252, 11.0.7, ...)

[java-version-info](#)

Returns the Java VM version info.

[top](#)

java-obj?

(java-obj? obj)

Returns true if obj is a Java object

```
(java-obj? (. :java.math.BigInteger :new "0"))
=> true
```

top

java-package-version

(java-package-version class)

Returns version information for a Java package or nil if the package does not exist or is not visible.

```
(java-package-version :java.lang.String)
=> {:implementation-title "Java Runtime Environment" :implementation-vendor "Azul Systems, Inc." :
implementation-version "1.8.0_462" :specification-title "Java Platform API Specification" :specification-vendor
"Oracle Corporation" :specification-version "1.8"}

(java-package-version (class :java.lang.String))
=> {:implementation-title "Java Runtime Environment" :implementation-vendor "Azul Systems, Inc." :
implementation-version "1.8.0_462" :specification-title "Java Platform API Specification" :specification-vendor
"Oracle Corporation" :specification-version "1.8"}
```

SEE ALSO

[jar-maven-manifest-version](#)

Returns the Maven version for a loaded JAR's manifest or nil if there is no Maven manifest.

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

top

java-source-location

(java-source-location class)

Returns the path of the source location of a class (fully qualified class name).

E.g.:

```
(java-source-location :com.github.jlangch.venice.Venice)
=> /Users/foo/venice/libs/venice-1.12.57.jar
```

```
(java-source-location :com.github.jlangch.venice.Venice)
```

top

java-string-list

(java-string-list l)

Converts a Venice list/vector to a Java `String` list

```
(java-string-list '("ab" "cd" "ef"))
=> [ab, cd, ef]

(java-string-list '("ab" 1I 2 3.2 3.56M))
=> [ab, 1, 2, 3.2, 3.56]
```

SEE ALSO

[string-array](#)

Returns an array of Java strings containing the contents of coll or returns an array with the given length and optional init value

[top](#)

[java-unwrap-optional](#)

```
(java-unwrap-optional val)
```

Unwraps a Java :java.util.Optional to its contained value or nil

[top](#)

[java-version](#)

```
(java-version)
```

Returns the Java VM version (1.8.0_252, 11.0.7, ...)

```
(java-version)
=> "1.8.0_462"
```

SEE ALSO

[java-major-version](#)

Returns the Java major version (8, 9, 11, ...).

[java-version-info](#)

Returns the Java VM version info.

[top](#)

[java-version-info](#)

```
(java-version-info)
```

Returns the Java VM version info.

```
(java-version-info)
=> {:version "1.8.0_462" :vendor "Azul Systems, Inc." :vm-version "25.462-b08" :vm-name "OpenJDK 64-Bit Server VM" :vm-vendor "Azul Systems, Inc."}
```

SEE ALSO

[java-version](#)

Returns the Java VM version (1.8.0_252, 11.0.7, ...)

[java-major-version](#)

Returns the Java major version (8, 9, 11, ...).

[top](#)

[java/as-biconsumer](#)

`(as-biconsumer f)`

Wraps the function `f` in a [java.util.function.BiConsumer](#)

[top](#)

[jdbc-core/closed?](#)

(closed? conn)

Returns true the connections is closed else false.

[top](#)

[jdbc-core/collect-result-set](#)

(collect-result-set rs)

Collects data form a JDBC `:java.sql.ResultSet` returns it as map with the column names and a vector of row values.

Row values may be of type:

- string
- boolean
- int
- long
- double
- decimal
- :java.sql.Clob
- :java.sql.Blob

```

{ :col-names ["name" "age"]
:rows [ ["john" 29]
      ["mary" 32] ] }

(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

  (try-with [conn (jdbp/create-connection "localhost" 5432 "test" "pg" "pg")
            stmt (jdbc/create-statement conn)
            rs (jdbc/execute-query* stmt "SELECT * FROM foo")]
    (jdbc/collect-result-set rs)))

```

SEE ALSO

[jdbc-core/render-query-result](#)

Renders the result from an execute-query in an ascii table format. Returns an ascii table formatted string.

[jdbc-core/print-query-result](#)

Prints the result from a execute-query in an ascii table format. Returns nil.

[jdbc-core/execute](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[jdbc-core/execute-query](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement or connection.

[jdbc-core/execute-update](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[top](#)

jdbc-core/columns

(columns conn table)

List the columns of a database table

Example PostgreSQL Chinook database "genre" table:

```

[ { :name "genre_id"
  :type :INTEGER
  :size "10"
  :nullable? "NO"
  :auto-inc? "YES" }
{ :name "name"
  :type :VARCHAR
  :size "120"
  :nullable? "YES"
  :auto-inc? "NO" } ]

(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
  (try-with [conn (jdbp/create-connection "localhost" 5432 "chinook" "pg" "pg")
            (jdbc/columns conn "genre")]))

```

[top](#)

jdbc-core/commit!

```
(commit! conn)
```

Commit the current transaction on the connection

```
(jdbc-core/auto-commit! conn false)
```

SEE ALSO

[jdbc-core/tx-isolation](#)

Returns transaction isolation level of the connection

[jdbc-core/tx-isolation!](#)

Set the transaction isolation level for the connection

[jdbc-core/auto-commit?](#)

Returns true if auto commit is enabled on the connection else false

[jdbc-core/auto-commit!](#)

Activate/Deactivate auto commit on a connection

[jdbc-core/rollback!](#)

Rollback the current transaction on the connection

[top](#)

jdbc-core/count-rows

```
(count-rows conn table)
```

Returns the row count of a table.

```
;; using a prepared statement
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

  (try-with [conn  (jdbp/create-connection "localhost" 5432 "test" "pg" "pg")]
    (jdbc/count-rows conn "Albums")))
```

SEE ALSO

[jdbc-core/execute-query](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement or connection.

[top](#)

jdbc-core/create-database

```
(create-database conn database)
(create-database conn database force)
```

Creates a new database. If force flag is true drops the database first if it exists.

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp]))
```

```
(try-with [conn (jdbp/create-connection "pg" "pg")]
         (jdbc/create-database conn "test")))

(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
  (try-with [conn (jdbp/create-connection "pg" "pg")]
         (jdbc/create-database conn "test" true)))
```

SEE ALSO

[jdbc-core/drop-database](#)

Drops a database if it exists.

[top](#)

jdbc-core/create-statement

```
(create-statement conn)
```

Create a statement

```
(jdbc-core/create-statement conn)
```

SEE ALSO

[jdbc-core/prepare-statement](#)

Create a prepared statement

[top](#)

jdbc-core/drop-database

```
(drop-database conn database)
(drop-database conn database force)
```

Drops a database if it exists.

The force option will attempt to terminate all existing connections to the database.

Note: The force option is supported for PostgreSQL only and disconnects all connections prior to dropping the database!

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
  (try-with [conn (jdbp/create-connection "pg" "pg")]
         (jdbc/drop-database conn "test")))
```

SEE ALSO

[jdbc-core/create-database](#)

Creates a new database. If force flag is true drops the database first if it exists.

[top](#)

jdbc-core/execute

```
(execute pstmt)
(execute stmt sql)
```

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

```
;; using a prepared statement
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

  (try-with [conn (jdbc/create-connection "localhost" 5432 "test" "pg" "pg")
            pstmt (jdbc/prepare-statement conn "INSERT INTO foo VALUES(?,?)")]
    (jdbc/ps-int pstmt 1 1I)
    (jdbc/ps-string pstmt 2 "Harry Potter")
    (jdbc/execute pstmt)))

;; running an SQL statement on a JDBC statement
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp'])

  (try-with [conn (jdbc/create-connection "localhost" 5432 "test" "pg" "pg")
            stmt (jdbc/create-statement conn)]
    (jdbc/execute stmt "INSERT INTO foo VALUES(1, \"Harry Potter\"))))
```

SEE ALSO

[jdbc-core/execute-query](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement or connection.

[jdbc-core/execute-query*](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[jdbc-core/execute-update](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[top](#)

jdbc-core/execute-query

```
(execute-query pstmt)
(execute-query stmt sql)
```

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement or connection.

Returns the JDBC `:java.sql.ResultSet` parsed as map with the column names and a vector of row values.

Row values may be of type:

- string
- boolean
- int
- long
- double
- decimal
- `:java.sql.Clob`

```

SEE ALSO

[jdbc-core/render-query-result](#)

Renders the result from an execute-query in an ascii table format. Returns an ascii table formatted string.

[jdbc-core/print-query-result](#)

Prints the result from a execute-query in an ascii table format. Returns nil.

[jdbc-core/execute](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[jdbc-core/execute-update](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[top](#)

jdbc-core/execute-query*

```
(execute-query* pstmt)
(execute-query* stmt sql)
```

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

Returns a JDBC `:java.sql.ResultSet`.

Note: The returned ResultSet has to be closed after use!

```
;; using a prepared statement

```

SEE ALSO

[jdbc-core/collect-result-set](#)

Collects data from a JDBC :java.sql.ResultSet returns it as map with the column names and a vector of row values.

[jdbc-core/render-query-result](#)

Renders the result from an execute-query in an ascii table format. Returns an ascii table formatted string.

[jdbc-core/print-query-result](#)

Prints the result from a execute-query in an ascii table format. Returns nil.

[jdbc-core/execute](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[jdbc-core/execute-query](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement or connection.

[jdbc-core/execute-update](#)

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

[top](#)

jdbc-core/execute-update

```
(execute-update pstmt)
(execute-update stmt sql & options)
```

Executes the SQL statement in prepared statement or executes an SQL statement on a JDBC statement.

Returns an integer value that reports the number of rows affected by the SQL statement.

Options:

:gen-key Provide access to the generated keys.

The generated keys can be retrieved by a call to `(jdbc-core/generated-keys stmt)`.

Values:

```

    true  Return all generated keys
    ["id"] Return only the generated keys in the specified list

;; using a prepared statement
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])

[top](#)

jdbc-core/meta-data

```
(meta-data conn)
```

List the meta data of a database

Example PostgreSQL meta data:

```
{ :product-name "PostgreSQL"
  :driver-name "PostgreSQL JDBC Driver"
  :driver-version "42.7.3"
  :product-version "16.2 (Debian 16.2-1.pgdg120+2)" }
```

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
  (try-with [conn (jdbp/create-connection "localhost" 5432 "pg" "pg")]
    (jdbc/meta-data conn)))
```

[top](#)

jdbc-core/postgresql?

```
(postgresql? conn)
```

Returns true if 'conn' is a PostgreSQL connection else false.

[top](#)

jdbc-core/prepare-statement

```
(prepare-statement conn sql)
```

```
(prepare-statement conn sql & options)
```

Create a prepared statement

Options:

:gen-key Provide access to the generated keys.
The generated keys can be retrieved by a call to `(jdbc-core/generated-keys stmt)`.

Values:

`true` Return all generated keys
`["id"]` Return only the generated keys in the specified list

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

            pstmt (jdbc/prepare-statement conn "INSERT INTO foo VALUES(?,?)")]
    (jdbc/ps-int pstmt 1 1I)
    (jdbc/ps-string pstmt 2 "Harry Potter")
    (jdbc/execute pstmt)))
```

SEE ALSO

[jdbc-core/create-statement](#)

Create a statement

[top](#)

jdbc-core/print-query-result

```
(print-query-result data)
(print-query-result data max-col-width)
```

Prints the result from a `execute-query` in an ascii table format. Returns `nil`.

The functions accepts a JDBC ':java.sql.ResultSet' or a collected result set as returned from [jdbc-core/collect-result-set](#).

max-col-width is limited to the range [5..200]

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

  (try-with [conn (jdbp/create-connection "localhost" 5432 "test" "pg" "pg")
            stmt (jdbc/create-statement conn)
            rs  (jdbc/execute-query* stmt "SELECT * FROM foo")]
    (jdbc/print-query-result rs)))
```

SEE ALSO

[jdbc-core/collect-result-set](#)

Collects data form a JDBC :java.sql.ResultSet returns it as map with the column names and a vector of row values.

[jdbc-core/render-query-result](#)

Renders the result from an execute-query in an ascii table format. Returns an ascii table formatted string.

[top](#)

jdbc-core/ps-blob

```
(ps-blob ps idx val)
```

Sets the prepared statement parameter to the given blob value.

The value may be a `bytebuf` or a `:java.io.InputStream`.

```
(jdbc-core/ps-decimal ps 1 (bytebuf [1 2 3]))
```

```
(jdbc-core/ps-decimal ps 1 (io/bytbuf-in-stream (bytebuf [1 2 3])))
```

Returns the length of a blob

[jdbc-core/blob-in-stream](#)

Returns a `:java.io.InputStream` to read the blob data

[jdbc-core/blob-bytbuf](#)

Returns the blob data as a bytbuf

[jdbc-core/blob-free](#)

Frees the Blob object and releases the resources the resources that it holds.

[jdbc-core/rs-string](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a string.

[jdbc-core/rs-boolean](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a boolean.

[jdbc-core/rs-int](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a int.

[jdbc-core/rs-long](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a long.

[jdbc-core/rs-float](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a double.

[jdbc-core/rs-double](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a double.

[jdbc-core/rs-decimal](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a decimal.

[jdbc-core/rs-date](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a `:java.time.LocalDate`.

[jdbc-core/rs-time](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a `:java.time.LocalTime`.

[jdbc-core/rs-timestamp](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a `:java.time.LocalDateTime`.

[jdbc-core/rs-clob](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a `:java.sql.Clob`.

[jdbc-core/rs-object](#)

Retrieves the value of the designated column in the current row of the ResultSet object converted tostring, boolean, int, long, double, ...

[top](#)

[jdbc-core/rs-boolean](#)

`(rs-boolean rs name-or-index)`

Retrieves the value of the designated column in the current row of the ResultSet object as a `boolean`.

`(jdbc-core/rs-boolean rs 1)`

`(jdbc-core/rs-boolean rs "openBill")`

SEE ALSO

[jdbc-core/rs-string](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a string.

[jdbc-core/rs-int](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a int.

[jdbc-core/rs-long](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a long.

[jdbc-core/rs-float](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a double.

[jdbc-core/rs-double](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a double.

[jdbc-core/rs-decimal](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a decimal.

[jdbc-core/rs-date](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a :java.time.LocalDate.

[jdbc-core/rs-time](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a :java.time.LocalTime.

[jdbc-core/rs-timestamp](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a :java.time.LocalDateTime.

[jdbc-core/rs-clob](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a :java.sql.Clob.

[jdbc-core/rs-blob](#)

Retrieves the value of the designated column in the current row of the ResultSet object as a :java.sql.Blob.

[jdbc-core/rs-object](#)

Retrieves the value of the designated column in the current row of the ResultSet object converted tostring, boolean, int, long, double, ...

[top](#)

jdbc-core/schemas

(schemas conn)

List the schemas of a database

Example PostgreSQL schemas:

```
[ { :schema "information_schema"
  :catalog nil
}
{ :schema "pg_catalog"
  :catalog nil
}
{ :schema "public"
  :catalog nil
} ]
```

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
  (try-with [conn (jdbp/create-connection "localhost" 5432 "pg" "pg")]
    (jdbc/schemas conn)))
```

top

jdbc-core/tables

```
(tables conn)
```

List the tables of a database

Example PostgreSQL Chinook database:

```
[ "album"
  "artist"
  "customer"
  "employee"
  "genre"
  "invoice"
  "invoice_line"
  "media_type"
  "playlist"
  "playlist_track"
  "track" ]
```

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
  (try-with [conn (jdbp/create-connection "localhost" 5432 "chinook" "pg" "pg")]
    (jdbc/tables conn)))
```

top

jdbc-core/tx-isolation

```
(tx-isolation conn)
```

Returns transaction isolation level of the connection

Levels:

- :tx-none
- :tx-read-committed
- :tx-read-uncommitted
- :tx-repeatable-read

- `:tx-serializable`

([jdbc-core/tx-isolation](#) conn)

SEE ALSO

[jdbc-core/tx-isolation!](#)

Set the transaction isolation level for the connection

[jdbc-core/auto-commit?](#)

Returns true if auto commit is enabled on the connection else false

[jdbc-core/auto-commit!](#)

Activate/Deactivate auto commit on a connection

[jdbc-core/commit!](#)

Commit the current transaction on the connection

[jdbc-core/rollback!](#)

Rollback the current transaction on the connection

[top](#)

jdbc-core/tx-isolation!

(tx-isolation! conn level)

Set the transaction isolation level for the connection

Levels:

- `:tx-none`
- `:tx-read-commited`
- `:tx-read-uncommited`
- `:tx-repeatable-read`
- `:tx-serializable`

([jdbc-core/tx-isolation!](#) conn :tx-repeatable-read)

SEE ALSO

[jdbc-core/tx-isolation](#)

Returns transaction isolation level of the connection

[jdbc-core/auto-commit?](#)

Returns true if auto commit is enabled on the connection else false

[jdbc-core/auto-commit!](#)

Activate/Deactivate auto commit on a connection

[jdbc-core/commit!](#)

Commit the current transaction on the connection

[jdbc-core/rollback!](#)

Rollback the current transaction on the connection

[top](#)

jdbc-core/with-conn

```
(with-conn conn & forms)
```

Sets the thread local var `conn` to the passed connection, wraps the connection in a `try-with` form to close the connection automatically at the end of the template and runs the forms.

The forms have access to the connection via the `conn` thread local var.

While thread local vars may work fine (most ORMs like *Hibernate* or *JPA* rely on thread local vars), using Venice *Components* for connection management give a cleaner and more functional architecture.

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

  (jdbc/with-conn [conn (jdbp/create-connection "localhost" 5432
                                                "test" "pg" "pg")]
    (try-with [stmt (jdbc/create-statement *conn*)])
    (-> (jdbc/execute-update stmt "INSERT INTO foo VALUES(100,3.1456)")
         (jdbc-core/print-query-result)))))
```

SEE ALSO

[jdbc-core/with-tx](#)

Runs the forms within a JDBC transaction, commits the transaction at the end or rolls the transaction back if the forms throw an exception.

[top](#)

jdbc-core/with-tx

```
(with-tx conn & forms)
```

Runs the forms within a JDBC transaction, commits the transaction at the end or rolls the transaction back if the forms throw an exception.

Restores the auto-commit mode on the connection at the end of the successful or failed transaction.

Throws a `:com.github.jlangch.venice.TransactionException` after rolling back.

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

  (try-with [conn (jdbp/create-connection "localhost" 5432 "test" "pg" "pg")]
    (jdbc/with-tx conn
      (try-with [stmt (jdbc/create-statement conn)])
      (-> (jdbc/execute-update stmt "INSERT INTO foo VALUES(100,3.1415)")
           (jdbc-core/print-query-result)))))
```

SEE ALSO

[jdbc-core/with-conn](#)

Sets the thread local var `conn` to the passed connection, wraps the connection in a try-with form to close the connection automatically ...

[top](#)

jdbc-postgresql/create-connection

```
(create-connection user password)
(create-connection host port user password)
(create-connection host port database user password)
(create-connection host port database user password properties)
```

Creates a PostgreSQL connection.

Arguments:

<i>user</i>	A mandatory ser name
<i>password</i>	A mandatory password
<i>host</i>	An optional host. Defaults to "localhost"
<i>port</i>	An optional port. Defaults to 5432
<i>database</i>	A mandatory database name
<i>properties</i>	Optional properties (a map). E.g.: { "ssl" "true", "options" "-c statement_timeout=90000" }

```
(do
  (load-module :jdbc-core ['jdbc-core :as 'jdbc])
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])

  (try-with [conn (jdbp/create-connection "localhost" 5432 "test" "pg" "pg")]

Drops a database if it exists.

[top](#)

jdbc-postgresql/describe-table

```
(describe-table conn table & options)
```

Describe the schema of a table.

Options:

:mode In `:print` mode prints the table description, in `:data` mode returns the description as a data structure. Defaults to `:print`.

Example PostgreSQL Chinook database "album" table:

column_name	data_type	character_maximum_length	is_nullable	column_default
album_id	integer	<null>	NO	<null>
artist_id	integer	<null>	NO	<null>
title	character varying	160	NO	<null>

```
(do
  (load-module :jdbc-postgresql ['jdbc-postgresql :as 'jdbp])
```

```
(try-with [conn (jdbp/create-connection "localhost" 5432 "test" "pg" "pg")]
         (jdbp/describe-table conn "album")))

Slurps a JSON data from a source and returns it as a Venice data.

[top](#)

json/read-str

`(json/read-str s & options)`

Reads a JSON string and returns it as a Venice datatype.

Options:

:key-fn fn Single argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.

:value-fn fn Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.

:decimal b If true use BigDecimal for decimal numbers instead of Double. Default is false.

```
(json/read-str (json/write-str {:a 100 :b 100}))  
=> {"a" 100 "b" 100}  
  
(json/read-str (json/write-str {:a 100 :b 100}) :key-fn keyword)  
=> {:a 100 :b 100}  
  
(json/read-str (json/write-str {:a 100 :b 100})  
               :value-fn (fn [k v] (if (= "a" k) (inc v) v)))  
=> {"a" 101 "b" 100}
```

[top](#)

json/slurp

```
(json/slurp source & options)
```

Slurps a JSON data from a source and returns it as a Venice data.

The source may be a:

- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.Path`
- `java.io.InputStream`
- `java.io.Reader`

Options:

:key-fn fn Single-argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.

:value-fn fn Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.

:decimal b If true use BigDecimal for decimal numbers instead of Double. Default is false.

:encoding e e.g :encoding :utf-8, defaults to :utf-8

```
(let [json (json/write-str {:a 100 :b 100 :c 1.233})]  
  (try-with [in (io/string-reader json)]  
    (pr-str (json/slurp in))))  
=> "{\"a\" 100 \"b\" 100 \"c\" 1.233}"
```

```
(let [json (json/write-str {:a 100 :b 100 :c 1.233})]  
  (try-with [in (io/string-reader json)]

jsonl/lazy-seq-slurper

```
(jsonl/lazy-seq-slurper in & options)
```

Returns a lazy sequence of the parsed JSON line strings from the input 'in'.

'in' may be a:

- `java.io.InputStream`
- `java.io.Reader`

Note: The caller is responsible for closing the in stream/reader!

Options:

- :key-fn fn Single argument function called on JSON property names; return value will replace the property names in the output. Default is 'identity', use 'keyword' to get keyword properties.
- :value-fn fn Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The default value-fn returns the value unchanged.
- :decimal b If true use BigDecimal for decimal numbers instead of Double. Default is false.
- :filter-fn fn Single argument function called on every read value from a JSON line. If it returns true the value will be kept otherwise it will be skipped
- :encoding e e.g.:encoding :utf-8, defaults to :utf-8

`jsonl/lazy-seq-slurper` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

{"a":100,"b":200}
=> nil

(do
  (load-module :jsonl)
  (println (jsonl/write-str [{:a 100 :b 200}
                            {:a 101 :b 201}
                            {:a 102 :b 202}])))

{"a":100,"b":200}
[{"a":101,"b":201}
 {"a":102,"b":202}]
=> nil
```

SEE ALSO

[jsonl/spit](#)

Spits the JSON Lines converted value 'val' to the output 'out'.

[jsonl/read-str](#)

Reads a JSON line string 's' and returns it as a Venice data type.

[top](#)

jtokkit/count-tokens

```
(count-tokens encoding text)
```

Encodes the given text into a list of token ids and returns the number of tokens.

The argument 'encoding' may be an encoding type like `:0200K_BASE` or a model type like `:GPT_40`

```
(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  ;; e.g. model types: :GPT_4, :GPT_40, :GPT_40_MINI
  (-> (jt/encoding :GPT_40)
       (jt/count-tokens "hello world")))

(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  ;; e.g. encoding types: :CL100K_BASE, :0200K_BASE
  (-> (jt/encoding :0200K_BASE)
       (jt/count-tokens "hello world")))
```

SEE ALSO

[jtokkit/encoding](#)

Returns the encoding (:com.knuddels.jtokkit.api.Encoding) object for the given encoding or model type.

[jtokkit/encoding-types](#)

Returns the defined encoding types. Actually from the enum type :com.knuddels.jtokkit.api.EncodingType.

[jtokkit/model-types](#)

Returns the defined model types. Actually from the enum type :com.knuddels.jtokkit.api.ModelType.

[jtokkit/encode](#)

Encodes the given text into a list of token ids.

[top](#)

jtokkit/encode

(**encode** *encoding* *text*)

Encodes the given text into a list of token ids.

The argument 'encoding' may be an encoding type like :0200K_BASE or a model type like :GPT_40

```
(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  ;; e.g. model types: :GPT_4, :GPT_40, :GPT_40_MINI
  (-> (jt/encoding :GPT_40)
       (jt/encode "hello world")))

(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  ;; e.g. encoding types: :CL100K_BASE, :0200K_BASE
  (-> (jt/encoding :0200K_BASE)
       (jt/encode "hello world")))
```

SEE ALSO

[jtokkit/encoding](#)

Returns the encoding (:com.knuddels.jtokkit.api.Encoding) object for the given encoding or model type.

[jtokkit/encoding-types](#)

Returns the defined encoding types. Actually from the enum type :com.knuddels.jtokkit.api.EncodingType.

[jtokkit/model-types](#)

Returns the defined model types. Actually from the enum type :com.knuddels.jtokkit.api.ModelType.

[jtokkit/count-tokens](#)

Encodes the given text into a list of token ids and returns the number of tokens.

[top](#)

jtokkit/encoding

(**encoding** *type*)

Returns the encoding (:com.knuddels.jtokkit.api.Encoding) object for the given encoding or model type.

Returns nil if it does not exist.

```
(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  ;; for a list of encoding types see `(jtokkit/encoding-types)`
  (jt/encoding :CL100K_BASE))

(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  ;; for a list of model types see `(jtokkit/model-types)`
  (jt/encoding :GPT_3_5_TURBO))
```

SEE ALSO

[jtokkit/encode](#)

Encodes the given text into a list of token ids.

[jtokkit/encoding-types](#)

Returns the defined encoding types. Actually from the enum type :com.knuddels.jtokkit.api.EncodingType.

[jtokkit/model-types](#)

Returns the defined model types. Actually from the enum type :com.knuddels.jtokkit.api.ModelType.

[jtokkit/count-tokens](#)

Encodes the given text into a list of token ids and returns the number of tokens.

[top](#)

[jtokkit/encoding-types](#)

(encoding-types)

Returns the defined encoding types. Actually from the enum type :com.knuddels.jtokkit.api.EncodingType.

```
(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  (jt/encoding-types))
```

SEE ALSO

[jtokkit/encode](#)

Encodes the given text into a list of token ids.

[jtokkit/model-types](#)

Returns the defined model types. Actually from the enum type :com.knuddels.jtokkit.api.ModelType.

[top](#)

[jtokkit/model-types](#)

(model-types)

Returns the defined model types. Actually from the enum type :com.knuddels.jtokkit.api.ModelType.

```
(do
  (load-module :jtokkit ['jtokkit :as 'jt])
  (jt/model-types))
```

SEE ALSO

[jtokkit/encode](#)

Encodes the given text into a list of token ids.

[jtokkit/encoding-types](#)

Returns the defined encoding types. Actually from the enum type :com.knuddels.jtokkit.api.EncodingType.

[top](#)

just

`(just x)`

Creates a wrapped x, that is dereferenceable

```
(just 10)
=> (just 10)
```

```
(just "10")
=> (just "10")
```

```
(deref (just 10))
=> 10
```

[top](#)

just?

`(just? x)`

Returns true if x is of type just

```
(just? (just 1))
=> true
```

[top](#)

juxt

```
(juxt f)
(juxt f g)
(juxt f g h)
(juxt f g h & fs)
```

Takes a set of functions and returns a fn that is the juxtaposition of those fns. The returned fn takes a variable number of args, and returns a vector containing the result of applying each fn to the args (left-to-right).

```
((juxt a b c) x) => [(a x) (b x) (c x)]
```

```
((juxt first last) '(1 2 3 4))
=> [1 4]
```

```
(do
  (defn index-by [coll key-fn]
    (into {} (map (juxt key-fn identity) coll)))

  (index-by [{:id 1 :name "foo"}
             {:id 2 :name "bar"}
             {:id 3 :name "baz"}]
            :id))
=> {1 {:name "foo" :id 1} 2 {:name "bar" :id 2} 3 {:name "baz" :id 3}})
```

top

keep

```
(keep f coll)
```

Returns a sequence of the non-nil results of `(f item)`. Note, this means false return values will be included. `f` must be free of side-effects.
Returns a transducer when no collection is provided.

```
(keep even? (range 1 4))
=> (false true false)
```

```
(keep (fn [x] (if (odd? x) x)) (range 4))
=> (1 3)
```

```
(keep #{3 5 7} '(1 3 5 7 9))
=> (3 5 7)
```

top

key

```
(key e)
```

Returns the key of the map entry.

```
(key (find {:a 1 :b 2} :b))
=> :b
```

```
(key (first (entries {:a 1 :b 2 :c 3})))
=> :a
```

SEE ALSO

map

Applies `f` to the set of first items of each coll, followed by applying `f` to the set of second items in each coll, until any one of the ...

entries

Returns a collection of the map's entries.

val

Returns the val of the map entry.

keys

Returns a collection of the map's keys.

keys

(keys map)

Returns a collection of the map's keys.

Please note that the functions 'keys' and 'vals' applied to the same map are not guaranteed to return the keys and vals in the same order!

To achieve this, keys and vals can be calculated based on the map's entry list:

```
(let [e (entries {:a 1 :b 2 :c 3})]
  (println (map key e))
  (println (map val e)))
```

```
(keys {:a 1 :b 2 :c 3})
=> (:a :b :c)
```

SEE ALSO

[vals](#)

Returns a collection of the map's values.

[entries](#)

Returns a collection of the map's entries.

[map](#)

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

keystores/aliases

(aliases keystore)

Returns the list of aliases defined for the keystore.

```
(do
  (load-module :keystores)
  (let [ks (keystores/load (io/file "cert.p12") "12345")]
    (keystores/aliases ks)))
```

SEE ALSO

[keystores/load](#)

Loads a certificate into a Java KeyStore. Reads it from the input 'in' and returns it as a Java :java.security.KeyStore.

[keystores/certificate](#)

Returns the certificate (of type X509Certificate) with the given alias name from the keystore.

[keystores/subject-dn](#)

Returns the subject DN for the certificate with the given alias name in the keystore.

[keystores/issuer-dn](#)

Returns the issuer DN for the certificate with the given alias name in the keystore.

[keystores/expiry-date](#)

Returns the expiry date as a :java.time.LocalDateTime for the certificate with the given alias name in the keystore.

[keystores/expired?](#)

Returns true if the certificate with the given alias name in the keystore has expired else false.

[top](#)

keystores/certificate

(certificate keystore alias)

Returns the certificate (of type `x509Certificate`) with the given alias name from the keystore.

```
(do
  (load-module :keystores)
  (let [ks   (keystores/load (io/file "cert.p12") "12345")
        alias (first (keystores/aliases ks))]
    (keystores/certificate ks alias)))
```

SEE ALSO

Returns the list of aliases defined for the keystore.

[keystores/certificate](#)

Returns the certificate (of type X509Certificate) with the given alias name from the keystore.

[keystores/subject-dn](#)

Returns the subject DN for the certificate with the given alias name in the keystore.

[keystores/issuer-dn](#)

Returns the issuer DN for the certificate with the given alias name in the keystore.

[keystores/expiry-date](#)

Returns the expiry date as a :java.time.LocalDateTime for the certificate with the given alias name in the keystore.

[top](#)

[keystores/expiry-date](#)

(expiry-date keystore alias)

Returns the expiry date as a :java.time.LocalDateTime for the certificate with the given alias name in the keystore.

```
(do
  (load-module :keystores)
  (let [ks   (keystores/load (io/file "cert.p12") "12345")
        alias (first (keystores/aliases ks))]
    (keystores/expiry-date ks alias)))
```

SEE ALSO

[keystores/load](#)

Loads a certificate into a Java KeyStore. Reads it from the input 'in' and returns it as a Java :java.security.KeyStore.

[keystores/aliases](#)

Returns the list of aliases defined for the keystore.

[keystores/certificate](#)

Returns the certificate (of type X509Certificate) with the given alias name from the keystore.

[keystores/subject-dn](#)

Returns the subject DN for the certificate with the given alias name in the keystore.

[keystores/issuer-dn](#)

Returns the issuer DN for the certificate with the given alias name in the keystore.

[keystores/expired?](#)

Returns true if the certificate with the given alias name in the keystore has expired else false.

[top](#)

[keystores/issuer-dn](#)

(issuer-dn keystore alias)

Returns the issuer DN for the certificate with the given alias name in the keystore.

```
(do
  (load-module :keystores)
  (let [ks   (keystores/load (io/file "cert.p12") "12345")
        alias (first (keystores/aliases ks))]
    (keystores/issuer-dn ks alias)))
```

SEE ALSO

[keystores/load](#)

Loads a certificate into a Java KeyStore. Reads it from the input 'in' and returns it as a Java :java.security.KeyStore.

[keystores/aliases](#)

Returns the list of aliases defined for the keystore.

[keystores/certificate](#)

Returns the certificate (of type X509Certificate) with the given alias name from the keystore.

[keystores/subject-dn](#)

Returns the subject DN for the certificate with the given alias name in the keystore.

[keystores/parse-dn](#)

Parses a DN and returns a map with the DN's elements.

[keystores/expiry-date](#)

Returns the expiry date as a :java.time.LocalDateTime for the certificate with the given alias name in the keystore.

[keystores/expired?](#)

Returns true if the certificate with the given alias name in the keystore has expired else false.

[top](#)

[keystores/load](#)

(load in password)

Loads a certificate into a Java `KeyStore`. Reads it from the input 'in' and returns it as a Java `:java.security.KeyStore`.

'in' may be a:

- `bytebuf`
- `java.io.File`, e.g: `(io/file "/temp/foo.json")`
- `java.nio.file.Path`
- `java.io.InputStream`

Note: The caller is responsible for closing the in stream!

```
(do
  (load-module :keystores)
  (keystores/load (io/file "cert.p12") "12345"))
```

SEE ALSO

[keystores/aliases](#)

Returns the list of aliases defined for the keystore.

[keystores/certificate](#)

Returns the certificate (of type X509Certificate) with the given alias name from the keystore.

[keystores/subject-dn](#)

Returns the subject DN for the certificate with the given alias name in the keystore.

[keystores/issuer-dn](#)

Returns the issuer DN for the certificate with the given alias name in the keystore.

[keystores/expiry-date](#)

Returns the expiry date as a :java.time.LocalDateTime for the certificate with the given alias name in the keystore.

[keystores/expired?](#)

Returns true if the certificate with the given alias name in the keystore has expired else false.

keystores/parse-dn

(parse-dn dn)

Parses a DN and returns a map with the DN's elements.

Typical elements of an LDAP distinguished name are:

CN	Common name
O	Organisation
OU	Organisational unit
ST	State or province
OID.2.5.4.17	Zip code
L	Locality name (city)
C	Country

```
(do
  (load-module :keystores)
  (let [ks   (keystores/load (io/file "cert.p12") "12345")
        alias (first (keystores/aliases ks))]
    (-> (keystores/subject-dn ks alias)
         (keystores/parse-dn))))
```

SEE ALSO

keystores/load

Loads a certificate into a Java KeyStore. Reads it from the input 'in' and returns it as a Java :java.security.KeyStore.

keystores/aliases

Returns the list of aliases defined for the keystore.

keystores/certificate

Returns the certificate (of type X509Certificate) with the given alias name from the keystore.

keystores/subject-dn

Returns the subject DN for the certificate with the given alias name in the keystore.

keystores/issuer-dn

Returns the issuer DN for the certificate with the given alias name in the keystore.

keystores/expiry-date

Returns the expiry date as a :java.time.LocalDateTime for the certificate with the given alias name in the keystore.

keystores/expired?

Returns true if the certificate with the given alias name in the keystore has expired else false.

keystores/subject-dn

(subject-dn keystore alias)

Returns the subject DN for the certificate with the given alias name in the keystore.

```
(do
  (load-module :keystores)
```

```
(let [ks (keystores/load (io/file "cert.p12") "12345")
      alias (first (keystores/aliases ks))]
  (keystores/subject-dn ks alias)))
```

SEE ALSO

[keystores/load](#)

Loads a certificate into a Java KeyStore. Reads it from the input 'in' and returns it as a Java :java.security.KeyStore.

Returns the first index of the sequence value that is equal to val or -1 if not found.

[top](#)

lazy-seq

```
(lazy-seq)
(lazy-seq f)
(lazy-seq seed f)
(lazy-seq head tail-lazy-seq)
```

Creates a new lazy sequence.

```
(lazy-seq)
empty lazy sequence
```

```
(lazy-seq f)
(theoretically) infinitely lazy sequence using a repeatedly invoked supplier function for each next value. The supplier function f is a no arg function. The sequence ends if the supplier function returns nil.
```

```
(lazy-seq seed f)
(theoretically) infinitely lazy sequence with a seed value and a supplier function to calculate the next value based on the previous. f is a single arg function. The sequence ends if the supplier function returns nil.
```

```
(lazy-seq head tail-lazy-seq)
Constructs a lazy sequence of a head element and a lazy sequence tail supplier.
```

```
; empty lazy sequence
(-> (lazy-seq)
     (doall))
=> ()
```

```
; lazy sequence with a supplier function producing random longs
(-> (lazy-seq rand-long)
     (take 4)
     (doall))
=> (1301209950736227765 2564484952689213664 5971994748823681768 8835595807824559355)
```

```
; lazy sequence with a constant value
(-> (lazy-seq (constantly 5))
     (take 4)
     (doall))
=> (5 5 5 5)
```

```
; lazy sequence with a seed value and a supplier function
; producing of all positive numbers (1, 2, 3, 4, ...)
(-> (lazy-seq 1 inc)
     (take 10)
     (doall))
=> (1 2 3 4 5 6 7 8 9 10)
```

```
; producing of all positive even numbers (2, 4, 6, ...)
(-> (lazy-seq 2 #(+ % 2))
```

```

(take 10)
(doall))
=> (2 4 6 8 10 12 14 16 18 20)

; lazy sequence as value producing function
(interleave [:a :b :c] (lazy-seq 1 inc))
=> (:a 1 :b 2 :c 3)

; lazy sequence with a mapping
(-> (lazy-seq 1 (fn [x] (do (println "realized" x)
                               (inc x))))
      (take 10)
      (map #(* 10 %))
      (take 2)
      (doall)))
realized 1
=> (10 20)

; finite lazy sequence from a vector
(-> (lazy-seq [1 2 3 4])
      (doall))
=> (1 2 3 4)

; finite lazy sequence with a supplier function that
; returns nil to terminate the sequence
(do
  (def counter (atom 5))
  (defn generate []
    (swap! counter dec)
    (if (pos? @counter) @counter nil))
  (doall (lazy-seq generate)))
=> (4 3 2 1)

; lazy sequence from a head element and a tail lazy
; sequence
(-> (cons -1 (lazy-seq 0 #(+ % 1)))
      (take 5)
      (doall))
=> (-1 0 1 2 3)

; lazy sequence from a head element and a tail lazy
; sequence
(-> (lazy-seq -1 (lazy-seq 0 #(+ % 1)))
      (take 5)
      (doall))
=> (-1 0 1 2 3)

; lazy sequence show its power to generate the Fibonacci sequence
(do
  (def fib (map first (lazy-seq [0N 1N] (fn [[a b]] [b (+ a b)]))))
  (doall (take 10 fib)))
=> (0N 1N 1N 2N 3N 5N 8N 13N 21N 34N)

```

SEE ALSO

[doall](#)

When lazy sequences are produced doall can be used to force any effects and realize the lazy sequence. Returns the realized items in a list!

[lazy-seq?](#)

Returns true if obj is a lazyseq

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

cycle

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

repeat

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[top](#)

lazy-seq?

```
(lazy-seq? obj)
```

Returns true if obj is a lazyseq

```
(lazy-seq? (lazy-seq rand-long))  
=> true
```

SEE ALSO

lazy-seq

Creates a new lazy sequence.

[top](#)

let

```
(let [bindings*] exprs*)
```

Evaluates the expressions and binds the values to symbols in the new local context.

```
(let [x 1] x)  
=> 1  
  
(let [x 1  
      y 2]  
  (+ x y))  
=> 3  
  
;; Destructured list  
(let [[x y] '(1 2)]  
  (printf "x: %d, y: %d%n" x y))  
x: 1, y: 2  
=> nil  
  
;; Destructured map  
(let [{:keys [width height title] :or {width 640 height 500} :as styles}  
      {:width 1000 :title "Title"}]  
  (println "width: " width)  
  (println "height: " height)  
  (println "title: " title)  
  (println "styles: " styles))  
width: 1000
```

```
height: 500
title: Title
styles: {:width 1000 :title Title}
=> nil
```

SEE ALSO

[letfn](#)

Takes a vector of function specs and a body, and generates a set of bindings of functions to their names. All of the names are available ...

[if-let](#)

bindings is a vector with 2 elements: binding-form test.

[when-let](#)

bindings is a vector with 2 elements: binding-form test.

[binding](#)

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

[top](#)

[letfn](#)

```
(letfn [fnspec*] exprs*)
```

Takes a vector of function specs and a body, and generates a set of bindings of functions to their names. All of the names are available in all of the definitions of the functions, as well as the body.

fnspec ==> (fname [params*] exprs) or (fname ([params*] exprs)+)

```
(letfn [(foo [] "abc")] (foo))
```

is equivalent to

```
(let [foo (fn [] "abc")] (foo))
```

```
(letfn [(foo [] "abc")
        (bar [] (str (foo) "def"))]
  (bar))
=> "abcdef"
```

SEE ALSO

[let](#)

Evaluates the expressions and binds the values to symbols in the new local context.

[top](#)

[license](#)

```
(license)
```

Returns the Venice license text.

```
(println (license))
```

[top](#)

license-all

```
(license-all)
```

Returns the Venice license text with all 3rd party licenses.

```
(println (license-all))
```

top

list

```
(list & items)
```

Creates a new list containing the items.

