Primitives	
Literals	
Nil	nil
Boolean	true, false
Integer	150I, 1_000_000I, 0x1FFI
Long	1500, 1_000_000, 0x00A055FF
Double	3.569, 2.0E+10
BigDecimal	6.897M, 2.345E+10M
BigInteger	1000N, 1_000_000N
Char	#\A, #\π, #\u03C0
	<pre>#\space, #\newline, #\return, #\tab, #\formfeed, #\backspace, #\lparen, #\rparen, #\quote</pre>
String	"abcd", "ab\"cd", "PI: \u03C0"
	"""{
String interpolation	"~{x}", """~{x}"""
	"~(inc x)", """~(inc x)"""

Collection	ns
Collections	
Generic	count compare empty-to-nil empty into into! cons conj conj! remove repeat repeatedly cycle replace range group-by frequencies get-in seq reverse shuffle
Tests	<pre>empty? not-empty? distinct? coll? list? vector? set? sorted-set? mutable-set? map? sequential? hash-map? ordered-map? sorted-map? mutable-map? bytebuf?</pre>
Process	map map-indexed filter reduce keep docoll mapv run!
Lists	
Create	() list list* mutable-list
Access	first second third fourth nth last peek rest butlast nfirst nlast sublist some
Modify	

Numbers  Arithmetic	+ - * /		<pre>cons conj conj! rest pop into into! concat distinct dedupe partition partition-all</pre>
Convert	int long double decimal bigint		partition-by interpose interleave cartesian-product combinations mapcat flatten sort sort-by
Compare	== = not= < > <= >= compare		take take-while take-last drop drop-while drop-last split-at split-with
Test	<pre>zero? pos? neg? even? odd? number? int? long? double? decimal?</pre>	Test	list? mutable-list? every? not-every? any? not-any?
NaN/Infinite	nan? infinite?	Vectors	
BigDecimal	dec/add dec/sub dec/mul dec/div dec/scale	Create	[] vector vector* mutable-vector mapv
Strings	str str/format str/quote	Access	first second third nth last peek butlast rest nfirst nlast subvec some
Create	str/double-quote str/double-unquote	Modify	cons conj conj! rest pop
Use	count compare empty-to-nil first last nth nfirst nlast seq rest butlast reverse shuffle str/index-of str/last-index-of str/subs str/nfirst str/nlast str/rest str/nrest str/butlast str/butnlast str/chars	iviouny	into into! concat distinct dedupe partition partition-by interpose interleave cartesian-product combinations mapcat flatten sort sort-by take take-while take-last drop drop-while drop-last update update! assoc assoc! split-with
	str/pos str/repeat str/reverse str/truncate	Nested	get-in assoc-in update-in dissoc-in
Caliattaia	str/expand str/lorem-ipsum str/wrap	Test	<pre>vector? mutable-vector? contains? not-contains? every? not-every? any? not-any?</pre>
Split/Join	<pre>str/split str/split-at str/split-lines str/split-columns str/join</pre>	Sets	
Replace	<pre>str/replace-first str/replace-last</pre>	Create	#{} set sorted-set mutable-set
Strip	str/replace-all str/strip-start str/strip-end	Modify	into into! cons cons! conj conj! disj
3,p	str/strip-indent str/strip-margin	Algebra	difference union intersection subset? superset?
Conversion	<pre>str/lower-case str/cr-lf</pre>	Test	set? sorted-set? mutable-set? contains? not-contains? every?
Regex	match? not-match?		not-every? any? not-any?
Trim	<pre>str/trim str/trim-to-nil str/trim-left str/trim-right</pre>	Maps	
Hex	str/hex-to-bytebuf str/bytebuf-to-hex	Create	{} hash-map ordered-map sorted-map mutable-map zipmap

# **Embedding in Java**

```
Eval
```

```
import com.github.jlangch.venice.Venice;

public class Example {
    public static void main(String[] args) {
        final Venice venice = new Venice();

        final Long result = (Long)venice.eval("(+ 1 2)");
    }
}
```

# Passing parameters

# Dealing with Java objects

```
import java.awt.Point;
import com.github.jlangch.venice.Parameters;
import com.github.jlangch.venice.Venice;
public class Example {
   public static void main(String[] args) {
     Venice venice = new Venice();
      // returns a string: "Point=(x: 100.0, y: 200.0)"
      String ret = (String)venice.eval(
                            "(let [x (:x point)
                                                                           \n" +
                                                                           \n" +
                                  y (:y point)]
                            " (str \"Point=(x: \" x \", y: \" y \")\"))
                            Parameters.of("point", new Point(100, 200)));
      // returns a java.awt.Point: [x=110,y=220]
      Point point = (Point)venice.eval(
                            "(. :java.awt.Point :new (+ x 10) (+ y 20))",
                            Parameters.of("x", 100, "y", 200));
}
```

# Precompiling

```

        final Venice venice = new Venice(sandbox);
        // => OK, 'println' is part of the unsafe functions, but enabled by the 2nd rule
        venice.eval("(println 100)");
        // => FAIL, 'read-line' is part of the unsafe functions
            venice.eval("(read-line)");
        catch(SecurityException ex) {
            System.out.println("REJECTED: (read-line)");
}
```

# VeniceDoc

VeniceDoc is a documentation generator for the Venice language for generating API documentation in HTML format from Venice source code.

It is used internally for generating the PDF and HTML cheatsheets. The function doc makes use of it to display the documentation for functions.

# Example

Define a function add with documentation:

```
(defn
 ^{ :arglists '(
       "(add)", "(add x)", "(add x y)", "(add x y & more)")
    :doc
       Returns the sum of the numbers.
        `(add)` returns 0.
    :examples '(
       "(add)",
       "(add 1)",
       "(add 1 2)",
       "(add 1 2 3 4)")
    :see-also '(
       "+", "-", "*", "/") }
 add
 ([] 0)
 ([x] x)
 ([x y] (+ x y))
 ([x y \& xs] (+ x y xs)))
```

Show its documentation from the REPL:

```
venice> (doc add)
```

REPL Output:

```
(add), (add x), (add x y), (add x y & more)

Returns the sum of the numbers. (add) returns 0.

EXAMPLES:
    (add)
    (add 1)
    (add 1 2)
    (add 1 2 3 4)
```

```
SEE ALSO:
+, -, *, /
```

# VeniceDoc Format

The documentation is defined as a Venice metadata map:

```
{ :arglists '("(add)", "(add x)")
  :doc "Returns the sum of the numbers."
  :examples '("(add 1)", "(add 1 2)")
  :see-also '("+", "-", "*", "/") }
```

# key description :arglist the optional arglist, a list of variadic arg specs :doc the documentation in Venice markdown format :examples optional examples, a list of Venice scripts. Use triple quotes for multi-line scripts :see-also an optional list of cross referenced functions

# Markdown

# Venice Markdown

# Headings

To create a heading, add one to four # symbols before the heading text. The number of # will determine the size of the heading.

```
# The largest heading
## The second largest heading
### The third largest heading
#### The fourth largest heading
```

# Paragraphs and Line Breaks

```
A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines (a line containing nothing but spaces or tabs).

Within a paragraph line breaks can be added by placing a `pilcrow`

Line 1¶Line 2¶

Line 3
```

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines (a line containing nothing but spaces or tabs).