```
(list)
```

```
=> ()
```

```
(list 1 2 3)
```

```
=> (1 2 3)
```

```
(list 1 2 3 [:a :b])

list*

```
(list* args)
```

```
(list* a args)
```

```
(list* a b args)
```

```
(list* a b c args)
```

```
(list* a b c d & more)
```

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

```
(list* 1 '(2 3))
```

```
=> (1 2 3)
```

```
(list* 1 2 3 [4])
```

```
=> (1 2 3 4)
```

```
(list* 1 2 3 '(4 5))
```

```
=> (1 2 3 4 5)
```

```
(list* '(1 2) 3 [4])
```

```
=> ((1 2) 3 4)
```

```
(list* nil)
```

```
=> nil
```

```
(list* nil [2 3])
```

```
=> (nil 2 3)
```

```
(list* 1 2 nil)
```

```
=> (1 2)
```

SEE ALSO

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[vector*](#)

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

list-comp

```
(list-comp seq-exprs body-expr)
```

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and yields a collection of evaluations of expr.

Supported modifiers are: :when predicate

List comprehensions are used when multiple lists have to be processed down to a single list and some filtering has to be applied.

Please use the `for` list comprehension instead.

```
(list-comp [x (range 10)] x)
=> (0 1 2 3 4 5 6 7 8 9)
```

```
(list-comp [x (range 5)] (* x 2))
=> (0 2 4 6 8)
```

```
(list-comp [x (range 10) :when (odd? x)] x)
=> (1 3 5 7 9)
```

```
(list-comp [x (range 10) :when (odd? x)] (* x 2))
=> (2 6 10 14 18)
```

```
(list-comp [x [1 2 3 4] :when (odd? x)
           y [1 2 3 4] :when (even? y)]
           [x y])
=> ([1 2] [1 4] [3 2] [3 4])
```

SEE ALSO

[for](#)

List comprehension. Takes a vector of one or more binding-form/collection-expr pairs, each followed by zero or more modifiers, and ...

[mapcat](#)

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

[doseq](#)

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

dotimes

Repeatedly executes body with name bound to integers from 0 through n-1.

top

list?

```
(list? obj)
```

Returns true if obj is a list

```
(list? (list 1 2))  
=> true
```

```
(list? '(1 2))  
=> true
```

top

load-classpath-file

```
(load-classpath-file f)  
(load-classpath-file f force)  
(load-classpath-file f nsalias)  
(load-classpath-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the classpath file. The function is restricted to classpath files with the extension '.venice'.

Returns a tuple with the file's name and the keyword `:loaded` if the file has been successfully loaded or `:already-loaded` if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

Loaded files are cached by Venice and subsequent loads are just skipped. To enforce a reload call the file load with the force flag set to true:

```
(load-classpath-file "com/github/jlangch/venice/test.venice" true)
```

An optional namespace alias can passed: `(load-classpath-file "com/github/jlangch/venice/test.venice" ['test :as 't])`

`load-classpath-file` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(do  
  (load-classpath-file "com/github/jlangch/venice/test-support.venice")  
  (test-support/test-fn "hello"))  
=> "test: hello"  
  
(do  
  (load-classpath-file "com/github/jlangch/venice/test-support.venice")  
  (test-support/test-fn "hello"))  
  ; reload the classpath file  
  (ns-remove 'test-support)  
  (load-classpath-file "com/github/jlangch/venice/test-support.venice" true)  
  (test-support/test-fn "hello"))  
=> "test: hello"
```

```
;; namespace aliases
(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice" ['test-support :as 't])
  (t/test-fn "hello"))
=> "test: hello"
```

SEE ALSO

[load-file](#)

Sequentially read and evaluate the set of forms contained in the file.

[load-string](#)

Sequentially read and evaluate the set of forms contained in the string.

[load-module](#)

Loads a Venice predefined extension module.

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[top](#)

[load-file](#)

```
(load-file f)
(load-file f force)
(load-file f nsalias)
(load-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the file.

If the file is found on one of the defined load paths it is read and the forms it contains are evaluated. If the file is not found an exception is raised.

Returns a tuple with the file's name and the keyword `:loaded` if the file has been successfully loaded or `:already-loaded` if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

The function is restricted to load files with the extension '.venice'. If the file extension is missing '.venice' will be implicitly added.

An optional namespace alias can passed: `(load-file "coffee.venice" ['coffee :as 'c])`

`load-file` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
;; With load-paths: [/users/foo/scripts]
;;           -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee")

;; With load-paths: [/users/foo/scripts]
;;           -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee.venice")

;; With load-paths: [/users/foo/scripts]
;;           -> loads: /users/foo/scripts/beverages/coffee.venice
(load-file "beverages/coffee")

;; With load-paths: [/users/foo/resources.zip]
;;           -> loads: /users/foo/resources.zip!beverages/coffee.venice
(load-file "beverages/coffee")
```

[top](#)

load-module

```
(load-module m)
(load-module m force)
(load-module m nsalias)
(load-module m force nsalias)
```

Loads a Venice predefined extension module.

Returns a tuple with the module's name and the keyword `:loaded` if the module has been successfully loaded or `:already-loaded` if the module has been already loaded. Throws an exception on any loading error.

With 'force' set to `false` (the default) the module is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to `true` it is always loaded and interpreted.

Loaded modules are cached by Venice and subsequent loads are just skipped. To enforce a reload call the module load with the force flag set to true: `(load-module :hexdump true)`

An optional namespace alias can passed: `(load-module :hexdump ['hexdump :as 'h])`

`load-module` supports load paths. See the `loadpath/paths` doc for a description of the *load path* feature.

```
(load-module :trace)
```

```
;; loading the :trace modul and define a ns alias 't for namespace
;; 'trace used in the module
(load-module :trace ['trace :as 't])
```

```
;; reloading a module
(do
  (load-module :trace)
  ; reload the module
  (ns-remove 'trace)
  (load-module :trace true))
```

```
;; namespace aliases
(do
  (load-module :hexdump ['hexdump :as 'h])
  (h/dump (range 32 64)))
```

```
;; dynamically load a module
(let [mname (keyword "hexdump")]
  (load-module mname))
```

SEE ALSO

Returns the names of the loaded modules.

SEE ALSO

[load-module](#)

Loads a Venice predefined extension module.

[top](#)

loadpath/normalize

```
(loadpath/normalize f)
```

Normalize a relative file regarding the load paths.

With the load paths: `["/Users/foo/img.png", "/Users/foo/resources"]`

- `(loadpath/normalize "img.png") -> "/Users/foo/img.png"`
- `(loadpath/normalize "test.json") -> "/Users/foo/resources/test.json"`
- `(loadpath/normalize "/tmp/data.json") -> "/tmp/data.json"`

SEE ALSO

[loadpath/paths](#)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

[loadpath/unrestricted?](#)

Returns true if the load paths are unrestricted.

[top](#)

loadpath/paths

```
(loadpath/paths)
```

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the application level. They are passed as part of the sandbox to theVenice evaluator.

The functions that support load paths try sequentially every load path to access files. If a load path is a ZIP file, files can be read from within that ZIP file.

Example:

```
/Users/foo/demo
|
+--- resources.zip
|
+--- /data
    |
    +--- config.json
    |
    +--- /scripts
        |
        +--- script1.venice
```

With a load path configuration of `["/Users/foo/demo/resources.zip", "/Users/foo/demo/data"]`

- `(io/slurp "config.json") -> slurps /Users/foo/demo/data/config.json`
- `(io/slurp "scripts/script1.venice") -> slurps /Users/foo/demo/data/scripts/script1.venice`
- `(io/slurp "img1.png") -> slurps /Users/foo/demo/resources.zip!img1.png`

I/O functions with support for load paths:

- `load-file`
- `io/slurp`
- `io/slurp-lines`
- `io/spit`

- `io/file-in-stream`
- `io/file-out-stream`
- `io/delete-file`

To enforce a Venice script to read/write files on the load paths only:

- Define a custom sandbox
- Disable all I/O functions
- Enable the I/O functions that support load paths

SEE ALSO

[loadpath/normalize](#)

Normalize a relative file regarding the load paths.

[top](#)

[lock](#)

(`lock`)

Creates a new lock object.

The lock object implements the Java `AutoClosable` interface thus it can be used with try-with-resources.

```
(let [l (lock)]
  (acquire l)
  ;; do something
  (release l))
=> nil

(let [l (lock)]
  (try-with [l (acquire l)]
  ;; do something
```

```
)  
=> nil
```

SEE ALSO

[acquire](#)

Acquires a lock, blocking until the lock is available.

[try-acquire](#)

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

[release](#)

Releases a lock.

[locked?](#)

Returns true if the lock is in use else false.

[lock?](#)

Returns true if o is a lock object else false.

[top](#)

lock?

```
(lock? o)
```

Returns `true` if o is a lock object else `false`.

```
(let [l (lock)]  
  (lock? l))  
=> true
```

SEE ALSO

[acquire](#)

Acquires a lock, blocking until the lock is available.

  ;; create the console logger with a custom formatter
  (logger/console-logger custom-formatter)

  ;; get the :console logger
  (def log (logger/logger :console))

  ;; log some messages
```

```
(log :info "test message")
(log :info "kermit" "test message")
(log :info "kermit" "test message" (ex :VncException "test exception")))
```

SEE ALSO

[logger/logger](#)

Returns the logger with the specified ID.

[logger/file-logger](#)

Create a file logger. The logger is identified by its ID.

[logger/format-level](#)

Formats a log level. The 'level' must be a keyword!

[logger/format-ex](#)

Formats an exception. The exception may be a Venice exception or a Java exception.

[top](#)

[logger/enable-auto-start-rotation-scheduler](#)

```
(enable-auto-start-rotation-scheduler activate)
```

Enable or disable the auto starting of the rotation scheduler. Default is deactivated.

If enabled, the scheduler starts when the first rotating file logger is created. As long as no rotating file logger exists, the scheduler remains inactive to conserve resources.

```
(do
  (load-module :logger)

  ;; disable auto start (auto start is enabled by default)
  (logger/enable-auto-start-rotation-scheduler false)

  (logger/file-logger :venice "/logs/venice.log"
    :rotate-mode :daily
    :rotate-dir "/logs/archive")

  (def log (logger/logger :venice))

  (log :info "test message 1")
  (log :info "test message 2"))
```

SEE ALSO

[logger/rotation-scheduler-running?](#)

Returns true if a rotation scheduler is running else false.

[logger/start-rotation-scheduler](#)

Manually start the rotation scheduler.

[logger/rotate](#)

Manually rotates the log file of the logger with the ID 'id' if the logger has file rotation enabled.

[logger/rotate-all](#)

Manually rotates the log files of all loggers that have file rotation enabled.

[logger/requires-rotation?](#)

Returns true if there is at least one logger that has log file rotation enabled.

[top](#)

logger/file-logger

```
(file-logger id file & options)
```

Create a file logger. The logger is identified by it's ID.

Arguments:

id The mandatory logger ID. ID's are of type keyword like `:venice`.

file The mandatory file to log to. The parent dir must exist!

Options:

`:max-size n` The max size of the file in bytes. If the size is reached, the file will be truncated at a line boundary to the given max size.
Defaults to `-1` meaning there is no limit in size.

The max size can be specified as a number like `20000` or a number with a unit like `:20KB`, `:20MB`, or `:2GB`

`:formatter f` A custom formatter. Defaults to `nil` to activate the default formatter

`:rotate-mode k` A file rotation mode {`:none`, `:daily`, `:monthly`}. Defaults to `:none`
Name convention for rotated files:

daily: `venice.log` `venice-{yyyy.mm.dd}.log`

monthly: `venice.log` `venice-{yyyy.mm}.log`

`:rotate-dir f` The file rotation directory. The directory must be specified and must exist if the rotate mode is `:daily` or `:monthly`. `nil` is passed for mode `:none`

```
(do
  (load-module :logger)

  ;; create the file loggers
  (logger/file-logger :venice "/data/logs/venice.log")
  (logger/file-logger :database "/data/logs/database.log" :max-size :20MB)

  ;; get the loggers

```

SEE ALSO

[logger/logger](#)

Returns the logger with the specified ID.

[logger/console-logger](#)

Create a console logger with either the default log message formatter or a custom formatter.

[logger/format-level](#)

Formats a log level. The 'level' must be a keyword!

[logger/format-ex](#)

Formats an exception. The exception may be a Venice exception or a Java exception.

[top](#)

[logger/format-level](#)

(format-level level)

Formats a log level. The 'level' must be a keyword!

```

(do
  (load-module :logger)

```

```

  (logger/format-level :info)
  (logger/format-level :warn))

```

[top](#)

[logger/level](#)

```
(level id)
(level id new-level)
```

Returns or sets the log level of logger with the specified ID.

Level is one of `:debug`, `:info`, `:warn`, `:error`, or `:fatal`

```
(do
  (load-module :logger)

  (println (logger/level :console)) ;; get log level

  (logger/level :console :warn) ;; set log level

  (println (logger/level :console))) ;; get log level
```

SEE ALSO

[logger/level-all](#)

Sets the log level of all registered loggers.

[top](#)

logger/level-all

```
(level-all new-level)
```

Sets the log level of all registered loggers.

Level is one of `:debug`, `:info`, `:warn`, `:error`, or `:fatal`

```
(do
  (load-module :logger)

  (println (logger/level :console)) ;; get log level

  (logger/level-all :warn) ;; set log level

  (println (logger/level :console))) ;; get log level
```

SEE ALSO

[logger/level](#)

Returns or sets the log level of logger with the specified ID.

[top](#)

logger/logger

```
(logger id)
```

Returns the logger with the specified ID.

The returned logger is a function with 1, 2, 3, and 4 arguments to log messages.

1-arg log fn: `(fn [msg] ...)` (logs at `:info` level)

2-arg log fn: `(fn [level msg] ...)`

```
3-arg log fn: (fn [level principal msg] ...)
4-arg log fn: (fn [level principal msg exc] ...)

The logger supports the levels :debug, :info, :warn, :error, and :fatal

If there is no logger with the specified id returns the default :console logger.
```

```
(do
  (load-module :logger)

  ;; create a file logger
  (logger/file-logger :venice "/data/logs/venice.log")

  ;; get the logger
  (def log (logger/logger :venice))

Enable or disable the auto starting of the rotation scheduler. Default is deactivated.

[logger/start-rotation-scheduler](#)

Manually start the rotation scheduler.

[logger/rotate](#)

Manually rotates the log file of the logger with the ID 'id' if the logger has file rotation enabled.

[logger/requires-rotation?](#)

Returns true if there is at least one logger that has log file rotation enabled.

top

logger/rotation-scheduler-running?

```
(rotation-scheduler-running?)
```

Returns `true` if a rotation scheduler is running else `false`.

The scheduler is started when the first file logger with enabled file rotation is created!

```
(do
  (load-module :logger)

  (logger/file-logger :venice "/logs/venice.log"
    :rotate-mode :daily
    :rotate-dir "/logs/archive")
```

```
;; check after creation of the first file logger with file rotation
(logger/rotation-scheduler-running?))
```

SEE ALSO

[logger/enable-auto-start-rotation-scheduler](#)

Enable or disable the auto starting of the rotation scheduler. Default is deactivated.

[logger/start-rotation-scheduler](#)

Manually start the rotation scheduler.

[logger/rotate](#)

Manually rotates the log file of the logger with the ID 'id' if the logger has file rotation enabled.

[logger/rotate-all](#)

Manually rotates the log files of all loggers that have file rotation enabled.

[logger/requires-rotation?](#)

Returns true if there is at least one logger that has log file rotation enabled.

[top](#)

logger/start-rotation-scheduler

(start-rotation-scheduler)

Manually start the rotation scheduler.

Note: Consider to use `(logger/enable-auto-start-rotation-scheduler true)` instead of manually starting the scheduler.

```
(do
  (load-module :logger)

  ;; disable auto start (auto start is enabled by default)
  (logger/enable-auto-start-rotation-scheduler false)

  ;; start the scheduler manually
  (logger/start-rotation-scheduler)

  (logger/file-logger :venice "/logs/venice.log"
    :rotate-mode :daily
    :rotate-dir "/logs/archive")

  (def log (logger/logger :venice))

  (log :info "test message 1")
  (log :info "test message 2"))
```

SEE ALSO

[logger/rotation-scheduler-running?](#)

Returns true if a rotation scheduler is running else false.

[logger/enable-auto-start-rotation-scheduler](#)

Enable or disable the auto starting of the rotation scheduler. Default is deactivated.

[logger/rotate](#)

Manually rotates the log file of the logger with the ID 'id' if the logger has file rotation enabled.

[logger/rotate-all](#)

Manually rotates the log files of all loggers that have file rotation enabled.

[logger/requires-rotation?](#)

Returns true if there is at least one logger that has log file rotation enabled.

[top](#)

[logo](#)

`(logo)`

Returns the Venice logo, a map with the keys `:name`, `:mimetype`, and `:data`

`(logo)`

```
(let [l (logo)]
  (io/spit (io/file (:name l)) (:data l)))
```

[top](#)

[long](#)

`(long x)`

Converts to long

```
(long 1)
=> 1
```

```
(long nil)
=> 0
```

```
(long false)
=> 0
```

```
(long true)
=> 1
```

```
(long 1.2F)
=> 1
```

```
(long 1.2)
=> 1
```

```
(long 1.2M)
=> 1
```

```
(long "1")
=> 1
```

```
(long (char "A"))
=> 65
```

[top](#)

long-array

```
(long-array coll)
(long-array len)
(long-array len init-val)
```

Returns an array of Java primitive longs containing the contents of coll or returns an array with the given length and optional init value.

To create an array of :java.lang.Long use:

```
(make-array :java.lang.Long 3)
```

```
(long-array '(1 2 3))
=> [1, 2, 3]
```

```
(long-array '(1I 2 3.2 3.56M))
=> [1, 2, 3, 3]
```

```
(long-array 10)
=> [0, 0, 0, 0, 0, 0, 0, 0, 0, 0]
```

```
(long-array 10 42)
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

SEE ALSO

[java-long-list](#)

Converts a Venice list/vector to a Java Long list

[top](#)

long?

```
(long? n)
```

Returns true if n is a long

```
(long? 4)
=> true
```

```
(long? 4I)
=> false
```

```
(long? 3.1)
=> false
```

```
(long? true)
=> false
```

```
(long? nil)
=> false
```

```
(long? {})
=> false
```

loop

```
(loop [bindings*] exprs*)
```

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

```
;; tail recursion
(loop [x 1] ; <-+ loop
  (when (< x 4) ;   |
    (println x) ;   |
    (recur (inc x)))) ; --+
1

      (when (< y 3) ;   |   |
        (println [x y]) ;   |   |
        (recur (inc y)))) ; --+   |
      (recur (inc x)))) ; -----+
[1 1]
[1 2]
[2 1]
[2 2]
[3 1]
[3 2]
=> nil

;; tail recursion
(do
  (defn sum [n]
    (loop [cnt n acc 0]
      (if (zero? cnt)
          acc
          (recur (dec cnt) (+ acc cnt)))))

  (sum 10000))
=> 50005000
```

SEE ALSO

[recur](#)

Evaluates the exprs and rebinds the bindings of the recursion point to the values of the exprs. The recur expression must be at the ...

macro?

```
(macro? x)
```

Returns true if x is a macro

```
(macro? and)
=> true
```

top

macroexpand

```
(macroexpand form)
```

If form represents a macro form, returns its expansion, else returns form.

To recursively expand all macros in a form use `(macroexpand-all form)`.

```
(macroexpand '(-> c (+ 3) (* 2)))
=> (* (+ c 3) 2)
```

SEE ALSO

[defmacro](#)

Macro definition

[macroexpand-all](#)

Recursively expands all macros in the form.

top

macroexpand-all

```
(macroexpand-all form)
```

Recursively expands all macros in the form.

```
(macroexpand-all '(and true true))
=> (let [cond_29291__auto true] (if cond_29291__auto true cond_29291__auto))
```

```
(macroexpand-all '(and true (or true false) true))
=> (let [cond_29319__auto true] (if cond_29319__auto (let [cond_29319__auto (let [cond_29320__auto true]
(if cond_29320__auto cond_29320__auto false))] (if cond_29319__auto true cond_29319__auto))
cond_29319__auto))
```

```
(macroexpand-all '(let [n 5] (cond (< n 0) -1 (> n 0) 1 :else 0)))
=> (let [n 5] (if (< n 0) -1 (if (> n 0) 1 (if :else 0 nil))))
```

SEE ALSO

[macroexpand](#)

If form represents a macro form, returns its expansion, else returns form.

[defmacro](#)

Macro definition

top

macroexpand-on-load?

```
(macroexpand-on-load?)
```

Returns true if `macroexpand-on-load` feature is enabled else false.

The activation of `macroexpand-on-load` (upfront macro expansion) results in 3x to 15x better performance. Upfront macro expansion can be activated through the `!macroexpand` command in the REPL.

```
(macroexpand-on-load?)
```

```
=> false
```

[top](#)

make-array

```
(make-array type len)
(make-array type dim &more-dims)
```

Returns an array of the given type and length

```
(str (make-array :long 5))
=> "[0, 0, 0, 0, 0]"
```

```
(str (make-array :java.lang.Long 5))
=> "[nil, nil, nil, nil, nil]"
```

```
(str (make-array :long 2 3))
=> "[[0 0 0], [0 0 0]]"
```

```
(aset (make-array :java.lang.Long 5) 3 9999)
=> [nil, nil, nil, 9999, nil]
```

[top](#)

map

```
(map f coll colls*)
```

Applies `f` to the set of first items of each `coll`, followed by applying `f` to the set of second items in each `coll`, until any one of the `colls` is exhausted. Any remaining items in other `colls` are ignored.

Returns a transducer when no collection is provided.

Note: if Java collections are used the mapper converts all mapped items back to Java data types to keep Java compatibility as much as possible! To avoid this just convert the Java collection to a Venice collection. E.g.: `(into [] ...)`.

```
(map inc [1 2 3 4])
=> (2 3 4 5)
```

```
(map + [1 2 3 4] [10 20 30 40])
=> (11 22 33 44)
```

```
(map list '(1 2 3 4) '(10 20 30 40))
=> ((1 10) (2 20) (3 30) (4 40))
```

```
(map vector (lazy-seq 1 inc) [10 20 30 40])
=> ([1 10] [2 20] [3 30] [4 40])
```

```

(map (fn [[k v]] [k v]) {:a 1 :b 2})
=> [:a 1] [:b 2]

(map (fn [e] [(key e) (inc (val e))]) {:a 1 :b 2})
=> [:a 2] [:b 3]

(map inc #{1 2 3})
=> (2 3 4)

;; Venice enforces Java types when using java collections instead
;; of Venice collections!
;; -> The returned element type is a 'java.util.ArrayList'
;;     and not a 'core/vector'
(-> (doto (. :java.util.ArrayList :new) (. :add 1) (. :add 2))
  (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
  (first)
  (type))
=> :java.util.ArrayList

;; Same example with a Venice collection!
;; -> The returned element type is a 'core/vector'
(-> [1 2]
  (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
  (first)
  (type))
=> :core/vector

```

SEE ALSO

[filter](#)

Returns a collection of the items in coll for which (predicate item) returns logical true.

Returns the map with the vals mapped to the keys.

```
(map-invert {:a 1 :b 2 :c 3})
=> {1 :a 2 :b 3 :c}
```

[top](#)

map-keys

```
(map-keys f m)
```

Applies function f to the keys of the map m.

```
(map-keys name {:a 1 :b 2 :c 3})
=> {"a" 1 "b" 2 "c" 3}
```

SEE ALSO

[map-vals](#)

Applies function f to the values of the map m.

[map-invert](#)

Returns the map with the vals mapped to the keys.

[top](#)

mapVals

```
(map-vals f m)
```

Applies function f to the values of the map m.

```
(map-vals inc {:a 1 :b 2 :c 3})  
=> {:a 2 :b 3 :c 4}  
  
(map-vals :len {:a {:col 1 :len 10} :b {:col 2 :len 20} :c {:col 3 :len 30}})  
=> {:a 10 :b 20 :c 30}
```

SEE ALSO

[map-keys](#)

Applies function f to the keys of the map m.

[map-invert](#)

Returns the map with the vals mapped to the keys.

[top](#)

map?

```
(map? obj)
```

Returns true if obj is a map

```
(map? {:a 1 :b 2})  
=> true
```

[top](#)

mapcat

```
(mapcat fn & colls)
```

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

```
(mapcat identity [[1 2 3] [4 5 6] [7 8 9]])  
=> (1 2 3 4 5 6 7 8 9)  
  
(mapcat identity [[1 2 [3 4]] [5 6 [7 8]]])  
=> (1 2 [3 4] 5 6 [7 8])  
  
(mapcat reverse [[3 2 1] [6 5 4] [9 8 7]])  
=> (1 2 3 4 5 6 7 8 9)  
  
(mapcat list [:a :b :c] [1 2 3])  
=> (:a 1 :b 2 :c 3)  
  
(mapcat #(remove even? %) [[1 2] [2 2] [2 3]])  
=> (1 3)  
  
(mapcat #(repeat 2 %) [1 2])  
=> (1 1 2 2)  
  
(mapcat (fn [& x] [(apply + x)]) [10 11 12] [1 2 3])  
=> (11 13 15)
```

```
(mapcat (juxt inc dec) [1 2 3 4])
=> (2 0 3 1 4 2 5 3)

;; Turn a frequency map back into a coll.
(mapcat (fn [[x n]] (repeat n x)) {:a 2 :b 1 :c 3})
=> (:a :a :b :c :c :c)
```

SEE ALSO

map

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

flatten

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. (flatten ...)

[top](#)

mapv

```
(mapv f coll colls*)
```

Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the colls is exhausted. Any remaining items in other colls are ignored.

```
(mapv inc [1 2 3 4])
=> [2 3 4 5]
```

```
(mapv + [1 2 3 4] [10 20 30 40])
=> [11 22 33 44]
```

```
(mapv vector [1 2 3 4] [10 20 30 40])
=> [[1 10] [2 20] [3 30] [4 40]]
```

SEE ALSO

docoll

Applies f to the items of the collection presumably for side effects. Returns nil.

[top](#)

match?

```
(match? s regex)
```

Returns true if the string s matches the regular expression regex.

The argument 'regex' may be a string representing a regular expression or a :java.util.regex.Pattern.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. `regex/matches?` performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"[0-9]+" "")]
  (filter #(regex/matches? m %) ["100" "1a1" "200"]))
```

```
(match? "1234" "[0-9]+")
=> true
```

```
(match? "1234ss" "[0-9]+")
```

```
=> false
```

```
(match? "1234" #"[0-9]+")
```

```
=> true
```

SEE ALSO

[not-match?](#)

Returns true if the string s does not match the regular expression regex.

[regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

[regex/matches-not?](#)

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

[regex/pattern](#)

Returns an instance of java.util.regex.Pattern.

[regex/matcher](#)

Returns an instance of java.util.regex.Matcher.

[regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

[regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

maven/dependencies

(maven/dependencies artifacts & options)

Returns the dependency tree of an artifact

Relies on the environment variable `MAVEN_HOME` to access Maven.

Options:

<code>:scope s</code>	A scope. <code>:compile</code> , <code>:provided</code> , <code>:runtime</code> , <code>:test</code> . Defaults to <code>:compile</code>
<code>:verbose v</code>	if true invokes for verbose output else standard output. Defaults to false
<code>:excludes e</code>	A list of excluded dependencies
<code>:format f</code>	An output format. <code>:raw</code> , <code>:tree</code> , or <code>:list</code> . Defaults to <code>:tree</code>
<code>:print p</code>	If true prints the data else returns the data. Defaults to true.
<code>:print-pom p</code>	If true print the generated pom for debugging purposes. Defaults to false.
<code>:managed-dependencies d</code>	An optional list of managed dependencies (artifacts). See example 2.

The scope is one of:

- `:compile` - build, test and run
- `:provided` - build and test
- `:runtime` - test and run
- `:test` - compile and test

Excludes dependencies with the group ids (except for `:test` scope):

- `org.junit.*`
- `org.opentest4j`
- `org.apiguardian`
- `junit`

Example 1:

```
(maven/dependencies [ "org.knowm.xchart:xchart:3.8.6" ])  
  
org.knowm.xchart:xchart:jar:3.8.6:compile  
+- de.erichseifert.vectorgraphics2d:VectorGraphics2D:jar:0.13:compile  
+- de.rototor.pdfbox:graphics2d:jar:3.0.0:compile  
|   \- org.apache.pdfbox:pdfbox:jar:3.0.0:compile  
|     +- org.apache.pdfbox:pdfbox-io:jar:3.0.0:compile  
|     +- org.apache.pdfbox:fontbox:jar:3.0.0:compile  
|       \- commons-logging:commons-logging:jar:1.2:compile  
+- com.madgag:animated-gif-lib:jar:1.4:compile
```

Example 2:

lock down a transitive dependency to a specific version using Maven managed dependencies

```
(maven/dependencies ["org.knowm.xchart:xchart:3.8.6"]  
                  :managed-dependencies ["org.apache.pdfbox:pdfbox:2.0.27"])  
  
org.knowm.xchart:xchart:jar:3.8.6::compile  
+- de.erichseifert.vectorgraphics2d:VectorGraphics2D:jar:0.13:runtime  
+- de.rototor.pdfbox:graphics2d:jar:3.0.0:runtime  
|   \- org.apache.pdfbox:pdfbox:jar:2.0.27:runtime  
|     +- org.apache.pdfbox:fontbox:jar:2.0.27:runtime
```

```

|   \- commons-logging:commons-logging:jar:1.2:runtime
\- com.madgag:animated-gif-lib:jar:1.4:runtime

top

maven/download

```
(maven/download artifact options*)
```

Downloads an artifact in the format 'group-id:artifact-id:version' from a Maven repository. Can download any combination of the jar, sources, or pom artifacts to a directory.

Accepts a sequence of artifacts as well.

Options:

:jar {true,false}	download the jar, defaults to true
:sources {true,false}	download the sources, defaults to false
:pom {true,false}	download the pom, defaults to false
:dir path	download dir, defaults to "."
:repo maven-repo	a maven repo, defaults to "https://repo1.maven.org/maven2"
:silent {true,false}	if silent is true does not show a progress bar, defaults to true
:force {true,false}	if force is true download the artifact even if it exist already on the download dir, else skip the download if it exists. Defaults to true.

```

(do
  (load-module :maven)
  (maven/download "org.knowm.xchart:xchart:3.8.6"))

(do
  (load-module :maven)
  (maven/download "org.knowm.xchart:xchart:3.8.6"
    :sources true
    :pom true))

(do
  (load-module :maven)
  (maven/download "org.knowm.xchart:xchart:3.8.6"
    :dir "."
    :jar false
    :sources true))

```

```

(do
  (load-module :maven)
  (maven/download "org.knowm.xchart:xchart:3.8.6"
    :dir "."
    :sources true))

(do
  (load-module :maven)
  (maven/download "org.knowm.xchart:xchart:3.8.6"
    :dir "."
    :sources true
    :repo "https://repo1.maven.org/maven2"))

(do

  (maven/download "org.knowm.xchart:xchart:3.8.6"
    :dir "."
    :silent false))

(do
  (load-module :maven)
  ;; download all langchain4j artifacts
  (maven/download (maven/dependencies
    [ "dev.langchain4j:langchain4j:0.28.0" ]
    :format :list
    :scope :runtime
    :print false)
    :dir "."
    :silent false))

```

SEE ALSO

[maven/get](#)

Downloads artifact in the format 'group-id:artifact-id:version' from a Maven repository. The artifact type 'type' is one of {:jar, ...}

[maven/parse-artifact](#)

Parses a Maven artifact

[top](#)

[maven/get](#)

```
(maven/get artifact type options*)
```

Downloads artifact in the format 'group-id:artifact-id:version' from a Maven repository. The artifact type 'type' is one of {:jar, :sources, :pom}.

Returns the artifact as byte buffer.

Options:

:repo maven-repo	a maven repo, defaults to "https://repo1.maven.org/maven2"
:silent {true,false}	if silent is true does not show a progress bar, defaults to true

```

(do
  (load-module :maven)
  (maven/get "org.knowm.xchart:xchart:3.8.6" :jar))

```

```

(do
  (load-module :maven)
  (maven/get "org.knowm.xchart:xchart:3.8.6" :jar :silent false))

```

```
(do

```

SEE ALSO

[maven/download](#)

Downloads an artifact in the format 'group-id:artifact-id:version' from a Maven repository. Can download any combination of the jar, ...

[maven/parse-artifact](#)

Parses a Maven artifact

[top](#)

maven/home-dir

```
(maven/home-dir)
```

Returns the Apache Maven home directory or nil if Maven is not installed.

If a REPL is active checks first for local Apache Maven installation in the REPL, if none is available checks the environment variable 'MAVEN_HOME'.

If a REPL is not active checks the environment variable 'MAVEN_HOME'.

```
(do
  (load-module :maven)
  (maven/home-dir))
```

SEE ALSO

[maven/mvn](#)

Runs a Maven command

[maven/version](#)

Runs the Maven version command and prints the commands output.

[top](#)

maven/install

```
(maven/install)
(maven/install version)
```

Installs Apache Maven to {repl-home-dir}/tools/apache-maven-x.y.z

Installation is possible from within a REPL only!

Manually download Maven:

```
curl https://archive.apache.org/dist/maven/maven-3/3.9.6/binaries/apache-maven-3.9.6-bin.zip
--output /Users/juerg/Desktop/apache-maven-3.9.6-bin.zip
```

```
(do
  (load-module :maven)
  (maven/install) ;; installs default version 3.9.6

(do
  (load-module :maven)
  (maven/install "3.9.5"))
```

SEE ALSO

[maven/home-dir](#)

Returns the Apache Maven home directory or nil if Maven is not installed.

[maven/uninstall](#)

Uninstalls Apache Maven from {repl-home-dir}/tools

[top](#)

maven/mvn

```
(maven/mvn proj-dir & args)
```

Runs a Maven command

Relies on the environment variable `MAVEN_HOME` to access Maven.

```
(do
  (load-module :maven)
  (-> (maven/mvn "/Users/foo/projects/my-project" "compile")
       (println))

(do
  (load-module :maven)
  (-> (maven/mvn "/Users/foo/projects/my-project" "-X" "package")
       (println)))
```

SEE ALSO

[maven/version](#)

Runs the Maven version command and prints the commands output.

[maven/home-dir](#)

Returns the Apache Maven home directory or nil if Maven is not installed.

[top](#)

maven/parse-artifact

```
(maven/parse-artifact artifact)
```

Parses a Maven artifact

Form 1: "org.knowm.xchart:xchart:3.8.6"

```
{ :group-id      "org.knowm.xchart"
  :artifact-id   "xchart"
  :version       "3.8.6" }
```

Form 2: "org.knowm.xchart:jar:xchart:3.8.6"

```
{ :group-id      "org.knowm.xchart"
  :artifact-id   "xchart"
  :version       "3.8.6"
  :type          :jar }
```

Form 3: "org.knowm.xchart:jar:xchart:3.8.6:compile"

```
{ :group-id      "org.knowm.xchart"
  :artifact-id   "xchart"
  :version       "3.8.6"
  :type          :jar
  :scope         :compile }
```

```
(do
  (load-module :maven)
  (maven/parse-artifact "org.knowm.xchart:xchart:3.8.6"))
```

SEE ALSO

[maven/artifact-filename](#)

Returns the artifact file name

[maven/artifact-uri](#)

Returns the artifact URI

[maven/download](#)

Downloads an artifact in the format 'group-id:artifact-id:version' from a Maven repository. Can download any combination of the jar, ...

[maven/get](#)

Downloads artifact in the format 'group-id:artifact-id:version' from a Maven repository. The artifact type 'type' is one of {jar, ...}

[top](#)

maven/uninstall

```
(maven/uninstall)
```

Uninstalls Apache Maven from {repl-home-dir}/tools

Uninstallation is possible from within a REPL only!

```
(do
```

  (load-module :maven)
```

```
  (maven/uninstall))
```

SEE ALSO

[maven/home-dir](#)

Returns the Apache Maven home directory or nil if Maven is not installed.

[maven/install](#)

Installs Apache Maven to {repl-home-dir}/tools/apache-maven-x.y.z

[top](#)

maven/version

```
(maven/version)
```

Runs the Maven version command and prints the commands output.

Relyes on the environment variable `MAVEN_HOME` to access Maven.

```
(do
  (load-module :maven)
  (maven/version))
```

SEE ALSO

`maven/mvn`

Runs a Maven command

`maven/home-dir`

Returns the Apache Maven home directory or nil if Maven is not installed.

[top](#)

max

```
(max x)
(max x y)
(max x y & more)
```

Returns the greatest of the values

```
(max 1)
=> 1
```

```
(max 1 2)
=> 2
```

```
(max 4 3 2 1)
=> 4
```

```
(max 1I 2I)
=> 2I
```

```
(max 1.0)
=> 1.0
```

```
(max 1.0 2.0)
=> 2.0
```

```
(max 4.0 3.0 2.0 1.0)
=> 4.0
```

```
(max 1.0M)
=> 1.0M
```

```
(max 1.0M 2.0M)
=> 2.0M
```

=> 4.0M
```

```
(max 1.0M 2)
```

```
=> 2
```

SEE ALSO

[min](#)

Returns the smallest of the values

[clamp](#)

Restricts a given value between a lower and upper bound. In this way, it acts like a combination of the min and max functions.

[top](#)

mbean/attribute

```
(mbean/attribute object-name attribute-name)
```

Returns the value of a Java MBean attribute.

```
// Java MBean example
public interface HelloMBean {
    int getMaxCount();
    void setMaxCount(int c);
}

public class Hello implements HelloMBean {
    @Override
    public int getMaxCount() {
        return maxCount;
    }

    @Override
    public void setMaxCount(int c) {
        maxCount = c;
    }

    private int maxCount = 42;
}
```

```
(-> (mbean/object-name "java.lang:type=OperatingSystem")
     (mbean/attribute :ProcessCpuLoad))
```

```
(-> (mbean/object-name "java.lang:type=OperatingSystem")
     (mbean/attribute :SystemCpuLoad))
```

```
;; static MBean
(do
  (import :com.github.jlangch.venice.demo.mbean.Hello)
  (let [bean (. :Hello :new)
        name (mbean/object-name "venice:type=Hello")]
    (mbean/register bean name)
    (mbean/attribute name :MaxCount)))
```

```
;; dynamic MBean
(do
  (let [bean (atom (hash-map :count 10))
        name (mbean/object-name "venice:type>Data")]
    (mbean/register-dynamic bean name)
    (mbean/attribute name :count)))
```

SEE ALSO

[mbean/platform-mbean-server](#)

Returns the Java platform MBean server

[mbean/query-mbean-object-names](#)

Returns a list of the registered Java MBean object names.

[mbean/object-name](#)

Creates a Java MBean object name

[mbean/info](#)

Return the MBean info of a Java MBean.

[mbean/attribute!](#)

Set the value of a Java MBean attribute.

[mbean/invoke](#)

Invoke a Java MBean operation and return its result value.

[mbean/register](#)

Register a Java MBean

[mbean/register-dynamic](#)

Register a bean (a map wrapped by an atom or a volatile) as a dynamic Java MBean.

[mbean/unregister](#)

Unregister a Java MBean

[top](#)

mbean/attribute!

([mbean/attribute!](#) object-name attribute-name attribute-value)

Set the value of a Java MBean attribute.

```
;; static MBean
(do
  (import :com.github.jlangch.venice.demo.mbean.Hello)
  (let [bean (. :Hello :new)
        name (mbean/object-name "venice:type=Hello")]
    (mbean/register bean name)
    (mbean/attribute! name :MaxCount 64I)
    (mbean/attribute name :MaxCount)))
```

;; dynamic MBean

```
(do
  (let [bean (atom (hash-map :count 10))
        name (mbean/object-name "venice:type=Data")]
    (mbean/register-dynamic bean name)
    (mbean/attribute! name :count 20)
    (mbean/attribute name :count)))
```

SEE ALSO

[mbean/platform-mbean-server](#)

Returns the Java platform MBean server

[mbean/query-mbean-object-names](#)

Returns a list of the registered Java MBean object names.

[mbean/object-name](#)

Creates a Java MBean object name

mbean/info

Return the MBean info of a Java MBean.

mbean/attribute

Returns the value of a Java MBean attribute.

mbean/invoke

Invoke a Java MBean operation and return its result value.

mbean/register

Register a Java MBean

mbean/register-dynamic

Register a bean (a map wrapped by an atom or a volatile) as a dynamic Java MBean.

mbean/unregister

Unregister a Java MBean

[top](#)

mbean/info

(mbean/info object-name)

Return the MBean info of a Java MBean.

Example MBean:

```
public interface HelloMBean {  
    void sayHello();  
    int add(int x, int y);  
    int getMaxCount();  
    void setMaxCount(int c);  
}
```

Example MBean info:

```
{:classname "com.github.jlangch.venice.demo.mbean.Hello"  
:notifications {}  
:operations {:add {:parameters {:p1 {:descriptor {}  
:type "int"  
:description ""}  
:p2 {:descriptor {}  
:type "int"  
:description ""}}  
:descriptor {}  
:return-type "int"  
:description "Operation exposed for management"}  
:sayHello {:parameters {}  
:descriptor {}  
:return-type "void"  
:description "Operation exposed for management"}  
:attributes {:MaxCount {:descriptor {}  
:type "int"  
:description "Attribute exposed for management"}}  
:constructors {:com.github.jlangch.venice.demo.mbean.Hello  
{:parameters {}  
:descriptor {}  
:description "Public constructor of the MBean"}  
:description "Information on the management interface of the MBean"}}
```

```
(let [name (mbean/object-name "java.lang:type=OperatingSystem")]
  (mbean/info name))

(do
  (import :com.github.jlangch.venice.demo.mbean.Hello)
  (let [bean (. :Hello :new)
        name (mbean/object-name "venice:type=Hello")]
    (mbean/register bean name)
    (mbean/info name)))
```

Returns a list of the registered Java MBean object names.

[mbean/object-name](#)

Creates a Java MBean object name

[mbean/attribute](#)

Returns the value of a Java MBean attribute.

[mbean/attribute!](#)

Set the value of a Java MBean attribute.

[mbean/invoke](#)

Invoke a Java MBean operation and return its result value.

[mbean/register](#)

Register a Java MBean

[mbean/register-dynamic](#)

Register a bean (a map wrapped by an atom or a volatile) as a dynamic Java MBean.

[mbean/unregister](#)

Unregister a Java MBean

[top](#)

mbean/invoke

```
(mbean/invoke object-name operation params)
(mbean/invoke object-name operation params signature)
```

Invoke a Java MBean operation and return its result value.

Supported for static MBeans only!