Within a paragraph line breaks can be added by placing a pilcrow

Line 1

Line 2

Line 3

# Styling

Venice markdown supports italic, bold, and bold-italic styling

```
This is *italic*, **bold**, and ***bold-italic*** styled text.
```

This is italic, bold, and bold-italic styled text.

# Lists

Unordered List

```
* item 1
* item 2
* item 3
```

- item 1
- item 2

```
• item 3
Ordered List
  1. item 1
 2. item 2
  3. item 3
     1. item 1
     2. item 2
     3. item 3
Mulitiline list items with explicit line breaks:
  * item 1
  * item 2¶
    next line¶
    next line
  * item 3
     • item 1
     • item 2
       next line
       next line
     • item 3
Mulitiline list items with auto line breaks:

SEE ALSO
import
Imports one or multiple Java classes. Imports are bound to the current namespace.
```

# proxify

Proxifies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

# java/as-runnable

Wraps the function f in a java.lang.Runnable (https://docs.oracle.com/javase/8/docs/api/java/lang/Runnable.html)

# java/as-callable

Wraps the function f in a java.util.concurrent.Callable (https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/Callable.html)

```
i.

(.: type-name args*)

Instantiates a custom type.

Note: Venice implicitly creates a builder function suffixed with a dot:
    (deftype :complex [real :long, imaginary :long])
    (complex. 200 300)

For readability prefer (complex. 200 300) over (.: :complex 100 200).
```

```
(do
  (ns foo)
  (deftype :complex [real :long, imaginary :long])
  (def x (.: :complex 100 200))
  [(:real x) (:imaginary x)])
=> [100 200]
SEE ALSO
deftype
Defines a new custom record type for the name with the fields.
deftype?
Returns true if type is a custom type else false.
deftype-of
Defines a new custom wrapper type based on a base type.
deftype-or
Defines a new custom choice type.
deftype-describe
Describes a custom type.
```

```
(/ x)
(/ x y)
(/ x y & more)
If no denominators are supplied, returns 1/numerator, else returns numerator divided by all of the denominators.
(/ 2.0)
=> 0.5
(/ 12 2 3)
=> 2
(/ 12 3)
=> 4
(/ 12I 3I)
=> 4I
(/ 6.0 2)
=> 3.0
(/61.5M)
=> 4.0000000000000000000
SEE ALSO
Returns the sum of the numbers. (+) returns 0.
If one number is supplied, returns the negation, else subtracts the numbers from x and returns the result.
```

\*

Returns the product of numbers. (\*) returns 1

#### dec/add

Adds two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, : UNNECESSARY, or :UP

#### dec/sub

Subtract y from x and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, : UNNECESSARY, or :UP

#### dec/mul

Multiplies two decimals and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, : UNNECESSARY, ...

# dec/div

Divides x by y and scales the result. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

# dec/scale

Scales a decimal. rounding-mode is one of :CEILING, :DOWN, :FLOOR, :HALF\_DOWN, :HALF\_EVEN, :HALF\_UP, :UNNECESSARY, or :UP

# Object

Defines a protocol to customize the toString and/or the compareTo function of custom datatypes.

Definition:

```
(defprotocol Object
  (toString [this] (to-str false this))
  (compareTo [this other] (compare this other)))
```

compareTo returns a negative integer, zero, or a positive integer as this value is less than, equal to, or greater than the other value.

# **SEE ALSO**

# defprotocol

Defines a new protocol with the supplied function specs.

deftype

Defines a new custom record type for the name with the fields.

```
top

Creates a vector.

[10 20 30]
=> [10 20 30]
```

```
abs
(abs x)
Returns the absolute value of the number
(abs 10)
=> 10

=> 10.1
(abs -10.12M)
=> 10.12M
SEE ALSO
sgn function for a number.
negate
Negates x
```

```
accept-either

(accept-either p p-other f)

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result as argument to the supplied function f.

(-> (promise (fn [] (sleep 200) 200)) (accept-either (promise (fn [] (sleep 100) 100)))
```

```
(fn [v] (println (+ v 1))))
  (deref))
101
=> nil
```

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### then-accept

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

### then-accept-both

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

### then-apply

Applies a function f on the result of the previous stage of the promise p.

### then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

### then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

### when-complete

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

### apply-to-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

### complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

```
acquire

(acquire lock)

Acquires a lock, blocking until the lock is available.

(let [l (lock)]
  (acquire l)
  ;; do something
```

```
(release l))
=> nil

SEE ALSO
lock
Creates a new lock object.
try-acquire
Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.
release
Releases a lock.
locked?
Returns true if the lock is in use else false.
```

agent

(agent state & options)

Creates and returns an agent with an initial value of state and zero or more options.

Options:

:error-handler handler-fn :error-mode mode-keyword :validator validate-fn

The handler-fn is called if an action throws an exception. It's a function taking two args the agent and the exception. The mode-keyword may be either:continue (the default) or:fail The validate-fn must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the validate-fn should return false or throw an exception.

```
(do
  (def x (agent 100))
  (send x + 5)
  (sleep 100)
```

```
(deref x))
=> 105
```

### send

Dispatch an action to an agent. Returns the agent immediately.

### sand-off

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

### await

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

### await-for

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout ...

### dorof

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### set-error-handler!

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

### agent-error

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

top

# agent-error

```
(agent-error agent)
```

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

```
(do
  (def x (agent 100 :error-mode :fail))
  (send x (fn [n] (/ n 0)))
  (sleep 500)
  (agent-error x))
=> com.github.jlangch.venice.VncException: / by zero
```

### SEE ALSO

### agent

Creates and returns an agent with an initial value of state and zero or more options.

### set-error-handler!

Sets the error-handler of an agent to handler-fn. If an action being run by the agent throws an exception handler-fn will be called ...