```
// Java MBean example
public interface HelloMBean {
    void sayHello();
    int add(int x, int y);
}

public class Hello implements HelloMBean {
    @Override
    public void sayHello() {
        System.out.println("Hello, world!");
    }

    @Override
    public int add(int x, int y) {
```

```

        return x + y;
    }
}

(do
(import :com.github.jlangch.venice.demo.mbean.Hello)
(let [bean (. :Hello :new)
      name (mbean/object-name "venice:type=Hello")]
  (mbean/register bean name)
  ;; use an explicit operation signature
  (mbean/invoke name :add [1I 2I] ["int" "int"])))

(do
(import :com.github.jlangch.venice.demo.mbean.Hello)
(let [bean (. :Hello :new)
      name (mbean/object-name "venice:type=Hello")]
  (mbean/register bean name)
  ;; use the :add operation signature from the MBeanInfo
  (mbean/invoke name :add [1I 2I])))

```

  (import :com.github.jlangch.venice.demo.mbean.Hello)
  (let [bean (. :Hello :new)
        name (mbean/object-name "venice:type=Hello")]
    (mbean/register bean name)))
```

SEE ALSO

[mbean/platform-mbean-server](#)

Returns the Java platform MBean server

[mbean/query-mbean-object-names](#)

Returns a list of the registered Java MBean object names.

[mbean/object-name](#)

Creates a Java MBean object name

[mbean/info](#)

Return the MBean info of a Java MBean.

[mbean/attribute](#)

Returns the value of a Java MBean attribute.

[mbean/attribute!](#)

Set the value of a Java MBean attribute.

[mbean/invoke](#)

Invoke a Java MBean operation and return its result value.

[mbean/register-dynamic](#)

Register a bean (a map wrapped by an atom or a volatile) as a dynamic Java MBean.

[mbean/unregister](#)

Unregister a Java MBean

[top](#)

[mbean/register-dynamic](#)

([mbean/register-dynamic](#) bean name)

Register a bean (a map wrapped by an atom or a volatile) as a dynamic Java MBean.

```
(do
  (let [bean (atom {:count 10})
        name (mbean/object-name "venice:type=Data")]
    (mbean/register-dynamic bean name)
    (println ":count " (mbean/attribute name :count))
    (mbean/attribute! name :count 20)
    (println ":count " (mbean/attribute name :count))))
```

[mbean/register](#)
Register a Java MBean

[mbean/register-dynamic](#)
Register a bean (a map wrapped by an atom or a volatile) as a dynamic Java MBean.

[top](#)

memoize

```
(memoize f)
```

Returns a memoized version of a referentially transparent function.

Note:

Use memoization for expensive calculations. If used with fast calculations it has the opposite effect and can slow it down actually!

```
(do
  (def fibonacci
    (memoize
      (fn [n]
        (cond
          (<= n 0) 0
          (< n 2) 1
          :else (+ (fibonacci (- n 1)) (fibonacci (- n 2)))))))

  (time (fibonacci 25)))
Elapsed time: 868.67μs
=> 75025

(do
  (defn test [a b]
    (println (str "calculating a=" a ", b=" b))
    (+ a b))

  (def test-memo (memoize test))

  (test-memo 1 1)
  (test-memo 1 2)
  (test-memo 1 1)
  (test-memo 1 2)
  (test-memo 1 1))
calculating a=1, b=1
calculating a=1, b=2
=> 2
```

SEE ALSO

[delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...)

[top](#)

merge

```
(merge & maps)
```

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from the latter (left-to-right) will be the mapping in the result.

```
(merge {:a 1 :b 2 :c 3} {:b 9 :d 4})
=> {:a 1 :b 9 :c 3 :d 4}

(merge {:a 1} nil)
=> {:a 1}
```

```
(merge nil {:a 1})
```

```
=> {:a 1}
```

```
(merge nil nil)
```

```
=> nil
```

SEE ALSO

[merge-with](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from ...

[merge-deep](#)

Recursively merges maps.

[into](#)

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

[concat](#)

Returns a list of the concatenation of the elements in the supplied collections.

[top](#)

merge-deep

```
(merge-deep values)
```

```
(merge-deep strategy & values)
```

Recursively merges maps.

If the first parameter is a keyword it defines the strategy to use when merging non-map collections. Options are:

1. `:replace`, the default, the last value is used

2. `:into`, if the value in every map is a collection they are concatenated using `into`. Thus the type of (first) value is maintained.

```
(merge-deep {:a {:c 2}} {:a {:b 1}})
```

```
=> {:a {:b 1 :c 2}}
```

```
(merge-deep :replace {:a [1]} {:a [2]})
```

```
=> {:a [2]}
```

```
(merge-deep :into {:a [1]} {:a [2]})
```

```
=> {:a [1 2]}
```

```
(merge-deep {:a 1} nil)
```

```
=> nil
```

SEE ALSO

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[merge-with](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from ...

[top](#)

merge-with

```
(merge-with f & maps)
```

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from the latter (left-to-right) will be combined with the mapping in the result by calling (f val-in-result val-in-latter).

```
(merge-with + {:a 1 :b 2} {:a 9 :b 98 :c 0})  
=> {:a 10 :b 100 :c 0}
```

```
(merge-with into {:a [1] :b [2]} {:b [3 4] :c [5 6]})  
=> {:a [1] :b [2 3 4] :c [5 6]}
```

SEE ALSO

[merge](#)

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

[merge-deep](#)

Recursively merges maps.

[top](#)

meta

```
(meta obj)
```

Returns the metadata of obj, returns nil if there is no metadata.

```
(meta (vary-meta [1 2] assoc :foo 3))  
=> {:foo 3 :line 67 :column 28 :file "example"}
```

SEE ALSO

[vary-meta](#)

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

[with-meta](#)

Returns a copy of the object obj, with a map m as its metadata.

[var-val-meta](#)

Returns the var's value meta data.

[var-sym-meta](#)

Returns the var's symbol meta data.

[top](#)

mimetypes/probe-content-type

```
(probe-content-type f)
```

Probes the content type of a file.

The function uses a built-in "mime.types" data file to lookup the file's mimetype based on the file extension.

f must be a string or a java.io.File.

Returns `nil` if a mapping is not defined.

```
(do
  (load-module :mimetypes)
  (mimetypes/probe-content-type "foo.png"))
=> "image/png"
```

top

min

```
(min x)
(min x y)
(min x y & more)
```

Returns the smallest of the values

```
(min 1)
=> 1
```

```
(min 1 2)
=> 1
```

```
(min 4 3 2 1)
=> 1
```

```
(min 1I 2I)
=> 1I
```

```
(min 1.0)
=> 1.0
```

```
(min 1.0 2.0)
=> 1.0
```

```
(min 4.0 3.0 2.0 1.0)
=> 1.0
```

```
(min 1.0M)
=> 1.0M
```

```
(min 1.0M 2.0M)
=> 1.0M
```

```
(min 4.0M 3.0M 2.0M 1.0M)
=> 1.0M
```

```
(min 1.0M 2)
=> 1.0M
```

SEE ALSO

[max](#)

Returns the greatest of the values

[clamp](#)

Restricts a given value between a lower and upper bound. In this way, it acts like a combination of the min and max functions.

[top](#)

mod

(mod n d)

Modulus of n and d.

(mod 10 4)

=> 2

(mod -1 5)

=> 4

(mod 10I 4I)

=> 2I

SEE ALSO

[mod-floor](#)

floor a number towards 0 to the nearest multiple of a number

[top](#)

mod-floor

(mod-floor n m)

floor a number towards 0 to the nearest multiple of a number

(mod-floor 9 3)

=> 9

(mod-floor 10 3)

=> 9

(mod-floor 11 3)

=> 9

(mod-floor -11 3)

=> -9

SEE ALSO

[mod](#)

Modulus of n and d.

[top](#)

module-name

(module-name class)

Returns the Java module name of a class.

```
(module-name (class :java.util.ArrayList))
```

SEE ALSO

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[class-name](#)

Returns the Java class name of a class.

[top](#)

modules

```
(modules)
```

Lists the available Venice modules

SEE ALSO

[load-module](#)

Loads a Venice predefined extension module.

[doc](#)

Prints documentation for a var or special form given x as its name. Prints the definition of custom types.

[ns-list](#)

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[top](#)

multipart/http-content-type-header

```
(http-content-type-header)
```

Returns the HTTP content type header value for *multipart/form-data* HTTP requests.

The `multipart/render` function uses this boundary.

E.g: Content-Type: multipart/form-data; boundary=1234567890N

```
(do
  (load-module :multipart ['multipart :as 'm])
  (m/http-content-type-header))
```

SEE ALSO

[multipart/render](#)

Renders a map of named parts as multipart/form-data format.

[multipart/parse](#)

Parses a multipart bytebuf.

[top](#)

multipart/parse

(parse buffer boundary)

Parses a multipart bytebuf.

```
(do
  (load-module :multipart ['multipart :as 'm])
  (load-module :hexdump ['hexdump :as 'h])

  (defn render []
    (m/render { "Part-1" "xxxxxxxxxxxx"
               "Part-4" { :filename "data.xml"
                          :mimetype "application/xml"
                          :charset :utf-8
                          :data     "<user><name>foo</name></user>" }}))

  (let [mp (render)]
    (m/parse mp (m/boundary)))))

;; Returns a list of part maps:
;; ( { :name "Part-1"
;;     :filename nil
;;     :mimetype nil
;;     :charset nil
;;     :data [120 ... 120] ;; shortened for brevity
;;     :data-len 11 }
;;   { :name "Part-4"
;;     :filename "data.xml"
;;     :mimetype "application/xml"
;;     :charset "utf-8"
;;     :data [60 ... 62] ;; shortened for brevity
;;     :data-len 29 })
```

SEE ALSO

[multipart/render](#)

Renders a map of named parts as multipart/form-data format.

[multipart/http-content-type-header](#)

Returns the HTTP content type header value for multipart/form-data HTTP requests.

[top](#)

multipart/render

(render parts)

Renders a map of named parts as *multipart/form-data* format.

The part name must be a string and the part data may be of type:

- string
- string ("file:/user/foo/image.png" to reference a file)
- map (describing a part as :name, :mimetype, :data (string or bytebuf), and an optional charset) elements)
- io/file
- all other part data types are converted with `(str data)` to a string

Returns a bytebuf with all the rendered parts.

```

POST / HTTP/1.1
HOST: host.example.com
Connection: Keep-Alive
Content-Type: multipart/form-data; boundary=12345

--12345
Content-Disposition: form-data; name="notes"
Content-Type: text/plain; charset=utf-8

Lorem ipsum ...
--12345
Content-Disposition: form-data; name="foo"; filename="foo.json"
Content-Type: application/json; charset=utf-8

content of foo.json
--12345
Content-Disposition: form-data; name="image"; filename="picture.png"
Content-Type: image/png

content of picture.png
--12345--

```

See [multipart/form-data](#)

```

(do
  (load-module :multipart ['multipart :as 'm])

  (-> (m/render { "Part-1" "xxxxxxxxxx"
                  "Part-2" "yyyyyyyyyy"})
       (bytebuf-to-string)
       (println)))

(do
  (load-module :multipart ['multipart :as 'm])

  (m/render { "Part-1" "xxxxxxxxxx"
              "Part-2" "file:/user/foo/image.png"
              "Part-3" (io/file "/user/foo/image.png")
              "Part-4" { :filename "data.xml"
                         :mimetype "application/xml"
                         :charset :utf-8
                         :data    "<user><name>foo</name></user>" }})

```

SEE ALSO

[multipart/parse](#)

Parses a multipart bytebuf.

[multipart/http-content-type-header](#)

Returns the HTTP content type header value for multipart/form-data HTTP requests.

[top](#)

mutable-list

```
(mutable-list & items)
```

Creates a new mutable list containing the items.

The list is backed by `java.util.ArrayList` and is not thread-safe.

```
(mutable-list)
=> ()

(mutable-list 1 2 3)
=> (1 2 3)

(mutable-list 1 2 3 [:a :b])
=> (1 2 3 [:a :b])
```

top

mutable-list?

```
(mutable-list? obj)
```

Returns true if obj is a mutable list

```
(mutable-list? (mutable-list 1 2))
=> true
```

top

mutable-map

```
(mutable-map & keyvals)
(mutable-map map)
```

Creates a new mutable threadsafe map containing the items.

```
(mutable-map :a 1 :b 2)
=> {:a 1 :b 2}

(mutable-map {:a 1 :b 2})
=> {:a 1 :b 2}
```

top

mutable-map?

```
(mutable-map? obj)
```

Returns true if obj is a mutable map

```
(mutable-map? (mutable-map :a 1 :b 2))
=> true
```

top

mutable-set

```
(mutable-set & items)
```

Creates a new mutable set containing the items.

```
(mutable-set)  
=> #{}  
  
(mutable-set nil)  
=> #{nil}  
  
(mutable-set 1)  
=> #{1}  
  
(mutable-set 1 2 3)  
=> #{1 2 3}  
  
(mutable-set [1 2] 3)  
=> #{3 [1 2]}
```

top

mutable-set?

```
(mutable-set? obj)
```

Returns true if obj is a mutable-set

```
(mutable-set? (mutable-set 1))  
=> true
```

top

mutable-vector

```
(mutable-vector & items)
```

Creates a new mutable threadsafe vector containing the items.

```
(mutable-vector)  
=> []  
  
(mutable-vector 1 2 3)  
=> [1 2 3]  
  
(mutable-vector 1 2 3 [:a :b])  
=> [1 2 3 [:a :b]]
```

top

mutable-vector?

```
(mutable-vector? obj)
```

Returns true if obj is a mutable vector

```
(mutable-vector? (mutable-vector 1 2))  
=> true
```

top

name

```
(name x)
```

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

```
(name 'foo)  ;; symbol  
=> "foo"
```

```
(name 'user/foo)  ;; symbol  
=> "foo"
```

```
(name (symbol "user/foo"))  ;; symbol  
=> "foo"
```

```
(name :foo)  ;; keyword  
=> "foo"
```

```
(name :user/foo)  ;; keyword  
=> "foo"
```

```
(name +)  ;; function  
=> "+"
```

```
(name str/digit?)  ;; function  
=> "digit?"
```

```
(name "ab/text")  ;; string  
=> "ab/text"
```

```
(name (. :java.time.Month :JANUARY))  ;; java enum  
=> "JANUARY"
```

SEE ALSO

qualified-name

Returns the qualified name String of a string, symbol, keyword, or function

namespace

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

fn-name

Returns the qualified name of a function or macro

top

namespace

```
(namespace x)
```

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

Throws an exception if x does not support namespaces like `(namespace 2)`.

```
(namespace 'user/foo)  ;; symbol  
=> "user"
```

```
(namespace (symbol "user/foo"))  ;; symbol  
=> "user"
```

```
(namespace :user/foo)  ;; keyword  
=> "user"
```

```
(namespace str/digit?)  ;; function  
=> "str"
```

```
(namespace *ns*)  ;; symbol  
=> "user"
```

SEE ALSO

[name](#)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

[fn-name](#)

Returns the qualified name of a function or macro

[ns](#)

Opens a namespace.

[*ns*](#)

The current namespace

[var-ns](#)

Returns the namespace of the var's symbol.

[top](#)

nan?

```
(nan? x)
```

Returns true if x is a NaN else false. x must be a double!

```
(nan? 0.0)  
=> false
```

```
(nan? (/ 0.0 0))  
=> true
```

```
(nan? (sqrt -1))  
=> true
```

```
(pr (sqrt -1))  
:NaN  
=> nil
```

SEE ALSO

[infinite?](#)

Returns true if x is infinite else false. x must be a double!

[double](#)

Converts to double

[top](#)

nano-time

```
(nano-time)
```

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

```
(nano-time)  
=> 555663219607958
```

```
(let [t (nano-time)  
      _ (sleep 100)  
      e (nano-time)]  
  (format-nano-time (- e t) :precision 2))  
=> "101.10ms"
```

SEE ALSO

[current-time-millis](#)

Returns the current time in milliseconds.

[format-nano-time](#)

Formats a time given in nanoseconds as long or double.

[top](#)

neg?

```
(neg? x)
```

Returns true if x smaller than zero else false

```
(neg? -3)  
=> true
```

```
(neg? 3)  
=> false
```

```
(neg? -3I)  
=> true
```

```
(neg? -3.2F)

```

```
(neg? -3.2)  
=> true
```

```
(neg? -3.2M)  
=> true
```

SEE ALSO

[zero?](#)

Returns true if x zero else false

[pos?](#)

Returns true if x greater than zero else false

[negate](#)

Negates x

[top](#)

negate

```
(negate x)
```

Negates x

```
(negate 10)  
=> -10
```

```
(negate 10I)  
=> -10I
```

```
(negate 1.23)  
=> -1.23
```

```
(negate 1.23M)  
=> -1.23M
```

SEE ALSO

[abs](#)

Returns the absolute value of the number

[sgn](#)

sgn function for a number.

[top](#)

newline

```
(newline)  
(newline os)
```

Without arg writes a platform-specific newline to the output channel that is the current value of `*out*`. With arg writes a newline to the passed stream that must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Returns `nil`.

```
(newline)
=> nil

(newline *out*)
=> nil

(newline *err*)
=> nil
```

SEE ALSO

`print`

Prints the values xs to the stream that is the current value of `*out*` or to the passed stream os that must be a subclass of either ...

`println`

Prints the values xs to the stream that is the current value of `*out*` or to the passed output stream os if given followed by a (newline).

`printf`

Without output stream prints formatted output as per format to the stream that is the current value of `*out*`. With a stream prints ...

[top](#)

nfirst

```
(nfirst coll n)
```

Returns a collection of the first n items

```
(nfirst nil 2)
=> ()

(nfirst [] 2)
=> []

(nfirst [1] 2)
=> [1]

(nfirst [1 2 3] 2)

=> false
```

SEE ALSO

any?

Returns true if the predicate is true for at least one collection item, false otherwise.

every?

Returns true if coll is a collection and the predicate is true for all collection items, false otherwise.

not-every?

Returns true if coll is a collection and the predicate is not true for all collection items, false otherwise.

[top](#)

not-contains?

```
(not-contains? coll key)
```

Returns true if key is not present in the given collection, otherwise returns false.

```
(not-contains? #{:a :b} :c)
=> true
```

```
(not-contains? {:a 1 :b 2} :c)
=> true
```

```
(not-contains? [10 11 12] 1)
=> false
```

```
(not-contains? [10 11 12] 5)
=> true
```

```
(not-contains? "abc" 1)
=> false
```

```
(not-contains? "abc" 5)
=> true
```

SEE ALSO

contains?

Returns true if key is present in the given collection, otherwise returns false.

[top](#)

not-empty?

```
(not-empty? x)
```

Returns true if x is not empty. Accepts strings, collections and bytebufs.

```
(not-empty? {:a 1})  
=> true  
  
(not-empty? [1 2])  
=> true  
  
(not-empty? '(1 2))  
=> true  
  
(not-empty? "abc")  
=> true  
  
(not-empty? nil)  
=> false  
  
(not-empty? "")  
=> false
```

SEE ALSO

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[top](#)

not-every?

```
(not-every? pred coll)
```

Returns true if coll is a collection and the predicate is not true for all collection items, false otherwise.

```
(not-every? number? nil)  
=> false  
  
(not-every? number? [])  
=> true  
  
(not-every? number? [1 2 3 4])  
=> false  
  
(not-every? number? [1 2 3 :a])  
=> true  
  
(not-every? #(>= % 10) [10 11 12])  
=> false
```

SEE ALSO

[every?](#)

Returns true if coll is a collection and the predicate is true for all collection items, false otherwise.

[any?](#)

Returns true if the predicate is true for at least one collection item, false otherwise.

[not-any?](#)

Returns false if the predicate is true for at least one collection item, true otherwise

[top](#)

not-match?

```
(not-match? s regex)
```

Returns true if the string s does not match the regular expression regex.

The argument 'regex' may be a string representing a regular expression or a :java.util.regex.Pattern.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. `regex/matches-not?` performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"^[0-9]+")]  
  (filter #(regex/matches-not? m %) ["100" "1a1" "200"]))
```

```
(not-match? "S1000" "[0-9]+")  
=> true
```

```
(not-match? "S1000" #"^[0-9]+")  
=> true
```

```
(not-match? "1000" "[0-9]+")  
=> false
```

SEE ALSO

[match?](#)

Returns true if the string s matches the regular expression regex.

[regex/matches-not?](#)

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

[regex/matches?](#)

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

[regex/pattern](#)

Returns an instance of java.util.regex.Pattern.

[regex/matcher](#)

Returns an instance of java.util.regex.Matcher.

[regex/matches](#)

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

[regex/find](#)

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

[regex/find-all](#)

Returns all regex matches as list or an empty list if there are no matches.

[top](#)

not=

```
(not= x)  
(not= x y)  
(not= x y & more)
```

Same as (not (= x y))

```
(not= "abc" "abc")
=> false

(not= 0 0)
=> false

(not= 0 1)
=> true

(not= 0 0.0)
=> true

(not= 0 0.0M)
=> true

(not= "0" 0)
=> true

(not= 4)
=> false

(not= 1 2 3)
=> true
```

SEE ALSO

=
Returns true if both operands have equivalent type and value
==
Returns true if both operands have equivalent value.

[top](#)

ns

(ns sym)

Opens a namespace.

```
(do
  (ns xxx)
  (def foo 1)
  (ns yyy)
  (def foo 5)
  (println xxx/foo foo yyy/foo))
1 5 5
=> nil
```

SEE ALSO

ns
The current namespace

ns?
Returns true if n is an existing namespace that has been defined with (ns n) else false.

ns-unmap

Removes the mappings for the symbol from the namespace.

ns-remove

Removes the mappings for all symbols from the namespace.

ns-list

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

ns-alias

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name ...

ns-meta

Returns the meta data of the namespace n or nil if n is not an existing namespace

namespace

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

var-ns

Returns the namespace of the var's symbol.

[top](#)

ns-alias

```
(ns-alias alias namespace-sym)
```

Add an alias in the current namespace to another namespace. Arguments are two symbols: the alias to be used, and the symbolic name of the target namespace.

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[var-ns](#)

Returns the namespace of the var's symbol.

[top](#)

ns?

```
(ns? n)
```

Returns true if n is an existing namespace that has been defined with `(ns n)` else false.

```
(do
  (ns foo)
  (ns? foo))
=> true
```

SEE ALSO

[ns](#)

Opens a namespace.

[top](#)

nth

```
(nth coll idx)
(nth coll idx defaultVal)
```

Returns the nth element of coll.

Throws an exception if the index does not exist and there is no default value passed else returns the default value.

```
(nth nil 1)
=> nil
```

```
(nth [1 2 3] 1)
=> 2
```

```
(nth '(1 2 3) 1)
=> 2
```

```

```
(number? "a")
=> false
```

top

object-array

```
(object-array coll)
(object-array len)
(object-array len init-val)
```

Returns an array of Java Objects containing the contents of coll or returns an array with the given length and optional init value

```
(object-array '(1 2 3 4 5))
=> [1, 2, 3, 4, 5]

(object-array '(1 2.0 3.45M "4" true))
=> [1, 2.0, 3.45, 4, true]

(object-array 10)
=> [nil, nil, nil, nil, nil, nil, nil, nil, nil, nil]

(object-array 10 42)
=> [42, 42, 42, 42, 42, 42, 42, 42, 42, 42]
```

[top](#)

odd?

```
(odd? n)
```

Returns true if n is odd, throws an exception if n is not an integer

```
(odd? 3)
=> true
```

```
(odd? 4)
=> false
```

```
(odd? 4I)
=> false
```

SEE ALSO

[even?](#)

Returns true if n is even, throws an exception if n is not an integer

[top](#)

offer!

```
(offer! queue v)
(offer! queue timeout v)
```

Offers an item to tail of the a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary for space to become available. For an indefinite timeout pass the timeout value :indefinite. If no timeout is given returns immediately false if the queue does not have any more capacity. Returns true if the element was added to this queue, else false.

```
(let [q (queue)]
  (offer! q 1)
  (offer! q 1000 2)
  (offer! q :indefinite 3)
  (offer! q 3)
  (poll! q)
  q)
=> (2 3 3)
```

SEE ALSO

queue

Creates a new mutable threadsafe bounded or unbounded queue.

put!

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

take!

Retrieves and removes the head value of the queue or the deque, waiting if necessary until a value becomes available.

poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

top

offer-head!

```
(offer-head! deque v)
(offer-head! deque timeout v)
```

Offers an item to the head of a deque with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary for space to become available. For an indefinite timeout pass the timeout value :indefinite. If no timeout is given returns immediately false if the queue does not have any more capacity. Returns true if the element was added to this queue, else false.

```
(let [q (deque)]
  (offer! q 1)
  (offer! q 1000 2)
  (offer! q :indefinite 3)
  (offer-head! q 0)
  (println (poll! q))
  (println q))
0
(1 2 3)
=> nil
```

SEE ALSO

deque

Creates a new mutable threadsafe bounded or unbounded deque.

put!

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

take!

Retrieves and removes the head value of the queue or the deque, waiting if necessary until a value becomes available.

poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

put-head!

Puts an item to the head of a deque. The operation is synchronous, it waits indefinitely until the value can be placed on the queue.

take-tail!

Retrieves and removes the tail value of the deque, waiting if necessary until a value becomes available.

`poll-tail!`

Polls an item from the tail of a deque with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

`peek`

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

`empty?`

Returns true if x is empty. Accepts strings, collections and bytebufs.

`count`

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

[openai/assert-response-http-ok](#)

`(assert-response-http-ok response)`

Throws an exception if the response HTTP status is not HTTP_OK.

The exception holds the response details.

[top](#)

[openai/assistant-create](#)

`(assistant-create name model & options)`

Create an assistant with a model and instructions.

Parameter «name»

The name of the assistant. The maximum length is 256 characters.

Parameter «model»

ID of the model to use. E.g.: `:gpt-4o`

Parameter «options»

<code>:description</code>	The description of the assistant. The maximum length is 512 characters.
<code>:instructions</code>	The system instructions that the assistant uses. The maximum length is 256,000 characters.
<code>:tools</code>	A list of tool enabled on the assistant. There can be a maximum of 128 tools per assistant. Tools can be of types "code_interpreter", "file_search", or "function".
<code>:tool-resources</code>	A set of resources that are used by the assistant's tools. The resources are specific to the type of tool. For example, the code_interpreter tool requires a list of file IDs, while the file_search tool requires a list of vector store IDs.
<code>:assistant-opts</code>	A map of additional assistant options like "metadata", "temperature", "top_p", "response_format". See: OpenAI Request Options
<code>:openai-api-key</code>	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
<code>:headers</code>	Additional headers. E.g.: {"OpenAI-Beta" "assistants=v2"}
<code>:uri</code>	An OpenAI assistants URL. E.g.: "https://api.openai.com/v1/assistants". Defaults to "https://api.openai.com/v1/assistants"
<code>:debug</code>	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

See:

- [OpenAI Models API](#)

```
(do
  (load-module :openai)

  (let [response  (openai/assistant-create
                  "Math Tutor"
                  :gpt-4o
                  :instructions (str "You are a personal math tutor. When asked "
                                      "a question, write and run Python code to "
                                      "answer the question.")
                  :tools [ { "type" "code_interpreter" } ]
                  :headers { "OpenAI-Beta" "assistants=v2" })]
    (openai/assert-response-http-ok response)
    (prn (:data response))))
```

SEE ALSO

Retrieves an assistant.

[openai/assistant-delete](#)

Delete an assistant.

[top](#)

openai/assistant-delete

`(assistant-delete assistant-id & options)`

Delete an assistant.

Parameter «assistant-id»

The ID of the assistant to delete.

Parameter «options»

:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "assistants=v2"}
:uri	An OpenAI assistants URI. E.g.: "https://api.openai.com/v1/assistants/{assistant-id}" Defaults to "https://api.openai.com/v1/assistants/{assistant-id}"

:debug An optional debug flag (true/false). Defaults to false.
In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status The HTTP status (a long)
:mimetype The content type's mimetype
:headers A map of headers. key: header name, value: list of header values
:data If the response HTTP status is `HTTP_OK` the data fields contains the chat completion message.
If the response HTTP status is not `HTTP_OK` the data fields contains an error message formatted as plain or JSON string.

See:

- [OpenAI Models API](#)

```
(do

:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "assistants=v2"}
:uri	An OpenAI assistants URI. E.g.: "https://api.openai.com/v1/assistants". Defaults to "https://api.openai.com/v1/assistants"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

[openai/assistant-create](#)

Create an assistant with a model and instructions.

[openai/assistant-list](#)

Returns a list of assistants.

[openai/assistant-retrieve](#)

Retrieves an assistant.

[openai/assistant-delete](#)

Delete an assistant.

openai/assistant-retrieve

```
(assistant-retrieve assistant-id & options)
```

Retrieves an assistant.

Parameter «assistant-id»

The ID of the assistant to retrieve.

Parameter «options»

:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "assistants=v2"}
:uri	An OpenAI assistants URI. E.g.: "https://api.openai.com/v1/assistants/{assistant-id}" Defaults to "https://api.openai.com/v1/assistants/{assistant-id}"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

Delete an assistant.

[top](#)

openai/audio-file-ext

```
(audio-file-ext mimetype)
```

Returns the file extension for an audio mimetype.

Examples:

mimetype	file extension
audio/aac	"aac"
audio/flac	"flac"
audio/mpeg	"mp3"
audio/mp4	"mp4"
audio/mpega	"mpega"
audio/opus	"opus"
audio/ogg	"ogg"
audio/pcm	"pcm"
audio/wav	"wav"
audio/webm	"webm"
else	"binary"

[top](#)

openai/audio-speech-generate

```
(audio-speech-generate text voice response-format & options)
```

Generates audio from the input text.

Parameter «text»

"The quick brown fox jumped over the lazy dog."

Parameter «voice»

The voice to use when generating the audio.

- `:alloy`
- `:echo`
- `:fable`
- `:onyx`
- `:nova`
- `:shimmer`

Parameter «response-format»

The format in which the generated images are returned

- `:mp3` (mimetype: audio/mpeg)
- `:opus` (mimetype: audio/opus)
- `:aac` (mimetype: audio/aac)
- `:flac` (mimetype: audio/flac)
- `:wav` (mimetype: audio/wav)
- `:pcm` (mimetype: audio/pcm)

Parameter request «options»

:model	An OpenAI model. E.g.: "tts-1". Defaults to "tts-1". The model can also be passed as a keyword. E.g.: <code>:tts-1</code> , <code>:tts-1-hd</code> , ...
:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:audio-opts	An optional map of OpenAI audio options. Map keys can be keywords or strings. E.g. <code>{ :speed 1.0 }</code> . See: OpenAI Request Options
:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: <code>{"OpenAI-Beta" "audio=v2"}</code>
:uri	An OpenAI audio speech URI. E.g.: "https://api.openai.com/v1/audio/speech". Defaults to "https://api.openai.com/v1/audio/speech"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

[openai/audio-speech-transcribe](#)

Transcribes audio into the input language.

[openai/audio-speech-translate](#)

Translates audio into English.

[openai/audio-file-ext](#)

Returns the file extension for an audio mimetype.

openai/audio-speech-transcribe

(audio-speech-transcribe data audio-type response-format & options)

Transcribes audio into the input language.

Parameter «data»

The audio data (a byte buffer)

Parameter «audio-type»

The audio type

- `:flac` (mimetype: audio/flac)
- `:mp3` (mimetype: audio/mpeg)
- `:mp4` (mimetype: audio/mp4)
- `:m4a` (mimetype: audio/m4a)
- `:mpeg4` (mimetype: audio/mpega)
- `:ogg` (mimetype: audio/ogg)
- `:wav` (mimetype: audio/wav)
- `:webm` (mimetype: audio/webm)

Parameter «response-format»

The format in which the transcribed text is returned

- `:json`
- `:text`
- `:srt`
- `:verbose_json`
- `:vtt`

Parameter «options»

<code>:model</code>	An OpenAI model. E.g.: "whisper-1". Defaults to "whisper-1". The model can also be passed as a keyword. E.g.: <code>:whisper-1</code> ...
<code>:audio-opts</code>	An optional map of OpenAI audio options. Map keys can be keywords or strings. E.g. <code>{ :language "en", :temperature 0, :timestamp_granularities "word" }</code> . See: OpenAI Request Options
<code>:openai-api-key</code>	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
<code>:headers</code>	Additional headers. E.g.: <code>{"OpenAI-Beta" "audio=v2"}</code>
<code>:uri</code>	An OpenAI audio speech URI. E.g.: "https://api.openai.com/v1/audio/transcriptions". Defaults to "https://api.openai.com/v1/audio/transcriptions"
<code>:debug</code>	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

<code>:status</code>	The HTTP status (a long)
<code>:mimetype</code>	The content type's mimetype
<code>:headers</code>	A map of headers. key: header name, value: list of header values
<code>:data</code>	If the response HTTP status is <code>HTTP_0K</code> the data fields contains the chat completion message.

If the response HTTP status is not `HTTP_OK` the data fields contains an error message formatted as plain or JSON string.

[top](#)

openai/chat-completion

`(chat-completion prompt & options)`

Runs a chat completion.

To run the request asynchronously just wrap it in a `future` and deref it, when the result is required.

Parameter «prompt»

A prompt is either a simple string like:

`"Who won the world series in 2020?"`

or a list of prompt messages:

```
[ {"role": "system", "content": "You are a helpful assistant."},
  {"role": "user", "content": "Who won the world series in 2020?"},
  {"role": "assistant", "content": "The Los Angeles Dodgers won the World Series in 2020."},
  {"role": "user", "content": "Where was it played?"} ]
```

Using prompt roles:

`system` Allows to specify the way the model answers questions.
Classic example: "You are a helpful assistant."

`user` Equivalent to the queries made by the user.

`assistant` Assistant roles are the model's responses, based on the user messages.

Parameter request «options»

:model An OpenAI model. E.g.: "gpt-4o". Defaults to "gpt-4o".
The model can also be passed as a keyword. E.g.: `:gpt-4o`, `:gpt-4-turbo`, ...

:tools a list of tools. e.g.: function definitions (see OpenAI api for details)

:tool-choice a tool choice. e.g.: function definitions (see OpenAI api for details)
This forces the model to use a specific function:
`{:type "function", :function {:name "get_n_day_weather_forecast"}}`

:chat-opts An optional map of OpenAI chat request options Map keys can be keywords or strings.
E.g. `{ :temperature 0.2 }`.
See: [OpenAI Request Options](#)

:openai-api-key An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".

:headers Additional headers.
E.g.: { "OpenAI-Beta" "chats=v2"
"OpenAI-Organization" "YOUR_ORG_ID"
"OpenAI-Project" "YOUR_PROJECT_ID" }

:uri An OpenAI chat completion URI. E.g.: "https://api.openai.com/v1/chat/completions".
Defaults to "https://api.openai.com/v1/chat/completions"

:debug An optional debug flag (true/false). Defaults to false.
In debug mode prints the HTTP request and response data

Tools options (a Venice map) for passing a function definition:

```
[  
  { :type "function"  
    :function {  
      :name "get_current_weather"  
      :description "Get the current weather"  
      :parameters {  
        :type "object"  
        :properties {  
          :location {  
            :type "string"  
            :description "The city and state, e.g. San Francisco, CA"  
          }  
          :format {  
            :type "string"  
            :enum ["celsius", "fahrenheit"]  
            :description "The temperature unit to use. Infer this from the users location."  
          }  
        }  
        :required ["location", "format"]  
      }  
    }  
  }  
]
```

Return value

Returns a map with the response data:*

:status The HTTP status (a long)

:mimetype The content type's mimetype

:headers A map of headers. key: header name, value: list of header values

:message The final chat completion message if the OpenAI server returned the HTTP status `HTTP_OK`, else `nil`

:data If the response HTTP status is `HTTP_OK` the data fields contains the chat completion message.
If the response HTTP status is not `HTTP_OK` the data fields contains an error message formatted as plain or JSON string.

SEE ALSO

[openai/chat-completion-streaming](#)

Runs a chat completion in streaming mode.

[openai/chat-extract-response-message-content](#)

Returns the message content of an OpenAI chat JSON response.

[openai/pretty-print-json](#)

Returns a pretty printed Venice JSON data value.

[top](#)

[openai/chat-completion-streaming](#)

(chat-completion-streaming prompt handler & options)

Runs a chat completion in streaming mode.

Processes OpenAI server side events (SSE) and calls for every event the handler 'handler'.

Parameter «prompt»

A prompt is either a simple string like:

```
"Who won the world series in 2020?"
```

or a list of prompt messages:

```
[ {"role": "system", "content": "You are a helpful assistant."},  
 {"role": "user", "content": "Who won the world series in 2020?"},  
 {"role": "assistant", "content": "The Los Angeles Dodgers won the World Series in 2020."},  
 {"role": "user", "content": "Where was it played?"} ]
```

Parameter «handler»

The event handler is a three argument function:

```
(defn handler [delta accumulated status] ...)
```

Handler arguments:

<i>delta</i>	the delta message sent with the event
<i>accumulated</i>	the accumulated message
<i>type</i>	the notification type: :opened - streaming started :data - streamed event :done - streaming done by the server

Parameter request «options»

<i>:model</i>	An OpenAI model. E.g.: "gpt-4o". Defaults to "gpt-4o". The model can also be passed as a keyword. E.g.: :gpt-4o , :gpt-4-turbo , ...
<i>:sync</i>	if <i>true</i> runs the request synchronously and waits until the full message response is available. if <i>false</i> runs the request asynchronously and returns immediately with the response :data field holding a <code>future</code> that can be deref'd (with an optional timeout) to get the full message. Defaults to <i>true</i>
<i>:chat-opts</i>	An optional map of OpenAI chat request options Map keys can be keywords or strings. E.g. { :temperature 0.2 } . E.g. '{ :stream_options { :include_usage true } } . See: OpenAI Request Options
<i>:openai-api-key</i>	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
<i>:headers</i>	Additional headers. E.g.: {"OpenAI-Beta" "chats=v2"}
<i>:uri</i>	An OpenAI chat completion URI. E.g.: "https://api.openai.com/v1/chat/completions". Defaults to "https://api.openai.com/v1/chat/completions"
<i>:debug</i>	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

```
:status          The HTTP status (a long)
:mimetype       The content type's mimetype
:headers         A map of headers. key: header name, value: list of header values
:message        The final chat completion message if the OpenAI server returned the HTTP status HTTP_OK, else nil
:data           If the response HTTP status is HTTP_OK the data field contains the chat completion message and token usage:  
{:message "1234" :usage nil }  
If the response HTTP status is not HTTP_OK the data fields contains an error message formatted as plain or JSON string.
```

Note: The streaming mode does not support functions!

[openai/exec-fn](#)

Execute all functions from an OpenAI JSON response.

[top](#)

openai/chat-process-streaming-events

```
(chat-process-streaming-events response handler & options)
```

Processes OpenAI server side events (SSE) and calls for every event the passed handler function.

Returns a `future`. This gives the caller the choice to synchronously or asynchronously process the events from the OpenAI server.

Note: The response from the server must be of the mimetype "text/event-stream" otherwise the processor throws an exception!

The event handler is a three argument function:

```
(defn handler [delta accumulated status] ...)
```

`delta` the delta message sent with the event

`accumulated` the accumulated message

`type` the notification type:

`:opened` - streaming started

`:data` - streamed event

`:done` - streaming done by the server

Parameter «options»

`:debug` An optional debug flag (true/false). Defaults to false.

In debug mode prints the streaming response data

```

(do
  (load-module :openai)
  (load-module :http-client-j8 ['http-client-j8 :as 'hc])

  (let [api-key  (system-env "OPENAI_API_KEY")

E.g., 1, 2, 3, ...")]
    body      { :model     :gpt-4o
                :messages [ { :role    "user"
                             :content content } ]
                :stream    true }
    response (hc/send :post
                        "https://api.openai.com/v1/chat/completions"
                        :headers { "Content-Type" "application/json"
                                   "Authorization" (str "Bearer " api-key)}
                        :body (json/write-str body)
                        :debug false])
  (println "Status:" (:http-status response))
  (if (= "text/event-stream" (:content-type-mimetype response))
      (let [data @(openai/chat-process-streaming-events
                    response
                    (fn [delta accumulated status]
                      (case status
                        :opened (println "Started...")
                        :data   (println "Delta:" (pr-str delta))
                        :done   (println "Completed."))))]
        (println "Message:" (pr-str (message data))))
      (println (hc/slurp-response response :json-parse-mode :pretty-print)))))

```

SEE ALSO

[http-client-j8/slurp-response](#)

Slurps the response data from the response' input stream.

[top](#)

[openai/embedding-create](#)

```
(embedding-create input & options)
```

Creates an embedding vector representing the input text.

Parameter «input»

The input text to embed

Parameter «options»

:model	An OpenAI model. E.g.: "text-embedding-ada-002". Defaults to "text-embedding-ada-002". The model can also be passed as a keyword. E.g.: :text-embedding-ada-002 , :text-embedding-3-small , :text-embedding-3-large
:embed-opts	An optional map of OpenAI embedding request options Map keys can be keywords or strings. E.g. { :encoding_format :float } . E.g. { :dimensions 1536 } . See: OpenAI Request Options
:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "assistants=v2"}
:uri	An OpenAI assistants URI. E.g.: "https://api.openai.com/v1/embeddings".

Defaults to "https://api.openai.com/v1/embeddings"
:debug An optional debug flag (true/false). Defaults to false.
In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status The HTTP status (a long)
:mimetype The content type's mimetype
:headers A map of headers. key: header name, value: list of header values
:data If the response HTTP status is `HTTP_OK` the data fields contains the chat completion message.
If the response HTTP status is not `HTTP_OK` the data fields contains an error message formatted as plain or JSON string.

See:

- [OpenAI Models API](#)

```
(do
  (load-module :openai)

  (let [response  (openai/embedding-create
                  "Happy Christmas ..."
                  :embed-opts { :model "text-embedding-ada-002"
                               :encoding_format :float} )]
    (openai/assert-response-http-ok response)
    (let [data      (:data response)
          embed-vec (:embedding (first (:data data)))]
      (prn data))))
```

top

openai/exec-fn

```
(exec-fn response fn-map)
```

Execute all functions from an OpenAI JSON response.

`fn-map` is map of named functions:

```
{ "get_current_weather"      get-current-weather
  "get_n_day_weather_forecast" get-n-day-weather-forecast }
```

Returns a list of function results, one for each function called.

OK result `{ :ok value }` . E.g: `{ :ok "15°C" }`

ERROR result `{ :err exception }` .

Returns true if the OpenAI JSON response contains tool calls (functions) that it wants the client to run

top

openai/file-delete

(file-delete file-id & options)

Delete a file.

Parameter «file-id»

The ID of the file to use for this request.

Parameter «options»

:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "files=v2"}
:uri	An OpenAI files URI. E.g.: "https://api.openai.com/v1/files/{file-id}". Defaults to "https://api.openai.com/v1/files/{file-id}"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

See:

Returns the contents of the specified file.

openai/image-create

(image-create prompt response-format & options)

Create images.

Parameter «prompt»

"A portrait of a dog in a library, Sigma 85mm f/1.4"

Parameter «response-format»

The format in which the generated images are returned

- :url
 - :b64 json

Note: URLs are only valid for 60 minutes after the image has been generated.

Parameter request «options»

:model	An OpenAI model. E.g.: "dall-e-3". Defaults to "dall-e-3". The model can also be passed as a keyword. E.g.: :dall-e-2 , :dall-e-3 , ...
:image-opts	An optional map of OpenAI image request options Map keys can be keywords or strings. E.g. { :style "vivid" :size "1024x1024" , :quality "hd" :n 1 } . See: OpenAI Request Options
:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "images=v2"}
:uri	An OpenAI chat completion URI. E.g.: "https://api.openai.com/v1/images/generations". Defaults to "https://api.openai.com/v1/images/generations"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

See:

- OpenAI Image Guide
 - OpenAI Image API

Edits an image.

[openai/pretty-print-json](#)

Returns a pretty printed Venice JSON data value.

openai/image-download

Downloads an image from the given url.

[top](#)

openai/image-download

(image-download url basename)

Downloads an image from the given url.

Returns a map with the image data.

E.g.: basename = image-1

```
{ :name      image-1.png
  :mimetype "image/png"
  :data      <bytebuf> }
```

[top](#)

openai/image-edits

(image-edits image mask prompt response-format & options)

Edits an image.

Parameter «image»

The image to edit.

Parameter «mask»

The mask image.

Parameter «prompt»

A text description of the desired image.

Parameter «response-format»

The format in which the generated images are returned

- `:url`
- `:b64_json`

Note: URLs are only valid for 60 minutes after the image has been generated.

Parameter request «options»

`:model` An OpenAI model. E.g.: "dall-e-2". Defaults to "dall-e-2".

The model can also be passed as a keyword. E.g.: `:dall-e-2`, `:dall-e-3`, ...

`:image-opts` An optional map of OpenAI image request options Map keys can be keywords or strings.

E.g. `{ :size "1024x1024", :n 1 }`.

See: [OpenAI Request Options](#)

`:openai-api-key` An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".

:headers	Additional headers. E.g.: {"OpenAI-Beta" "images=v2"}
:uri	An OpenAI chat completion URI. E.g.: "https://api.openai.com/v1/images/edits". Defaults to "https://api.openai.com/v1/images/edits"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

[top](#)

openai/image-variants

(image-variants image response-format & options)

Create image variants.

It only supports "dall-e-2". The quality of the variants is poor. Looks like OpenAI is giving it up.

Parameter «image»

The image to create variants from.

Parameter «response-format»

The format in which the generated images are returned

- `:url`
- `:b64_json`

Note: URLs are only valid for 60 minutes after the image has been generated.

Parameter request «options»

`:model` An OpenAI model. E.g.: "dall-e-2". Defaults to "dall-e-2".

The model can also be passed as a keyword. E.g.: `:dall-e-2, :dall-e-3, ...`

:image-opts	An optional map of OpenAI image request options Map keys can be keywords or strings. E.g. <code>{ :size "1024x1024", :n 1 }</code> . See: OpenAI Request Options
:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "images=v2"}
:uri	An OpenAI chat completion URI. E.g.: "https://api.openai.com/v1/images/variants". Defaults to "https://api.openai.com/v1/images/variants"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

openai/me

(**me** & **options**)

If you need to find the user and organizations associated with an API key, you can do so by calling the 'me' endpoint. The request just needs the the API key.

Parameter request «options»

:openai-api-key An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:uri An OpenAI chat completion URI. E.g.: "https://api.openai.com/v1/me".
Defaults to "https://api.openai.com/v1/me"
:debug An optional debug flag (true/false). Defaults to false.
In debug mode prints the HTTP request and response data

```
(do
  (load-module :openai)

  (let [response (openai/me)]
    (println "Status: " (:status response))
    (println "Mimetype:" (:mimetype response))
    (if (= (:status response) 200)
        (println "Message:" (openai/pretty-print-json (:data response)))
        (println "Error:" (:data response)))))
```

[top](#)

openai/model-delete

(**model-delete** **model** & **options**)

Deletes a model instance.

Parameter «model»

The ID of the model to use for this request

Parameter «options»

:openai-api-key An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers Additional headers. E.g.: {"OpenAI-Beta" "models=v2"}
:uri An OpenAI models URI. E.g.: "https://api.openai.com/v1/models/{model}".

	Defaults to "https://api.openai.com/v1/models/{model}"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

[top](#)

openai/thread-create

```
(thread-create & options)
```

Create a thread that assistants can interact with.

Parameter «options»

:messages A list of messages

:tool-resources	A set of resources that are made available to the assistant's tools in this thread. The resources are specific to the type of tool. For example, the code_interpreter tool requires a list of file IDs, while the file_search tool requires a list of vector store IDs.
:metadata	Set of 16 key-value pairs that can be attached to an object. This can be useful for storing additional information about the object in a structured format. Keys can be a maximum of 64 characters long and values can be a maximum of 512 characters long.
:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
:headers	Additional headers. E.g.: {"OpenAI-Beta" "assistants=v2"}
:uri	An OpenAI assistants URI. E.g.: "https://api.openai.com/v1/threads". Defaults to "https://api.openai.com/v1/threads"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

See:

[openai/thread-retrieve](#)

Retrieves a thread.

[top](#)

[openai/thread-retrieve](#)

```
(thread-retrieve thread-id & options)
```

Retrieves a thread.

Parameter `thread-id`

The ID of the thread to retrieve.

Parameter «options»

:openai-api-key	An optional OpenAI API Key. As default the key is read from the environment variable "OPENAI_API_KEY".
-----------------	--

:headers	Additional headers. E.g.: {"OpenAI-Beta" "assistants=v2"}
:uri	An OpenAI assistants URI. E.g.: "https://api.openai.com/v1/threads/{thread-id}". Defaults to "https://api.openai.com/v1/threads/{thread-id}"
:debug	An optional debug flag (true/false). Defaults to false. In debug mode prints the HTTP request and response data

Return value

Returns a map with the response data:

:status	The HTTP status (a long)
:mimetype	The content type's mimetype
:headers	A map of headers. key: header name, value: list of header values
:data	If the response HTTP status is <code>HTTP_OK</code> the data fields contains the chat completion message. If the response HTTP status is not <code>HTTP_OK</code> the data fields contains an error message formatted as plain or JSON string.

See:

- [OpenAI Models API](#)

```
(do
  (load-module :openai)

  (let [response  (openai/thread-retrieve "thread_abc123"
                                         :headers { "OpenAI-Beta" "assistants=v2" })]
    (openai/assert-response-http-ok response)
    (prn (:data response))))
```

SEE ALSO

[openai/thread-create](#)

Create a thread that assistants can interact with.

[openai/thread-retrieve](#)

Retrieves a thread.

[top](#)

or

```
(or x)
(or x & next)
```

Ors the predicate forms

```
(or true false)
=> true
```

```
(or false false)
=> false
```

```
(or nil 100)
=> 100
```

```
(or)
=> false
```

SEE ALSO

[and](#)

Ands the predicate forms

[not](#)

Returns true if x is logical false, false otherwise.

[top](#)

or-timeout

(**or-timeout** p time time-unit)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
  (or-timeout 500 :milliseconds)
  (then-apply str/upper-case)
  (deref))
=> "THE QUICK BROWN FOX"

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
  (or-timeout 200 :milliseconds)
  (then-apply str/upper-case)
  (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
  (then-apply str/upper-case)
  (or-timeout 200 :milliseconds)
  (deref))
=> TimeoutException: java.util.concurrent.TimeoutException
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

ordered-map

```
(ordered-map & keyvals)
(ordered-map map)
```

Creates a new ordered map containing the items.

```
(ordered-map :a 1 :b 2)
=> {:a 1 :b 2}

(ordered-map (hash-map :a 1 :b 2))
=> {:a 1 :b 2}
```

[top](#)

ordered-map?

```
(ordered-map? obj)
```

Returns true if obj is an ordered map

```
(ordered-map? (ordered-map :a 1 :b 2))
=> true
```

[top](#)

[parsifal/>>](#)

```
(>> p)
(>> p q)
(>> p q & ps)
```

Returns a new parser that parses a list of parsers. Returns the value of the last parser if all parsers succeed, else the parser fails.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parser `>>` does not rewind the input state if any of the sub parsers fails. `>>*` is the backtracking version of `>>` that wraps the parsers within a call to `attempt`. See the backtracking example below.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/>> (p/char #\lparen) (p/digit) (p/char #\rparen)) "(1)"
  ; => #\)

  ; Using bindings
  (p/run (p/let->> [l (p/char #\lparen)
                      d (p/digit)
                      r (p/char #\rparen)]
                  (p/always (str l d r)))
         "(1)"
  ; => "(1)"
  )

; Backtracking demo
(do
  (load-module :parsifal ['parsifal :as 'p])

  ; No backtracking with `>>` parser
  (p/run (p/either (p/>> (p/letter) (p/digit))
                    (p/letter))
         "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Backtracking with `>>*` parser
  (p/run (p/either (p/>>* (p/letter) (p/digit))
                    (p/letter))
         "abc")
  ; => #\a
)
```

[top](#)

parsifal/SourcePosition

Defines a protocol to add line and column information for custom tokens.

Definition:

```
(defprotocol SourcePosition
  (line [p])
  (column [p]))

(do
  (load-module :parsifal ['parsifal :as 'p])

  (deftype :Token [type :keyword, val :string, line :long, column :long]
  Object
    (toString [this] (str/format "[%s %s (%d,%d)]"
                                (pr-str (:type this))
                                (pr-str (:val this))
                                (:line this)
                                (:column this)))
  p/SourcePosition
    (line [this] (:line this)))
```

```
(column [this] (:column this))

(p/defparser lbracket []
  (p/let->> [[l c] (p/pos)
               t      (p/char #\[)])
  (p/always (Token. :lbracket (str t) l c)))

(p/run (lbracket) "[1,2,3]")
; => [:lbracket "[" (1,1)]
)
```

SEE ALSO

defprotocol

Defines a new protocol with the supplied function specs.

deftype

Defines a new custom record type for the name with the fields.

[top](#)

parsifal/always

```
(always x)
```

A parser that always succeeds with the value given and consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [t (p/many1 (p/digit))]
    (p/always (long (apply str t)))))

  (p/run (integer) "400")
; => 400
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser optional [p default-value]
    (p/either (p/attempt p)
              (p/always default-value)))

  (p/run (optional (p/char #\X) #\?) "X400")
; => #\X

  (p/run (optional (p/char #\X) #\?) "400")
; => #\?
)
```

[top](#)

parsifal/any

```
(any)
```

Consume any single item from the head of the input. This parser will fail to consume if the input is empty.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any) "Cats")
  ; => #\C

  (p/run (p/any) [#\C #\a #\t #\s])
  ; => #\C
)
```

[top](#)

parsifal/any-char

(any-char)

Consume any character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any-char) "Cats")
  ; => #\C

  (p/run (p/any-char) [#\C #\a #\t #\s])
  ; => #\C
)
```

[top](#)

parsifal/any-char-of

(any-char-of s)

Consume any of the characters given in the string. E.g.: (any-char-of "[{").

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any-char-of "HXYZ") "Hello, world!")
  ; => #\H
)
```

[top](#)

parsifal/attempt

(attempt p)

A parser that will attempt to parse `p`, and upon failure never consume any input.

Note: `Parsifal` is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parsers `>>` and `let->>` do not rewind the input state if any of the sub parsers fails. To add backtracking parsers can be wrapped with `attempt!`

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser optional [p default-value]
    (p/either (p/attempt p)
              (p/always default-value)))

  (p/run (optional (p/char #\X) #\?) "400")
  ; => #\?

)

(do
  (load-module :parsifal ['parsifal :as 'p])

  ; Backtracking

  ; No implicit backtracking with `>>` parser!
  (p/run (p/either (p/>> (p/letter) (p/digit))
                    (p/letter)))
         "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Explicit backtracking with `>>` parser using `attempt`!
  (p/run (p/either (p/attempt (p/>> (p/letter) (p/digit)))
                    (p/letter)))
         "abc")
  ; => #\a
)
```

top

parsifal/between

```
(between open close p)
```

Returns a new parser that parses `open`, `p`, and `close` returning the value of `p` and discarding the values of `open` and `close`. Does not consume any input on failure.

```
(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/run (p/between (p/char #\lparen)
                     (p/char #\rparen)
                     (p/many1 (p/digit)))
         "(123)")
  ; => [#\1 #\2 #\3]
)
```

top

parsifal/char

(char)

Consume the given character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/char #\H) "Hello")
  ; => #\H

  (p/run (p/char #\H) [#\H #\e #\l #\l #\o])
  ; => #\H
)
```

top

parsifal/choice

(choice & p)

Returns a new parser that tries each given parsers in turn, returning the value of the first one that succeeds.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "Hello")
  ; => [#\H #\e #\l #\l #\o]

  (p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
  ; => [#\4 #\2]
)
```

top

parsifal/defparser

(defparser name args & body)

The `defparser` macro defines _functions_ that create parsers.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parsers created by this macro do not rewind the input state if one of the sub parsers fails. To allow backtracking `attempt` can be used!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser sample []
    (p/string "Hello")
    (p/always 42))
```

```

(p/run (sample) "Hello, world!")
; => 42
)

(do
(load-module :parsifal ['parsifal :as 'p])

; Backtracking

(p/defparser letter-and-digit []
  (p/letter)
  (p/digit))

; No implicit backtracking!
(p/run (p/either (letter-and-digit) (p/letter)) "abc")
; => ParseError: Unexpected token 'b' at line: 1 column: 2

; Explicit backtracking with `attempt`!
(p/run (p/either (p/attempt (letter-and-digit)) (p/letter)) "abc")
; => #\a
)

```

[top](#)

parsifal/digit

(digit)

Consume a digit [0-9] character.

Note: Works with char items only!

```

(do
(load-module :parsifal ['parsifal :as 'p])

(p/run (p/digit) "123")
; => #\1

(p/run (p/any-char) [#\1 #\2 #\3])
; => #\1
)

```

[top](#)

parsifal/either

(either p q)

Returns a new parser that tries `p`, upon success, returning its value, and upon failure (if no input was consumed) tries to parse `q`.

```

(do
(load-module :parsifal ['parsifal :as 'p])

(p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter)))) "Hello")
; => [#\H #\e #\l #\l #\o]
)

```

```
(p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
; => [#\4 #\2]
)
```

top

parsifal/eof

```
(eof)
(eof err-msg)
```

A parser to detect the end of input. If there is nothing more to consume from the underlying input, this parser succeeds with a `nil` value, otherwise it fails.

A custom error message can be provided for the case the parser fails.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/eof ""))
; => nil

  (p/run (p/eof) "a")
; => ParseError: Expected end of input at line: 1 column: 1
)
```

top

parsifal/hexdigit

```
(hexdigit)
```

Consume a hex digit [0-9a-fA-F] character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/hexdigit) "A00")
; => #\A

  (p/run (p/hexdigit) [#\A #\0 #\0])
; => #\A
)
```

top

parsifal/let->>

```
(let->> [& bindings_] & body)
```

Binds parser results to names for further processing input.

Note: `Parsifal` is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

The parser `let->>` does not rewind the input state if one of the sub parsers fails. `let->>*` is the backtracking version of `let->>` that wraps the parsers within a call to `attempt`. See the backtracking example below.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser float []
    (p/let->> [i (p/many1 (p/digit))
                d (p/char #\.)
                f (p/many1 (p/digit))])
    (p/always (apply str (flatten (list i d f))))))

  (p/run (float) "10.56")
  ; => "10.56"
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser int []
    (p/let->> [i (p/many1 (p/digit))]
      (let [n (long (apply str i))]
        (if (even? n)
          (p/always (str n " is even"))
          (p/always (str n " is odd")))))

    (p/run (int) "500")
    ; => "500 is even"
)

; Backtracking demo
(do
  (load-module :parsifal ['parsifal :as 'p])

  ; No backtracking with `let->>` parser!
  (p/run (p/either (p/let->> [c (p/letter)
                                 d (p/digit)]
                           (p/always (list c d)))
                    (p/letter)))
        "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2

  ; Backtracking with `let->>*` parser
  (p/run (p/either (p/let->>* [c (p/letter)
                                 d (p/digit)]
                           (p/always (list c d)))
                    (p/letter)))
        "abc")
  ; => #\a
)
```

top

parsifal/letter

```
(letter)
```

Consume a letter character defined by Java `Character.isLetter(ch)`.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/letter) "Cats")
  ; => #\C

  (p/run (p/letter) [#\C #\a #\t #\s])
  ; => #\C
)
```

top

parsifal/letter-or-digit

(letter-or-digit)

Consume a letter or digit character defined by Java `Character.isLetterOrDigit(ch)`.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/letter-or-digit) "Cats")
  ; => #\C

  (p/run (p/letter-or-digit) "5Cats")
  ; => #\5

  (p/run (p/letter-or-digit) [#\C #\a #\t #\s])
  ; => #\C
)
```

top

parsifal/lineno

(lineno)

A parser that returns the current line number. It consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [l (p/lineno)
                t (p/many1 (p/digit))])
    (p/always [:int (apply str t) l])))

  (p/run (integer) "400")
  ; => [:int "400" 1]
)
```

parsifal/lookahead

```
(lookahead p)
```

A parser that upon success consumes no input, but returns what was parsed.

Note: *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser block-string-tok []
    (p/between (p/times 3 (p/char #\quote))
                (p/times 3 (p/char #\quote))
                (p/many (p/let-> [cs (p/lookahead (p/times 3 (p/any-char)))]
                               (if (= cs [#\quote #\quote #\quote])
                                   (p/never)
                                   (p/any-char))))))

  (p/defparser block-string []
    (p/let-> [s (block-string-tok)]
      (p/always (apply str s)))))

  (p/run (block-string) "\"\"\"A \"string\" with quotes!\"\"\"")
  ; => "A \"string\" with quotes!"
)
```

parsifal/many

```
(many p)
```

Returns a new parser that will parse zero or more items that match the given parser `p`. The matched items are concatenated into a sequence.

Note: A ParseError will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/many (p/digit)) "1234-0000")
  ; => [#\1 #\2 #\3 #\4]

  (p/run (p/many (p/digit)) "ABC-12345")
  ; => []
)
```

parsifal/many1

```
(many1 p)
```

Returns a new parser that will parse one or more items that match the given parser `p`. The matched items are concatenated into a sequence.

Note: A ParseError will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/many1 (p/digit)) "1234-0000")
  ; => [#\1 #\2 #\3 #\4]

  (p/run (p/many1 (p/digit)) "ABC-12345")
  ; => ParseError: Unexpected token 'A' at line: 1 column: 1
)
```

top

parsifal/never

```
(never)
(never err-msg)
(never err-msg line column)
```

A parser that always fails, consuming no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  ;; parse a string with a single integer
  (p/defparser single-integer [])
  (p/let->> [i (p/many1 (p/digit))
              t (p/either (p/eof) (p/any))]
  (if (nil? t)
      (p/always (apply str i))
      (p/never (str "Unexpected token '" t "'"))))

  (p/run (single-integer) "400")
  ; => "400"

  (p/run (single-integer) "400-")
  ; => ParseError: Unexpected token '-' at line: 1 column: 5
)
```

top

parsifal/none-char-of

```
(none-char-of s)
```

Consume all but of the characters given in the string. E.g.: `(none-char-of "[{}")`.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])
```

```
(p/run (p/none-char-of "()[]{}") "Hello, world!")
; => #\H
)
```

top

parsifal/not-char

(not-char)

Consume all but the given character

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/not-char #\x) "Cats")
  ; => #\C

  (p/run (p/not-char #\x) [#\C #\a #\t #\s])
  ; => #\C
)
```

top

parsifal/pos

(pos)

A parser that returns the current line/column number as tuple of [line col] . It consumes no input.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/defparser integer []
    (p/let->> [[l c] (p/pos)
                 t      (p/many1 (p/digit))])
    (p/always [:int (apply str t) (list l c)]))

  (p/run (integer) "400")
  ; => [:int "400" (1,1)]
)
```

top

parsifal/run

(run p input)

Run a parser p over some input. The input can be a string or a seq of tokens, if the parser produces an error, its message is wrapped in a *ParseError* and thrown, and if the parser succeeds, its value is returned.

Parsifal is port of Nate Young's Clojure Parsatron [parser combinators](#) project.

Parsifal is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like `lookahead` and `attempt`.

A simple parser example:

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/char #\H) "Hello")
  ; => #\H

  (p/run (p/char #\H) [#\H #\e #\l #\l #\o])
  ; => #\H
)
```

[top](#)

parsifal/string

```
(string s)
```

Consume the given string and returns a string. Does not consume any input upon failure.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/string "Hello") "Hello, world!")
  ; => "Hello"

  (p/run (p/string "Hello") (seq "Hello, world!"))
  ; => "Hello"
)

(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
  ; => "Hello"

  (p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
  ; => #\H
)
```

[top](#)

parsifal/times

```
(times n p)
```

Returns a new parser that consumes exactly `n` times what the parser `p` matches. The matched items are concatenated into a sequence. Does not consume any input if not all of the repetitions match.

```
(do
  (load-module :parsifal ['parsifal :as 'p])
```

```
(p/run (p/times 5 (p/letter)) "Hello, world!")
; => [#\H #\e #\l #\l #\o]

;; Note: `p/times` is different from parsing letters explicitly
(p/run (p/>> (p/letter)
              (p/letter)
              (p/letter)
              (p/letter)
              (p/letter))
      "Hello, world!")
; => [#\o]
)
```

[top](#)

parsifal/token

(token)

Consume a single item from the head of the input if `(consume? item)` predicate is not `nil`. This parser will fail to consume if either the `consume?` test returns `false` or if the input is empty.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/token #(< % 5)) [3 5 7])
  ; => 3

  (p/run (p/token str/upper-case) "Hello")
  ; => #\H
)
```

[top](#)

partial

(partial f args*)

Takes a function `f` and fewer than the normal arguments to `f`, and returns a fn that takes a variable number of additional args. When called, the returned function calls `f` with `args + additional args`.

```
((partial * 2) 3)
=> 6

(map (partial * 2) [1 2 3 4])
=> (2 4 6 8)

(map (partial reduce +) [[1 2 3 4] [5 6 7 8]])
=> (10 26)

(do
  (def hundred-times (partial * 100))
  (hundred-times 5))
=> 500
```

partition

```
(partition n coll)
(partition n step coll)
(partition n step padcoll coll)
```

Returns a collection of lists of n items each, at offsets step apart. If step is not supplied, defaults to n, i.e. the partitions do not overlap. If a padcoll collection is supplied, use its elements as necessary to complete last partition upto n items. In case there are not enough padding elements, return a partition with less than n items. padcoll may be a lazy sequence

```
(partition 3 [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5])

(partition 3 3 (repeat 99) [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6 99 99])

(partition 3 3 [] [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6])

(partition 2 3 [0 1 2 3 4 5 6])
=> ([0 1] [3 4])

(partition 3 1 [0 1 2 3 4 5 6])
=> ([0 1 2] [1 2 3] [2 3 4] [3 4 5] [4 5 6])

(partition 3 6 ["a"] (range 20))
=> ((0 1 2) (6 7 8) (12 13 14) (18 19 "a"))

(partition 4 6 ["a" "b" "c" "d"] (range 20))
=> ((0 1 2 3) (6 7 8 9) (12 13 14 15) (18 19 "a" "b"))
```

```

Returns the PID of this process.

```
(pid)
```

```
=> "50855"
```

[top](#)

pmap

```
(pmap f coll)
(pmap f coll & colls)
```

Like `map`, except `f` is applied in parallel. Only useful for computationally intensive functions where the time of `f` dominates the coordination overhead.

The result collection is sorted in the same way as for `map`, i.e. it preserves the items' order in the `coll` (or `colls`) parameter(s) of `pmap`. In other words: calculation is done parallel, but the result is delivered in the order the input came (in `coll/colls`). In contrast, side effects of `f` (if any) are coming in random order!

`pmap` is implemented using Venice futures and processes `(+ 2 (cpus))` items in parallel.

; With `pmap`, the total elapsed time is just over 2 seconds:

```
(do
  (defn long-running-job [n]
    (sleep 2000) ; wait for 2 seconds
    (+ n 10))
  (time (pmap long-running-job (range 4))))
Elapsed time: 2.01s
=> (10 11 12 13)
```

```
;; With `map`, the total elapsed time is roughly 4 * 2 seconds:  
(do  
  (defn long-running-job [n]  
    (sleep 2000) ; wait for 2 seconds  
    (+ n 10))  
  (time (map long-running-job (range 4))))  
Elapsed time: 8.01s  
=> (10 11 12 13)
```

Offers an item to tail of the a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

[put-head!](#)

Puts an item to the head of a deque. The operation is synchronous, it waits indefinitely until the value can be placed on the queue.

[take-tail!](#)

Retrieves and removes the tail value of the deque, waiting if necessary until a value becomes available.

[offer-head!](#)

Offers an item to the head of a deque with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

pop

```
(pop coll)
```

For a list, returns a new list without the first item, for a vector, returns a new vector without the last item.

```
(pop '(1 2 3 4))  
=> (2 3 4)
```

```
(pop [1 2 3 4])  
=> [1 2 3]
```

[top](#)

pop!

```
(pop! stack)
```

Pops an item from a stack.

```
(let [s (stack)]  
  (push! s 1)  
  (push! s 2)  
  (push! s 3)  
  (pop! s))  
=> 3
```

SEE ALSO

[stack](#)

Creates a new mutable threadsafe stack.

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

[push!](#)

Pushes an item to a stack.

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[count](#)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

pos?

```
(pos? x)
```

Returns true if x greater than zero else false

```
(pos? 3)  
=> true
```

```
(pos? -3)  
=> false
```

```
(pos? 3I)
=> true
```

```
(pos? 3.2F)
=> true
```

```
(pos? 3.2)
=> true
```

```
(pos? 3.2M)
=> true
```

SEE ALSO

[zero?](#)

Returns true if x zero else false

[neg?](#)

Returns true if x smaller than zero else false

[top](#)

postwalk

```
(postwalk f form)
```

Performs a depth-first, post-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

```
(postwalk (fn [x] (println "Walked:" (pr-str x)) x)
          '(1 2 {:a 1 :b 2}))
Walked: 1
Walked: 2
Walked: :a
Walked: 1
Walked: [:a 1]
Walked: :b
Walked: 2
Walked: [:b 2]
Walked: {:a 1 :b 2}
Walked: (1 2 {:a 1 :b 2})
=> (1 2 {:a 1 :b 2})
```

SEE ALSO

[prewalk](#)

Performs a depth-last, pre-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

[top](#)

postwalk-replace

```
(postwalk-replace smap form)
```

Recursively transforms form by replacing keys in smap with their values. Like `replace` but works on any data structure. Does replacement at the leaves of the tree first.

`postwalk-replace` is the equivalent of *Common Lisp*'s `sublis` function.

```
(postwalk-replace {:a 1 :b 2} [:a :b])
=> [1 2]

(postwalk-replace {:a 1 :b 2} [:a :b :c])
=> [1 2 :c]

(postwalk-replace {:a 1 :b 2} [:a :b [:a :b] :c])
=> [1 2 [1 2] :c]

(postwalk-replace {'x 1 'y 2} '(+ x y))
=> (+ 1 2)
```

SEE ALSO

[prewalk-replace](#)

Recursively transforms form by replacing keys in smap with their values. Like replace but works on any data structure. Does replacement ...

[postwalk](#)

Performs a depth-first, post-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

[top](#)

pow

```
(pow x y)
```

Returns the value of x raised to the power of y

```
(pow 10 2)
=> 100.0
```

```
(pow 10.23 2)
=> 104.6529
```

```
(pow 10.23 2.5)
=> 334.7257199023319
```

[top](#)

pr

```
(pr & xs)
(pr os & xs)
```

Prints the values `xs` to the output stream that is the current value of `*out*` or to the passed output stream `os` if given. The passed stream must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Prints the values, separated by spaces if there is more than one. `pr` and `prn` print in a way that objects can be read by the reader.

Returns `nil`.

```
(pr "hello")
"hello"
=> nil
```

```
(pr {:foo "hello" :bar 34.5})  
{:foo "hello" :bar 34.5}  
=> nil
```

```
(pr ['a :b "\n" #\space "c"])  
[a :b "\n" #\space "c"]  
=> nil
```

```
(pr *out* [10 20 30])  
[10 20 30]  
=> nil
```

```
(pr *err* [10 20 30])  
[10 20 30]  
=> nil
```

SEE ALSO

prn

Prints the values xs to the output stream that is the current value of *out* or to the passed stream os if given followed by a (newline).

newline

Without arg writes a platform-specific newline to the output channel that is the current value of *out*. With arg writes a newline ...

pr-str

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of ...

[top](#)

pr-str

```
(pr-str & xs)
```

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of the str values of the args with delimiter ''.

```
(pr-str)  
=> ""
```

```
(pr-str 1 2 3)  
=> "1 2 3"
```

```
(pr-str 1I)  
=> "1I"

[top](#)

preduce

```
(preduce n combine-fn combine-seed reduce-fn reduce-seed coll)
(preduce n reduce-fn reduce-seed coll)
```

Reduces a collection using a parallel reduce-combine strategy. The collection is partitioned into groups of approximately n items, each of which is reduced with reduce-fn (with reduce-seed as its seed value) in parallel. The results of these reductions are then reduced with the combine-fn (with combine-seed as its seed value). Without an explicit combine-fn the reduce-fn and its seed reduce-seed will be used as combine-fn and combine-seed.

```
(preduce 3 + 0 + 0 [1 2 3 4 5])
=> 15
```

```
(preduce 3 (fn [acc x] (+ acc x)) 0 (fn [acc x] (+ acc x)) 0 [1 2 3 4 5])
=> 15
```

```
(preduce 3 + 0 [1 2 3 4 5])
=> 15
```

```
(preduce 3 (fn [acc x] (+ acc x)) 0 [1 2 3 4 5])

Performs a depth-last, pre-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

[top](#)

print

```
(print & xs)
(print os & xs)
```

Prints the values `xs` to the stream that is the current value of `*out*` or to the passed stream `os` that must be a subclass of either `:java.io.PrintStream` or `:java.io.Writer`.

Prints the values, separated by spaces if there is more than one. `print` and `println` print in a human readable form.

If the printed data needs to be read back by a Venice reader use the functions `pr` and `prn` instead.

Returns `nil`.

```
(print [10 20 30])
[10 20 30]
=> nil
```

```
(print *out* [10 20 30])
[10 20 30]
=> nil
```

```
(print *err* [10 20 30])
[10 20 30]
=> nil
```

SEE ALSO

`println`

Prints the values `xs` to the stream that is the current value of `*out*` or to the passed output stream `os` if given followed by a (newline).

`printf`

Without output stream prints formatted output as per format to the stream that is the current value of `*out*`. With a stream prints ...

prof

```
(prof opts)
```

Controls the code profiling. See the companion functions/macros 'dorun' and 'perf'. The perf macro is built on prof and dorun and provides all for simple Venice profiling.

The profiler reports a function's elapsed time as "time with children"!

Profiling recursive functions:

Because the profiler reports "time with children" and accumulates the elapsed time across all recursive calls the resulting time for a particular recursive function is higher than the effective time.

```
(do
  (prof :on) ; turn profiler on
  (prof :off) ; turn profiler off
  (prof :status) ; returns the profiler on/off status
  (prof :clear) ; clear profiler data captured so far
  (prof :data) ; returns the profiler data as map
  (prof :data-formatted) ; returns the profiler data as formatted text
  (prof :data-formatted "Metrics") ; returns the profiler data as formatted text with a title
  nil)
=> nil
```

SEE ALSO

[perf](#)

Performance test with the given expression.

[time](#)

Evaluates expr and prints the time it took. Returns the value of expr.

[top](#)

promise

```
(promise)
(promise fn)
```

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, unless the variant of deref with timeout is used. All subsequent derefs will return the same delivered value without blocking.

Promises are implemented on top of Java's `CompletableFuture`.

```
(do
  (def p (promise))
  (deliver p 10)
  (deliver p 20) ; no effect
  @p)
=> 10

;; deliver the promise from a future
(do
  (def p (promise))
  (defn task1 [] (sleep 500) (deliver p 10))
  (defn task2 [] (sleep 800) (deliver p 20))
  (future task1)
  (future task2)
  @p)
=> 10

;; deliver the promise from a task's return value
(do
  (defn task [] (sleep 300) 10)
  (def p (promise task))
  @p)
=> 10
```

```
(let [p (promise #(do (sleep 300) 10))]
  @p)
=> 10
```

SEE ALSO

[deliver](#)

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

[promise?](#)

Returns true if f is a Promise otherwise false

[realized?](#)

Returns true if a value has been produced for a promise, delay, or future.

[deref](#)

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

[done?](#)

Returns true if the future or promise is done otherwise false

[cancel](#)

Cancels a future or a promise

[cancelled?](#)

Returns true if the future or promise is cancelled otherwise false

[all-of](#)

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

[any-of](#)

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[timeout-after](#)

Returns a promise that timeouts after the specified time. The promise throws a TimeoutException.

promise?

```
(promise? p)
```

Returns true if f is a Promise otherwise false

```
(promise? (promise))  
=> true
```

top

proxy

```
(proxyify interface method-map)
```

Proxies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

The dynamic invocation handler takes care that the methods are called in the context of a Venice sandbox even if the Java method that invokes the callback methods is running in another thread.

Supports default method implementations in the proxied Java interface. These Java interface methods can be either overridden by a Venice function or just be omitted. In the latter case the return value of methods default implementation will be handed back.

In case a Java `FunctionalInterface` is required the proxy wrappers from the `:java` module are often simpler to use:

- `java/as-runnable`
- `java/as-callable`
- `java/as-predicate`
- `java/as-function`
- `java/as-consumer`
- `java/as-supplier`
- `java/as-bipredicate`
- `java/as-bifunction`
- `java/as-biconsumer`
- `java/as-binaryoperator`

```
(do  
  (import :java.io.File :java.io.FilenameFilter)  
  
  (def file-filter  
    (fn [dir name] (str/ends-with? name ".xxx")))  
  
  (let [dir (io/tmp-dir)]  
    ;; create a dynamic proxy for the interface FilenameFilter  
    ;; and implement its function 'accept' by 'file-filter'  
    (. dir :list (proxyify :FilenameFilter {:accept file-filter})))  
=> []  
  
  ;; Instead of explicit proxies, functional interface wrappers are  
  ;; often simpler to use  
  (do  
    (load-module :java)  
    (import :java.util.stream.Collectors)  
  
    (-> (. [1 2 3 4] :stream)  
         (. :filter (java/as-predicate #(> % 2))))
```

```
(. :map (java/as-function #(* % 10)))
(. :collect (. :collectors :toList)))
=> (30 40)
```

(1 2 3)
=> nil
```

SEE ALSO

deque

Creates a new mutable threadsafe bounded or unbounded deque.

take!

Retrieves and removes the head value of the queue or the deque, waiting if necessary until a value becomes available.

offer!

Offers an item to tail of the a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

take-tail!

Retrieves and removes the tail value of the deque, waiting if necessary until a value becomes available.

offer-head!

Offers an item to the head of a deque with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

poll-tail!

Polls an item from the tail of a deque with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[qrbill/address](#)

Create a combined or structured address

[qrbill/bill](#)

Create a bill data object

qrcode/decode

(decode source)

Decode a QR code image. Returns the text decoded from the QR code image.

Loads the image from a `:java.io.File`, `:java.io.InputStream` or a `:java.awt.image.BufferedImage`

```
(do
  (load-module :qrcode)
  (qrcode/decode (io/file "./example.png")))
```

SEE ALSO

[qrcode/encode](#)

Encodes text into a PNG QR code image. Writes the generated QR code image to the supplied output stream.

qrcode/encode

(encode text width height margin os)

Encodes text into a PNG QR code image. Writes the generated QR code image to the supplied output stream.

Arguments:

text	The text to encode in the QR code image
width	the image width in pixels
height	the image height in pixels
margin	the image margin in pixels
os	The output stream to write the image to

```
(do
  (load-module :qrcode)
  (qrcode/encode "Hello" 600 600 3 (io/file-out-stream "./example.png")))
```

SEE ALSO

[qrcode/decode](#)

Decode a QR code image. Returns the text decoded from the QR code image.

qrref/checksum

(checksum ref)

Computes the checksum for a raw reference.

The passed ref may be a raw QR reference or a QR reference with a checksum digit. It may contain spaces.

Returns the computed checksum digit 0..9.

If the passed ref is a QR reference with a correct checksum digit the computed checksum digit will always be 0. This fact is used for QR reference validation!

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/checksum "230 55361 34663 9301")
  (qr/checksum "23055361346639301")
  (qr/checksum "00 00000 00230 55361 34663 9301")
  (qr/checksum "0000000023055361346639301"))
=> 3
```

SEE ALSO

[qrref/create](#)

Creates a QR reference according to the Swiss payment standards.

[qrref/valid?](#)

Returns true if ref is a valid QR reference else false. The reference may contain spaces.

[qrref/format](#)

Format a QR reference.

[top](#)

qrref/create

```
(create ref-raw)
```

Creates a QR reference according to the Swiss payment standards.

A QR reference has 27 digits. The raw reference plus a checksum digit as the last digit.

The raw reference passed must not have more than 26 digits. With less than 26 digits leading '0' will be used to fill up to 26 digits.

Raw reference: "23055361346639301"

QR reference: "00000000230553613466393013"

The QR reference can be formatted to "00 00000 00230 55361 34663 93013" using:

```
(qrref/format "00000000230553613466393013")
```

[Swiss Payment Standards / de](#)

[Swiss Payment Standards / en](#)

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/create "1234")
  (qr/create "23055361346639301"))
=> "00000000230553613466393013"
```

SEE ALSO

[qrref/valid?](#)

Returns true if ref is a valid QR reference else false. The reference may contain spaces.

[qrref/format](#)

Format a QR reference.

[qrref/checksum](#)

Computes the checksum for a raw reference.

qrref/format

(format ref)

Format a QR reference.

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/format "000000000230553613466393013"))
=> "00 0000 00230 55361 34663 93013"
```

SEE ALSO

[qrref/create](#)

Creates a QR reference according to the Swiss payment standards.

[qrref/valid?](#)

Returns true if ref is a valid QR reference else false. The reference may contain spaces.

[qrref/checksum](#)

Computes the checksum for a raw reference.

qrref/valid?

(valid? ref)

Returns true if ref is a valid QR reference else false. The reference may contain spaces.

A valid QR reference must have 27 digits and the checksum must be correct. The last digit is the checksum digits for the first 26 digits.

```
(do
  (load-module :qrref ['qrref :as 'qr])
  (qr/valid? "000000000230553613466393013")
  (qr/valid? "00 0000 00230 55361 34663 93013"))
=> true
```

SEE ALSO

[qrref/create](#)

Creates a QR reference according to the Swiss payment standards.

[qrref/format](#)

Format a QR reference.

[qrref/checksum](#)

Computes the checksum for a raw reference.

qualified-name

```
(name x)
```

Returns the qualified name String of a string, symbol, keyword, or function

```
(qualified-name :user/x)  
=> "user/x"
```

```
(qualified-name 'x)  
=> "x"
```

```
(qualified-name "x")  
=> "x"
```

```
(qualified-name str/digit?)  
=> "str/digit?"
```

SEE ALSO

[name](#)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

[namespace](#)

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[fn-name](#)

Returns the qualified name of a function or macro

[top](#)

qualified-symbol?

```
(qualified-symbol? x)
```

Returns true if x is a qualified symbol

```
(qualified-symbol? 'foo/a)  
=> true
```

```
(qualified-symbol? (symbol "foo/a"))  
=> true
```

```
(qualified-symbol? 'a)  
=> false
```

```
(qualified-symbol? nil)  
=> false
```

```
(qualified-symbol? :a)  
=> false
```

[top](#)

quasiquote

```
(quasiquote form)
```

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

unquote:

It is possible to unquote part of the form that is quoted with `~`. Unquoting allows you to evaluate parts of the syntax quoted expression.

unquote-splicing:

Unquote evaluates to a collection of values and inserts the collection into the quoted form. But sometimes you want to unquote a list and insert its elements (not the list) inside the quoted form. This is where `~@` (unquote-splicing) comes to rescue.

```
(quasiquote (16 17 (inc 17)))
=> (16 17 (inc 17))
```

```
`(16 17 (inc 17))
=> (16 17 (inc 17))
```

```
`(16 17 ~(inc 17))
=> (16 17 18)
```

```
`(16 17 ~(map inc [16 17]))
=> (16 17 (17 18))
```

```
`(16 17 ~@(map inc [16 17]))
=> (16 17 17 18)
```

```
`(1 2 ~@#{1 2 3})
=> (1 2 1 2 3)
```

```
`(1 2 ~@{:a 1 :b 2 :c 3})
=> (1 2 [:a 1] [:b 2] [:c 3])
```

SEE ALSO

quote

There are two equivalent ways to quote a form either with `quote` or with `'`. They prevent the quoted form from being evaluated.

[top](#)

queue

```
(queue)
(queue capacity)
```

Creates a new mutable threadsafe bounded or unbounded queue.

The queue can be turned into a synchronous queue when using the functions `put!` and `take!`. `put!` waits until the value be added and `take!` waits until a value is available from queue thus synchronizing the producer and consumer.