### agent-error-mode

Returns the agent's error mode

top

# agent-send-off-thread-pool-info

(agent-send-off-thread-pool-info)

Returns the thread pool info of the ThreadPoolExecutor serving agent send-off.

the number of threads to keep in the pool, even if they are idle

maximum-pool-size the maximum allowed number of threads current-pool-size the current number of threads in the pool

largest-pool-size the largest number of threads that have ever simultaneously been in the pool

active-thread-count the approximate number of threads that are actively executing tasks

scheduled-task-count the approximate total number of tasks that have ever been scheduled for execution

completed-task-count the approximate total number of tasks that have completed execution

### (agent-send-off-thread-pool-info)

=> {:core-pool-size 0 :maximum-pool-size 2147483647 :current-pool-size 2 :largest-pool-size 2 :active-thread-count 0 :scheduled-task-count 10 :completed-task-count 10}

### **SEE ALSO**

core-pool-size

### agent

Creates and returns an agent with an initial value of state and zero or more options.

### send-off

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

top

# agent-send-thread-pool-info

(agent-send-thread-pool-info)

Returns the thread pool info of the ThreadPoolExecutor serving agent send.

core-pool-size the number of threads to keep in the pool, even if they are idle

=> {:core-pool-size 10 :maximum-pool-size 10 :current-pool-size 9 :largest-pool-size 9 :active-thread-count 0 : scheduled-task-count 9 :completed-task-count 9}

### SEE ALSO

### agent

Creates and returns an agent with an initial value of state and zero or more options.

### send

Dispatch an action to an agent. Returns the agent immediately.

top

### aget

(aget array idx)

```
Returns the value at the index of an array of Java Objects

(aget (long-array '(1 2 3 4 5)) 1)
=> 2
```

```
alength

(alength array)

Returns the length of an array

(alength (long-array '(1 2 3 4 5)))

=> 5
```

# all-of

```
(all-of p & ps)
```

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, then the returned promise also does so. Otherwise, the results, if any, of the given promises are not reflected in the returned promise, but may be obtained by inspecting them individually.

### **SEE ALSO**

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### any-of

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

# alter-ns-meta!

(alter-ns-meta! n f & args)

Alters the metadata for a namespace. f must be free of side-effects.

```
(do
  (ns foo)
  (alter-ns-meta! foo assoc :a 1))
=> {:a 1}
```

```
(do
    (ns foo)
    (def n 'foo)
    (alter-ns-meta! (var-get n) assoc :a 1)
    (pr-str (ns-meta (var-get n))))

=> "{:a 1}"

SEE ALSO

ns-meta
Returns the meta data of the namespace n or nil if n is not an existing namespace

reset-ns-meta!
Resets the metadata for a namespace

ns
Opens a namespace.
```

```
amap

(amap f arr)

Applys f to each item in the array arr. Returns a new array with the mapped values.

(str (amap (fn [x] (+ 1 x)) (long-array 6 0)))
=> "[1, 1, 1, 1, 1, 1]"
```

```
and

(and x)
(and x & next)

Ands the predicate forms

(and true true)
=> true

(and true false)
=> false

(and)
=> true

SEE ALSO

or
Ors the predicate forms

not
Returns true if x is logical false, false otherwise.
```

```
ansi/ansi
(ansi style)
Output an ANSI escape code using a style key.
If *use-ansi* is bound to false, outputs an empty string instead of an ANSI code.
(println (str (ansi/ansi :blue) "foo"))
(println (str (ansi/ansi :underline) "foo"))
(println (str (ansi/ansi (ansi/fg-color 33)) "foo"))
ansi/bg-color
(bg-color code)
Defines an extended background color from the 256-color extended color set. The code ranges from 0 to 255.
(ansi/bg-color 197)
ansi/fg-color
(fg-color code)
Defines an extended foreground color from the 256-color extended color set. The code ranges from 0 to 255.
(ansi/fg-color 197)
ansi/progress
(progress & options)
Returns a progress handler that renders the progress as a percentage string.
The returned progress handler takes two args:
 - progress, a value 0..100 in :percent mode otherwise any value
 - status , one of {:start :progress :end :failed}
```

E.g: Download: 54% Progress options:

A caption text. Defaults to empty.

:caption txt

```
:start-msg msg
                 A start message. Defaults to "{caption} started".
:end-msg msg
                 An end message. Defaults to "{caption} ok".
:end-col col
                 An end message ansi color code.
                 A failed message. Defaults to "{caption} failed".
:failed-msg msg
:failed-col col
                 A failed message ansi color code.
:mode m
                 A mode {:percent, :custom}. Defaults to :percent.
(let [pb (ansi/progress :caption "Test:")]
  (pb 0 :progress)
  (sleep 1 :seconds)
  (pb 50 :progress)
  (sleep 1 :seconds)
  (pb 100 :progress)
  (sleep 1 :seconds)
  (pb 100 :end))
(io/download "https://foo.org/image.png"
              :binary true
              :user-agent "Mozilla"
               :progress-fn (ansi/progress :caption "Download:"))
```

# ansi/progress-bar

```
(progress-bar & options)
```

Returns a progress handler that renders a progress bar.

The returned progress handler takes two args:

- progress (0..100%)
- status {:start :progress :end :failed}

### E.g:

- Download: [########### ]
- Download: [############ ] 70%

### Progress bar options:

:caption txt A caption text. Defaults to empty.

:width val The width of the bar in chars. Defaults to 25.:start-msg msg A start message. Defaults to "{caption} started".:end-msg msg An end message. Defaults to "{caption} ok".

:end-col col An end message ansi color code.

:failed-msg msg  $\,$  A failed message. Defaults to "{caption} failed".

:failed-col col A failed message ansi color code.

:show-percent bool If true shows the percentage. Defaults to 'false'.

```
ansi/style

(style text styles)

Applies ANSI color and style to a text string.

(println (ansi/style "foo" :green))

(println (ansi/style "foo" :green :underline))

(println (ansi/style "foo" :green :bg-yellow :underline))

(println (ansi/style "foo" (ansi/fg-color 21) (ansi/bg-color 221) :underline))

(println (ansi/style "foo" nil))
```

ansi/with-ansi

(with-ansi & forms)

Runs the given forms with the *use-ansi* variable temporarily bound to true, to enable the production of any ANSI color codes specified in the forms.

(ansi/with-ansi (println (ansi/style "foo" :green)))

ton

### ansi/without-ansi

(without-ansi & forms)

Runs the given forms with the *use-ansi* variable temporarily bound to false, to suppress the production of any ANSI color codes specified in the forms.