```
; unbounded queue
(let [q (queue)]
  (offer! q 1)
  (offer! q 2)
  (offer! q 3)
  (poll! q)
  q)
=> (2 3)
```

```
; unbounded queue
(let [q (conj! (queue) 1 2 3)]
```

```

(offer! q 4)
(poll! q)
q)
=> (2 3 4)

; bounded queue
(let [q (queue 10)]
(offer! q 1000 1)
(offer! q 1000 2)
(offer! q 1000 3)
(poll! q 1000)
q)
=> (2 3)

; bounded queue
(let [q (conj! (queue 10) 1 2 3)]
(offer! q 4)
(poll! q)
q)
=> (2 3 4)

; synchronous unbounded queue
(let [q (queue)]
(put! q 1)
(put! q 2)
(put! q 3)
(take! q)
q)
=> (2 3)

; synchronous bounded queue
(let [q (queue 10)]
(put! q 1)
(put! q 2)
(put! q 3)
(take! q)
q)
=> (2 3)

```

SEE ALSO

`peek`

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

`put!`

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

`take!`

Retrieves and removes the head value of the queue or the deque, waiting if necessary until a value becomes available.

`offer!`

Offers an item to tail of the a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

`poll!`

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

`empty`

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

`empty?`

Returns true if x is empty. Accepts strings, collections and bytebufs.

`count`

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

queue?

Returns true if coll is a queue

reduce

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

transduce

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be ...

docoll

Applies f to the items of the collection presumably for side effects. Returns nil.

into!

Adds all of the items of 'from' conjoined to the mutable 'to' collection

conj!

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

[top](#)

queue?

(queue? coll)

Returns true if coll is a queue

```
(queue? (queue))
=> true
```

[top](#)

quote

(quote form)

There are two equivalent ways to quote a form either with `quote` or with `'`. They prevent the quoted form from being evaluated.

Regular quotes work recursively with any kind of forms and types: strings, maps, lists, vectors...

```
(quote (1 2 3))
=> (1 2 3)
```

```
(quote (+ 1 2))
=> (+ 1 2)
```

```
'(1 2 3)
=> (1 2 3)
```

```
'(+ 1 2)
=> (+ 1 2)
```

```
'(a (b (c d (+ 1 2))))
=> (a (b (c d (+ 1 2))))
```

SEE ALSO

```

SEE ALSO

[future](#)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

[delay](#)

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[top](#)

recur

```
(recur expr*)
```

Evaluates the exprs and rebinds the bindings of the recursion point to the values of the exprs. The recur expression must be at the tail position. The tail position is a position which an expression would return a value from.

```

;; tail recursion
(loop [x 10]
  (when (> x 1)
    (println x)
    (recur (- x 2))))
10
8
6
4
2
=> nil

;; tail recursion
(do
  (defn sum [n]
    (loop [cnt n acc 0]
      (if (zero? cnt)
          acc
          (recur (dec cnt) (+ acc cnt)))))
  (sum 10000))
=> 50005000

```

SEE ALSO

loop

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

[top](#)

reduce

```
(reduce f coll)
(reduce f val coll)
```

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then applying f to that result and the 3rd item, etc. If coll contains no items, f must accept no arguments as well, and reduce returns the result of calling f with no arguments. If coll has only 1 item, it is returned and f is not called. If val is supplied, returns the result of applying f to val and the first item in coll, then applying f to that result and the 2nd item, etc. If coll contains no items, returns val and f is not called.

`reduce` can work with queues as collection, given that the end of the queue is marked by adding a `nil` element. Otherwise the reducer does not know when to stop reading elements from the queue.

```
(reduce + [1 2 3 4 5 6 7])
=> 28

(reduce + 10 [1 2 3 4 5 6 7])
=> 38

(reduce (fn [x y] (+ x y 10)) [1 2 3 4 5 6 7])
=> 88

(reduce (fn [x y] (+ x y 10)) 10 [1 2 3 4 5 6 7])
=> 108

((reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100)
=> 207
```

```

(reduce (fn [m [k v]] (assoc m k v)) {} {[[:a 1] [:b 2] [:c 3]]})
=> {:a 1 :b 2 :c 3}

(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})
=> {1 :a 2 :b 3 :c}

(reduce (fn [m c] (assoc m (first c) c)) {} {[[:a 1] [:b 2] [:c 3]]})
=> {:a [:a 1] :b [:b 2] :c [:c 3]}

;; sliding window (width 3) average
(-> (partition 3 1 (repeatedly 10 #(rand-long 30)))
     (map (fn [window] (/ (reduce + window) (count window)))))
=> (18 9 1 10 17 25 22 21)

;; reduce all elements of a queue.
;; calls (take! queue) to get the elements of the queue.
;; note: use nil to mark the end of the queue otherwise
;;       reduce will block forever!
(let [q (conj! (queue) 1 2 3 4 5 6 7 nil)]
  (reduce + q))
=> 28

;; reduce data supplied by a finit lazy seq
(do
  (def counter (atom 5))
  (defn generate []
    (swap! counter dec)
    (if (pos? @counter) @counter nil))
  (reduce + 100 (lazy-seq generate)))

Acquires a lock, blocking until the lock is available.

[try-acquire](#)

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

[locked?](#)

Returns true if the lock is in use else false.

[top](#)

remove

```
(remove predicate coll)
```

Returns a collection of the items in coll for which `(predicate item)` returns logical false.
Returns a transducer when no collection is provided.

```
(remove nil? [1 nil nil 4 5 6])  
=> (1 4 5 6)
```

```
(remove even? [1 2 3 4 5 6 7])  
=> (1 3 5 7)
```

```
(remove #{3 5} '(1 3 5 7 9))  
=> (1 7 9)
```

```
(remove #(= 3 %) '(1 2 3 4 5 6))  
=> (1 2 4 5 6)
```

[top](#)

remove-formal-type

```
(remove-formal-type object)
```

Removes the *formal type* from a Java object.

This is identical to casting an object back to its real type without knowing its real type.

```
(do  
  (let [p0 (. :java.awt.Point :new 0 0)  
        p1 (cast :java.lang.Object p0)  
        p2 (remove-formal-type p1)]  
    (println "p0 ->" (formal-type p0))  
    (println "p1 ->" (formal-type p1))  
    (println "p2 ->" (formal-type p2)))  
p0 -> :java.awt.Point  
p1 -> :java.lang.Object  
p2 -> :java.awt.Point  
=> nil
```

SEE ALSO

[formal-type](#)

Returns the formal type of a Java object.

[cast](#)

Casts a Java object to a specific type

[class](#)

Returns the Java class for the given name. Throws an exception if the class is not found.

[top](#)

remove-tap

```
(remove-tap f)
```

Remove f from the tap set.

```
(do
  (add-tap prn)
  (remove-tap prn))
=> nil
```

SEE ALSO

[add-tap](#)

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via tap>.

[tap>](#)

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

[top](#)

remove-watch

```
(remove-watch ref key)
```

Removes a watch function from an agent/atom reference.

```
(do
  (def x (agent 10))
  (defn watcher [key ref old new]
    (println "watcher: " key))
  (add-watch x :test watcher)
  (remove-watch x :test))
=> nil
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

repeat

```
(repeat x)
(repeat n x)
```

Returns a lazy sequence of x values or a collection with the value x repeated n times.

```
(repeat 3 "hello")
=> ("hello" "hello" "hello")

(repeat 5 [1 2])
=> ([1 2] [1 2] [1 2] [1 2] [1 2])

(repeat ":")
=> (...)
```

```
(interleave [:a :b :c] (repeat 100))
=> (:a 100 :b 100 :c 100)
```

SEE ALSO

[repeatedly](#)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

[repeatedly](#)

```
(repeatedly n fn)
```

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

```
(repeatedly 5 #(rand-long 11))
=> (1 4 0 9 3)
```

```
;; compare with repeat, which only calls the 'rand-long'
;; function once, repeating the value five times.
(repeat 5 (rand-long 11))
=> (8 8 8 8 8)
```

SEE ALSO

[repeat](#)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

[dotimes](#)

Repeatedly executes body with name bound to integers from 0 through n-1.

[constantly](#)

Returns a function that takes any number of arguments and returns always the value x.

[top](#)

[repl/add-env](#)

```
(repl/add-env name value)
```

Add (or replace) an env var to the REPL's local env file.

The REPL env file ('repl.env' on Unix or 'repl.env.bat' on Windows) is 'sourced' at REPL start time to make the contained vars available as system env vars!

DO NOT FORGET to restart the REPL after adding an env var!

Note: This function is only available when called from within a REPL!

Example

1. Add env var:

```
(repl/add-env "DEMO" "100")
```

2. Restart the REPL:

```
venice> !restart
```

3. Test:

```
(system-env "DEMO")
```

```
(repl/add-env "DEMO" "100")
```

SEE ALSO

[system-env](#)

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

[repl?](#)

Returns true if running within a REPL.

[repl/home-dir](#)

Returns the REPL home directory.

[repl/get-env](#)

Returns the value of a REPL local env var.

[repl/cat-env](#)

Returns the content of the REPL's local env file.

[repl/remove-env](#)

Remove an env var to the REPL's local env file.

[top](#)

repl/cat-env

```
(repl/cat-env)
```

Returns the content of the REPL's local env file.

The REPL env file ('repl.env' on Unix or 'repl.env.bat' on Windows) is 'sourced' at REPL start time to make the contained vars available as system env vars!

Note: This function is only available when called from within a REPL!

```
(printl (repl/cat-env))
```

SEE ALSO

[system-env](#)

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

[repl?](#)

Returns true if running within a REPL.

[repl/home-dir](#)

Returns the REPL home directory.

[repl/get-env](#)

Returns the value of a REPL local env var.

[repl/add-env](#)

Add (or replace) an env var to the REPL's local env file.

[repl/remove-env](#)

Remove an env var to the REPL's local env file.

repl/color-theme

([repl/color-theme](#))

Returns REPL's color theme (:light, :dark, :none)

([repl/color-theme](#))

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/color-theme!](#)

Set the REPL's color theme (:light, :dark)

[repl/prompt!](#)

Sets the REPL prompt string

[repl/handler!](#)

Sets the REPL command handler

[repl/info](#)

Returns information on the REPL.

repl/color-theme!

([repl/color-theme!](#) theme)

Set the REPL's color theme (:light, :dark)

([repl/color-theme!](#))

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/color-theme](#)

Returns REPL's color theme (:light, :dark, :none)

[repl/prompt!](#)

Sets the REPL prompt string

[repl/handler!](#)

Sets the REPL command handler

[repl/info](#)

Returns information on the REPL.

repl/get-env

```
(repl/get-env name)
```

Returns the value of a REPL local env var.

The REPL env file ('repl.env' on Unix or 'repl.env.bat' on Windows) is 'sourced' at REPL start time to make the contained vars available as system env vars!

Note: This function is only available when called from within a REPL!

```
(repl/get-env "DEMO")
```

SEE ALSO

[system-env](#)

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

[repl?](#)

Returns true if running within a REPL.

[repl/home-dir](#)

Returns the REPL home directory.

[repl/cat-env](#)

Returns the content of the REPL's local env file.

[repl/add-env](#)

Add (or replace) an env var to the REPL's local env file.

[repl/remove-env](#)

Remove an env var to the REPL's local env file.

[top](#)

repl/handler!

```
(repl/handler! f)
```

Sets the REPL command handler

```
(do
  (defn handle-command [cmd]
    ;; run the command 'cmd'
    (println "Demo:" cmd))

  (repl/handler! handle-command))
```

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/prompt!](#)

Sets the REPL prompt string

[repl/color-theme](#)

Returns REPL's color theme (:light, :dark, :none)

[repl/info](#)

Returns information on the REPL.

[top](#)

repl/home-dir

(repl/home-dir)

Returns the REPL home directory.

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/libs-dir](#)

Returns the REPL libs directory

[top](#)

repl/info

(repl/info)

Returns information on the REPL.

Note: This function is only available when called from within a REPL!

E.g.:

```
{ :term-name "JLine terminal"
  :term-type "xterm-256color"
  :term-cols 80
  :term-rows 24
  :term-colors 256
  :term-class :org.repackage.org.jline.terminal.impl.PosixSysTerminal
  :color-mode :light }
```

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-rows](#)

Returns number of rows in the REPL terminal.

[repl/term-cols](#)

Returns number of columns in the REPL terminal.

[top](#)

repl/libs-dir

(repl/libs-dir)

Returns the REPL libs directory

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/home-dir](#)

Returns the REPL home directory.

[top](#)

repl/prompt!

`(repl/prompt! s)`

Sets the REPL prompt string

`(repl/prompt! "venice> ")`

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/handler!](#)

Sets the REPL command handler

[repl/color-theme](#)

Returns REPL's color theme (:light, :dark, :none)

[repl/info](#)

Returns information on the REPL.

[top](#)

repl/remove-env

`(repl/remove-env name)`

Remove an env var to the REPL's local env file.

The REPL env file ('repl.env' on Unix or 'repl.env.bat' on Windows) is 'sourced' at REPL start time to make the contained vars available as system env vars!

To take a removed env var into effect a whole new REPL has to be started! A simple restart does not work!

Note: This function is only available when called from within a REPL!

`(repl/remove-env "DEMO")`

SEE ALSO

[system-env](#)

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or its value is nil.

[repl?](#)

Returns true if running within a REPL.

[repl/home-dir](#)

Returns the REPL home directory.

[repl/get-env](#)

Returns the value of a REPL local env var.

[repl/cat-env](#)

Returns the content of the REPL's local env file.

[repl/add-env](#)

Add (or replace) an env var to the REPL's local env file.

[top](#)

[repl/term-cols](#)

`(repl/term-cols)`

Returns number of columns in the REPL terminal.

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-rows](#)

Returns number of rows in the REPL terminal.

[repl/info](#)

Returns information on the REPL.

[top](#)

[repl/term-rows](#)

`(repl/term-rows)`

Returns number of rows in the REPL terminal.

Note: This function is only available when called from within a REPL!

SEE ALSO

[repl?](#)

Returns true if running within a REPL.

[repl/term-cols](#)

Returns number of columns in the REPL terminal.

[repl/info](#)

Returns information on the REPL.

[top](#)

[repl?](#)

`(repl?)`

Returns true if running within a REPL.

([repl?](#))

[top](#)

replace

([replace](#) smap coll)

Given a map of replacement pairs and a collection, returns a collection with any elements that are a key in smap replaced with the corresponding value in smap.

```
(replace {2 :two, 4 :four} [4 2 3 4 5 6 2])
=> [:four :two 3 :four 5 6 :two]

(replace {2 :two, 4 :four} #{1 2 3 4 5})
=> #{1 3 5 :four :two}

(replace {[{:a 10} [:c 30]} {:a 10 :b 20}})
=> {:b 20 :c 30}
```

[top](#)

reset!

([reset!](#) box newval)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

```
(do
  (def counter (atom 0))
  (reset! counter 99)
  @counter)
=> 99

(do
  (def counter (atom 0))
  (reset! counter 99))
=> 99

(do
  (def counter (volatile 0))
  (reset! counter 99)
  @counter)
=> 99
```

SEE ALSO

[atom](#)

Creates an atom with the initial value x.

[volatile](#)

Creates a volatile with the initial value x

reset-ns-meta!

```
(reset-ns-meta! n datamap)
```

Resets the metadata for a namespace

```
(do
  (ns foo)
  (reset-ns-meta! foo {}))
=> {}

(do
  (ns foo)
  (def n 'foo)
  (reset-ns-meta! (var-get n) {}))
  (pr-str (ns-meta (var-get n))))
=> "{}"
```

SEE ALSO

[ns-meta](#)

Returns the meta data of the namespace n or nil if n is not an existing namespace

[alter-ns-meta!](#)

Alters the metadata for a namespace. f must be free of side-effects.

[ns](#)

Opens a namespace.

resolve

```
(resolve symbol)
```

Resolves a symbol.

```
(resolve '+)
=> +
(resolve 'y)
=> nil

(resolve (symbol "+"))
=> +
((resolve (symbol "core" "+")) 1 2)
=> 3

((-> "first" symbol resolve) [1 2 3])
=> 1
```

SEE ALSO

symbol

Returns a symbol from the given name

[top](#)

rest

(rest coll)

Returns a possibly empty collection of the items after the first.

```
(rest nil)
=> nil
```

```
(rest [])
=> []
```

```
(rest [1])
=> []
```

```
(rest [1 2 3])
=> [2 3]
```

```
(rest '())
=> ()
```

```
(rest '(1))
=> ()
```

```
(rest '(1 2 3))
=> (2 3)
```

```
(rest "1234")
=> (#\2 #\3 #\4)
```

SEE ALSO

str/rest

Returns a possibly empty string of the characters after the first.

[top](#)

restart-agent

(restart-agent agent state)

When an agent is failed, changes the agent state to new-state and then un-fails the agent so that sends are allowed again.

```
(do
  (def x (agent 100))
  (restart-agent x 200)
  (deref x))
=> 200
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

reverse

(`reverse coll`)

Returns a collection of the items in coll in reverse order.

Returns a stateful transducer when no collection is provided.

```
(reverse [1 2 3 4 5 6])
=> [6 5 4 3 2 1]
```

```
(reverse "abcdef")
=> (#\f #\e #\d #\c #\b #\a)
```

SEE ALSO

[str/reverse](#)

Reverses a string

[top](#)

rf-any?

(`rf-any? pred`)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

```
(transduce (filter number?) (rf-any? pos?) [true -1 1 2 false])
=> true
```

SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

rf-every?

(`rf-every? pred`)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

```
(transduce (filter number?) (rf-every? pos?) [1 2 3])
=> true
```

SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

[top](#)

rf-first

(rf-first)

Returns a reducing function for a transducer that returns the first item.

```
(transduce (filter number?) rf-first [false 1 2])
=> 1
```

```
(transduce identity rf-first [nil 1 2])
=> nil
```

SEE ALSO

[rf-last](#)

Returns a reducing function for a transducer that returns the last item.

[rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

[rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

rf-last

(rf-last)

Returns a reducing function for a transducer that returns the last item.

```
(transduce (filter number?) rf-last [false 1 2])
=> 2
```

```
(transduce identity rf-last [1 2 1.2])
=> 1.2
```

SEE ALSO

[rf-first](#)

Returns a reducing function for a transducer that returns the first item.

[rf-any?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

[rf-every?](#)

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

[top](#)

[ring-multipart/multipart-request?](#)

`(ring-multipart/multipart-request? req)`

Returns true if the request is a multipart request 'multipart/form-data'

SEE ALSO

[ring-multipart/parts](#)

Returns a list of parts of a multipart HTTP request.

[ring-multipart/parts-delete-all](#)

Safely deletes for all parts the underlying storage for the file items, including deleting any associated temporary disk files.

[top](#)

[ring-multipart/parts](#)

`(ring-multipart/parts req)`

Returns a list of parts of a multipart HTTP request.

A part is map with the fields:

:name	The name of the part
:file-name	The file-name of the part or <i>nil</i> if not available
:size	The size of the file
:content-type	The content type of the part
:headers	A map of part's headers. key: header name, value: list of header values. The header names are mapped to lower case. Use <code>(first ("xxxx" :headers))</code> to get a single value header
:in-stream	The content part as input stream
:delete-fn	A function that deletes the underlying storage for a file item, including deleting any associated temporary disk file.

The part list is empty if the request is not a multipart request.

SEE ALSO

[ring-multipart/multipart-request?](#)

Returns true if the request is a multipart request 'multipart/form-data'

[ring-multipart/parts-delete-all](#)

Safely deletes for all parts the underlying storage for the file items, including deleting any associated temporary disk files.

[top](#)

ring-multipart/parts-delete-all

(`ring-multipart/parts-delete-all req`)

Safely deletes for all parts the underlying storage for the file items, including deleting any associated temporary disk files.

Calls the *delete-fn* on every part data map.

SEE ALSO

[ring-multipart/multipart-request?](#)

Returns true if the request is a multipart request 'multipart/form-data'

[ring-multipart/parts](#)

Returns a list of parts of a multipart HTTP request.

[top](#)

ring-mw/mw-debug

(`ring-mw/mw-debug handler option`)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

SEE ALSO

[ring-mw/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring-mw/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring-mw/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring-mw/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring-mw/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring-mw/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

ring-mw/mw-dump-request

(`ring-mw/mw-dump-request handler`)

Dumps the request and then calls the handler.

SEE ALSO

[ring-mw/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring-mw/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring-mw/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring-mw/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring-mw/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring-mw/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

[ring-mw/mw-dump-response](#)

([ring-mw/mw-dump-response](#) `handler`)

Calls the handler and the dumps the handler's response.

SEE ALSO

[ring-mw/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring-mw/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring-mw/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring-mw/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring-mw/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring-mw/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring-mw/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

[ring-mw/mw-identity](#)

([ring-mw/mw-identity](#) `handler`)

Identity, does effectively just delegate to the handler

SEE ALSO

[ring-mw/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring-mw/mw-print-uri](#)

Prints the URI from the request and then calls the handler

[ring-mw/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring-mw/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring-mw/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring-mw/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

[ring-mw/mw-print-uri](#)

([ring-mw/mw-print-uri](#) handler)

Prints the URI from the request and then calls the handler

SEE ALSO

[ring-mw/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring-mw/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring-mw/mw-request-counter](#)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

[ring-mw/mw-add-session](#)

Adds the session to the request. If a new session is created the given timeout is set as the MaxInactiveInterval. If a timeout is not ...

[ring-mw/mw-dump-request](#)

Dumps the request and then calls the handler.

[ring-mw/mw-dump-response](#)

Calls the handler and the dumps the handler's response.

[top](#)

[ring-mw/mw-request-counter](#)

([ring-mw/mw-request-counter](#) handler)

Increments the number requests, stores it in the attribute 'request-counter' in the session, and then calls the handler.

SEE ALSO

[ring-mw/mw-identity](#)

Identity, does effectively just delegate to the handler

[ring-mw/mw-debug](#)

Turns handler debug flag on the request on/off and then calls the handler with the modified request.

[ring-session/session-get-value](#)

Get a value from the session

[ring-session/session-remove-value](#)

Remove a value from the session

[ring-session/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[top](#)

ring-session/session-get-value

(`ring-session/session-get-value req name`)

Get a value from the session

SEE ALSO

[ring-session/session-invalidate](#)

Invalidate the session

[ring-session/session-clear](#)

Removes all attributes from the session

[ring-session/session-id](#)

Get the session ID

[ring-session/session-set-value](#)

Sets a value on the session

[ring-session/session-remove-value](#)

Remove a value from the session

[ring-session/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[ring-session/session-creation-time](#)

Returns the time (milliseconds since epoch) when this session was created.

[top](#)

ring-session/session-id

(`ring-session/session-id req`)

Get the session ID

SEE ALSO

[ring-session/session-invalidate](#)

Invalidate the session

[ring-session/session-clear](#)

Removes all attributes from the session

[ring-session/session-set-value](#)

Sets a value on the session

[ring-session/session-get-value](#)

Get a value from the session

[ring-session/session-remove-value](#)

Remove a value from the session

[ring-session/session-last-access-time](#)

Returns the time (milliseconds since epoch) when this session was last accessed.

[ring-session/session-creation-time](#)

Returns the time (milliseconds since epoch) when this session was created.

[top](#)

[ring-session/session-invalidate](#)

([ring-session/session-invalidate](#) req)

Invalidate the session

Get the session ID

ring-session/session-set-value

Sets a value on the session

ring-session/session-get-value

Get a value from the session

ring-session/session-last-access-time

Returns the time (milliseconds since epoch) when this session was last accessed.

ring-session/session-creation-time

Returns the time (milliseconds since epoch) when this session was created.

[top](#)

ring-util/debug?

```
(ring-util/debug? req)
```

Returns true if debugging is turned on else false

[top](#)

ring-util/get-request-header

```
(ring-util/get-request-header req name)
```

Returns the first value of the specified case independent request header name.

If the request did not include a header of the specified name, this method returns `nil`. If there are multiple headers with the same name, this method returns the first header in the request.

[top](#)

ring-util/get-request-header-accept-mimetypes

```
(ring-util/get-request-header-accept-mimetypes req)
```

Returns all 'Accept' header mime-types of the request as a set. Strips off the ratings

[top](#)

ring-util/get-request-long-parameter

```
(ring-util/get-request-long-parameter request name)
```

```
(ring-util/get-request-long-parameter request name value)
```

Returns the first parameter a the multi value request parameter with the name 'name'. Accepts an optional default value.

Converts the parameter value to long. Returns the default value if the parameter is not of type long.

Returns `nil` if the parameter does not exist and a default value is not passed.

[top](#)

ring-util/get-request-parameter

```
(ring-util/get-request-parameter req name)
```

Returns the first value of the specified case independent request parameter name.

If the request did not include a parameter of the specified name, this method returns `nil`. If there are multiple headers with the same name, this method returns the first parameter in the request.

[top](#)

ring-util/get-request-parameters

```
(ring-util/get-request-parameters req name)
```

Returns all values of the specified case independent request parameter name as a list.

[top](#)

ring-util/html-request?

```
(ring-util/html-request? req)
```

Returns true if the request has content type 'text/html'

[top](#)

ring-util/json-request?

```
(ring-util/json-request? req)
```

Returns true if the request has content type 'application/json'

[top](#)

ring-util/not-found-response

```
(ring-util/not-found-response)
(ring-util/not-found-response msg)
```

Create a HTTP Not-Found 404 response with content-type text/html.

[top](#)

ring-util/parse-charset

```
(ring-util/parse-charset header)
```

Parses the charset from a header value

E.g.: Returns `utf-8` for a content tye header like: `Content-Type: text/html; charset=utf-8`

[top](#)

ring-util/redirect

```
(ring-util/redirect request url)
```

Redirect to the given URL.

[top](#)

ring/create-servlet

```
(ring/create-servlet handler)
```

Create a ring servlet.

SEE ALSO

[ring/match-routes](#)

Compile the routes and return a function that calls the handler matching the URI.

[top](#)

ring/match-routes

```
(ring/match-routes routes)
```

Compile the routes and return a function that calls the handler matching the URI.

A route is defined by a HTTP verb, a URI filter and a handle function. If multiple routes match the route with the longest URI filter will be chosen.

```
(def routes [
  [:get    "/"                      hello-world-handler]
  [:get    "/test/**"                test-handler]
  [:get    "/static/images/*.png"   image-handler]

  [:get    "/employees"             get-all-employees]
  [:get    "/employees/:id"        get-employee]
  [:post   "/employees"            create-employee]
  [:put    "/employees/:id"        update-employee]
  [:delete "/employees/:id"        delete-employee] ])
```

Routing URI pattern filters:

- "/**"
- "/app/**"
- "/static/images/chart.png"
- "/static/images/*.png"
- "/static/**/*.png"

A routing handler is single argument function that receives the request and returns a response.

Handler request:

:server-port	The server port. E.g.: 8080
:server-name	The server name. E.g.: localhost
:remote-addr	The remote address. E.g.: "0:0:0:0:0:0:1"
:uri	The request URI. E.g.: "/employees"
:query-string	The query string
:scheme	The scheme {:http, :https}
:request-method	The lower case request method. {:get, :post, :put, :delete, :head, :options, :trace}
:protocol	The protocol. E.g. "HTTP/1.1"
:headers	A map of part's headers. Key: header name, value: list of header values. The header names are mapped to lower case. Use (first ("xxxx" :headers)) to get a single value header
:parameters	A name/value map of the request parameters
:cookies	A map of the cookies. Key: cookie name, value: the Java servlet cookie object
:content-type	The content type (may be nil)
:content-length	The content length
:character-encoding	The character encoding
:ssl-client-cert	The client certificate, if available
:parts	A list of parts, empty for non multipart requests
:body	The content part as input stream

Handler response:

```
{ :status 400
  :headers { "Content-Type" "text/plain" }
  :body "Not a json request!" }
```

The `:body` element of a handler response may be a:

- string
- bytebuf
- :java.io.InputStream
- :java.io.File

Rigging up a Ring WEB App and starting Tomcat:

```
(tc/run-tomcat
  (ring/create-servlet (-> (ring/match-routes routes)      ; >--+
                           ;   ; | 
                           (ring-mw/mw-dump-request) ; ^ |
                           (ring-mw/mw-request-counter) ; | |
                           (ring-mw/mw-add-session 3600) ; | |
                           (ring-mw/mw-print-uri)       ; | |
                           (ring-mw/mw-debug :on)))    ; +--+
  {:await? false})
```

SEE ALSO

[ring/create-servlet](#)

Create a ring servlet.

run!

(`run! f coll`)

Runs the supplied function, for purposes of side effects, on successive items in the collection. Returns `nil`

```
(run! prn [1 2 3 4])
1
2
3
4
=> nil
```

SEE ALSO

`docoll`

Applies `f` to the items of the collection presumably for side effects. Returns `nil`.

`mapv`

Returns a vector consisting of the result of applying `f` to the set of first items of each `coll`, followed by applying `f` to the set of ...

sandbox/functions

(`sandbox/functions group`)

Lists the sandboxed functions defined by a sandbox function group.

Groups:

- :io
- :print
- :concurrency
- :java-interop
- :system
- :special-forms
- :unsafe

(`sandbox/functions :print`)

SEE ALSO

`sandboxed?`

Returns true if there is a sandbox other than `:AcceptAllInterceptor` otherwise false.

sandbox/type

```
(sandbox/type)
```

Returns the sandbox type.

Venice sandbox types:

- `:AcceptAllInterceptor` - accepts all (no restrictions)
- `:RejectAllInterceptor` - safe sandbox, rejects access to all I/O functions, system properties, environment vars, extension modules, dynamic code loading, multi-threaded functions (futures, agents, ...), and Java calls
- `:SandboxInterceptor` - customized sandbox

```
(sandbox/type)
```

```
=> :AcceptAllInterceptor
```

SEE ALSO

[sandboxed?](#)

Returns true if there is a sandbox other than `:AcceptAllInterceptor` otherwise false.

[top](#)

sandboxed?

```
(sandboxed?)
```

Returns true if there is a sandbox other than `:AcceptAllInterceptor` otherwise false.

```
(sandboxed?)
```

```
=> false
```

SEE ALSO

[sandbox/type](#)

Returns the sandbox type.

[top](#)

schedule-at-fixed-rate

```
(schedule-at-fixed-rate fn initial-delay period time-unit)
```

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period.

Returns a future. `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future.

Time unit is one of `:milliseconds`, `:seconds`, `:minutes`, `:hours`, or `:days`.

```
(schedule-at-fixed-rate #(println "test") 1 2 :seconds)
```

```
(let [s (schedule-at-fixed-rate #(println "test") 1 2 :seconds)]
  (sleep 16 :seconds)
  (cancel s))
```

SEE ALSO

[schedule-delay](#)

Creates and executes a one-shot action that becomes enabled after the given delay.

schedule-delay

```
(schedule-delay fn delay time-unit)
```

Creates and executes a one-shot action that becomes enabled after the given delay.

Returns a future. `(deref f)`, `(future? f)`, `(cancel f)`, and `(done? f)` will work on the returned future.

Time unit is one of :milliseconds, :seconds, :minutes, :hours, or :days.

```
(schedule-delay (fn[] (println "test")) 1 :seconds)
```

```
(deref (schedule-delay (fn [] 100) 2 :seconds))
```

SEE ALSO

[schedule-at-fixed-rate](#)

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period.

second

```
(second coll)
```

Returns the second element of coll.

```
(second nil)
=> nil
```

```
(second [])
=> nil
```

```
(second [1 2 3])
=> 2
```

```
(second '())
=> nil
```

```
(second '(1 2 3))
=> 2
```

select-keys

```
(select-keys map keyseq)
```

Returns a map containing only those entries in map whose key is in keys

```
(select-keys {:a 1 :b 2} [:a])
=> {:a 1}

(select-keys {:a 1 :b 2} [:a :c])
=> {:a 1}

(select-keys {:a 1 :b 2 :c 3} [:a :c])
=> {:a 1 :c 3}
```

SEE ALSO

keys

Returns a collection of the map's keys.

entries

Returns a collection of the map's entries.

map

Applies f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

[top](#)

semver/cmp

```
(semver/cmp a b)
```

C.compares versions a and b, returning -1 if a is older than b, 0 if they're the same version, and 1 if a is newer than b.

```
(semver/cmp "1.2.3" "1.5.4")
=> -1

(semver/cmp (semver/version "1.2.3") (semver/version "1.5.4"))
=> -1
```

SEE ALSO

semver/equal?

Is version a the same as version b?

semver/newer?

Is version a newer than version b?

semver/older?

Is version a older than version b?

[top](#)

semver/equal?

```
(semver/equal? a b)

(semver/newer? (semver/version "1.2.3") (semver/version "1.5.4"))
=> false
```

SEE ALSO

[semver/newer?](#)

Is version a newer than version b?

semver/equal?

Is version a the same as version b?

semver/cmp

Compares versions a and b, returning -1 if a is older than b, 0 if they're the same version, and 1 if a is newer than b.

[top](#)

semver/parse

(**semver/parse** s)

Parses string 's' into a semantic version map.

Semantic verioning format:

```
standard
version:      1.0.0
pre-release:   1.0.0-beta
meta data:     1.0.0-beta+001
```

```
with revision
version:      1.0.0.0
pre-release:   1.0.0.0-beta
meta data:     1.0.0.0-beta+001
```

```
E.g.: { :major 1, :minor 3, :patch 5 }
{ :major 1, :minor 3, :patch 5 :pre-release "beta"}
{ :major 1, :minor 3, :patch 5 :pre-release "beta"}
{ :major 1, :minor 3, :patch 5 :pre-release "beta" :meta "001"}
```

(**semver/parse** "1.2.3")

=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}

(**semver/parse** "1.2.3-beta")

=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release "beta"}

(**semver/parse** "1.2.3-beta+001")

=> {:patch 3 :meta-data "001" :minor 2 :major 1 :revision nil :pre-release "beta"}

SEE ALSO

semver/version

If 'o' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'o' and return a version map.

semver/valid-format?

Checks the string 's' for semantic versioning formatting

[top](#)

semver/valid-format?

(**semver/valid-format?** s)

Checks the string 's' for semantic versioning formatting

```
(semver/valid-format? "1.2.3")
=> true
```

SEE ALSO

[semver/parse](#)

Parses string 's' into a semantic version map.

[semver/valid?](#)

Checks if the supplied version map is valid regarding semantic versioning or not.

[top](#)

[semver/valid?](#)

```
(semver/valid? v)
```

Checks if the supplied version map is valid regarding semantic versioning or not.

```
(semver/valid? (semver/parse "1.2.3"))
=> true
```

SEE ALSO

[semver/parse](#)

Parses string 's' into a semantic version map.

[semver/valid?](#)

Checks if the supplied version map is valid regarding semantic versioning or not.

[top](#)

[semver/version](#)

```
(semver/version o)
```

If 'o' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'o' and return a version map.

```
(semver/version "1.2.3")
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}
```

SEE ALSO

[semver/parse](#)

Parses string 's' into a semantic version map.

[top](#)

[send](#)

```
(send agent action-fn args)
```

Dispatch an action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do
  (def x (agent 100))
  (send x + 5)
  (send x (partial + 7))
  (sleep 100)
  (deref x))
=> 112
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send-off](#)

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

[top](#)

send-off

```
(send-off agent fn args)
```

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do
  (def x (agent 100))
  (send-off x + 5)
  (send-off x (partial + 7))
  (sleep 100)
  (deref x))
=> 112
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[send](#)

Dispatch an action to an agent. Returns the agent immediately.

[top](#)

seq

```
(seq coll)
```

Returns a sequence on the collection.

If the collection is empty, returns nil!! `(seq nil)` returns nil.

seq also works on strings and converts Java streams to lists.

```
(seq nil)
=> nil

(seq [])
=> nil

(seq [1 2 3])
=> (1 2 3)

(seq '(1 2 3))
=> (1 2 3)

(seq {:_a 1 :_b 2})
=> ([:a 1] [:b 2])

(seq "abcd")
=> (#\a #\b #\c #\d)

(flatten (seq {:_a 1 :_b 2}))
=> (:a 1 :b 2)
```

[top](#)

sequential?

```
(sequential? coll)
```

Returns true if coll is a sequential collection

```
(sequential? '(1))
=> true

(sequential? [1])
=> true

(sequential? {:_a 1})
=> false

(sequential? nil)
=> false

(sequential? "abc")
=> false
```

[top](#)

server-side-events/parse

```
(parse s)
```

Parses a server side event in string representation to a map.

```
(do
  (load-module :server-side-events ['server-side-events :as 'sse])
  (-> (sse/render { :id "100"
                    :event "scores"
                    :data ["100" "200"] } )
    (sse/parse)))
=> {:data ["100" "200"] :event "scores" :id "100"}
```

SEE ALSO

[server-side-events/render](#)

Renders a server side event to a string.

[top](#)

server-side-events/read-event

```
(read-event rd)
```

Read a single event from a `:java.io.BufferedReader`.

Returns the event or `nil` if the underlying stream has been closed.

```
(do
  (load-module :server-side-events ['server-side-events :as 'sse])

  (defn sample-events []
    (str (sse/render { :id "100" :event "scores" :data ["100"] } )
      (sse/render { :id "101" :event "scores" :data ["101"] } )
      (sse/render { :id "102" :event "scores" :data ["102"] } )))

  (try-with [is (io/string-in-stream (sample-events))
            rd (io/wrap-is-with-buffered-reader is :utf-8)]
    (sse/read-event rd)))
=> {:data ["100"] :event "scores" :id "100"}
```

SEE ALSO

[server-side-events/read-events](#)

Reads multiple events from a `:java.io.BufferedReader`.

[top](#)

server-side-events/read-events

```
(read-events rd limit)
```

Reads multiple events from a `:java.io.BufferedReader`.

Returns a list of events. Stops reading events if the limit is reached or the underlying stream has been closed.

```
(do
  (load-module :server-side-events ['server-side-events :as 'sse])

  (defn sample-events []
    (str (sse/render { :id "100" :event "scores" :data ["100"] } )
      (sse/render { :id "101" :event "scores" :data ["101"] } ))
```

```
(sse/render { :id "102" :event "scores" :data ["102"] } )
(sse/render { :id "103" :event "scores" :data ["103"] } )))

(try-with [is (io/string-in-stream (sample-events))
           rd (io/wrap-is-with-buffered-reader is :utf-8)]
  (sse/read-events rd 3)))
=> [{:data ["100"] :event "scores" :id "100"} {:data ["101"] :event "scores" :id "101"} {:data ["102"] :event "scores" :id "102"}]
```

SEE ALSO

[server-side-events/read-event](#)

Read a single event from a `:java.io.BufferedReader`.

[top](#)

server-side-events/render

`(render event)`

Renders a server side event to a string.

Returns the event as string or `nil` if the event is `nil` or all its fields are empty or `nil`,

Note: SSE is restricted to transporting UTF-8 messages.

The event is a map. E.g.:

```
{ :id    "1"
  :event "score"
  :data  [ "GOAL Liverpool 1 - 1 Arsenal"
          "GOAL Manchester United 3 - 3 Manchester City" ] }
```

with the text representation

```
id: 1\n
event: score\n
data: GOAL Liverpool 1 - 1 Arsenal\n
data: GOAL Manchester United 3 - 3 Manchester City\n\n
```

The event fields `:id`, `:event`, and `:data` must not contain newline, carriage return, backspace, or formfeed characters!

A HTTP request to initiate SSE streaming looks like:

```
GET /api/v1/live-scores
Accept: text/event-stream
Cache-Control: no-cache
Connection: keep-alive
```

```
(do
  (load-module :server-side-events ['server-side-events :as 'sse])
  (sse/render { :id "100"
               :event "scores"
               :data ["100" "200"] } ))
=> "id: 100\r\nevent: scores\r\ndata: 100\r\ndata: 200\r\n\r\n"
```

SEE ALSO

[server-side-events/parse](#)

Parses a server side event in string representation to a map.

[top](#)

service

```
(service name method & args)
```

Calls a service with the specified name from the Venice's service registry.

Venice's service registry is used with application scripting scenarios where multiple external services must be made available to Venice. E.g.: the service registry can be used to register an application's *Spring Framework* services and make them discoverable by a Venice script.

Example:

```
Venice venice = new Venice();

venice.getServiceRegistry()
    .register("Calculator", new Calculator())
    .registerServiceDiscovery(new TestServiceDiscovery());

long r = (Long)venice.eval("(service :Calculator :multiply 10 20)");
venice.eval("(service :Logger :log (version))");
```

while `Calculator` and `TestServiceDiscovery` are defined as:

```
public static class TestServiceDiscovery implements IServiceDiscovery {
    @Override public Object lookup(final String name) {

```

```
(service :UserService :find "Smith" "John")
```

SEE ALSO

[service?](#)

Returns true if the named service exists otherwise false

[top](#)

service?

```
(service? name)
```

Returns true if the named service exists otherwise false

```
(service? :UserService)
```

SEE ALSO

[service](#)

Calls a service with the specified name from the Venice's service registry.

[top](#)

set

```
(set & items)
```

Creates a new set containing the items.

```
(set)  
=> #{}  
  
(set nil)  
=> #{nil}  
  
(set 1)  
=> #{1}  
  
(set 1 2 3)  
=> #{1 2 3}  
  
(set [1 2] 3)  
=> #[[1 2] 3]
```

[top](#)

set!

```
(set! var-symbol expr)
```

Sets a global or thread-local variable to the value of the expression.

```
(do  
  (def x 10)  
  (set! x 20)  
  x)  
=> 20
```

```
(do  
  (def-dynamic x 100)  
  (set! x 200)  
  x)  
=> 200
```

```
(do
  (def-dynamic x 100)
  (with-out-str
    (print x)
    (binding [x 200]
      (print (str "-" x))
      (set! x (inc x))
      (print (str "-" x)))
    (print (str "-" x))))
=> "100-200-201-100"
```

SEE ALSO

[def](#)

Creates a global variable.

[def-dynamic](#)

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

[top](#)

set-error-handler!

```
(set-error-handler! agent handler-fn)
```

Sets the error-handler of an agent to `handler-fn`. If an action being run by the agent throws an exception `handler-fn` will be called with two arguments: the agent and the exception.