(ansi/without-ansi (println (ansi/style "foo" :green)))

# ansi/without-cursor

```
(without-cursor & forms)
```

Runs the given forms with the cursor turned off.

top

# any-of

```
(any-of p & ps)
```

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, the returned promise also does so.

### **SEE ALSO**

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### all-of

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

top

# any-pred

```
(any-pred p1 & p)
```

Takes a set of predicates and returns a function f that returns the first logical true value returned by one of its composing predicates against any of its arguments, else it returns logical false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical true result against the original predicates.

```
((any-pred number?) 1)
=> true

((any-pred number?) 1 "a")
=> true

((any-pred number? string?) 2 "a")
=> true
```

# any? (any? pred coll) Returns true if the predicate is true for at least one collection item, false otherwise. (any? number? nil) => false (any? number? []) => false (any? number? [1 :a :b]) => true (any? number? [1 2 3]) => true (any? #(== % 10) [10 20 30]) (any? #(>= % 10) [1 5 10]) => true **SEE ALSO** every? Returns true if the predicate is true for all collection items, false otherwise. Returns false if the predicate is true for at least one collection item, true otherwise Returns false if the predicate is true for all collection items, true otherwise

# app/build (app/build name main-file file-map dest-dir) Creates a Venice application archive that can be distributed and executed as a single file. E.g.: staging billing.venice utils util.venice render.venice data bill.template logo.jpg With these staged files the archive is built as: (app/build "billing"

"billing.venice"

```
app/manifest

(app/manifest app)

Returns the manifest of a Venice application archive as a map.
```

```
apply

(apply f args* coll)

Applies f to all arguments composed of args and coll
```

```
(apply + [1 2 3])
=> 6

(apply + 1 2 [3 4 5])
=> 15

(apply str [1 2 3 4 5])
=> "12345"

(apply inc [1])
=> 2
```

ton

# apply-to-either

```
(apply-to-either p p-other f)
```

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result as argument to the supplied function f.

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### then-accept

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

### then-accept-both

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

### then-apply

Applies a function f on the result of the previous stage of the promise p.

### then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

### then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

### when-complete

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

### accept-either

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result ...

### or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

### complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

top

### as->

```
(as-> expr name & forms)
```

Binds name to expr, evaluates the first form in the lexical context of that binding, then binds name to that result, repeating for each successive form, returning the result of the last form. This allows a value to thread into any argument position.

->

Threads the x through the forms. Inserts x as the second item in the first form, making a list of it if it is not a list already.

->>

Threads the x through the forms. Inserts x as the last item in the first form, making a list of it if it is not a list already. If ...

-<>

Threads the x through the forms. Inserts x at position of the <> symbol of the first form, making a list of it if is not a list already.

```
aset

(aset array idx val)

Sets the value at the index of an array

(aset (long-array '(1 2 3 4 5)) 1 20)

=> [1, 20, 3, 4, 5]
```

# assert

```
(assert expr)
(assert expr message)
```

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

```
(assert (= 3 (+ 1 2)))
=> true

(assert (= 4 (+ 1 2)))
=> AssertionException: Assert failed.
Expression:
(= 4 (+ 1 2))
```

### **SEE ALSO**

### assert-false

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

### assert-eq

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

### assert-ne

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

### assert-throws

 $\label{thm:exact} \textit{Evaluates expr} \ \textit{and throws an :} Assertion \textit{Exception exception if it does not throw the expected exception of type ex-type.}$ 

### assert-does-not-throw

 $\label{thm:exact} \textit{Evaluates expr} \ \textit{and throws an :} \textit{AssertionException exception if it does throw any kind of exception.}$ 

### test/deftest

Defines a test function with no arguments.

# assert-does-not-throw

```
(assert-does-not-throw expr)
(assert-does-not-throw expr message)
```

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

```
(assert-does-not-throw (/ 2 1))
=> true

(assert-does-not-throw (/ 2 0))
=> AssertionException: Assert failed.
Unexpected exception: :com.github.jlangch.venice.VncException
Expression:
(/ 2 0)
```

### **SEE ALSO**

### assert

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

### assert-false

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

### assert-eo

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

### assert-ne

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

### assert-throws

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

### test/deftest

Defines a test function with no arguments.

top

# assert-eq

```
(assert-eq expected actual)
(assert-eq expected actual message)
```

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

```
(assert-eq 3 (+ 1 2))
=> true

(assert-eq 4 (+ 1 2))
=> AssertionException: Assert failed.
Expected: 4
Actual: 3
Expression:
(+ 1 2)
```

### assert

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

### assert-false

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

### accort\_no

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

### accort\_throws

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

### assert-does-not-throw

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

### test/deftest

Defines a test function with no arguments.

top

### assert-false

```
(assert-false expr)
(assert-false expr message)
```

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

```
(assert-false (= 3 (+ 1 3)))
=> true

(assert-false (= 4 (+ 1 3)))
=> AssertionException: Assert failed.
Expression:
(= 4 (+ 1 3))
```

### **SEE ALSO**

### asser

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

### assert-eq

 $Assert\ that\ expected\ and\ actual\ are\ equal.\ Throws\ an\ : Assertion Exception\ exception\ if\ they\ are\ not\ equal.$ 

### assert-ne

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

### assert-throws

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

### assert-does-not-throw

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

### test/deftest

Defines a test function with no arguments.

top

### assert-ne

```
(assert-ne unexpected actual)
(assert-ne unexpected actual message)
```

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

```
(assert-ne :foo :bar)
=> true

(assert-ne :foo :foo)
=> AssertionException: Assert failed.
Unexpected: :foo
Actual: :foo
Expression: :foo
```

### **SEE ALSO**

### assert

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

### assert-false

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

### assert-en

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

### assert-throws

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

### assert-does-not-throw

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

### test/deftest

Defines a test function with no arguments.

ton

### assert-throws

```
(assert-throws ex-type expr)
(assert-throws ex-type expr message)
```

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

```
(assert-throws :VncException (/ 2 0))
=> true

(assert-throws :VncException (/ 2 1))
=> AssertionException: Assert failed.
Expected: :VncException
But no exception has been thrown!
Expression:
(/ 2 1)
```

### **SEE ALSO**

### assert

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

### assert-false

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

### assert-en

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

### assert-ne

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

### assert-does-not-throw

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

### test/deftest

Defines a test function with no arguments.

top

# assert-throws-with-msg

```
(assert-throws-with-msg ex-type ex-msg-regexp expr)
(assert-throws-with-msg ex-type ex-msg-regexp expr message)
```

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

```
(assert-throws-with-msg :VncException #"/ by zero" (/ 2 0))
=> true
```

### SEE ALSO

### accort

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

### assert-false

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

### assert-eq

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

### assert-ne

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

### assert-does-not-throw

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

### test/deftest

Defines a test function with no arguments.

top

### assoc

```
(assoc coll key val)
(assoc coll key val & kvs)
```

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector, returns a new vector that contains val at index. Note - index must be <= (count vector). When applied to a custom type, returns a new custom type with passed fields changed.

```
(assoc {} :a 1 :b 2)
=> {:a 1 :b 2}
```

```
(assoc nil :a 1 :b 2)
=> {:a 1 :b 2}

(assoc [1 2 3] 0 10)
=> [10 2 3]

(assoc [1 2 3] 3 10)
=> [1 2 3 10]

(assoc [1 2 3] 6 10)
=> [1 2 3 10]

(do
   (deftype :complex [real :long, imaginary :long])
   (def x (complex. 100 200))
   (def y (assoc x :real 110))
   (pr-str y))
=> "{:custom-type* :user/complex :real 110 :imaginary 200}"
```

### dissoc

Returns a new coll of the same type, that does not contain a mapping for key(s)

### undate

Updates a value in an associative structure, where k is a key and f is a function that will take the old value and any supplied fargs ...

top

### assoc!

```
(assoc! coll key val)
(assoc! coll key val & kvs)
```

Associates key/vals with a mutable map, returns the map

```
(assoc! nil :a 1 :b 2)

> {:a 1 :b 2}

(assoc! (mutable-map) :a 1 :b 2)

> {:a 1 :b 2}

(assoc! (mutable-vector 1 2 3) 0 10)

>> [10 2 3]

(assoc! (mutable-vector 1 2 3) 3 10)

>> [1 2 3 10]

(assoc! (mutable-vector 1 2 3) 6 10)

>> [1 2 3 10]
```

### **SEE ALSO**

### dissoc!

Dissociates keys from a mutable map, returns the map

### update!

Updates a value in a mutable associative structure, where k is a key and f is a function that will take the old value and any supplied ...

top

### assoc-in

```
(assoc-in m ks v)
```

Associates a value in a nested associative structure, where ks is a sequence of keys and v is the new value and returns a new nested structure. If any levels do not exist, hash-maps or vectors will be created.

asub

```
(asub array start len)
```

Returns a sub array

```
(asub (long-array '(1 2 3 4 5)) 2 3)
=> [3, 4, 5]
```

top

### atom

```
(atom x)
(atom x & options)
```

Creates an atom with the initial value x.

Options:

:meta metadata-map

:validator validate-fn

If metadata-map is supplied, it will become the metadata on the atom. validate-fn must be nil or a side-effect-free fn of one argument, which will be passed the intended new state on any state change. If the new state is unacceptable, the validate-fn should return false or throw an exception.

```
(do (def counter (atom 0))
```

```
(swap! counter inc)
  (deref counter))
=> 1

(do
   (def counter (atom 0))
   (reset! counter 9)
   @counter)
=> 9
```

### deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

### reset!

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

### swap

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

### compare-and-set!

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

### add-watch

Adds a watch function to an agent/atom reference. The watch fn must be a fn of 4 args: a key, the reference, its old-state, its new-state.

### remove-watch

Removes a watch function from an agent/atom reference.

```
atom?

(atom? x)

Returns true if x is an atom, otherwise false

(do
    (def counter (atom 0))
    (atom? counter))
=> true
```

top

# await

```
(await agents)
```

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

```
;; blocks till the agent actions are finished
  (await x1 x2))
=> true
```

### agent

Creates and returns an agent with an initial value of state and zero or more options.

### await-for

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout ...

top

# await-for

```
(await-for timeout-ms agents)
```

Blocks the current thread until all actions dispatched thus far (from this thread or agent) to the agents have occurred, or the timeout (in milliseconds) has elapsed. Returns logical false if returning due to timeout, logical true otherwise.

### **SEE ALSO**

### agent

Creates and returns an agent with an initial value of state and zero or more options.

### await

Blocks the current thread (indefinitely) until all actions dispatched thus far (from this thread or agent) to the agents have occurred.

top

# await-termination-agents

```
(shutdown-agents)
```

Blocks until all actions have completed execution after a shutdown request, or the timeout occurs, or the current thread is interrupted, whichever happens first.

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (await-termination-agents 1000))
```

### **SEE ALSO**

### agent

Creates and returns an agent with an initial value of state and zero or more options.

await-termination-agents?

(await-termination-agents?)

Returns true if all tasks have been completed following agent shut down

```
(do
  (def x1 (agent 100))
  (def x2 (agent 100))
  (shutdown-agents)
  (await-termination-agents 1000)
  (sleep 300)
   (await-termination-agents?))
```

### **SEE ALSO**

### agent

Creates and returns an agent with an initial value of state and zero or more options.

top

# bases

(bases class)

Returns the immediate superclass and interfaces of class, if any.

```
(bases :java.util.ArrayList)
=> (:java.util.AbstractList :java.util.List :java.util.RandomAccess :java.lang.Cloneable :java.io.Serializable)
```

top

# benchmark/benchmark

(benchmark expr warmup-iterations iterations & options)

Benchmarks the given expression.

Note: All macros in the expression are expanded before running running the benchmark phases.

Runs the benchmark in 4 phases:

- 1. Run the expression in a warm-up phase to allow the JIT compiler to do optimizations
- 2. Run the garbage collector to isolate timings from GC state prior to testing
- 3. Runs the expression benchmark
- **4.** Analyzes and prints the benchmark statistics

Options:

```
If true generates a chart and saves it to 'benchmark.png'. Defaults to false.
:chart b
             the number of steps for the quantization, defaults to 100
:steps n
:median b
             show the median value in the chart {true/false}, defaults to false
             show the outlier range in the chart {true/false}, defaults to false
:outlier b
             the number of GC runs
:gc n
(do
  (load-module :benchmark ['benchmark :as 'b])
  (b/benchmark (+ 1 2) 120000 10000)
  (b/benchmark (+ 1 2) 120000 10000 :chart true :median true)
  (b/benchmark (+ 1 2) 120000 10000 :chart true :outlier true)
  (b/benchmark (+ 1 2) 120000 10000 :chart true :steps 100))
```

```
bigint

(bigint x)

Converts to big integer.