```
(do
  (def x (agent 100))
  (defn err-handler-fn [ag ex]
    (println "error occurred: "
            (:message ex)
            " and we still have value"
            @ag))
  (set-error-handler! x err-handler-fn)
  (send x (fn [n] (/ n 0))))
=> (agent :value 100)
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[agent-error-mode](#)

Returns the agent's error mode

[agent-error](#)

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

[top](#)

set?

```
(set? obj)
```

Returns true if `obj` is a set

```
(set? (set 1))  
=> true
```

top

sgn

```
(sgn x)
```

sgn function for a number.

```
-1 if x < 0  
0 if x = 0  
1 if x > 0
```

```
(sgn -10)  
=> -1
```

```
(sgn 0)  
=> 0
```

```
(sgn 10)  
=> 1
```

```
(sgn -101)

```

```
(sgn -10.1)  
=> -1
```

```
(sgn -10.12M)  
=> -1
```

SEE ALSO

[abs](#)

Returns the absolute value of the number

[negate](#)

Negates x

top

sh

```
(sh & args)
```

Launches a new sub-process.

Options:

- :in may be given followed by input source as InputStream, Reader, File, ByteBuf, or String, to be fed to the sub-process's stdin.
- :in-enc option may be given followed by a String, used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the input string specified by the :in option to the sub-process's stdin. Defaults to "UTF-8". If the :in option provides a byte array, then the bytes are passed unencoded, and this option is ignored.
- :out-enc option may be given followed by :bytes or a String. If a String is given, it will be used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the sub-process's stdout to a String which is returned. If :bytes is given, the sub-process's

stdout will be stored in a Bytebuf and returned. Defaults to UTF-8.

:out-fn a function with a single string argument that receives line by line from the process' stdout. If passed the :out value in the return map will be empty.

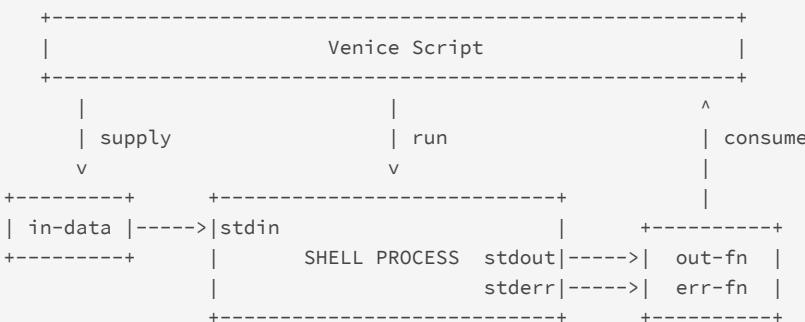

:err-fn a function with a single string argument that receives line by line from the process' stderr. If passed the :err value in the return map will be empty.

:env override the process env with a map.

:dir override the process dir with a String or java.io.File.

:throw-ex If true throw an exception if the exit code is not equal to zero, if false returns the exit code. Defaults to false.
It's recommended to use
`(with-sh-throw (sh "ls" "-l"))`
instead.

:timeout A timeout in milliseconds

You can bind :env, :dir for multiple operations using `with-sh-env` or `with-sh-dir`. `with-sh-throw` is binds `:throw-ex` as `true`.

`sh` returns a map of:

```
:exit => sub-process's exit code
:out  => sub-process's stdout (as Bytebuf or String)
:err  => sub-process's stderr (String via platform default encoding)
```

E.g.:

```
(sh "uname" "-r")
=> {:err "" :out "20.5.0\n" :exit 0}

(printhln (sh "ls" "-l"))

(printhln (sh "ls" "-l" "/tmp"))

(printhln (sh "sed" "s/[aeiou]/oo/g" :in "hello there\n"))

(printhln (sh "cat" :in "x\u25bax\n"))

(printhln (sh "echo" "x\u25bax"))

(printhln (sh "/bin/sh" "-c" "ls -l"))

(sh "ls" "-l" :out-fn printhln)

(sh "ls" "-l" :out-fn printhln :err-fn printhln)

;; background process
(printhln (sh "/bin/sh" "-c" "sleep 30 >/dev/null 2>&1 &"))

(printhln (sh "/bin/sh" "-c" "nohup sleep 30 >/dev/null 2>&1 &"))

;; asynchronously slurping stdout and stderr
(sh "/bin/sh"
```

```

"-c" "for i in {1..5}; do sleep 1; echo \"Hello $i\"; done"
:out-fn println
:err-fn println

;; asynchronously slurping stdout and stderr with a timeout
(sh "/bin/sh"
"-c" "for i in {1..5}; do sleep 1; echo \"Hello $i\"; done"
:out-fn println
:err-fn println
:timeout 2500)

;; reads 4 single-byte chars
(println (sh "echo" "x\u25bax" :out-enc "ISO-8859-1"))

;; reads binary file into bytes[]
(println (sh "cat" "birds.jpg" :out-enc :bytes))

;; working directory
(println (with-sh-dir "/tmp" (sh "ls" "-l") (sh "pwd")))

(println (sh "pwd" :dir "/tmp"))

;; throw an exception if the shell's subprocess exit code is not equal to 0
(println (with-sh-throw (sh "ls" "-l")))

(println (sh "ls" "-l" :throw-ex true))

;; windows
(println (sh "cmd" "/c dir 1>&2"))

```

SEE ALSO

[with-sh-throw](#)

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

[with-sh-dir](#)

Sets the directory for use with sh, see sh for details.

[with-sh-env](#)

Sets the environment for use with sh.

[top](#)

sh/alive?

```
(sh/alive? pid)
```

Returns true if the process represented by the PID is alive otherwise false.

Runs internally the Unix command `ps -p {pid}` to check if there is a process with the given pid.

Note: This function is available for Linux and MacOS only!

```
(sh/alive? "2345")
```

SEE ALSO

[sh](#)

Launches a new sub-process.

sh/kill

Kills a process.

sh/killall

Kills all processes with the given name.

sh/pgrep

Returns a list of all pids for a process with the given name or nil if there are no processes matching the name.

sh/pkill

Sends a signal to all processes with the given name.

sh/pargs

Returns a process' command line.

[top](#)

sh/kill

```
(sh/kill pid)
(sh/kill pid signal)
```

Kills a process.

The signal to be sent is one of {`:sighup`, `:sigint`, `:sigquit`, `:sigkill`, `:sigterm`}. If no signal is specified, the `:sigterm` signal is sent.

Runs the Unix command: `kill -signal {pid}`

Throws an exception if the process does not exist or cannot be killed!

Note: This function is available for Linux and MacOS only!

```
(sh/kill "2345")
```

```
(sh/kill "2345" :sigkill)
```

SEE ALSO

sh

Launches a new sub-process.

sh/alive?

Returns true if the process represented by the PID is alive otherwise false.

sh/killall

Kills all processes with the given name.

sh/pgrep

Returns a list of all pids for a process with the given name or nil if there are no processes matching the name.

sh/pkill

Sends a signal to all processes with the given name.

sh/pargs

Returns a process' command line.

[top](#)

sh/killall

```
(sh/killall name)
(sh/killall name signal)
```

Kills all processes with the given name.

The signal to be sent is one of {`:sighup`, `:sigint`, `:sigquit`, `:sigkill`, `:sigterm`}. If no signal is specified, the `:sigterm` signal is sent.

Runs the Unix command: `killall -signal -e {name}`

Note: This function is available for Linux and MacOS only!

```
(sh/killall "clamd")
```

```
(sh/killall "clamd" :sigkill)
```

SEE ALSO

[sh](#)

Launches a new sub-process.

[sh/alive?](#)

Returns true if the process represented by the PID is alive otherwise false.

[sh/kill](#)

Kills a process.

[sh/pgrep](#)

Returns a list of all pids for a process with the given name or nil if there are no processes matching the name.

[sh/pkill](#)

Sends a signal to all processes with the given name.

[sh/pargs](#)

Returns a process' command line.

[top](#)

sh/load-pid

```
(sh/load-pid pid-file)
```

Load a process PID from a PID file.

Returns the PID or `nil` if the file does not exist or is empty

```
(sh/load-pid "/data/scan.pid")
```

SEE ALSO

[sh](#)

Launches a new sub-process.

Kills a process.

[sh/killall](#)

Kills all processes with the given name.

[sh/pgrep](#)

Returns a list of all pids for a process with the given name or nil if there are no processes matching the name.

[sh/pkill](#)

Sends a signal to all processes with the given name.

sh/pargs

Returns a process' command line.

top

sh/open

(sh/open `f`)

Opens a *file* or an *URL* with the associated platform specific application.

Uses the OS commands:

- *MacOS*: `/usr/bin/open f`
- *Windows*: `cmd /C start f`
- *Linux*: `/usr/bin/xdg-open f`

Note: `sh/open` can only be run from a REPL!

(sh/open "sample.pdf")

(sh/open "https://github.com/jlangch/venice")

top

sh/pargs

(sh/pargs `pid`)

(sh/pargs :parse `pid`)

Returns a process' command line.

Without the `:parse` option returns the command line as a string or `nil` if there is no process matching the PID. With the `:parse` option returns a list of the command line arguments or an empty list the process does not exist.

Runs the Unix command: `ps -p {pid} -ww -o args` to get the command line.

Note: This function is available for Linux and MacOS only!

(sh/pargs "1234")

(sh/pargs :parse "1234")

Returns a list of all pids for a process with the given name or nil if there are no processes matching the name.

sh/pargs

Returns a process' command line.

[top](#)

sh/pwd

(sh/pwd)

Returns the current working directory.

Note:

You can't change the current working directory of the Java VM but if you were to launch another process using (sh & args) you can specify the working directory for the new spawned process.

(sh/pwd)

SEE ALSO

sh

Launches a new sub-process.

[top](#)

sh/which

(sh/which program)

Locates a program's file in the user's path.

Returns the program's full path or `nil` if not found.

E.g. `(sh/which "ps")` returns `"/bin/ps"` for MacOSX and `"/usr/bin/ps"` for Linux RHEL variants.

Note: This function is available for Linux and MacOS only!

(sh/which "ps")

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

[top](#)

[shell/nice](#)

```
(nice n)
(nice pid n)
```

The *Nice* command in linux allows users to prioritize process execution. The nice value determines the priority of a process, with lower values indicating higher priority.

A niceness of -20 is the lowest niceness, or highest priority. The default niceness for processes is inherited from its parent process and is usually 0.

Systems have diverged on what priority is the lowest. Linux systems document a niceness of 19 as the lowest priority, BSD systems document 20 as the lowest priority. In both cases, the "lowest" priority is documented as running only when nothing else wants to.

`(nice n)` change the nice value of this process

`(nice pid n)` change the nice value of this process with the given pid

Command line equivalent: `nice -n -10 tar cvzf archive.tgz largefile`

Requires Java 9+.

```
(shell/nice -10)
```

```
(shell/nice (shell/pid) -10)
```

SEE ALSO

[shell/processes-info](#)

Returns a snapshot of all processes visible to the current process. Returns a list of process infos for the processes.

[top](#)

shell/processes-info

(processes-info)

Returns a snapshot of all processes visible to the current process. Returns a list of process infos for the processes.

The process info is a map with the keys:

:pid	the PID
:alive	true if the process is alive else false
:arguments	the list of strings of the arguments of the process
:command	the executable pathname of the process
:command-line	the command line of the process
:start-time	the start time of the process
:total-cpu-millis	the total cputime accumulated of the process
:user	the user of the process.

Requires Java 9+.

(shell/processes-info)

```
;; find the PID of the ArangoDB process
;; like: pgrep -lf ArangoDB3 | cut -d ' ' -f 1
(-> (shell/processes-info)
  (filter #(str/contains? (:command-line %) "ArangoDB3"))
  (map :pid))
```

SEE ALSO

[shell/processes](#)

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

[top](#)

shell/wait-for-process-exit

```
(wait-for-process-exit pid timeout)
(wait-for-process-exit process-handle timeout)
```

Waits until the process with the pid exits. Waits max timeout seconds. Returns nil if the process exits before reaching the timeout, else the pid is returned. Accepts a PID or a process handle (:java.lang.ProcessHandle).

Requires Java 9+.

```
(shell/wait-for-process-exit 12345 20)
```

SEE ALSO

[shell/pid](#)

Without argument returns the PID (type long) of this process. With a process-handle (:java.lang.ProcessHandle) returns the PID for ...

[shell/kill](#)

Requests the process to be killed. Returns true if the process is killed and false if the process stays alive. Returns nil if the process ...

[shell/processes](#)

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

[top](#)

shuffle

```
(shuffle coll)
```

Returns a collection of the items in coll in random order.

```
(shuffle '(1 2 3 4 5 6))  
=> (3 5 2 4 6 1)
```

```
(shuffle [1 2 3 4 5 6])  
=> [2 5 1 4 6 3]
```

```
(shuffle "abcdef")  
=> (#\a #\e #\d #\b #\f #\c)
```

[top](#)

shutdown-agents

```
(shutdown-agents)
```

Initiates a shutdown of the thread pools that back the agent system. Running actions will complete, but no new actions will be accepted.

```
(do  
  (def x1 (agent 100))  
  (def x2 (agent 100))  
  (shutdown-agents))
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

shutdown-agents?

```
(shutdown-agents?)
```

Returns true if the thread-pool that backs the agents is shut down

```
(do  
  (def x1 (agent 100))  
  (def x2 (agent 100))  
  (shutdown-agents)  
  (sleep 300)  
  (shutdown-agents?))
```

SEE ALSO

[agent](#)

Creates and returns an agent with an initial value of state and zero or more options.

shutdown-hook

```
(shutdown-hook f)
```

Registers the function f as a JVM shutdown hook.

Shutdown hooks can be tested in a REPL:

- start a REPL
- run `(shutdown-hook (fn [] (println "SHUTDOWN") (sleep 3000)))`
- exit the REPL with `!exit`

The sandbox is active within the shutdown hook:

- start a REPL
- run `!sandbox customized`
- run `!sandbox add-rule blacklist:venice:func:+`
- run `(shutdown-hook (fn [] (try (+ 1 2) (catch :SecurityException ex (println ex) (sleep 3000)))))`
- exit the REPL with `!exit`

```
(shutdown-hook (fn [] (println "shutdown")))
```

sleep

```
(sleep n)
(sleep n time-unit)
```

Sleep for the time n. The default time unit is milliseconds.

Time unit is one of :milliseconds, :seconds, :minutes, :hours, or :days or their abbreviations :msec, :ms, :sec, :s, :min, :hr, :h, :d.

```
(sleep 30)
=> nil
```

```
(sleep 30 :milliseconds)
=> nil
```

```
(sleep 30 :msec)
=> nil
```

```
(sleep 5 :seconds)
=> nil
```

```
(sleep 5 :sec)
=> nil
```

some

```
(some pred coll)
```

Returns the first logical true value of (pred x) for any x in coll, else nil.

Stops processing the collection if the first value is found that meets the predicate.

```
(some even? '(1 2 3 4))  
=> true
```

```
(some even? '(1 3 5 7))  
=> nil
```

```
(some #{5} [1 2 3 4 5])  
=> 5
```

```
(some #(== 5 %) [1 2 3 4 5])  
=> true
```

```
(some #(if (even? %) %) [1 2 3 4])  
=> 2
```

[top](#)

some->

```
(some-> expr & forms)
```

When expr is not nil, threads it into the first form (via `->`), and when that result is not nil, through the next etc.

```
(some-> {:y 3 :x 5}  
         :y  
         (- 2))  
=> 1
```

```
(some-> {:y 3 :x 5}  
         :z  
         (- 2))  
=> nil
```

SEE ALSO

[some->>](#)

When expr is not nil, threads it into the first form (via `->>`), and when that result is not nil, through the next etc.

[top](#)

some->>

```
(some->> expr & forms)
```

When expr is not nil, threads it into the first form (via `->>`), and when that result is not nil, through the next etc.

```
(some->> {:y 3 :x 5}
           :y
           (- 2))
=> -1

(some->> {:y 3 :x 5}
           :z
           (- 2))
=> nil
```

SEE ALSO

[some->](#)

When expr is not nil, threads it into the first form (via ->), and when that result is not nil, through the next etc.

[top](#)

some?

```
(some? x)
```

Returns true if x is not nil, false otherwise

```
(some? nil)
=> false

(some? 0)
=> true

(some? 4.0)
=> true

(some? false)
=> true

(some? [])
=> true
```

SEE ALSO

[nil?](#)

Returns true if x is nil, false otherwise

[top](#)

sort

```
(sort coll)
(sort comparefn coll)
```

Returns a sorted list of the items in coll. If no compare function comparefn is supplied, uses the natural compare. The compare function takes two arguments and returns -1, 0, or 1

```
(sort [3 2 5 4 1 6])
=> [1 2 3 4 5 6]

(sort compare [3 2 5 4 1 6])
=> [1 2 3 4 5 6]

; reversed
(sort (comp - compare) [3 2 5 4 1 6])
=> [6 5 4 3 2 1]

(sort {:c 3 :a 1 :b 2})
=> ([:a 1] [:b 2] [:c 3])
```

SEE ALSO

sort-by

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, ...

[top](#)

sort-by

```
(sort-by keyfn coll)
(sort-by keyfn compfn coll)
```

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, uses compare.

To sort by multiple values use `juxt`, see the examples below.

```
(sort-by :id [{:id 2 :name "Smith"} {:id 1 :name "Jones"} ])
=> [{:name "Jones" :id 1} {:name "Smith" :id 2}]

(sort-by count ["aaa" "bb" "c"])
=> ["c" "bb" "aaa"]

; reversed
(sort-by count (comp - compare) ["aaa" "bb" "c"])
=> ["aaa" "bb" "c"]

(sort-by first [[1 2] [3 4] [2 3]])
=> [[1 2] [2 3] [3 4]]

; sort tuples by first value, and where first value is equal,
; sort by second value
(sort-by (juxt first second) [[3 2] [1 3] [3 1] [1 2]])
=> [[1 2] [1 3] [3 1] [3 2]]

; reversed
(sort-by first (comp - compare) [[1 2] [3 4] [2 3]])
=> [[3 4] [2 3] [1 2]]

(sort-by :rank [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 1} {:rank 2} {:rank 3}]
```

```

; reversed
(sort-by :rank (comp - compare) [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 3} {:rank 2} {:rank 1}]

; sort entries in a map by value
(sort-by val {:foo 7, :bar 3, :baz 5})
=> ([:bar 3] [:baz 5] [:foo 7])

; sort by :foo, and where :foo is equal, sort by :bar
(do
(def x [ {:foo 2 :bar 11}
         {:foo 1 :bar 99}
         {:foo 2 :bar 55}
         {:foo 1 :bar 77} ])
  (sort-by (juxt :foo :bar) x))
=> [{:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11} {:foo 2 :bar 55}]

; sort by a given key order
(do
(def x [ {:foo 2 :bar 11}
         {:foo 1 :bar 99}
         {:foo 2 :bar 55}
         {:foo 1 :bar 77} ])
(def order [55 77 99 11])
  (sort-by #((into {} (map-indexed (fn [i e] [e i]) order)) (:bar %))
           x))
=> [{:foo 2 :bar 55} {:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11}]

```

SEE ALSO

sort

Returns a sorted list of the items in coll. If no compare function comparefn is supplied, uses the natural compare. The compare function ...

[top](#)

sorted

```
(sorted cmp coll)
```

Returns a sorted collection using the compare function cmp. The compare function takes two arguments and returns -1, 0, or 1.
Returns a stateful transducer when no collection is provided.

```

(sorted compare [4 2 1 5 6 3])
=> [1 2 3 4 5 6]

(sorted (comp (partial * -1) compare) [4 2 1 5 6 3])
=> [6 5 4 3 2 1]

```

[top](#)

sorted-map

```
(sorted-map & keyvals)
(sorted-map map)
```

Creates a new sorted map containing the items.

```
(sorted-map :a 1 :b 2)
=> {:a 1 :b 2}
```

```
(sorted-map (hash-map :a 1 :b 2))
=> {:a 1 :b 2}
```

[top](#)

sorted-map?

```
(sorted-map? obj)
```

Returns true if obj is a sorted map

```
(sorted-map? (sorted-map :a 1 :b 2))
=> true
```

[top](#)

sorted-set

```
(sorted-set & items)
```

Creates a new sorted-set containing the items.

```
(sorted-set)
=> #{}  
 
```

```
(sorted-set nil)
=> #{nil}  
 
```

```
(sorted-set 1)
=> #{1}  
 
```

```
(sorted-set 6 2 4)
=> #{2 4 6}  
 
```

```
(str (sorted-set [2 3] [1 2]))
=> "#{[1 2] [2 3]}"
```

[top](#)

sorted-set?

```
(sorted-set? obj)
```

Returns true if obj is a sorted-set

```
(sorted-set? (sorted-set 1))  
=> true
```

top

split-at

```
(split-at n coll)
```

Returns a vector of [(take n coll) (drop n coll)]

```
(split-at 2 [1 2 3 4 5])  
=> [(1 2) (3 4 5)]
```

```
(split-at 3 [1 2])  
=> [(1 2) ()]
```

top

split-with

```
(split-with pred coll)
```

Splits the collection at the first false/nil predicate result in a vector with two lists

```
(split-with odd? [1 3 5 6 7 9])  
=> [(1 3 5) (6 7 9)]
```

```
(split-with odd? [1 3 5])  
=> [(1 3 5) ()]
```

```
(split-with odd? [2 4 6])  
=> [() (2 4 6)]
```

[top](#)

stack

```
(stack)
```

Creates a new mutable threadsafe stack.

```
(let [s (stack)]
  (push! s 1)
  (push! s 2)
  (push! s 3))
=> (3 2 1)
```

SEE ALSO

[peek](#)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

`pop!`

Pops an item from a stack.

`push!`

Pushes an item to a stack.

`empty`

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

`empty?`

Returns true if x is empty. Accepts strings, collections and bytebufs.

`count`

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

`into!`

Adds all of the items of 'from' conjoined to the mutable 'to' collection

`conj!`

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

`stack?`

Returns true if coll is a stack

[top](#)

stack?

`(stack? coll)`

Returns true if coll is a stack

`(stack? (stack))`

=> true

[top](#)

stacktrace

`(stacktrace ex)`

Returns the stacktrace of a java exception

`(println (stacktrace (. :VncException :new (str "test"))))`

[top](#)

stopwatch/copy

`(copy sw)`

Copies a stop watch with its internal state.

Returns the copied stop watch.

```
(do
  (load-module :stopwatch ['stopwatch :as 'sw])
  (let [sw-1 (sw/create)]
    (sleep 500)
    (let [sw-2 (sw/copy sw-1)]
      (sw/stop sw-1)
      (sw/stop sw-2)
      (println (str "sw-1: " (sw/elapsed sw-1) "ms"))
      (println (str "sw-2: " (sw/elapsed sw-2) "ms")))))
```

SEE ALSO

[stopwatch/create](#)

Create a new stop watch and implicitly starts it by setting the start time as now. The stop watch has a resolution of milliseconds.

[stopwatch/start](#)

Restart a stop watch by resetting the start time to now.

[stopwatch/stop](#)

Stops a stop watch. Remembers the elapsed time and sets the start time to now.

[stopwatch/resume](#)

Resumes a stop watch. Sets the start time to now.

[stopwatch/split](#)

Returns the split time (now - start time) in milli seconds or in the requested time unit.

[stopwatch/elapsed](#)

Returns the elapsed time (now - last stop time) in milliseconds or in the requested time unit.

[stopwatch/elapsed-formatted](#)

Returns the elapsed time (now - last stop time) formatted.

[top](#)

[stopwatch/create](#)

(create)

Create a new stop watch and implicitly starts it by setting the start time as now. The stop watch has a resolution of milliseconds.

Returns the created stop watch.

```
(do
  (load-module :stopwatch ['stopwatch :as 'sw])
  (let [sw (sw/create)]
    (sleep 500)
    (sw/stop sw)
    (println (str (sw/elapsed sw) "ms"))))

Restart a stop watch by resetting the start time to now.

[stopwatch/stop](#)

Stops a stop watch. Remembers the elapsed time and sets the start time to now.

[stopwatch/resume](#)

Resumes a stop watch. Sets the start time to now.

[stopwatch/split](#)

Returns the split time (now - start time) in milli seconds or in the requested time unit.

[stopwatch/elapsed](#)

Returns the elapsed time (now - last stop time) in milliseconds or in the requested time unit.

[stopwatch/elapsed-formatted](#)

Returns the elapsed time (now - last stop time) formatted.

[top](#)

[stopwatch/create-time-limit](#)

`(create-time-limit unit n)`

Create a new stop watch with a time limit and implicitly starts it by setting the start time as now. The stop watch has a resolution of milliseconds.

This stop watch has the same functionality as a standard stop watch. But in addition the time limit can be checked with [expired?](#)

Returns the created stop watch.

```
(do
  (load-module :stopwatch ['stopwatch :as 'sw])
  (let [sw (sw/create-time-limit :seconds 3)]
    (sleep 2000)
    (println "Expired:" (sw/expired? sw))
    (sleep 2000)
    (println "Expired:" (sw/expired? sw))
    (sw/stop sw)
    (println (str (sw/elapsed sw) "ms"))))
```

SEE ALSO

[stopwatch/expired?](#)

Returns true if the stop watch has expired, meaning it exceeded the time limit, else false.

[stopwatch/create](#)

Create a new stop watch and implicitly starts it by setting the start time as now. The stop watch has a resolution of milliseconds.

[stopwatch/copy](#)

Copies a stop watch with its internal state.

[stopwatch/start](#)

Restart a stop watch by resetting the start time to now.

[stopwatch/stop](#)

Stops a stop watch. Remembers the elapsed time and sets the start time to now.

[stopwatch/resume](#)

Resumes a stop watch. Sets the start time to now.

[stopwatch/split](#)

Returns the split time (now - start time) in milli seconds or in the requested time unit.

[stopwatch/elapsed](#)

Returns the elapsed time (now - last stop time) in milliseconds or in the requested time unit.

[stopwatch/elapsed-formatted](#)

Returns the elapsed time (now - last stop time) formatted.

stopwatch/elapsed

```
(elapsed sw)
(elapsed sw time-unit)
```

Returns the elapsed time (now - last stop time) in milliseconds or in the requested time unit.

time-unit:

- :milliseconds
- :seconds
- :minutes
- :hours
- :days

Returns the elapsed time.

```
(do
  (load-module :stopwatch ['stopwatch :as 'sw])
  (let [sw (sw/create)]
    (sleep 500)
    (sw/stop sw)
    (println (str (sw/elapsed sw) "ms"))

Returns the elapsed time (now - last stop time) in milliseconds or in the requested time unit.

[stopwatch/elapsed-formatted](#)

Returns the elapsed time (now - last stop time) formatted.

top

stopwatch/start

```
(start sw)
```

Restart a stop watch by resetting the start time to now.

Returns the stop watch.

```
(do
  (load-module :stopwatch ['stopwatch :as 'sw])
  (let [sw (sw/create)]
    (sleep 500)
    (sw/start sw))
```

```
(sleep 200)
(sw/stop sw)
(println (str (sw/elapsed sw) "ms"))))
```

SEE ALSO

[stopwatch/create](#)

Create a new stop watch and implicitly starts it by setting the start time as now. The stop watch has a resolution of milliseconds.

[stopwatch/copy](#)

Copies a stop watch with its internal state.

[stopwatch/stop](#)

Stops a stop watch. Remembers the elapsed time and sets the start time to now.

[stopwatch/resume](#)

Resumes a stop watch. Sets the start time to now.

[stopwatch/split](#)

Returns the split time (now - start time) in milli seconds or in the requested time unit.

[stopwatch/elapsed](#)

Returns the elapsed time (now - last stop time) in milliseconds or in the requested time unit.

[stopwatch/elapsed-formatted](#)

Returns the elapsed time (now - last stop time) formatted.

[top](#)

[stopwatch/stop](#)

```
(stop sw)
```

Stops a stop watch. Remembers the elapsed time and sets the start time to now.

Returns the stop watch.

```
(do
  (load-module :stopwatch ['stopwatch :as 'sw])
  (let [sw (sw/create)]
    (sleep 500)
    (sw/stop sw)
    (println (str (sw/elapsed sw) "ms"))))
```

```
(do
  (load-module :stopwatch ['stopwatch :as 'sw])
  (let [sw (sw/create)]
    (sleep 500)
    (sw/stop sw)
    (println (str (sw/elapsed sw) "ms"))
    (sleep 300)
    (sw/stop sw)
    (println (str (sw/elapsed sw) "ms"))))
```

Returns the elapsed time (now - last stop time) in milliseconds or in the requested time unit.

[stopwatch/elapsed-formatted](#)

Returns the elapsed time (now - last stop time) formatted.

[top](#)

str

(str & xs)

With no args, returns the empty string. With one arg x, returns x.toString(). (str nil) returns the empty string. With more than one arg, returns the concatenation of the str values of the args.

```
(str)  
=> ""
```

```
(str 1 2 3)  
=> "123"
```

```
(str 1I)  
=> "1"
```

```
(str 3.1415927M)  
=> "3.1415927"
```

```
(str +)  
=> "+"
```

```
(str [1 2 3])  
=> "[1 2 3]"
```

```
(str "total " 100)  
=> "total 100"
```

```
(str #\h #\i)  
=> "hi"
```

SEE ALSO

[pr-str](#)

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of ...

[top](#)

str/align

(str/align width align overflow text)

Aligns a text within a string of width characters.

align: :left, :center, :right

overflow: :newline, :clip-left, :clip-right, :ellipsis-left, :ellipsis-right

```
(str/align 6 :left :clip-right "abc")  
=> "abc "
```

```
(str/align 6 :center :clip-right "abc")  
=> " abc "
```

```
(str/align 6 :right :clip-right "abc")  
=> " abc"
```

```
(str/align 6 :left :clip-left "abcdefg")  
=> "cdefgh"
```

```
(str/align 6 :left :ellipsis-left "abcdefg")  
=> "...defgh"
```

```
(str/align 6 :left :ellipsis-right "abcdefg")  
=> "abcde..."
```

SEE ALSO

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

str/blank?

```
(str/blank? s)
```

True if s is nil, empty, or contains only whitespace.

```
(str/blank? nil)  
=> true
```

```
(str/blank? "")  
=> true
```

```
(str/blank? " ")  
=> true
```

```
(str/blank? "abc")  
=> false
```

SEE ALSO

`str/not-blank?`

True if s contains at least one non whitespace char.

`empty?`

Returns true if x is empty. Accepts strings, collections and bytebufs.

`not-empty?`

Returns true if x is not empty. Accepts strings, collections and bytebufs.

`nil?`

Returns true if x is nil, false otherwise

[top](#)

`str/butlast`

`(str/butlast s)`

Returns a possibly empty string of the characters without the last.

```
(str/butlast "abcdef")
=> "abcde"
```

[top](#)

`str/butnlast`

`(str/butnlast s n)`

Returns a possibly empty string of the characters without the n last characters.

```
(str/butnlast "abcdef" 3)
=> "abc"
```

[top](#)

`str/bytebuf-to-hex`

```
(str/bytebuf-to-hex data)
(str/bytebuf-to-hex data :upper)
```

Converts byte data to a hex string using the hexadecimal digits: 0123456789abcdef .

If the :upper options is passed the hex digits 0123456789ABCDEF are used.

```
(str/bytebuf-to-hex (bytebuf [0 1 2 3 4 5 6]))
=> "00010203040506"
```

```
(str/bytebuf-to-hex (bytebuf [202 254]) :upper)
=> "CAFE"
```

[top](#)

str/char?

```
(str/char? s)
```

Returns true if s is a char or a single char string.

```
(str/char? "x")
=> true
```

```
(str/char? #\x)
=> true
```

[top](#)

str/chars

```
(str/chars s)
```

Converts a string to a char list.

```
(str/chars "abcdef")
=> (#\a #\b #\c #\d #\e #\f)
```

```
(str/join (str/chars "abcdef"))
=> "abcdef"
```

[top](#)

str/contains?

```
(str/contains? s substr)
```

True if s contains with substr.

```
(str/contains? "abc" "ab")
=> true
```

```
(str/contains? "abc" #\b)
=> true
```

[top](#)

str/cr-lf

```
(str/cr-lf s mode)
```

Convert a text to use LF or CR-LF.

```
(str/cr-lf "line1  
line2  
line3" :cr-lf)  
  
(str/cr-lf "line1  
line2  
line3" :lf)
```

top

str/crlf-to-lf

```
(str/crlf-to-lf s)
```

Converts CR-LF to LF

```
(str/crlf-to-lf nil)
```

```
(str/crlf-to-lf "100  
200  
")
```

SEE ALSO

[str/cr-lf](#)

Convert a text to use LF or CR-LF.

=> "1 2 3 &amp; &lt; &gt; &quot; &apos;"
```

top

str/expand

```
(str/expand s len fill mode*)
```

Expands a string to the max lenght len. Fills up with the fillstring if the string needs to be expanded. The fill string is added to the start or end of the string depending on the mode :start, :end. The mode defaults to :end

```
(str/expand "abcdefghijkl" 8 ".")  
=> "abcdefghijkl"  
  
(str/expand "abcdefghijkl" 20 ".")  
=> "abcdefghijkl....."  
  
(str/expand "abcdefghijkl" 20 "." :start)  
=> ".....abcdefghijkl"  
  
(str/expand "abcdefghijkl" 20 "." :end)  
=> "abcdefghijkl....."  
  
(str/expand "abcdefghijkl" 30 "1234" :start)  
=> "12341234123412341234abcdefghijkl"  
  
(str/expand "abcdefghijkl" 30 "1234" :end)  
=> "abcdefghijkl12341234123412341234"
```

top

str/format

```
(str/format format args*)  
(str/format locale format args*)
```

Returns a formatted string using the specified format string and arguments.
Venice uses the Java format syntax.

JavaDoc: [Format Syntax](#)

```
(str/format "value: %.4f" 1.45)  
=> "value: 1.4500"  
  
(str/format (. :java.util.Locale :new "de" "DE") "value: %.4f" 1.45)  
=> "value: 1,4500"  
  
(str/format (. :java.util.Locale :GERMANY) "value: %.4f" 1.45)  
=> "value: 1,4500"
```

```
(str/format (. :java.util.Locale :new "de" "CH") "value: %,d" 2345000)
=> "value: 2'345'000"

[top](#)

str/letter?

```
(str/letter? s)
```

True if s is a char and the char is a letter.

Defined by Java Character.isLetter(ch).

```
(str/letter? #\x)
=> true
```

str/levenshtein

```
(str/levenshtein s1 s2)
```

Returns the *Levenshtein* distance of two strings.

The *Damerau-Levenshtein* algorithm is an extension to the *Levenshtein* algorithm which solves the edit distance problem between a source string and a target string with the following operations:

- Character Insertion
- Character Deletion
- Character Replacement
- Adjacent Character Swap

Note that the adjacent character swap operation is an edit that may be applied when two adjacent characters in the source string match two adjacent characters in the target string, but in reverse order, rather than a general allowance for adjacent character swaps.

This implementation allows the client to specify the costs of the various edit operations with the restriction that the cost of two swap operations must not be less than the cost of a delete operation followed by an insert operation. This restriction is required to preclude two swaps involving the same character being required for optimality which, in turn, enables a fast dynamic programming solution.

The cost of the *Damerau-Levenshtein* algorithm is $O(n*m)$ where n is the length of the source string and m is the length of the target string. This implementation consumes $O(n*m)$ space.

```
(str/levenshtein "Tier" "Tor")
=> 2
```

```
(str/levenshtein "Tier" "tor")
=> 3
```

str/linefeed?

```
(str/linefeed? s)
```

True if s is a char and the char is a linefeed.

```
(str/linefeed? #\newline)
=> true
```

```
(str/linefeed? (first "
"))
=> true
```

str/lorem-ipsum

```
(str/lorem-ipsum & options)
```

Creates an arbitrary length Lorem Ipsum text.

Options:

:chars n returns n characters (limited to 1000000)
:paragraphs n returns n paragraphs (limited to 100)

```
(str/lorem-ipsum :chars 250)
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis turpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat aliquet, lectus diam fringilla velit, finibus eleifend ipsum
urna at lacus. Phasellus sit am"
```

```
(str/lorem-ipsum :paragraphs 1)
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis turpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat aliquet, lectus diam fringilla velit, finibus eleifend ipsum
urna at lacus. Phasellus sit amet nisl fringilla, cursus est in, mollis lacus. Proin dignissim rhoncus dolor.
Cras tellus odio, elementum sed erat sit amet, euismod tincidunt nisl. In hac habitasse platea dictumst. Duis
aliquam sollicitudin tempor. Sed gravida tincidunt felis at fringilla. Morbi tempor enim at commodo vulputate.
Aenean et ultrices lorem, placerat pretium augue. In hac habitasse platea dictumst. Cras fringilla ligula quis

```

[top](#)

str/lower-case

```
(str/lower-case s)
(str/lower-case locale s)
```

Converts s to lowercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/lower-case "aBcDeF")
=> "abcdef"

(str/lower-case #\A)
=> #\a

(str/lower-case (. :java.util.Locale :new "de" "DE") "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :GERMANY) "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :new "de" "CH") "aBcDeF")
=> "abcdef"

(str/lower-case [ "de"] "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" "DE"] "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" "DE"] "aBcDeF")
=> "abcdef"
```

SEE ALSO

[str/upper-case](#)

Converts s to uppercase.

[top](#)

[str/lower-case?](#)

([str/lower-case?](#) s)

True if s is a char and the char is a lower case char.

Defined by Java Character.isLowerCase(ch).

```
(str/lower-case? #\x)  
=> true
```

```
(str/lower-case? #\X)  
=> false
```

```
(str/lower-case? #\8)

```

[top](#)

[str/nfirst](#)

([str/nfirst](#) s n)

Returns a string of the n first characters of s.

```
(str/nfirst "abcdef" 2)  
=> "ab"
```

```
(str/nfirst "abcdef" 10)  
=> "abcdef"
```

```
(str/nfirst "abcdef" 0)  
=> ""
```

[top](#)

[str/nlast](#)

([str/nlast](#) s n)

Returns a string of the n last characters of s.

```
(str/nlast "abcdef" 2)  
=> "ef"
```

```
(str/nlast "abcdef" 10)
=> "abcdef"

(str/nlast "abcdef" 0)
=> ""
```

top

str/normalize-utf

```
(str/normalize-utf text form)
```

Normalizes an UTF string.

On MacOS umlauts like ä are just encoded as 'a' plus the combining diaresis character. Therefore an 'ä' (\u00FC) and an 'ä' (a + \u0308) from a MacOS filename are different!

This function normalizes UTF strings to simplify processing.

The *form* argument is one of:

- :NFD Canonical decomposition
- :NFC Canonical decomposition, followed by canonical composition
- :NFKD Compatibility decomposition
- :NFKC Compatibility decomposition, followed by canonical composition

```
(load-module :hexdump ['hexdump :as 'h])

;; Even though printed the same these two strings are NOT equal
;; 1: "ü"           prints to "ü"
;; 2: "u\u0308"     prints to "ü"

«If it looks like a duck and quacks like a duck, then it probably is a duck» is definitely WRONG here!

;; ü represented as u with combining diaresis char: \u0308   "
(println "u\u0308")
;; => u" (actually prints as ü on a terminal)

;; ü: \u00FC
(println "\u00FC")
;; => ü

;; u with combining diaresis character   "
(h/dump (bytebuf-from-string "u\u0308"))
;; 00000000: 75cc 88                         u..

;; ü
(h/dump (bytebuf-from-string "ü"))
;; 00000000: c3bc                          ..

;; ü: \u00FC
(h/dump (bytebuf-from-string "\u00FC"))
;; 00000000: c3bc                          ..

;; u with combined diaresis character normalized to get a standard ü
(h/dump (bytebuf-from-string (str/normalize-utf "u\u0308" :NFC)))
;; 00000000: c3bc                          ..
```

```
;; the reverse (decomposition)
(h/dump (bytebuf-from-string (str/normalize-utf "\u00FC" :NFD)))
;; 00000000: 75cc 88          u..
```

SEE ALSO

[io/file-normalize-utf](#)

Normalizes the UTF string of a file path.

[top](#)

str/not-blank?

```
(str/not-blank? s)
```

True if s contains at least one non whitespace char.

```
(str/not-blank? "abc")
=> true
```

```
(str/not-blank? " a ")
=> true
```

```
(str/not-blank? nil)
=> false
```

```
(str/not-blank? "")
=> false
```

```
(str/not-blank? " ")
=> false
```

SEE ALSO

[str/blank?](#)

True if s is nil, empty, or contains only whitespace.

[empty?](#)

Returns true if x is empty. Accepts strings, collections and bytebufs.

[not-empty?](#)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

[nil?](#)

Returns true if x is nil, false otherwise

[top](#)

str/nrest

```
(str/nrest s n)
```

Returns a possibly empty string of the characters after the n first characters.

```
(str/nrest "abcdef" 3)
=> "def"
```

top

str/platform-lf

```
(str/platform-lf)
```

Returns the platform linefeed: LF or CR-LF.

```
(str/platform-lf
```

top

str/pos

```
(str/pos s pos)
```

Returns the 0 based row/column position within a string based on absolute character position. Returns a map with the keys 'row' and 'col'.

Note: CR & LF count together as one each regarding the absolute position.

```
(str/pos "abcdefghijklm" 4)  
=> {:col 4 :row 0}
```

```
(str/pos "ab  
cdefghij" 6)  
=> {:col 3 :row 1}
```

top

str/quote

```
(str/quote str q)  
(str/quote str start end)
```

Quotes a string.

```
(str/quote "abc" "-")  
=> "-abc-"
```

```
(str/quote "abc" "<" ">")  
=> "<abc>"
```

top

str/quoted?

```
(str/quoted? str q)  
(str/quoted? str start end)
```

Returns true if the string is quoted.

```
(str/quoted? "-abc-" "-")
=> true
```

```
(str/quoted? "<abc>" "<" ">")
=> true
```

[top](#)

str/repeat

```
(str/repeat s n)
(str/repeat s n sep)
```

Repeats s n times with an optional separator.

```
(str/repeat "abc" 0)
=> ""
```

```
(str/repeat "abc" 3)
=> "abcabcabc"
```

```
(str/repeat "abc" 3 "-")
=> "abc-abc-abc"
```

```
(str/repeat #\* 0)
=> ""
```

```
(str/repeat #\* 3)
=> "***"
```

```
(str/repeat #\* 3 #\-
=> "*--*"
```

[top](#)

str/replace-all

```
(str/replace-all s search replacement)
```

Replaces the all occurrences of search in s. The search arg may be a string or a regex pattern

```
(str/replace-all "abcdefabc" "ab" "__")
=> "__cdef__c"
```

```
(str/replace-all "a0b01c012d" (regex/pattern "[0-9]+") "_")
=> "a_b_c_d"
```

```
(str/replace-all "a0b01c012d" #"[0-9]+" "_")
=> "a_b_c_d"
```

SEE ALSO

str/replace-first

Replaces the first occurrence of search in s. The search arg may be a string or a regex pattern. If the search arg is of type string ...

str/replace-last

Replaces the last occurrence of search in s.