(bigint 2000)
=> 2000N

(bigint 34897.65)
=> 34897N

(bigint "5676000000000")
=> 5676000000000N

(bigint nil)
=> 0N
```

```
100
=> nil

;; binding-introduced bindings are thread-locally mutable:
(binding [x 1]
   (set! x 2)
    x)
=> 2

;; binding can use qualified names :
(binding [user/x 1]
   user/x)
=> 1
```

### def-dynamic

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

### let

Evaluates the expressions and binds the values to symbols in the new local context.

```
boolean

(boolean x)

Converts to boolean. Everything except 'false' and 'nil' is true in boolean context.

(boolean false)
=> false

(boolean true)
=> true

(boolean nil)
=> false

(boolean 100)
=> true
```

boolean?

(boolean? n)

Returns true if n is a boolean

(boolean? true)
=> true

(boolean? false)
=> true

```
(boolean? nil)
=> false

(boolean? 0)
=> false
```

```
bound?
(bound? s)
Returns true if the symbol is bound to a value else false
(bound? 'test)
=> false
(let [test 100]
 (bound? 'test))
=> true
(do
  (def a 100)
  (bound? 'a))
=> true
SEE ALSO
let
Evaluates the expressions and binds the values to symbols in the new local context.
Creates a global variable.
defonce
```

butlast

(butlast coll)

Returns a collection with all but the last list element

Creates a global variable that can not be overwritten

```
(butlast nil)
=> nil

(butlast [])
=> []

(butlast [1])
=> []
```

top

```
(butlast [1 2 3])
=> [1 2]

(butlast '())
=> ()

(butlast '(1))
=> (1 2)

(butlast "1234")
=> (#\1 #\2 #\3)

SEE ALSO

str/butlast

Returns a possibly empty string of the characters without the last.
```

```
bytebuf

(bytebuf x)

Converts x to bytebuf, x can be a bytebuf, a list/vector of longs, a string

(bytebuf [0 1 2])
=> [0 1 2]

(bytebuf '(0 1 2))
=> [0 1 2]

(bytebuf "abc")
=> [97 98 99]

SEE ALSO

io/bytebuf-out-stream
Returns a new java.io.ByteArrayOutputStream.
```

```
bytebuf-capacity

(bytebuf-capacity buf)

Returns the capacity of a bytebuf.

(bytebuf-capacity (bytebuf-allocate 100))
=> 100
```

```
bytebuf-from-string

(bytebuf-from-string s encoding)

Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8

(bytebuf-from-string "abcdef" :UTF-8)
=> [97 98 99 100 101 102]

SEE ALSO

bytebuf-to-string
Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8
```

top

# bytebuf-get-byte

```
(bytebuf-get-byte buf)
(bytebuf-get-byte buf pos)
```

Reads a byte from the buffer. Without a pos reads from the current position and increments the position by one. With a position reads the byte from that position.

```
(-> (bytebuf-allocate 4)
   (bytebuf-put-byte! 1)
   (bytebuf-put-byte! 2)
   (bytebuf-get-byte 0))
=> 1I
```

ton

# bytebuf-get-double

```
(bytebuf-get-double buf)
(bytebuf-get-double buf pos)
```

Reads a double from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the double from that position.

```
(-> (bytebuf-allocate 16)
   (bytebuf-put-double! 20.0)
   (bytebuf-put-double! 40.0)
   (bytebuf-get-double 0))
=> 20.0
```

ор

# bytebuf-get-float

```
(bytebuf-get-float buf)
(bytebuf-get-float buf pos)
```

Reads a float from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the float from that position.

```
(-> (bytebuf-allocate 16)
   (bytebuf-put-float! 20.0)
   (bytebuf-put-float! 40.0)
   (bytebuf-get-float 0))
=> 20.0
```

top

# bytebuf-get-int

```
(bytebuf-get-int buf)
(bytebuf-get-int buf pos)
```

Reads an integer from the buffer. Without a pos reads from the current position and increments the position by four. With a position reads the integer from that position.

```
(-> (bytebuf-allocate 8)
   (bytebuf-put-int! 1I)
   (bytebuf-put-int! 2I)
   (bytebuf-get-int 0))
=> 1I
```

top

# bytebuf-get-long

```
(bytebuf-get-long buf)
(bytebuf-get-long buf pos)
```

Reads a long from the buffer. Without a pos reads from the current position and increments the position by eight. With a position reads the long from that position.

```
(-> (bytebuf-allocate 16)
  (bytebuf-put-long! 20)
```

```
(bytebuf-put-long! 40)
  (bytebuf-get-long 0))
=> 20
```

```
bytebuf-limit

(bytebuf-limit buf)

Returns the limit of a bytebuf.

(bytebuf-limit (bytebuf-allocate 100))
=> 100
```

```
bytebuf-pos

(bytebuf-pos buf)

Returns the buffer's current position.

(bytebuf-pos (bytebuf-allocate 10))
=> 0
```

```
bytebuf-pos!

(bytebuf-pos! buf pos)

Sets the buffer's position.

(-> (bytebuf-allocate 10)
    (bytebuf-pos! 4)
    (bytebuf-put-byte! 1)
    (bytebuf-pos! 8)
    (bytebuf-put-byte! 2))
=> [0 0 0 0 1 0 0 0 2 0]
```

top

# bytebuf-put-buf!

(bytebuf-put-buf! dst src src-offset length)

This method transfers bytes from the src to the dst buffer at the current position, and then increments the position by length.

```
(-> (bytebuf-allocate 10)
    (bytebuf-pos! 4)
    (bytebuf-put-buf! (bytebuf [1 2 3]) 0 2))
=> [0 0 0 0 1 2 0 0 0 0]
```

```
bytebuf-put-byte!

(bytebuf-put-byte! buf b)

Writes a byte to the buffer at the current position, and then increments the position by one.

(-> (bytebuf-allocate 4) (bytebuf-put-byte! 1) (bytebuf-put-byte! 21))
=> [1 2 0 0]
```

```
bytebuf-put-double!

(bytebuf-put-double! buf d)

Writes a double (8 bytes) to buffer at the current position, and then increments the position by eight.

(-> (bytebuf-allocate 16)
    (bytebuf-put-double! 64.0)
    (bytebuf-put-double! 200.0))

=> [64 80 0 0 0 0 0 64 105 0 0 0 0 0]
```

```
bytebuf-put-int!

(bytebuf-put-int! buf i)
```

```
Writes an integer (4 bytes) to buffer at the current position, and then increments the position by four.