[top](#)

str/replace-first

```
(str/replace-first s search replacement & options)
```

Replaces the first occurrence of search in s. The search arg may be a string or a regex pattern. If the search arg is of type string the options :ignore-case and :nfirst are supported.

Options:

:ignore-case b if true ignores case, defaults to false
:nfirst n e.g. :nfirst 2, defaults to 1

```
(str/replace-first "ab-cd-ef-ab-cd" "ab" "XYZ")  
=> "XYZ-cd-ef-ab-cd"
```

```
(str/replace-first "AB-CD-EF-AB-CD" "ab" "XYZ" :ignore-case true)  
=> "XYZ-CD-EF-AB-CD"
```

```
(str/replace-first "ab-ab-cd-ab-ef-ab-cd" "ab" "XYZ" :nfirst 3)  
=> "XYZ-XYZ-cd-XYZ-ef-ab-cd"
```

```
(str/replace-first "a0b01c012d" (regex/pattern "[0-9]+") "_")  
=> "a_b01c012d"
```

```
(str/replace-first "a0b01c012d" #"[0-9]+" "_")  
=> "a_b01c012d"
```

SEE ALSO

str/replace-last

Replaces the last occurrence of search in s.

str/replace-all

Replaces the all occurrences of search in s. The search arg may be a string or a regex pattern

[top](#)

str/replace-last

```
(str/replace-last s search replacement & options)
```

Replaces the last occurrence of search in s.

Options:

:ignore-case b if true ignores case, defaults to false

```
(str/replace-last "abcdefabc" "ab" "XYZ")  
=> "abcdefXYZc"
```

```
(str/replace-last "foo.JPG" ".jpg" ".png" :ignore-case true)
=> "foo.png"
```

SEE ALSO

[str/replace-first](#)

Replaces the first occurrence of search in s. The search arg may be a string or a regex pattern. If the search arg is of type string ...

[str/replace-all](#)

Replaces the all occurrences of search in s. The search arg may be a string or a regex pattern

[top](#)

str/rest

```
(str/rest s)
```

Returns a possibly empty string of the characters after the first.

```
(str/rest "abcdef")
=> "bcdef"
```

[top](#)

str/reverse

```
(str/reverse s)
```

Reverses a string

```
(str/reverse "abcdef")
=> "fedcba"
```

[top](#)

str/split

```
(str/split s regex)
(str/split s regex limit)
```

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

```
(str/split "abc,def,ghi" ",")
=> ("abc" "def" "ghi")
```

```
(str/split "James Peter Robert" " " 2)
=> ("James" "Peter Robert")
```

```
(str/split "abc , def , ghi" " *, *")
=> ("abc" "def" "ghi")
```

```
(str/split "abc,def,ghi" "((?<=,)|(?=,))")
=> ("abc" "," "def" "," "ghi")

(str/split "q1w2e3r4t5y6u7i8o9p0" "#"\d+)
=> ("q" "w" "e" "r" "t" "y" "u" "i" "o" "p")

(str/split "q1w2e3r4t5y6u7i8o9p0" "#"\d+ 5)
=> ("q" "w" "e" "r" "t5y6u7i8o9p0")

(str/split "1234567890" "#(?<=\G.{4})")
=> ("1234" "5678" "90")

(str/split "1234567890" "#(?=(.{4})+$)")
=> ("12" "3456" "7890")

(str/split " q1w2 " #"" )
=> (" " "q" "1" "w" "2" " ")
```

SEE ALSO

[str/split-lines](#)

Splits s into lines.

[top](#)

str/split-at

```
(str/split-at s pos)
```

Splits string at the given position. Returns a list of the splits.

```
(str/split-at nil 1)
=> ("")
```

```
(str/split-at "" 1)
=> ("")
```

```
(str/split-at "abc" 0)
=> ("" "abc")
```

```
(str/split-at "abc" 1)
=> ("a" "bc")
```

```
(str/split-at "abc" 2)
=> ("ab" "c")
```

```
(str/split-at "abc" 3)
=> ("abc" "")
```

SEE ALSO

[str/split-lines](#)

Splits s into lines.

[top](#)

str/split-columns

(str/split-columns s cols)

Splits a string into columns. The columns are given by their start positions.

```
(str/split-columns "1abc 2d 3gh" [0 6 12])
=> ("1abc" "2d" "3gh")
```

SEE ALSO

[str/split](#)

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

[top](#)

str/split-lines

(str/split-lines s)

Splits s into lines.

```
(str/split-lines "line1
line2
line3")
=> ("line1" "line2" "line3")
```

SEE ALSO

[str/split](#)

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

[io/slurp-lines](#)

Read all lines from f.

[top](#)

str/starts-with?

(str/starts-with? s substr)

True if s starts with substr.

```
(str/starts-with? "abc" "ab")
=> true
```

[top](#)

str/strip-end

```
(str/strip-end s substr)
```

Removes a substr only if it is at the end of a s, otherwise returns s.

```
(str/strip-end "abcdef" "def")
=> "abc"
```

```
(str/strip-end "abcdef" "abc")
=> "abcdef"
```

[top](#)

str/strip-indent

```
(str/strip-indent s)
```

Strip the indent of a multi-line string. The first line's leading whitespaces define the indent.

```
(str/strip-indent "
  line1
  line2
  line3")
=> "line1\n line2\n line3"
```

[top](#)

str/strip-margin

```
(str/strip-margin s)
```

Strips leading whitespaces upto and including the margin '|' from each line in a multi-line string.

```
(str/strip-margin "line1
  | line2
  | line3")
=> "line1\n line2\n line3"
```

[top](#)

str/strip-start

```
(str/strip-start s substr)
```

Removes a substr only if it is at the beginning of a s, otherwise returns s.

```
(str/strip-start "abcdef" "abc")
=> "def"
```

```
(str/strip-start "abcdef" "def")
=> "abcdef"
```

top

str/subs

```
(str/subs s start)
(str/subs s start end)
```

Returns the substring of s beginning at start inclusive, and ending at end (defaults to length of string), exclusive.

```
(str/subs "abcdef" 2)
=> "cdef"
```

```
(str/subs "abcdef" 2 5)
=> "cde"
```

top

str/trim

```
(str/trim s)
```

Trims leading and trailing whitespaces from s.

```
(str/trim " abc ")
=> "abc"
```

SEE ALSO

[str/trim-to-empty](#)

Trims leading and trailing whitespaces from s. Returns an empty string if s is nil.

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

top

str/trim-left

```
(str/trim-left s)
```

Trims leading whitespaces from s.

```
(str/trim-left " abc ")
=> "abc "
```

SEE ALSO

[str/trim-right](#)

Trims trailing whitespaces from s.

[str/trim](#)

Trims leading and trailing whitespaces from s.

[str/trim-to-nil](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[top](#)

str/trim-right

`(str/trim-right s)`

Trims trailing whitespaces from s.

```
(str/trim-right " abc ")
=> " abc"
```

SEE ALSO

[str/trim-left](#)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

[top](#)

str/trim-to-empty

`(str/trim-to-empty s)`

Trims leading and trailing whitespaces from s. Returns an empty string if s is nil.

```
(str/trim-to-empty "")
=> ""
```

```
(str/trim-to-empty "    ")
=> ""
```

```
(str/trim-to-empty nil)
=> ""
```

```
(str/trim-to-empty " abc   ")
=> "abc"
```

SEE ALSO

[str/trim](#)

Trims leading and trailing whitespaces from s.

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

[str/trim-to-nil](#)

([str/trim-to-nil](#) s)

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

```
(str/trim-to-nil "")  
=> nil
```

```
(str/trim-to-nil " ")  
=> nil
```

```
(str/trim-to-nil nil)  
=> nil
```

```
(str/trim-to-nil " abc ")  
=> "abc"
```

SEE ALSO

[str/trim-to-empty](#)

Trims leading and trailing whitespaces from s. Returns an empty string if s is nil.

[str/trim](#)

Trims leading and trailing whitespaces from s.

[str/trim-left](#)

Trims leading whitespaces from s.

[str/trim-right](#)

Trims trailing whitespaces from s.

[top](#)

[str/truncate](#)

([str/truncate](#) s maxlen marker mode*)

Truncates a string to the max lenght maxlen and adds the marker if the string needs to be truncated. The marker is added to the start, middle, or end of the string depending on the mode :start, :middle, :end. The mode defaults to :end

```
(str/truncate "abcdefghijklm" 20 "...")  
=> "abcdefghijklm"
```

```
(str/truncate "abcdefghijklm" 9 "...")  
=> "abcdef..."
```

```
(str/truncate "abcdefghijklm" 4 "...")  
=> "a..."  
  
(str/truncate "abcdefghijklm" 7 "... :start)  
=> "...ghijm"  
  
(str/truncate "abcdefghijklm" 7 "... :middle)  
=> "ab...ijm"  
  
(str/truncate "abcdefghijklm" 7 "... :end)  
=> "abcd..."
```

[top](#)

str/upper-case

```
(str/upper-case s)  
(str/upper-case locale s)
```

Converts s to uppercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/upper-case "aBcDeF")  
=> "ABCDEF"  
  
(str/upper-case #\a)  
=> #\A  
  
(str/upper-case (. :java.util.Locale :new "de" "DE") "aBcDeF")  
=> "ABCDEF"  
  
(str/upper-case (. :java.util.Locale :GERMANY) "aBcDeF")  
=> "ABCDEF"  
  
(str/upper-case (. :java.util.Locale :new "de" "CH") "aBcDeF")  
=> "ABCDEF"  
  
(str/upper-case [ "de"] "aBcDeF")  
=> "ABCDEF"  
  
(str/upper-case [ "de" "DE"] "aBcDeF")  
=> "ABCDEF"  
  
(str/upper-case [ "de" "DE"] "aBcDeF")  
=> "ABCDEF"
```

SEE ALSO

[str/lower-case](#)

Converts s to lowercase.

[top](#)

str/upper-case?

```
(str/upper-case? s)
```

True if s is a char and the char is an upper case char.

Defined by Java Character.isUpperCase(ch).

```
(str/upper-case? #\x)  
=> false
```

```
(str/upper-case? #\X)  
=> true
```

```
(str/upper-case? #\8)  
=> false
```

[top](#)

str/valid-email-addr?

```
(str/valid-email-addr? e)
```

Returns true if e is a valid email address according to RFC5322, else returns false

```
(str/valid-email-addr? "user@domain.com")  
=> true
```

```
(str/valid-email-addr? "user@domain.co.in")  
=> true
```

```
(str/valid-email-addr? "user.name@domain.com")  
=> true
```

```
(str/valid-email-addr? "user_name@domain.com")  
=> true
```

```
(str/valid-email-addr? "username@yahoo.corporate.in")  
=> true
```

[top](#)

str/whitespace?

```
(str/whitespace? s)
```

True if s is char and the char is a whitespace.

Defined by Java Character.isWhitespace(ch).

```
(str/whitespace? #\space)  
=> true
```

str/wrap

```
(str/wrap text & options)
```

Wraps ascii text to lines with a length of maxlen characters .

Options:

```
:maxlen n      the max len of line (default 80)
:line-wrap     controls the line wrap
{:anywhere,
:break-
word}
```

```
(-> (str/lorem-ipsum :paragraphs 1)
    (str/wrap :maxlen 80 :line-wrap :break-word))
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis\ntrpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat\naliquet, lectus diam fringilla velit, finibus eleifend

```

string-array

```
(string-array coll)
(string-array len)
(string-array len init-val)
```

Returns an array of Java strings containing the contents of coll or returns an array with the given length and optional init value

```
(string-array '("1" "2" "3"))
=> [1, 2, 3]

(string-array 10)
=> [nil, nil, nil, nil, nil, nil, nil, nil, nil, nil]

(string-array 10 "42")
=> [42, 42, 42, 42, 42, 42, 42, 42, 42]
```

SEE ALSO

[java-string-list](#)

Converts a Venice list/vector to a Java String list

string?

```
(string? x)
```

Returns true if x is a string

```
(string? "abc")
```

```
=> true
```

```
(string? 1)
```

```
=> false
```

```
(string? nil)
```

```
=> false
```

[top](#)

sublist

```
(sublist l start) (sublist l start end)
```

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

`sublist` accepts a lazy-seq if both start and end is given.

```
(sublist '(1 2 3 4 5 6) 2)
```

```
=> (3 4 5 6)
```

```
(sublist '(1 2 3 4 5 6) 2 3)
```

```
=> (3)
```

```
(doall (sublist (lazy-seq 1 inc) 3 7))
```

```
=> (4 5 6 7)
```

SEE ALSO

[subvec](#)

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

[top](#)

subset?

```
(subset? set1 set2)
```

Return true if set1 is a subset of set2

```
(subset? #{2 3} #{1 2 3 4})
```

```
=> true
```

```
(subset? #{2 5} #{1 2 3 4})
```

```
=> false
```

SEE ALSO

[set](#)

Creates a new set containing the items.

[superset?](#)

Return true if set1 is a superset of set2

[union](#)

Return a set that is the union of the input sets

[difference](#)

Return a set that is the first set without elements of the remaining sets

[intersection](#)

Return a set that is the intersection of the input sets

[top](#)

subvec

```
(subvec v start) (subvec v start end)
```

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

```
(subvec [1 2 3 4 5 6] 2)  
=> [3 4 5 6]
```

```
(subvec [1 2 3 4 5 6] 2 3)  
=> [3]
```

SEE ALSO

[sublist](#)

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

[top](#)

supers

```
(supers class)
```

Returns the immediate and indirect superclasses and interfaces of class, if any.

```
(supers :java.util.ArrayList)  
=> (:java.util.AbstractList :java.util.AbstractCollection :java.util.List :java.util.Collection :java.lang.Iterable)
```

[top](#)

superset?

```
(superset? set1 set2)
```

Return true if set1 is a superset of set2

```
(superset? #{1 2 3 4} #{2 3} )  
=> true
```

```
(superset? #{1 2 3 4} #{2 5})  
=> false
```

SEE ALSO

[set](#)

Creates a new set containing the items.

[subset?](#)

Return true if set1 is a subset of set2

[union](#)

Return a set that is the union of the input sets

[difference](#)

Return a set that is the first set without elements of the remaining sets

[intersection](#)

Return a set that is the intersection of the input sets

[top](#)

supertype

```
(supertype x)
```

Returns the super type of x.

```
(supertype 5)  
=> :core/number
```

```
(supertype [1 2])  
=> :core/sequence
```

```
(supertype (. :java.math.BigInteger :valueOf 100))  
=> :java.lang.Number
```

SEE ALSO

[type](#)

Returns the type of x.

[supertypes](#)

Returns the super types of x.

[instance-of?](#)

Returns true if x is an instance of the given type

[top](#)

supertypes

```
(supertypes x)
```

Returns the super types of x.

```
(supertypes 5)
=> (:core/number :core/val)

(supertypes [1 2])
=> (:core/sequence :core/collection :core/val)

(supertypes (. :java.math.BigInteger :valueOf 100))
=> (:java.lang.Number :java.lang.Object)
```

SEE ALSO

type

Returns the type of x.

supertype

Returns the super type of x.

instance-of?

Returns true if x is an instance of the given type

[top](#)

swap!

```
(swap! box f & args)
```

Atomically swaps the value of an atom or a volatile to be: `(apply f current-value-of-box args)`. Note that f may be called multiple times, and thus should be free of side effects. Returns the value that was swapped in.

```
(do
  (def counter (atom 0))
  (swap! counter inc))
=> 1

(do
  (def counter (atom 0))
  (swap! counter inc)
  (swap! counter + 1)
  (swap! counter #(inc %))
  (swap! counter (fn [x] (inc x)))
  @counter)
=> 4

(do
  (def fruits (atom()))
  (swap! fruits conj :apple)
  (swap! fruits conj :mango)
  @fruits)
=> (:apple :mango)

(do
  (def counter (volatile 0))
  (swap! counter (partial + 6))
  @counter)
=> 6
```

SEE ALSO

swap-vals!

Atomically swaps the value of an atom to be: (apply f current-value-of-atom args). Note that f may be called multiple times, and thus ...

reset!

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

compare-and-set!

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

atom

Creates an atom with the initial value x.

volatile

Creates a volatile with the initial value x

[top](#)

swap-vals!

(swap-vals! atom f & args)

Atomically swaps the value of an atom to be: (apply f current-value-of-atom args) . Note that f may be called multiple times, and thus should be free of side effects. Returns [old new], the value of the atom before and after the swap.

```
(do
  (def queue (atom '(1 2 3)))
  (swap-vals! queue pop))
=> [(1 2 3) (2 3)]
```

SEE ALSO

swap!

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

reset!

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

compare-and-set!

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

atom

Creates an atom with the initial value x.

volatile

Creates a volatile with the initial value x

[top](#)

symbol

(symbol name)
(symbol ns name)

Returns a symbol from the given name

```
(symbol "a")
=> a
```

```
(symbol "foo" "a")
=> foo/a

(symbol *ns* "a")
=> user/a

(symbol 'a)
=> a

((resolve (symbol "core" "+")) 1 2)
=> 3

(name str/reverse)
=> "reverse"

(namespace str/reverse)
=> "str"
```

SEE ALSO

resolve

Resolves a symbol.

name

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

namespace

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

[top](#)

symbol?

```
(symbol? x)
```

Returns true if x is a symbol

```
(symbol? 'a)
=> true
```

```
(symbol? (symbol "a"))
=> true
```

```
(symbol? nil)
=> false
```

```
(symbol? :a)
=> false
```

[top](#)

system-env

```
(system-env)
```

```
(system-env name)
(system-env name default-val)
```

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

Without arguments returns all system env variables authorized by the configured sandbox.

```
(system-env :SHELL)
=> "/bin/zsh"
```

```
(system-env :FOO "test")
=> "test"
```

```
(system-env "SHELL")
=> "/bin/zsh"
```

SEE ALSO

[system-prop](#)

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

[top](#)

system-exit-code

```
(system-exit-code code)
```

Defines the exit code that is used if the Java VM exits. Defaults to 0.

Note:

The exit code is only used when the Venice launcher has been used to run a script file, a command line script, a Venice app archive, or the REPL.

```
(system-exit-code 0)
```

[top](#)

system-prop

```
(system-prop)
(system-prop name)
(system-prop name default-val)
```

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

Without arguments returns all system properties authorized by the configured sandbox.

```
(system-prop :os.name)
=> "Mac OS X"
```

```
(system-prop :foo.org "abc")
=> "abc"
```

```
(system-prop "os.name")
=> "Mac OS X"
```

SEE ALSO

system-env

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or its value is nil.

[top](#)

tail-pos

```
(tail-pos)
(tail-pos name)
```

Throws a NotInTailPositionException if the expr is not in tail position otherwise returns nil.

Definition:

The tail position is a position which an expression would return a value from. There are no more forms evaluated after the form in the tail position is evaluated.

```
;; in tail position
(do 1 (tail-pos))
=> nil

;; not in tail position
(do (tail-pos) 1)
=> NotInTailPositionException: Not in tail position
```

[top](#)

take

```
(take n coll)
```

Returns a collection of the first n items in coll, or all items if there are fewer than n.

Returns a stateful transducer when no collection is provided. Returns a lazy sequence if coll is a lazy sequence.

```
(take 3 [1 2 3 4 5])
=> [1 2 3]

(take 10 [1 2 3 4 5])
=> [1 2 3 4 5]

(doall (take 4 (repeat 3)))
=> (3 3 3 3)

(doall (take 10 (cycle (range 0 3))))
=> (0 1 2 0 1 2 0 1 2 0)
```

[top](#)

take!

```
(take! queue)
```

Retrieves and removes the head value of the queue or the deque, waiting if necessary until a value becomes available.

```
(let [q (queue)]
  (put! q 1)
  (take! q)
  q)
=> ()
```

SEE ALSO

queue

Creates a new mutable threadsafe bounded or unbounded queue.

put!

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

offer!

Offers an item to tail of the a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

[top](#)

take-last

```
(take-last n coll)
```

Return a sequence of the last n items in coll.

Returns a stateful transducer when no collection is provided.

```
(take-last 3 [1 2 3 4 5])
=> [3 4 5]
```

```
(take-last 10 [1 2 3 4 5])
=> [1 2 3 4 5]
```

[top](#)

take-tail!

```
(take-tail! deque)
```

Retrieves and removes the tail value of the deque, waiting if necessary until a value becomes available.

```
(let [q (deque)]
  (put! q 1)
  (put! q 2)
  (put! q 3)
=> ()
```

```
(put! q 4)
(println q)
(println (take-tail! q))
(println (take! q))
(println q))
(1 2 3 4)
4
1
(2 3)
=> nil
```

SEE ALSO

deque

Creates a new mutable threadsafe bounded or unbounded deque.

put!

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

offer!

Offers an item to tail of the a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

put-head!

Puts an item to the head of a deque. The operation is synchronous, it waits indefinitely until the value can be placed on the queue.

offer-head!

Offers an item to the head of a deque with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait ...

poll-tail!

Polls an item from the tail of a deque with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

top

take-while

```
(take-while predicate coll)
```

Returns a list of successive items from coll while `(predicate item)` returns logical true.

Returns a transducer when no collection is provided.

```
(take-while neg? [-2 -1 0 1 2 3])
=> [-2 -1]
```

top

tap>

```
(tap> x)
```

Sends x to any taps. Will not block. Returns true if there was room in the queue, false if not (x is dropped).

```
(do
  (add-tap prn)
  (tap> {:foo "hello" :bar 34.5}))
=> true
```

SEE ALSO

[add-tap](#)

adds f, a fn of one argument, to the tap set. This function will be called with anything sent via tap>.

[remove-tap](#)

Remove f from the tap set.

[clear-taps](#)

Removes all tap sets.

[top](#)

test/deftest

```
(deftest name & body)
```

Defines a test function with no arguments.

All assertion macros are available for test assertions within the test function body:

- `assert`
- `assert-false`
- `assert-eq`
- `assert-ne`
- `assert-throws`
- `assert-does-not-throw`
- `assert-throws-with-msg`

It's recommended to use dedicated test namespaces for the tests and to group tests by namespaces.

Note: Actually, the test body goes in the :test metadata on the var, and the real function (the value of the var) calls test-var on itself.

```
(do
  (load-module :test)

  (ns foo-test)

  (test/deftest add-test []
    (assert-eq 0 (+ 0 0))
    (assert-eq 3 (+ 1 2)))

  (test/deftest mul-test []
    (assert-eq 6 (* 2 3)))

  (ns bar)
  (test/run-tests 'foo-test))
```

Testing namespace 'foo-test'

```
PASS foo-test/add-test
PASS foo-test/mul-test
```

```
Ran 2 tests with 3 assertions
0 failures, 0 errors.
=> {:assert 3 :error 0 :pass 2 :test 2 :type :summary :fail 0}

;; Explicit setup/teardown
(do
(ns foo-test)
(load-module :test)

(test/deftest sum-test []
(let [f (io/temp-file "test-", ".txt")]
(try
(io/spit f "1234" :append true)
(assert=eq "1234" (io/slurp f :binary false))
(finally
(io/delete-file f)))))

(test/run-tests *ns*))
```

Testing namespace 'foo-test'

PASS foo-test/sum-test

```
Ran 1 tests with 1 assertions
0 failures, 0 errors.
=> {:assert 1 :error 0 :pass 1 :test 1 :type :summary :fail 0}
```

SEE ALSO

[test/run-tests](#)

Runs all tests in the given namespaces; prints results. The tests are run grouped by the namespace.

[test/run-test-var](#)

Runs a single test; prints results. Returns a map summarizing the test results.

[test/use-fixtures](#)

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different ...

[test/successful?](#)

Returns true if the given test summary indicates all tests were successful, false otherwise.

[assert](#)

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

[assert=false](#)

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

[assert=eq](#)

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

[assert-ne](#)

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

[assert-throws](#)

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

[assert-does-not-throw](#)

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

[top](#)

[test/run-test-var](#)

```
(run-test-var v)
```

Runs a single test; prints results. Returns a map summarizing the test results.

```
(do
  (ns foo-test)
  (load-module :test)

  (test/deftest plus-test []
    (assert-eq 3 (+ 1 2)))

  (test/run-test-var plus-test))

Testing namespace 'foo-test'

PASS foo-test/plus-test

Ran 1 tests with 1 assertions
0 failures, 0 errors.
=> {:assert 1 :error 0 :pass 1 :test 1 :type :summary :fail 0}

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different ...

[top](#)

test/use-fixtures

```
(use-fixtures ns fixture-type & fixture-fns)
```

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different namespaces have different fixtures.

A fixture of type `:each` is called before and after each test in the fixture's namespace.

A fixture of type `:once` is called before the first and after the last test in the fixture's namespace serving as an initial setup and final teardown.

To pass a value from a fixture to the tests dynamic vars can be used. See the 3rd example below.

```
;; Fixtures :each
;; Adds logic for a setup and teardown method that will be called
;; before and after each test
(do
  (load-module :test)

  (defn each-time-setup []
    (println "Fixture each time setup"))

  (defn each-time-teardown []
    (println "Fixture each time teardown"))

  (defn each-fixture [f]
    (each-time-setup)
    (try
      (f)
      (finally (each-time-teardown)))))

  ;; register as an each-time callback
  (test/use-fixtures *ns* :each each-fixture)

  (test/deftest add-test []
    (assert= 3 (+ 1 2)))

  (test/deftest sub-test []
    (assert= 3 (- 4 1)))

  (test/run-tests *ns*))
```

Testing namespace 'user'

```
Fixture each time setup
PASS user/add-test
Fixture each time teardown
Fixture each time setup
PASS user/sub-test
Fixture each time teardown
```

```
Ran 2 tests with 2 assertions
0 failures, 0 errors.
=> {:assert 2 :error 0 :pass 2 :test 2 :type :summary :fail 0}
```

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-compose](#)

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

then-compose

```
(then-compose p f)
```

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value with this promise.

```
(-> (promise (fn [] "The Quick Brown Fox"))
  (then-apply str/upper-case)
  (then-compose (fn [x] (-> (promise (fn [] "Jumps Over The Lazy Dog"))
    (then-apply str/lower-case)
    (then-apply #(str x " " %1)))))

  (deref)))
=> "THE QUICK BROWN FOX jumps over the lazy dog"
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

[then-apply](#)

Applies a function f on the result of the previous stage of the promise p.

[then-combine](#)

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

[when-complete](#)

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

[complete-on-timeout](#)

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

third

`(third coll)`

Returns the third element of coll.

```
(third nil)  
=> nil
```

```
(third [])  
=> nil
```

```
(third [1 2 3])  
=> 3
```

```
(third '())  
=> nil
```

```
(third '(1 2 3))  
=> 3
```

[top](#)

thread

`(thread f)`
`(thread f name)`
`(thread f name type)`

Executes the function f in another thread, returning immediately to the calling thread. Returns a `promise` which will receive the result of calling the function f when completed. Optionally a name can be assigned to the spawned thread.

The thread can be given a name by passing the `name` argument. By default the thread name is set to "venice-thread". For each thread spawned on a name the thread's name will be suffixed with an incrementing index starting from 1.

The thread type (*daemon* or *user*) can be controlled by the *type* argument that must be one of `{:daemon, :user}`. By default a daemon thread is spawned.

Note: Each call to `thread` creates a new expensive system thread. Consider to use futures or promises that use an *ExecutorService* to deal efficiently with threads.

```
@(thread #(do (sleep 100) 1))
=> 1

@(thread #(do (sleep 100) (thread-name)))
=> "venice-thread-3"

@(thread #(do (sleep 100) (thread-name)) "job")
=> "job-1"

@(thread #(do (sleep 100) (thread-name)) "job" :daemon)
=> "job-2"

;; consumer / producer
(do
  (defn produce [q]
    (doseq [x (range 4)] (put! q x) (sleep 100))
    (put! q nil))
  (defn consume [q]
    (transduce (map println) (constantly nil) q))
  (let [q (queue 10)]
    (thread #(produce q))
    @(thread #(consume q))))
0
1
2
3
=> nil
```

SEE ALSO

`future`

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

`promise`

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

`agent`

Creates and returns an agent with an initial value of state and zero or more options.

[top](#)

thread-daemon?

```
(thread-daemon?)
```

Returns true if this Thread is a daemon thread else false.

```
(thread-daemon?)
=> false
```

SEE ALSO

[thread-name](#)

Returns this thread's name.

top

thread-id

(**thread-id**)

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is unique and remains unchanged during its lifetime. When a thread is terminated, this thread ID may be reused.

([thread-id](#))

=> 1

SEE ALSO

[thread-name](#)

Returns this thread's name.

top

thread-interrupted

(**thread-interrupted**)

Tests whether the current thread has been interrupted. The interrupted status of the thread is cleared by this method. In other words, if this method were to be called twice in succession, the second call would return false (unless the current thread were interrupted again, after the first call had cleared its interrupted status and before the second call had examined it).

Returns true if the current thread has been interrupted else false.

([thread-interrupted](#))

=> false

SEE ALSO

[thread-interrupted?](#)

Tests whether this thread has been interrupted. The interrupted status of the thread is unaffected by this method. Returns true if ...

[top](#)

thread-local

(thread-local)

Creates a new thread-local accessor

```
(do
  (assoc! (thread-local) :a 1)
  (get (thread-local) :a))
=> 1

(do
  (assoc! (thread-local) :a 1)
  (get (thread-local) :b 999))
=> 999

(do
  (thread-local :a 1 :b 2)
  (get (thread-local) :a))
=> 1

(do
  (thread-local { :a 1 :b 2 })
  (get (thread-local) :a))
=> 1

(do
  (thread-local-clear)
  (assoc! (thread-local) :a 1 :b 2)
  (dissoc! (thread-local) :a)
  (get (thread-local) :a 999))
=> 999
```

SEE ALSO

[thread-local-clear](#)

Removes all thread local vars

[thread-local-map](#)

Returns a snapshot of the thread local vars as a map.

[assoc!](#)

Associates key/vals with a mutable map, returns the map

[dissoc!](#)

Dissociates keys from a mutable map, returns the map

[get](#)

Returns the value mapped to key, not-found or nil if key not present.

[top](#)

thread-local-clear

```
(thread-local-clear)
```

Removes all thread local vars

```
(thread-local-clear)
```

```
=> thread-local-clear
```

SEE ALSO

Creates a new thread-local accessor

[dissoc!](#)

Dissociates keys from a mutable map, returns the map

[top](#)

thread-local-map

```
(thread-local-map)
```

Returns a snapshot of the thread local vars as a map.

Note:

The returned map is a copy of the current thread local vars. Thus modifying this map is not modifying the thread local vars! Use [assoc!](#) and [dissoc!](#) for that purpose!

```
(do
  (thread-local-clear)
  (thread-local :a 1 :b 2)
  (thread-local-map))
=> {:a 1 :b 2 :*assertions* (0)}
```

SEE ALSO

[thread-local](#)

Creates a new thread-local accessor

[get](#)

Returns the value mapped to key, not-found or nil if key not present.

[assoc!](#)

Associates key/vals with a mutable map, returns the map

[dissoc!](#)

Dissociates keys from a mutable map, returns the map

[top](#)

thread-local?

```
(thread-local? x)
```

Returns true if x is a thread-local, otherwise false

```
(do
  (def x (thread-local))
  (thread-local? x))
=> true
```

SEE ALSO

[thread-local](#)

Creates a new thread-local accessor

[top](#)

thread-name

```
(thread-name)
```

Returns this thread's name.

```
(thread-name)
=> "main"
```

SEE ALSO

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is ...

[top](#)

throw

```
(throw)
(throw val)
(throw ex)
```

Throws an exception.

```
(throw)
Throws a :ValueException with nil as its value.
```

```
(throw val)
With val as a Venice value throws a :ValueException with val as its value.  
E.g: (throw [1 2 3])
```

```
(throw ex)
With a ex as an exception type throws the exception.  
E.g: (throw (ex :VncException "invalid data"))
```

```
(try
(+ 100 200)
(catch :Exception e
  "caught ~(ex-message e)"))
=> 300
```

```
(try
(+ 100 200)
(throw)
(catch :ValueException e
```

```

    "caught ~(pr-str (ex-value e))")
=> "caught nil"

(try
 (+ 100 200)
 (throw 100)
 (catch :ValueException e
   "caught ~(ex-value e))")
=> "caught 100"

;; The finally block is just for side effects, like
;; closing resources. It never returns a value!
(try
 (+ 100 200)
 (throw [100 {:a 3}])
 (catch :ValueException e
   "caught ~(ex-value e))")
 (finally (println "#finally")
   :finally))
#finally
=> "caught [100 {:a 3}]"

(try
 (throw (ex :RuntimeException "#test"))
 (catch :RuntimeException e
   "caught ~(ex-message e))")
=> "caught #test"

;; Venice wraps thrown checked exceptions with a RuntimeException!
(do
 (import :java.io.IOException)
 (try
   (throw (ex :IOException "#test"))
   (catch :RuntimeException e
     "caught ~(ex-message (ex-cause e)))))
=> "caught #test"

```

SEE ALSO

ex
Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

try
Exception handling: try - catch - finally

try-with
try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

[top](#)

time

(time expr)

Evaluates expr and prints the time it took. Returns the value of expr.

```

(time (+ 100 200))
Elapsed time: 4.08μs
=> 300

```

SEE ALSO

[dorun](#)

Runs the expr count times in the most effective way. It's main purpose is supporting benchmark tests. Returns the expression result ...

[top](#)

time/after?

```
(time/after? date1 date2)
(time/after? date1 date2 & more)
```

Returns true if all dates are ordered from the latest to the earliest (same semantics as `>`)

```
(time/after? (time/local-date 2019 1 1)
             (time/local-date 2018 1 1))
=> true

time/format

```
(time/format date format)
(time/format date format locale)
(time/format date formatter)
(time/format date formatter locale)
```

Formats a date with a format.

To format a large number of dates a pre instantiated formatter delivers best performance:

```
(let [fmt (time/formatter "yyyy-MM-dd'T'HH:mm:ss")]
  (dotimes [n 100] (time/format (time/local-date-time) fmt)))
```

```
(time/format (time/local-date) "dd-MM-yyyy")
=> "23-11-2025"
```

```
(time/format (time/local-date) (time/formatter "dd-MM-yyyy"))
=> "23-11-2025"
```

```
(time/format (time/local-date) :iso)
=> "2025-11-23T11:15:55"
```

```
(time/format (time/local-date-time) "yyyy-MM-dd'T'HH:mm:ss")
=> "2025-11-23T11:15:55"
```

```
(time/format (time/local-date-time) :iso)
=> "2025-11-23T11:15:55.767"
```

```
(time/format (time/zoned-date-time) "yyyy-MM-dd'T'HH:mm:ss.SSSz")
=> "2025-11-23T11:15:55.835CET"
```

```
(time/format (time/zoned-date-time) :iso)
=> "2025-11-23T11:15:55.868+01:00"
```

```
(time/format (time/zoned-date-time) (time/formatter "yyyy-MM-dd'T'HH:mm:ss.SSSz"))
=> "2025-11-23T11:15:55.900CET"

(time/formatter format locale)
```

Creates a formatter

```
(time/formatter "dd-MM-yyyy")
```

```
(time/formatter "dd-MM-yyyy" :en_EN)
```

```
(time/formatter "dd-MM-yyyy" "en_EN")
```

```
(time/formatter "yyyy-MM-dd'T'HH:mm:ss.SSSz")
```

```
(time/formatter :ISO_OFFSET_DATE_TIME)
```

SEE ALSO

[time/format](#)

Formats a date with a format.

[top](#)

time/hour

```
(time/hour date)
```

Returns the hour of the date 0..23

```
(time/hour (time/local-date))
=> 0
```

```
(time/hour (time/local-date-time))
=> 11
```

```
(time/hour (time/zoned-date-time))
=> 11
```

SEE ALSO

[time/minute](#)

Returns the minute of the date 0..59

=> false
```

SEE ALSO

[time/length-of-year](#)

Returns the length of the year represented by this date.

[time/length-of-month](#)

Returns the length of the month represented by this date.

[top](#)

time/length-of-month

`(time/length-of-month date)`

Returns the length of the month represented by this date.

This returns the length of the month in days. For example, a date in January would return 31.

```
(time/length-of-month (time/local-date 2000 2 1))  
=> 29
```

```
(time/length-of-month (time/local-date 2001 2 1))  
=> 28
```

```
(time/length-of-month (time/local-date-time))  
=> 30
```

```
(time/length-of-month (time/zoned-date-time))  
=> 30
```

SEE ALSO

[time/length-of-year](#)

Returns the length of the year represented by this date.

[time/leap-year?](#)

Checks if the year is a leap year.

[top](#)

time/length-of-year

`(time/length-of-year date)`

Returns the length of the year represented by this date.

This returns the length of the year in days, either 365 or 366.

```
(time/length-of-year (time/local-date 2000 1 1))  
=> 366
```

```
(time/length-of-year (time/local-date 2001 1 1))  
=> 365
```

```
(time/length-of-year (time/local-date-time))  
=> 365
```

```
(time/length-of-year (time/zoned-date-time))
=> 365
```

SEE ALSO

[time/length-of-month](#)

Returns the length of the month represented by this date.

[time/leap-year?](#)

Checks if the year is a leap year.

[top](#)

time/local-date

```
(time/local-date)
(time/local-date year month day)
(time/local-date date)
```

Creates a new local-date. A local-date is represented by 'java.time.LocalDate'

```
(time/local-date)
=> 2025-11-23
```

```
(time/local-date 2018 8 1)
=> 2018-08-01
```

```
(time/local-date "2018-08-01")
=> 2018-08-01
```

```
(time/local-date (time/local-date-time 2018 8 1 14 20 10))
=> 2018-08-01
```

```
(time/local-date 1375315200000)
=> 2013-08-01
```

```
(time/local-date (. :java.util.Date :new))
=> 2025-11-23
```

SEE ALSO

[time/local-date-time](#)

Creates a new local-date-time. A local-date-time is represented by 'java.time.LocalDateTime'

[time/zoned-date-time](#)

Creates a new zoned-date-time. A zoned-date-time is represented by 'java.time.ZonedDateTime'

[top](#)

time/local-date-parse

```
(time/local-date-parse str format
(time/local-date-parse str format locale
```

Parses a local-date.

To parse a large number of dates a pre instantiated formatter delivers best performance:

```
(let [fmt (time/format "yyyy-MM-dd")]
  (dotimes [n 100] (time/local-date-parse "2018-12-01" fmt)))
```

```
(time/local-date-parse "2018-12-01" "yyyy-MM-dd")
=> 2018-12-01
```

```
(time/local-date-parse "2018-Dec-01" "yyyy-MMM-dd" :ENGLISH)
=> 2018-12-01
```

```
(time/local-date-parse "2018-12-01" :iso)
=> 2018-12-01
```

[top](#)

time/local-date-time

```
(time/local-date-time)
(time/local-date-time year month day)
(time/local-date-time year month day hour minute second)
(time/local-date-time year month day hour minute second millis)
(time/local-date-time date)
```

Creates a new local-date-time. A local-date-time is represented by 'java.time.LocalDateTime'

```
(time/local-date-time)
=> 2025-11-23T11:15:52.700
```

```
(time/local-date-time 2018 8 1)
=> 2018-08-01T00:00
```

```
(time/local-date-time 2018 8 1 14 20 10)
=> 2018-08-01T14:20:10
```

```
(time/local-date-time 2018 8 1 14 20 10 200)
=> 2018-08-01T14:20:10.200
```

```
(time/local-date-time "2018-08-01T14:20:10.200")
=> 2018-08-01T14:20:10.200
```

```
(time/local-date-time (time/local-date 2018 8 1))
=> 2018-08-01T00:00
```

```
(time/local-date-time 1375315200000)

[top](#)

time/zoned-date-time-parse

```
(time/zoned-date-time-parse str format
(time/zoned-date-time-parse str format locale
```

Parses a zoned-date-time.

To parse a large number of dates a pre instantiated formatter delivers best performance:

```
(let [fmt (time/formatter "yyyy-MM-dd'T'HH:mm:ssz")]
  (dotimes [n 100] (time/zoned-date-time-parse "2018-12-01T14:20:01+01:00" fmt)))
```

```
(time/zoned-date-time-parse "2018-08-01T14:20:01+01:00" "yyyy-MM-dd'T'HH:mm:ssz")
=> 2018-08-01T14:20:01+01:00
```

```
(time/zoned-date-time-parse "2018-08-01T14:20:01.000+01:00" "yyyy-MM-dd'T'HH:mm:ss.SSSz")
=> 2018-08-01T14:20:01+01:00
```

```
(time/zoned-date-time-parse "2018-08-01T14:20:01.000+01:00" :iso)
=> 2018-08-01T14:20:01+01:00
```

```
(time/zoned-date-time-parse "2018-08-01 14:20:01.000 +01:00" "yyyy-MM-dd' 'HH:mm:ss.SSS' 'z")
=> 2018-08-01T14:20:01+01:00
```

[top](#)

time/zoned-date-time?

```
(time/zoned-date-time? date)
```

Returns true if date is a zoned-date-time ('java.time.ZonedDateTime') else false

```
(time/zoned-date-time? (time/zoned-date-time))
=> true
```

[top](#)

timeout-after

```
(timeout-after p time time-unit)
```

Returns a promise that timeouts after the specified time. The promise throws a `TimeoutException`.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
  (accept-either (timeout-after 500 :milliseconds)
    (fn [v] (println (pr-str v))))
  (deref))
"The quick brown fox"
=> nil

(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
  (accept-either (timeout-after 500 :milliseconds)
    (fn [v] (println (pr-str v))))
  (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
  (accept-either (timeout-after 500 :milliseconds)
    (fn [v] (println (pr-str v))))
  (deref 2000 :timeout))
=> :timeout

(-> (promise (fn [] (sleep 200) "The quick brown fox"))
  (apply-to-either (timeout-after 100 :milliseconds)
    identity)
  (deref))
=> TimeoutException: java.util.concurrent.TimeoutException
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with `deref`, and set, once only, with `deliver`. Calls to `deref` prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function `f` with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function `f` with the two ...