(-> (bytebuf-allocate 8)
    (bytebuf-put-int! 4I)
    (bytebuf-put-int! 8I))
=> [0 0 0 4 0 0 0 8]
```

```
bytebuf-put-long!

(bytebuf-put-long! buf l)

Writes a long (8 bytes) to buffer at the current position, and then increments the position by eight.

(-> (bytebuf-allocate 16)
    (bytebuf-put-long! 4)
    (bytebuf-put-long! 8))
=> [0 0 0 0 0 0 0 4 0 0 0 0 0 0 8]
```

```
bytebuf-sub

(bytebuf-sub x start) (bytebuf-sub x start end)

Returns a byte buffer of the items in buffer from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count bytebuffer)

(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 2)

=> [3 4 5 6]

(bytebuf-sub (bytebuf [1 2 3 4 5 6]) 4)

=> [5 6]
```

```
bytebuf-to-list

(bytebuf-to-list buf)

Returns the bytebuf as lazy list of integers

(doall (bytebuf-to-list (bytebuf [97 98 99])))

=> (97I 98I 99I)
```

top

# bytebuf-to-string

```
(bytebuf-to-string buf encoding)

Converts a bytebuf to a string using an optional encoding. The encoding defaults to :UTF-8

(bytebuf-to-string (bytebuf [97 98 99]) :UTF-8)
=> "abc"

SEE ALSO

bytebuf-from-string
Converts a string to a bytebuf using an optional encoding. The encoding defaults to :UTF-8
```

```
bytebuf?

(bytebuf? x)

Returns true if x is a bytebuf

(bytebuf? (bytebuf [1 2]))
=> true

(bytebuf? [1 2])
=> false

(bytebuf? nil)
=> false
```

```
callstack

(callstack)

Returns the current callstack.

(do
    (defn f1 [x] (f2 x))
    (defn f2 [x] (f3 x))
    (defn f3 [x] (f4 x))
    (defn f4 [x] (callstack))
    (f1 100))

=> [{:fn-name "callstack" :file "example" :line 34 :col 18} {:fn-name "user/f4" :file "example" :line 33 :col 18} {:fn-name "user/f1" :file "example" :line 35 :col 5}]
```

cancel

(cancel f)

```
Cancels a future or a promise
```

```
(do
  (def wait (fn [] (sleep 400) 100))
  (let [f (future wait)]
        (sleep 50)
        (printf "After 50ms: cancelled=%b\n" (cancelled? f))
        (cancel f)
        (sleep 100)
        (printf "After 150ms: cancelled=%b\n" (cancelled? f))))
After 50ms: cancelled=false
After 150ms: cancelled=true
=> nil
```

### future

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### done?

Returns true if the future or promise is done otherwise false

### cancelled?

Returns true if the future or promise is cancelled otherwise false

top

# cancelled?

```
(cancelled? f)
```

Returns true if the future or promise is cancelled otherwise false

```
(cancelled? (future (fn [] 100)))
=> false
```

### SEE ALSO

### future

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### done?

Returns true if the future or promise is done otherwise false

### cancel

Cancels a future or a promise

top

# cargo-arangodb/start

(cargo-arangodb/start cname version mapped-port root-passwd memory cores log)

Starts an ArangoDB container.

### Start rules:

- If a container with another version exists for the container name remove the container and the image
- Pull the image if not yet locally available
- If the container already runs use it
- If the container is available but does not run start it (docker/start ...)
- If the container is not available run it (docker/run ...)
- Finally check for a successful startup. The container log must contain the string ".is ready for business. Have fun." on the last line.

### Args:

cname A unique container name

version The ArangoDB version to use. E.g.: 3.11.4

mapped-port The published (mapped) ArangoDB port on the host

root-passwd The ArangoDB root password

memory The detected memory ArangoDB is to use. E.g.: 8GB, 8000MB

cores The detected number of cores ArangoDB is to use

log A log function (may be *nil*)

### **SEE ALSO**

### cargo-arangodb/stop

Stops an ArangoDB container

top

# cargo-arangodb/stop

```
(cargo-arangodb/stop cname log)
```

Stops an ArangoDB container

Args:

cname A unique container name log A log function (may be *nil*)

### **SEE ALSO**

### cargo-arangodb/start

Starts an ArangoDB container.

# cargo/purge

(cargo/purge cname)

Removes a container and its image. The container must not be running.

Args:

cname A unique container name

;; Purge an ArangoDB container
(cargo/purge "arangodb-test")

### **SEE ALSO**

### cargo/start

Starts a container.

### cargo/stop

Stops a container

### cargo/running?

Returns true if a container with the specified name is running.

top

# cargo/running?

(cargo/running? cname)

Returns true if a container with the specified name is running.

Args:

cname A unique container name

;; Test if ArangoDB container is running
(cargo/running? "arangodb-test")

### **SEE ALSO**

## cargo/start

Starts a container.

### cargo/stop

Stops a container

### cargo/purge

Removes a container and its image. The container must not be running.

top

# cargo/start

(cargo/start cname repo version publish envs args ready? log)
(cargo/start cname repo version publish envs args ready? log wait-after-start-secs ready-check-max-secs)

Starts a container.

#### Start rules:

- If a container with the passed name exists or is running in another version, stop that container and remove it together with the image
- Pull the image if it is not yet locally available
- If the container runs with the requested version already use it
- If the container is available but does not run start it using (docker/start ...)
- If the container is not available run it using (docker/run ...)
- Finally check for a successful startup using the supplied ready? function. E.g.: ready? may scan the container logs for a successful startup message.

Args:

cname A unique container name repo The image repository version The image version publish The port publish envs A vector of env variables

vols A vector of volume mounts

args A vector of arguments for the process run in the container

ready? A function to decide if the container is ready (may be nil). The function takes the unique container name as its single

argument. It returns true if the conatiner is ready else false

log A log function (may be *nil*). The function takes a single string argument

wait-after-start-secs Wait n seconds after starting the container (may be *nil*) ready-check-max-secs Try max n seconds for ready check (defaults to 30s if *nil*)

### SEE ALSO

### cargo/stop

Stops a container

### cargo/running?

Returns true if a container with the specified name is running.

### cargo/purge

Removes a container and its image. The container must not be running.

## cargo/stop

```
(cargo/stop cname log)
```

Stops a container

Args:

cname A unique container name

log A log function (may be *nil*). The function takes a single string argument

### **SEE ALSO**

### cargo/start

Starts a container.

### cargo/running?

Returns true if a container with the specified name is running.

### cargo/purge

Removes a container and its image. The container must not be running.

top

# cartesian-product

```
(cartesian-product coll1 coll2 coll*)
```

Returns the cartesian product of two or more collections.

Removes all duplicates items in the collections before computing the cartesian product.