[then-apply](#)

Applies a function `f` on the result of the previous stage of the promise `p`.

[then-combine](#)

Applies a function `f` to the result of the previous stage of promise `p` and the result of another promise `p-other`

[then-compose](#)

Composes the result of two promises. `f` receives the result of the first promise `p` and returns a new promise that composes that value ...

[when-complete](#)

Returns the promise `p` with the same result or exception at this stage, that executes the action `f`. Passes the current stage's result ...

[accept-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[apply-to-either](#)

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

[or-timeout](#)

Exceptionally completes the promise with a `TimeoutException` if not otherwise completed before the given timeout.

complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

timing/elapsed

(`timing/elapsed f`)

Runs a function `f` and returns the elapsed time in milliseconds.

```
(timing/elapsed #(sleep 500))
=> 505
```

SEE ALSO

[timing/run](#)

Runs a function `f` with printing the elapsed time. Returns the value that `f` has produced.

[top](#)

timing/run

(`timing/run f`)
(`timing/run f start-msg`)

Runs a function `f` with printing the elapsed time. Returns the value that `f` has produced.

```
(timing/run #(sleep 500))
Elapsed: 505ms
=> nil
```

```
(timing/run #(sleep 500) "Sleeping...")
Sleeping...
Elapsed: 505ms
=> nil
```

SEE ALSO

[timing/elapsed](#)

Runs a function `f` and returns the elapsed time in milliseconds.

[top](#)

tomcat/create-servlet

(`create-servlet handler-map`)

Creates a servlet from a HTTP method handler map

```
;; minimal servlet
(tomcat/create-servlet
 { :doGet (fn [req res servlet] (tomcat/send-ok res "Hello World")) })

;; servlet with lifecycle and all HTTP methods
(tomcat/create-servlet
 { :init (fn [config] nil)
   :destroy (fn [servlet] nil)
   :doGet (fn [req res servlet] (tomcat/send-ok res "Hello World"))
   :doHead (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method HEAD"))
   :doPost (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method POST"))
   :doPut (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method PUT"))
   :doDelete (fn [req res servlet] (tomcat/send-not-implemented res "HTTP Method DELETE"))
   :getLastModified (fn [req] -1) })
```

top

tomcat/destroy

(destroy server)

Destroys a Tomcat server after having stopped it.

```
(do
  (load-module :tomcat ['tomcat :as 'tc])
  (let [server  (tc/start (tc/hello-world-servlet)
                           {:await? false, :base-dir ".", :port 8080})]
    (tc/state server)
    (sleep 20_000)
    (tc/stop server)
    (tc/destroy server)))
```

SEE ALSO

[tomcat/start](#)

Start a Tomcat to serve given servlet with supplied options:

[tomcat/state](#)

Returns the state of a Tomcat server.

[tomcat/stop](#)

Stops a Tomcat server.

[tomcat/shutdown](#)

Shutdown a Tomcat server.

top

tomcat/hello-world-servlet

'Hello World' demo servlet

top

tomcat/shutdown

```
(shutdown server)
```

Shutdown a Tomcat server.

Shutdown effectively calls

- (stop server)
- (destroy server)

on the server

```
(do
  (load-module :tomcat ['tomcat :as 'tc])
  (let [server  (tc/start (tc/hello-world-servlet)
                           {:await? false, :base-dir ".", :port 8080}])
    (tc/state server)
    (sleep 20_000)
    (tc/shutdown server)))
```

SEE ALSO

[tomcat/start](#)

Start a Tomcat to serve given servlet with supplied options:

[tomcat/state](#)

Returns the state of a Tomcat server.

[tomcat/stop](#)

Stops a Tomcat server.

[tomcat/destroy](#)

Destroys a Tomcat server after having stopped it.

[top](#)

tomcat/start

```
(start servlet options)
(start servlet context-path context-doc-base options)
```

Start a Tomcat to serve given servlet with supplied options:

Server options:

:base-dir	the server's base directory (default: ".")
:await?	block the thread until server get shutdown command (default: true)
:http?	create http connector (default: true)
:port	the port to listen on http connector (default: 8080)
:https?	create https connector (default: false)
:https-port	the port to listen on https connector (default: 8443)
:keystore	path to keystore file include server certificate
:key-pass	password of keystore file
:tls-hostname	hostname to listen for https connector (default: _default_)
:tls-protocol	list of SSL/TLS protocol to support for https connector (default: TLS)
:tls-ciphers	list of SSL/TLS ciphers to support for https connector
:executor?	use executor (default: true)
:executor-name	name of executor (default: tc-executor)

```
:max-threads      max number of threads in executor (default: 200)
:min-spare-threads minimum number of spare threads in executor (default: 25)
:max-idle-time    max milliseconds before an idle thread shutdown (default: 60000)

| :max-post-size | max post size for file uploads. Tomcat defaults to 2MB. A value of -1 specifies a indefinite upload size
```

Servlet options:

```
:name            the servlet's name (default: "venice-servlet")
:mapping         the servlet's mapping path (default: "/")
single or multiple mappings are possible for a servlet:
  - single: "/employees"
  - multiple: ["/employees" "/employees/*"]
:async-support   if true add async support for servlet (default: false)
:load-on-startup  the load-on-startup order value, a negative value means load on first call. (default: -1)
:file-upload      if true configure as file-upload servlet (default: false)
:location         file-upload location (default: "")
:max-file-size    file-upload max file size in bytes (default: -1)
:max-request-size  file-upload max request size in bytes (default: -1)
:file-size-threshold  file-upload max file threshold in bytes (default: 0)
```

```
;; Example 1:
;; start Tomcat with
;;   - a servlet
;;   - server options
(tomcat/start (tomcat/hello-world-servlet)
  {:await? false, :base-dir ".", :port 8080})

;; Example 2:
;; start Tomcat with
;;   - a servlet
;;   - web app context-path
;;   - web app context-doc-base
;;   - server options
(tomcat/start (tomcat/hello-world-servlet)
  ""
  "."
  {:await? false, :base-dir ".", :port 8080})

;; Example 3:
;; start Tomcat with
;;   - a single servlet with servlet options
;;   - web app context-path
;;   - web app context-doc-base
;;   - server options
(tomcat/start [ [ (tomcat/hello-world-servlet)
  {:name "hello-servlet" :mapping "/"} ] ]
  ""
  "."
  {:await? false, :base-dir ".", :port 8080})

;; Example 4:
;; start Tomcat with
;;   - a single fileupload servlet with servlet options
;;   - web app context-path
;;   - web app context-doc-base
;;   - server options
(tomcat/start [ [ (upload-servlet)
  {:name "upload-servlet"} ] ])
```

```

:mapping          "/upload"
:file-upload     true
:location        "/tmp"
:max-file-size   10485760
:max-request-size 10485760
:file-size-threshold -1} ] ]
"""
".
{:await? false, :base-dir ".", :port 8080})

```

[top](#)

[trampoline](#)

(trampoline f)
(trampoline f & args)

trampoline can be used to convert algorithms requiring mutual recursion without stack consumption. Calls f with supplied args, if any. If f returns a fn, calls that fn with no arguments, and continues to repeat, until the return value is not a fn, then returns that non-fn value.

Note that if you want to return a fn as a final value, you must wrap it in some data structure and unpack it after trampoline returns.

```
(do
  (defn factorial
    ([n] #(factorial n 1N))
    ([n acc] (if (< n 2)
                  acc
                  #(factorial (dec n) (* acc n)))))

  (trampoline (factorial 20)))
=> 2432902008176640000N
```

top

transduce

```
(transduce xform f coll)
(transduce xform f init coll)
```

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be a reducing step function that accepts both 1 and 2 arguments. Returns the result of applying (the transformed) xf to init and the first item in coll, then applying xf to that result and the 2nd item, etc. If coll contains no items, returns init and f is not called.

`transduce` can work with queues as collection, given that the end of the queue is marked by adding a `nil` element. Otherwise the transducer does not know when to stop reading elements from the queue.

Transformations	Reductions	Control
map	map-indexed	rf-first
filter	flatten	rf-last
drop	drop-while	rf-any?
drop-last	remove	rf-every?
take	take-while	
take-last	keep	conj
dedupe	distinct	+, *
sorted	reverse	max, min

```
(transduce identity + [1 2 3 4])
=> 10
```

```
(transduce (map #(+ % 3)) + [1 2 3 4])
=> 22
```

```
(transduce identity max [1 2 3])
=> 3
```

```
(transduce identity rf-last [1 2 3])
=> 3
```

```
(transduce identity (rf-every? pos?) [1 2 3])
=> true
```

```
(transduce (map inc) conj [1 2 3])
=> [2 3 4]
```

```

;; transduce all elements of a queue or a deque.
;; calls (take! queue) to get the elements of the queue.

[top](#)

try

```
(try expr*)
(try expr* (catch selector ex-sym expr*)*)
(try expr* (catch selector ex-sym expr*)* (finally expr*))
```

Exception handling: try - catch - finally

(try) without any expression returns nil.

The exception types

- :java.lang.Exception
- :java.lang.RuntimeException
- :com.github.jlangch.venice.VncException
- :com.github.jlangch.venice.ValueException

are imported implicitly so its alias :Exception, :RuntimeException, :VncException, and :ValueException can be used as selector without an import of the class.

Selectors

- a class: (e.g., :RuntimeException, :java.text.ParseException), matches any instance of that class
- a key-values vector: (e.g., [key val & kvs]), matches any instance of :ValueException where the exception's value meets the expression
`(and (= (get ex-value key) val) ...)`
- a predicate: (a function of one argument like map?, set?), matches any instance of :ValueException where the predicate applied to the exception's value returns true

Notes:

The finally block is just for side effects, like closing resources. It never returns a value!

All exceptions in Venice are *unchecked*. If *checked* exceptions are thrown in Venice they are immediately wrapped in a :RuntimeException before being thrown! If Venice catches a *checked* exception from a Java interop call it wraps it in a :RuntimeException before handling it by the catch block selectors.

Venice follows the Java rules when propagating exceptions:

1. exception from finally block
2. exception from catch block
3. exception from body block

```
(try
  (throw "test")
  (catch :ValueException e
    "caught ~(ex-value e)"))
=> "caught test"
```

```
(try
  (throw 100)
  (catch :Exception e -100))
=> -100
```

```

(try
  (throw 100)
  (catch :ValueException e (ex-value e))
  (finally (println "...finally")))
...finally
=> 100

(try
  (throw (ex :RuntimeException "message"))
  (catch :RuntimeException e (ex-message e)))
=> "message"

;; exception type selector:
(try
  (throw [1 2 3])
  (catch :ValueException e (ex-value e))
  (catch :RuntimeException e "runtime ex")
  (finally (println "...finally")))
...finally
=> [1 2 3]

;; key-value selector:
(try
  (throw {:a 100, :b 200})
  (catch [:a 100] e
    (println "ValueException, value: ~(ex-value e)"))
  (catch [:a 100, :b 200] e
    (println "ValueException, value: ~(ex-value e)")))
ValueException, value: {:a 100 :b 200}
=> nil

;; key-value selector (exception cause):
(try
  (throw (ex :java.io.IOException "failure"))
  (catch [:cause-type :java.io.IOException] e
    (println "IOException, msg: ~(ex-message (ex-cause e)))")
  (catch :RuntimeException e
    (println "RuntimeException, msg: ~(ex-message e)")))
IOException, msg: failure
=> nil

;; predicate selector:
(try
  (throw {:a 100, :b 200})
  (catch long? e
    (println "ValueException, value: ~(ex-value e)"))
  (catch map? e
    (println "ValueException, value: ~(ex-value e)"))
  (catch #(and (map? %) (= 100 (:a %))) e
    (println "ValueException, value: ~(ex-value e)")))
ValueException, value: {:a 100 :b 200}
=> nil

;; predicate selector with custom types:
(do
  (deftype :my-exception1 [message :string, position :long])
  (deftype :my-exception2 [message :string])

  (try
    (throw (my-exception1. "error" 100))
    (catch my-exception1? e

```

```
(println (:value e))
(catch my-exception2? e
  (println (:value e))))
{:custom-type* :user/my-exception1 :message error :position 100}
=> nil
```

SEE ALSO

try-with

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...

throw

Throws an exception.

ex

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[top](#)

try-acquire

```
(try-acquire lock)
(try-acquired lock timeout time-unit)
```

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

Returns `true` if the lock could be acquired within the given time else `false`.

```
(let [l (lock)]
  (when (try-acquire l)
    ;; do something
    (release l)))
=> nil
```

```
(let [l (lock)]
  (when (try-acquire l 3 :seconds)
    ;; do something
    (release l)))
=> nil
```

SEE ALSO

lock

Creates a new lock object.

acquire

Acquires a lock, blocking until the lock is available.

release

Releases a lock.

locked?

Returns true if the lock is in use else false.

[top](#)

try-with

```
(try-with [bindings*] expr*)
```

```
(try-with [bindings*] expr* (catch selector ex-sym expr*)*)
(try-with [bindings*] expr* (catch selector ex-sym expr*)* (finally expr))
```

try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed after execution of that block. The resources declared must implement the Closeable or AutoCloseable interface.

Venice follows the Java rules when propagating exceptions:

1. exception from finally block
2. exception from catch block
3. exception from body block
4. exception from resource auto-close

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/spit file "123456789" :append true)
    (try-with [is (io/file-in-stream file)]
      (io/slurp-stream is :binary false)))
  => "123456789")
```

SEE ALSO

[try](#)

Exception handling: try - catch - finally

[throw](#)

Throws an exception.

[ex](#)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

[top](#)

type

```
(type x)
```

Returns the type of x.

```
(type 5)
=> :core/long
```

```
(type [1 2])
=> :core/vector
```

```
(type (. :java.math.BigInteger :valueOf 100))
=> :java.math.BigInteger
```

SEE ALSO

[supertype](#)

Returns the super type of x.

[superatypes](#)

Returns the super types of x.

[instance-of?](#)

Returns true if x is an instance of the given type

union

```
(union s1)
(union s1 s2)
(union s1 s2 & sets)
```

Return a set that is the union of the input sets

```
(union (set 1 2 3))
=> #{1 2 3}
```

```
(union (set 1 2) (set 2 3))
=> #{1 2 3}
```

```
(union (set 1 2 3) (set 1 2) (set 1 4) (set 3))
=> #{1 2 3 4}
```

SEE ALSO

[difference](#)

Return a set that is the first set without elements of the remaining sets

[intersection](#)

Return a set that is the intersection of the input sets

[cons](#)

Returns a new collection where x is the first element and coll is the rest.

[conj](#)

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

[disj](#)

Returns a new set with the x, xs removed.

update

```
(update m k f)
(update m k f & fargs)
```

Updates a value in an associative structure, where k is a key and f is a function that will take the old value and any supplied fargs and return the new value. Returns a new structure.

If the key does not exist, `nil` is passed as the old value. The optional fargs are passed to the function f as `(f old-value (f old-value arg1 arg2 ...))`.

```
(update [] 0 (fn [x] 5))
=> [5]
```

```
(update [0 1 2] 0 (fn [x] 5))
=> [5 1 2]
```

```
(update [0 1 2] 1 (fn [x] (+ x 3)))
=> [0 4 2]
```

```
(update {} :a (fn [x] 5))
=> {:a 5}

(update {:a 0} :b (fn [x] 5))
=> {:a 0 :b 5}

(update {:a 0 :b 1} :a (fn [x] (+ x 5)))
=> {:a 5 :b 1}

(update [0 1 2] 1 + 3)
=> [0 4 2]

(update {:a 0 :b 1} :b * 4)
=> {:a 0 :b 4}
```

SEE ALSO

[assoc](#)

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, ...

[dissoc](#)

Returns a new coll of the same type, that does not contain a mapping for key(s)

[top](#)

update!

```
(update! m k f & fargs)
```

Updates a value in a mutable associative structure, where k is a key and f is a function that will take the old value and any supplied fargs and return the new value. Returns a new structure.

If the key does not exist, `nil` is passed as the old value. The optional fargs are passed to the function f as `(f old-value arg1 arg2 ...)`.

```
(update! (mutable-vector) 0 (fn [x] 5))
=> [5]

(update! (mutable-vector 0 1 2) 0 (fn [x] 5))
=> [5 1 2]

(update! (mutable-vector 0 1 2) 0 (fn [x] (+ x 1)))
=> [1 1 2]

(update! (mutable-map) :a (fn [x] 5))
=> {:a 5}

(update! (mutable-map :a 0) :b (fn [x] 5))
=> {:a 0 :b 5}

(update! (mutable-map :a 0 :b 1) :a (fn [x] 5))
=> {:a 5 :b 1}

(update! (mutable-vector 0 1 2) 0 + 4)
=> [4 1 2]

(update! (mutable-map :a 0 :b 1) :b * 4)
=> {:a 0 :b 4}
```

SEE ALSO

[assoc!](#)

Associates key/vals with a mutable map, returns the map

[dissoc!](#)

Dissociates keys from a mutable map, returns the map

[top](#)

update-in

(update-in [m ks f & fargs])

Updates' a value in a nested associative structure, where ks is a sequence of keys and f is a function that will take the old value and any supplied fargs and return the new value, and returns a new nested structure.

If any levels do not exist, hash-maps will be created.

```
(do
  (def users [ {:name "James" :age 26}
              {:name "John" :age 43} ])
  (update-in users [1 :age] inc))
=> [{:name "James" :age 26} {:name "John" :age 44}]

(update-in {:a 12} [:a] * 4)
=> {:a 48}

(update-in {:a 12} [:a] + 3 4)
=> {:a 19}
```

[top](#)

used-memory

(used-memory)

Returns the currently used memory by the Java VM.

```
(used-memory)

Returns true if the var is global else false

[var-thread-local?](#)

Returns true if the var is thread-local else false

[top](#)

[var-sym-meta](#)

(var-sym-meta v)

Returns the var's symbol meta data.

The var must exist (bound with a value) otherwise nil is returned.

```
(do
  (def ^{:foo 3} x 100)
  (:foo (var-sym-meta 'x)))
=> 3
```

```
(do
  (let [^{:foo 3} x 100]
    (:foo (var-sym-meta 'x))))
=> 3
```

```
(do
  (defn bar [^{:foo 3} x]
    (:foo (var-sym-meta 'x)))
  (bar 100))
=> 3
```

SEE ALSO

[var-val-meta](#)

Returns the var's value meta data.

[var-get](#)

Returns a var's value.

[var-sym](#)

Returns the var's symbol.

[var-name](#)

Returns the unqualified name of the var's symbol.

[bound?](#)

Returns true if the symbol is bound to a value else false

[top](#)

[var-thread-local?](#)

(var-thread-local? v)

Returns true if the var is thread-local else false

```
(binding [x 100]
  (var-thread-local? x))
=> true
```

SEE ALSO

[var-get](#)

Returns a var's value.

[var-name](#)

Returns the unqualified name of the var's symbol.

[var-ns](#)

Returns the namespace of the var's symbol.

[var-local?](#)

Returns true if the var is local else false

[var-global?](#)

Returns true if the var is global else false

[bound?](#)

Returns true if the symbol is bound to a value else false

[top](#)

var-val-meta

```
(var-val-meta v)
```

Returns the var's value meta data.

The var must exist (bound with a value) otherwise nil is returned.

```
(do
  (def x ^{:foo 4} 100)
  (:foo (var-val-meta 'x)))
=> 4
```

```
(do
  (def x (vary-meta 100 assoc :foo 4))
  (:foo (var-val-meta 'x)))
=> 4
```

```
(do
  (let [x ^{:foo 4} 100]
    (:foo (var-val-meta 'x))))
=> 4
```

```
(do
  (defn bar [x]
    (:foo (var-val-meta 'x)))
  (bar (vary-meta 100 assoc :foo 4)))
=> 4
```

SEE ALSO

[var-sym-meta](#)

Returns the var's symbol meta data.

[var-get](#)

Returns a var's value.

[var-sym](#)

Returns the var's symbol.

[var-name](#)

Returns the unqualified name of the var's symbol.

[bound?](#)

Returns true if the symbol is bound to a value else false

[top](#)

[vary-meta](#)

`(vary-meta obj f & args)`

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

```
(meta (vary-meta [1 2] assoc :foo 3))
=> {:foo 3 :line 67 :column 28 :file "example"}
```

SEE ALSO

[meta](#)

Returns the metadata of obj, returns nil if there is no metadata.

[with-meta](#)

Returns a copy of the object obj, with a map m as its metadata.

[var-val-meta](#)

Returns the var's value meta data.

[var-sym-meta](#)

Returns the var's symbol meta data.

[top](#)

[vector](#)

`(vector & items)`

Creates a new vector containing the items.

```
(vector)
```

```
=> []
```

```
(vector 1 2 3)
```

```
=> [1 2 3]
```

```
(vector 1 2 3 [:a :b])
```

```
=> [1 2 3 [:a :b]]
```

```
(vector "abc")
```

```
=> ["abc"]
```

[top](#)

vector*

```
(vector* args)
(vector* a args)
(vector* a b args)
(vector* a b c args)
(vector* a b c & more)
```

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

```
(vector* 1 [2 3])
=> [1 2 3]
```

```
(vector* 1 2 3 [4])
=> [1 2 3 4]
```

```
(vector* 1 2 3 '(4 5))
=> [1 2 3 4 5]
```

```
(vector* '[1 2] 3 [4])
=> [[1 2] 3 4]
```

```
(vector* nil)
=> nil
```

```
(vector* nil [2 3])
=> [nil 2 3]
```

```
(vector* 1 2 nil)
=> (1 2)
```

SEE ALSO

cons

Returns a new collection where x is the first element and coll is the rest.

conj

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

concat

Returns a list of the concatenation of the elements in the supplied collections.

list*

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

[top](#)

vector?

```
(vector? obj)
```

Returns true if obj is a vector

```
(vector? (vector 1 2))
=> true
```

```
(vector? [1 2])
=> true
```

top

version

```
(version)
```

Returns the Venice version.

```
(version)
=> "0.0.0"
```

top

volatile

```
(volatile x)
```

Creates a volatile with the initial value x

```
(do
  (def counter (volatile 0))
  (swap! counter inc)
  (deref counter))
=> 1
```

```
(do
  (def counter (volatile 0))
  (reset! counter 9)
  @counter)
=> 9
```

SEE ALSO

deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

reset!

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

swap!

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

top

volatile?

```
(volatile? x)
```

Returns true if x is a volatile, otherwise false

```
(do
  (def counter (volatile 0))
  (volatile? counter))
=> true
```

top

when

```
(when test & body)
```

Evaluates test. If logical true, evaluates body in an implicit do.

```
(when (== 1 1) true)
=> true
```

SEE ALSO

[when-not](#)

Evaluates test. If logical false, evaluates body in an implicit do.

[when-let](#)

bindings is a vector with 2 elements: binding-form test.

[if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-not](#)

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-let](#)

bindings is a vector with 2 elements: binding-form test.

top

when-complete

```
(when-complete p f)
```

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result value as first and a possible exception as second argument to the function. The asynchronous function f is called presumably for handling side effects.

```
(-> (promise (fn [] "The Quick Brown Fox"))
      (then-apply str/upper-case)
      (when-complete (fn [v,e] (println (pr-str {:value v :ex e}))))
      (then-apply str/lower-case)
      (deref))
{:value "THE QUICK BROWN FOX" :ex nil}
=> "the quick brown fox"
```

SEE ALSO

[promise](#)

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

[then-accept](#)

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

[then-accept-both](#)

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

then-apply

Applies a function f on the result of the previous stage of the promise p.

then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

accept-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

apply-to-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

[top](#)

when-let

(when-let bindings & body)

bindings is a vector with 2 elements: binding-form test.

If test is true, evaluates the body expressions with binding-form bound to the value of test, if not, yields nil

```
(when-let [value (* 100 2)]
  (str "The expression is true. value=" value))
=> "The expression is true. value=200"
```

SEE ALSO

if-let

bindings is a vector with 2 elements: binding-form test.

let

Evaluates the expressions and binds the values to symbols in the new local context.

[top](#)

when-not

(when-not test & body)

Evaluates test. If logical false, evaluates body in an implicit do.

```
(when-not (== 1 2) true)
=> true
```

SEE ALSO

when

Evaluates test. If logical true, evaluates body in an implicit do.

[when-let](#)

bindings is a vector with 2 elements: binding-form test.

[if](#)

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-not](#)

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

[if-let](#)

bindings is a vector with 2 elements: binding-form test.

[top](#)

[while](#)

`(while test & body)`

Repeatedly executes body while test expression is true. Presumes some side-effect will cause test to become false/nil. Returns nil.

```
(do
  (def a (atom 5))
  (while (pos? @a)
    (println @a)
    (swap! a dec)))
5
4
3
2
1
=> nil
```

[top](#)

[with-err-str](#)

`(with-err-str & forms)`

Evaluates exprs in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing calls.
`with-err-str` can be nested.

```
(with-err-str (println *err* "a string"))
=> "a string\n"
```

SEE ALSO

[with-out-str](#)

Evaluates exprs in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing ...

[top](#)

[with-jmx-connection](#)

`(with-jmx-connection url ssl env & forms)`

Establishes a JMX connection to access MBeans of a local or remote Java VM.

Without an explicit JMX connection local MBeans will be accessed. This is the default setup.

It is strongly recommended to configure SSL and authentication for the JMX connector!

Authentication

To enable authentication, the server JVM must be started with these system properties:

```
-Dcom.sun.management.jmxremote
-Dcom.sun.management.jmxremote.port=9999
-Dcom.sun.management.jmxremote.authenticate=true
-Dcom.sun.management.jmxremote.ssl=false
-Dcom.sun.management.jmxremote.password.file=/path/to/jmxremote.password
-Dcom.sun.management.jmxremote.access.file=/path/to/jmxremote.access
```

Example password file (jmxremote.password):

```
admin secret
```

Set file permissions strictly:

```
chmod 600 /path/to/jmxremote.password
```

Example access file (jmxremote.access):

```
admin readwrite
```

SSL

Step 1: Generate Keystore and Truststore

For both client and server, the same keystore can be used for testing:

```
keytool -genkeypair -alias jmxssl -keyalg RSA -keystore jmx.keystore -storepass changeit -validity 365
```

Export the certificate:

```
keytool -export -alias jmxssl -keystore jmx.keystore -file jmx.cer -storepass changeit
```

Create a truststore (to trust the server's certificate):

```
keytool -import -alias jmxssl -file jmx.cer -keystore jmx.truststore -storepass changeit -noprompt
```

Step 2: JMX Server Configuration with SSL

```
-Dcom.sun.management.jmxremote
-Dcom.sun.management.jmxremote.port=9999
-Dcom.sun.management.jmxremote.rmi.port=9999
-Dcom.sun.management.jmxremote.ssl=true
-Dcom.sun.management.jmxremote.authenticate=true
-Dcom.sun.management.jmxremote.access.file=/path/to/jmxremote.access
-Dcom.sun.management.jmxremote.password.file=/path/to/jmxremote.password

# SSL configuration
-Djavax.net.ssl.keyStore=/path/to/jmx.keystore
-Djavax.net.ssl.keyStorePassword=changeit
-Djavax.net.ssl.trustStore=/path/to/jmx.truststore
-Djavax.net.ssl.trustStorePassword=changeit
```

```
(with-jmx-connection "service:jmx:rmi:///jndi/rmi://localhost:9999/jmxrmi"
  nil
  nil
(let [name (mbean/object-name "java.lang:type=OperatingSystem")]
  (mbean/info name)))

;; example with ssl and username/password authentication
(with-jmx-connection "service:jmx:rmi:///jndi/rmi://localhost:9999/jmxrmi"
```

```
{ "javax.net.ssl" true
  "javax.net.ssl.trustStore" "/path/to/jmx.truststore"
  "javax.net.ssl.trustStorePassword" "changeit" }
  { "jmx.remote.credentials" ["username" "password"] }

(let [name (mbean/object-name "java.lang:type=OperatingSystem")]
  (mbean/info name))

;; local access (without explicit JMX connection)
(let [name (mbean/object-name "java.lang:type=OperatingSystem")]
  (mbean/info name))
```

top

with-meta

```
(with-meta obj m)
```

Returns a copy of the object obj, with a map m as its metadata.

```
(meta (with-meta [1 2] {:foo 3}))
=> {:foo 3}
```

SEE ALSO

[meta](#)

Returns the metadata of obj, returns nil if there is no metadata.

[vary-meta](#)

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

[var-val-meta](#)

Returns the var's value meta data.

[var-sym-meta](#)

Returns the var's symbol meta data.

top

with-out-str

```
(with-out-str & forms)
```

Evaluates exprs in a context in which `*out*` is bound to a capturing output stream. Returns the string created by any nested printing calls.
`with-out-str` can be nested.

```
(with-out-str (println "a string"))
=> "a string\n"
```

SEE ALSO

[with-err-str](#)

Evaluates exprs in a context in which `*err*` is bound to a capturing output stream. Returns the string created by any nested printing ...

top

with-sh-dir

(with-sh-dir dir & forms)

Sets the directory for use with sh, see sh for details.

(with-sh-dir "/tmp" (sh "ls" "-l"))

SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-env](#)

Sets the environment for use with sh.

[with-sh-throw](#)

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

[top](#)

with-sh-env

(with-sh-env env & forms)

Sets the environment for use with sh .

(with-sh-env {"NAME" "foo"} (sh "ls" "-l"))

SEE ALSO

[sh](#)

Launches a new sub-process.

[with-sh-dir](#)

Sets the directory for use with sh, see sh for details.

[with-sh-throw](#)

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

[top](#)

with-sh-throw

(with-sh-throw forms)

Shell commands executed within a `with-sh-throw` context throw an exception if the spawned shell process returns an exit code other than 0.

For use with sh , see sh for details. with-sh-throw can be nested.

(with-sh-throw (sh "ls" "-l"))

SEE ALSO

[sh](#)

Launches a new sub-process.

with-sh-env

Sets the environment for use with sh.

with-sh-dir

Sets the directory for use with sh, see sh for details.

[top](#)

xml/children

(xml/children nodes)

Returns the children of the XML nodes collection

```
(do
  (load-module :xml)
  (xml/children
    (list (xml/parse-str "<a><b>B</b></a>")))))
=> ([:content ["B"] :tag "b"])
```

[top](#)

xml/parse

(xml/parse s)
 (xml/parse s handler)

Parses and loads the XML from the source s with the parser XMLHandler handler. The source may be an InputSource or an InputStream.

Returns a tree of XML element maps with the keys :tag, :attrs, and :content.

[top](#)

xml/parse-str

(xml/parse-str s)
 (xml/parse-str s handler)

Parses an XML from the string s. Returns a tree of XML element maps with the keys :tag, :attrs, and :content.

```
(do
  (load-module :xml)
  (xml/parse-str "<a><b>B</b></a>"))
=> ([:content [[:content ["B"] :tag "b"] :tag "a"]]
```

[top](#)

xml/path->

```
(xml/path-> path nodes)
```

Applies the path to a node or a collection of nodes

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b><c>C</c></b></a>")]
    path [((xml/tag= "b"))
          ((xml/tag= "c"))
          xml/text
          first]]
  (xml/path-> path nodes)))
=> "C"
```

top

xml/text

```
(xml/text nodes)
```

Returns a list of text contents of the XML nodes collection

```
(do
  (load-module :xml)
  (let [nodes (xml/parse-str "<a><b>B</b></a>")]
    path [((xml/tag= "b"))
          xml/text])
  (xml/path-> path nodes)))
=> ("B")
```

top

zero?

```
(zero? x)
```

Returns true if x zero else false

```
(zero? 0)
=> true
```

```
(zero? 2)
=> false
```

```
(zero? 0.1)
=> true
```

```
(zero? 0.0F)
=> true
```

```
(zero? 0.0)
=> true
```

```
(zero? 0.0M)
=> true
```

SEE ALSO

[neg?](#)

Returns true if x smaller than zero else false

[pos?](#)

Returns true if x greater than zero else false

[top](#)

zipmap

```
(zipmap keys vals)
```

Returns a map with the keys mapped to the corresponding vals.

To create a list of tuples from two or more lists use

```
(map list '(1 2 3) '(4 5 6)).
```

```
(zipmap [:a :b :c :d :e] [1 2 3 4 5])
=> {:a 1 :b 2 :c 3 :d 4 :e 5}
```

```
(zipmap [:a :b :c] [1 2 3 4 5])
=> {:a 1 :b 2 :c 3}
```

[top](#)

zipvault/add-empty-folder

```
(zipvault/add-empty-folder zip passphrase name)
```

Adds an empty folder to the zip file.

```
(do
  (load-module :zipvault)

  ;; create "vault.zip"
  ;;           └── data/
  ;;           └── doc/
  ;;                 └── setup/

  (let [zip (io/file "vault.zip")]
    (zipvault/add-empty-folder zip "pwd" "data")
    (zipvault/add-empty-folder zip "pwd" "doc/setup")))
```

SEE ALSO

[zipvault/zip](#)

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

[zipvault/add-file](#)

Adds a file to the zip.

zipvault/add-files

Adds a list of files to the zip.

zipvault/add-folder

Adds a folder to the zip file.

zipvault/add-stream

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

zipvault/remove-files

Removes all files from the zip file that match the names in the input list.

[top](#)

zipvault/add-file

```
(zipvault/add-file zip passphrase file)
(zipvault/add-file zip passphrase filename-in-zip file)
```

Adds a file to the zip.

`filename-in-zip` Set the filename that will be used to include a file into the ZIP file to a different name than given by the source filename added to the ZIP file. The `filename-in-zip` must adhere to the ZIP filename specification, including the use of forward slash '/' as the directory separator, and it must also be a relative file.

```
(do
  (load-module :zipvault))
```

```
;; create "vault.zip"
;;           └── a.txt
;;           └── b.txt

(let [zip   (io/file "vault.zip")
      tmp-1 (io/file (io/tmp-dir) "a.txt")
      tmp-2 (io/file (io/tmp-dir) "b.txt")]
  (io/spit tmp-1 "1234")
  (io/spit tmp-2 "2345")
  (io/delete-file-on-exit tmp-1)
  (io/delete-file-on-exit tmp-2)

  (zipvault/add-file zip "pwd" tmp-1)
  (zipvault/add-file zip "pwd" tmp-2)))
```

```
(do
  (load-module :zipvault))
```

```
;; create "vault.zip"

(let [zip   (io/file "vault.zip")
      tmp-1 (io/file (io/tmp-dir) "aa1.txt")
      tmp-2 (io/file (io/tmp-dir) "bb2.txt")]
  (io/spit tmp-1 "1234")
  (io/spit tmp-2 "2345")
  (io/delete-file-on-exit tmp-1)
  (io/delete-file-on-exit tmp-2)

  (zipvault/add-file zip "pwd" "test/aa1.txt" tmp-1)
  (zipvault/add-file zip "pwd" "test/bb2.txt" tmp-2)))
```

SEE ALSO

[zipvault/zip](#)

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

[zipvault/add-files](#)

Adds a list of files to the zip.

[zipvault/add-folder](#)

Adds a folder to the zip file.

[zipvault/add-empty-folder](#)

Adds an empty folder to the zip file.

[zipvault/add-stream](#)

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

[zipvault/remove-files](#)

Removes all files from the zip file that match the names in the input list.

[top](#)

[zipvault/add-files](#)

```
(zipvault/add-files zip passphrase root-folder-name-in-zip & files)
```

Adds a list of files to the zip.

'root-folder-name-in-zip' set the folder name that will be prepended to the filenames in the ZIP. Must be either `nil` or a non blank string!

```
(do
  (load-module :zipvault)

  ;; create "vault.zip"
  ;;   └── a1.txt
  ;;   └── b2.txt
  ;;     └── copies/
  ;;       └── a1.txt
  ;;       └── b2.txt

  (let [zip    (io/file "vault.zip")
        tmp-1 (io/file (io/tmp-dir) "a1.txt")
        tmp-2 (io/file (io/tmp-dir) "b2.txt")]
    (io/spit tmp-1 "1234")
    (io/spit tmp-2 "2345")
    (io/delete-file-on-exit tmp-1)
    (io/delete-file-on-exit tmp-2)

    (zipvault/zip zip "pwd" "a.txt" "A")
    (zipvault/add-files zip "pwd" nil tmp-1 tmp-2)
    (zipvault/add-files zip "pwd" "copies/" tmp-1 tmp-2)))
```

SEE ALSO

[zipvault/zip](#)

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

[zipvault/add-file](#)

Adds a file to the zip.

[zipvault/add-folder](#)

Adds a folder to the zip file.

[zipvault/add-empty-folder](#)

Adds an empty folder to the zip file.

[zipvault/add-stream](#)

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

[zipvault/remove-files](#)

Removes all files from the zip file that match the names in the input list.

[top](#)

[zipvault/add-folder](#)

```
(zipvault/add-folder zip passphrase folder)
(zipvault/add-folder zip passphrase folder include-root-folder?)
(zipvault/add-folder zip passphrase folder include-root-folder? exclude-fn)
(zipvault/add-folder zip passphrase folder root-folder-name-in-zip include-root-folder? exclude-fn)
```

Adds a folder to the zip file.

'root-folder-name-in-zip' set the folder name that will be prepended to the filenames in the ZIP. Must be either `nil` or a non blank string!

If 'include-root-folder?' (default true) is true the root folder name will be added to the entry name as folder.

The 'exclude-fn' filters the files in the folder that are to be excluded from the zip. 'exclude-fn' is a single argument function that receives a file and returns true if the files is to be excluded otherwise it returns false. May be `nil`.

Note: To add a folder but without any files of the folder

```
(let [zip (io/file "data.zip")]
  (zipvault/add-folder zip "123" (io/file "/tmp/test/data") true (fn [x] true)))
```

This creates the zip "data.zip" with the empty folder "data".

```
(do
  (load-module :zipvault)

  ;; create "vault.zip"

  (zipvault/encrypted? (io/file "vault.zip")))
```

top

zipvault/entropy

```
(zipvault/entropy passphrase)
```

Returns the passphrase's entropy in bits.

The password entropy using the formula: **E = log2(RL)**

- **E** stands for password entropy, measured in bits
- **Log2** is a mathematical formula that converts the total number of possible character combinations to bits
- **R** stands for the range of characters
- **L** stands for the number of characters in a password

The entropy is calculated based on 26 lower and upper case letters, 10 digits, and 24 symbols like °+*%&/()=?`^:_.-\$£!#~;

Note: The function just calculates the entropy. A strong passphrase does not rely on the entropy solely. Avoid passphrases containing words from the dictionary ("admin_passw0rd"), dates (birthdate, ...), repetitions ("aaaaa"), or sequences ("123456")!

```

[zipvault/valid-zip-file?](#)

`(zipvault/valid-zip-file? zip)`

Returns true if the zip is a valid zip file else false.

```
(do
  (load-module :zipvault)

  (zipvault/zip (io/file "vault.zip") "pwd" "a.txt" "abc")
  (zipvault/valid-zip-file? (io/file "vault.zip")))
```

[top](#)

[zipvault/zip](#)

`(zipvault/zip out passphrase & entries)`

Creates an AES-256 encrypted and password protected zip form the entries and writes it to out. out may be a file or an output stream.

An entry is given by a name and data. The entry data may be nil, a bytebuf, a string, a file, an input stream, or a producer function. An entry name with a trailing '/' creates a directory.

Entry value types:

nil	an empty file is written to the zip entry
bytebuf	the bytes are written to the zip entry
string	the string is written to the zip entry
file	the content of the file is written to the zip entry
input stream	the slurped input stream data is written to the zip entry
function	a producer function with a single output stream argument. All data written to the stream is written to the zip entry. The stream can be flushed but must not be closed!

Passphrases:

The AES-256 algorithm requires a 256-bit key as input. One should use a passphrase with at least 128 bits of entropy (that's roughly a 20-character passphrase of random upper/lower/digits/symbols). Less is dropping below general limits of safety, and more than 256 bits won't accomplish anything.

See function: `zipvault/entropy`

```
(do
  (load-module :zipvault)
  (zipvault/zip (io/file "vault.zip") "pwd")) ; empty zip
```

```

(do
  (load-module :zipvault)

  (zipvault/zip
    (io/file "vault.zip")
    "pwd"
    "a.txt"      "abc"
    "b.txt"      (bytebuf "def")
    file        file ; equivalent: (io/file-basename file) file
    "d.txt"      (io/string-in-stream "ghi")
    "e.txt"      (fn [os]
                  (let [wr (io/wrap-os-with-buffered-writer os)]
                    (println wr "200")
                    (flush wr)))
    "empty.txt"  nil
    "xx/g.txt"   "jkl")))

```

SEE ALSO

[zipvault/zip-folder](#)

Creates an AES-256 encrypted and password protected zip from the folder.

[zipvault/entries](#)

Returns a list of the entry names in the zip.

[zipvault/add-file](#)

Adds a file to the zip.

[zipvault/add-files](#)

Adds a list of files to the zip.

[zipvault/add-folder](#)

Adds a folder to the zip file.

[zipvault/add-empty-folder](#)

Adds an empty folder to the zip file.

[zipvault/add-stream](#)

Creates a new entry in the zip file and adds the content of the input stream to the zip file.

[zipvault/remove-files](#)

Removes all files from the zip file that match the names in the input list.

[zipvault/extract-file](#)

Extracts a specific file or folder from the zip file to the destination path.

[zipvault/extract-all](#)

Extracts all files from the zip file to the destination path.

[zipvault/extract-file-data](#)

Extracts a specific file from the zip file and returns it as binary data. in may be a file or an input stream.

[zipvault/entropy](#)

Returns the passphrase's entropy in bits.

[top](#)

[zipvault/zip-folder](#)

```
(zipvault/zip-folder out passphrase folder)
(zipvault/zip-folder out passphrase folder include-root-folder?)
(zipvault/zip-folder out passphrase folder include-root-folder? exclude-fn)
```

Creates an AES-256 encrypted and password protected zip from the folder.

If 'include-root-folder?' (default true) is true the root folder name will be added to the entry name as folder.

The 'exclude-fn' filters the files in the folder that are to be excluded from the zip. 'exclude-fn' is a single argument function that receives a file and returns true if the files is to be excluded otherwise it returns false.

```
(do
  (load-module :zipvault)