```
(cartesian-product [1 2 3] [1 2 3])
=> ((1 1) (1 2) (1 3) (2 1) (2 2) (2 3) (3 1) (3 2) (3 3))

(cartesian-product [0 1] [0 1] [0 1])
=> ((0 0 0) (0 0 1) (0 1 0) (0 1 1) (1 0 0) (1 0 1) (1 1 0) (1 1 1))
```

### **SEE ALSO**

## combinations

All the unique ways of taking n different elements from the items in the collection

top

### case

```
(case expr & clauses)
```

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

```
(case (+ 1 9)
    10 :ten
    20 :twenty
    30 :thirty
    :dont-know)
=> :ten
```

#### cond

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the ...

#### condp

Takes a binary predicate, an expression, and a set of clauses.

top

### cast

```
(cast class object)
```

Casts a Java object to a specific type

Note: Casting a Java object will change the object's formal type. See the formal-type function for detailed information.

```
(import :java.awt.Point)
   (import :java.awt.geom.Point2D)
   ;; upcasting :java.awt.Point to :java.awt.geom.Point2D
   ;; Point2D does not define the translate method!
   (let [p1 (. :Point :new 1.0 1.0)
        p2 (cast :Point2D p1)]
     (println "p1 ->" p1)
     (println "p2 ->" p2)
     (println "Formal type p1 ->" (formal-type p1))
     (println "Formal type p2 ->" (formal-type p2))
     (println "p1' ->" (doto p1 (. :translate 2.0 2.0)))
     ;; the translate method is not defined by Point2D
     ;; and will fail with a JavaMethodInvocationException!
     ;; (doto p2 (. :translate 2.0 2.0))
))
p1 -> java.awt.Point[x=1,y=1]
p2 -> java.awt.Point[x=1,y=1]
Formal type p1 -> :java.awt.Point
Formal type p2 -> :java.awt.geom.Point2D
p1' -> java.awt.Point[x=3,y=3]
=> nil
```

### **SEE ALSO**

## formal-type

Returns the formal type of a Java object.

### remove-formal-type

Removes the formal type from a Java object.

### class

Returns the Java class for the given name. Throws an exception if the class is not found.

```
Ceil (ceil x)

Returns the largest integer that is greater than or equal to x

(ceil 1.4)
=> 2.0

(ceil -1.4)
=> -1.0

(ceil 1.23M)
=> 2.00M

(ceil -1.23M)
=> -1.00M

SEE ALSO

floor
Returns the largest integer that is less than or equal to x
```

char

(char c)

Converts a number or s single char string to a char.

(char 65)

⇒ #\A

(char "A")

⇒ #\A

(long (char "A"))

⇒ 65

(str/join (map char [65 66 67 68]))

⇒ "ABCO"

(map #(- (long %) (long (char "0"))) (str/chars "123456"))

⇒ (1 2 3 4 5 6)

SEE ALSO

char?

Returns true if s is a char.

top

# char-escaped

(char-escaped c)

Returns the ASCII escaped character for c.

- \' single quote
- \" double quote
- \\ backslash
- \n new line
- \r carriage return
- \t tab
- \b backspace
- \f form feed
- \0 null character
- in all other cases returns the character c

(char-escaped #\n)

=> #\newline

(char-escaped #\a)

=> #\a

### **SEE ALSO**

#### char

Converts a number or s single char string to a char.

### char?

Returns true if s is a char.

top

## char-literals

(char-literals)

Returns all defined char literals.

Char Literal	Unicode	Char
#\space	\u0020	#\space
#\newline	\u000A	#\newline
#\tab	\u0009	#\tab
#\formfeed	\u000C	#\formfeed

## (char-literals)

## SEE ALSO

### char

Converts a number or s single char string to a char.

#### charz

Returns true if s is a char.

char?

(char? s)

Returns true if s is a char.

(char? #\a)
=> true

SEE ALSO
char
Converts a number or s single char string to a char.

# charset-default-encoding

(charset-default-encoding)

Returns the default charset of this Java virtual machine.

(charset-default-encoding)

=> :UTF-8

ιορ

## cidr/end-inet-addr

```
(cidr/end-inet-addr cidr)
```

Returns the end inet address of a CIDR IP block.

```
(cidr/end-inet-addr "222.192.0.0/11")
=> /222.223.255.255

(cidr/end-inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")
=> /2001:db8:85a3:8d3:ffff:ffff:ffff

(cidr/end-inet-addr (cidr/parse "222.192.0.0/11"))
=> /222.223.255.255
```

top

# cidr/in-range?

```
(cidr/in-range? ip cidr)
```

Returns true if the ip adress is within the ip range of the cidr else false. ip may be a string or a :java.net.InetAddress, cidr may be a string or a CIDR Java object obtained from 'cidr/parse'.

```
(cidr/in-range? "222.220.0.0" "222.220.0.0/11")
=> true
(cidr/in-range? (inet/inet-addr "222.220.0.0") "222.220.0.0/11")
=> true
(cidr/in-range? "222.220.0.0" (cidr/parse "222.220.0.0/11"))
=> true
```

top

## cidr/insert

```
(cidr/insert trie cidr value)
```

Insert a new CIDR / value relation into trie. Works with IPv4 and IPv6. Please keep IPv4 and IPv6 CIDRs in different tries.

# cidr/lookup

cidr/parse

(cidr/parse cidr)

Parses CIDR IP blocks to an IP address range. Supports both IPv4 and IPv6.

```
(cidr/parse "222.192.0.0/11")
=> 222.192.0.0/11: [/222.192.0.0 .. /222.223.255.255]

(cidr/parse "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")
=> 2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64: [/2001:db8:85a3:8d3:0:0:0:0 .. /2001:db8:85a3:8d3:ffff:fffff:ffff]
```

ton

## cidr/size

(cidr/size trie)

```
cidr/start-inet-addr

(cidr/start-inet-addr cidr)

Returns the start inet address of a CIDR IP block.

(cidr/start-inet-addr "222.192.0.0/11")
=> /222.192.0.0

(cidr/start-inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347/64")
=> /2001:db8:85a3:8d3:0:0:0:0

(cidr/start-inet-addr (cidr/parse "222.192.0.0/11"))
=> /222.192.0.0
```

top

## class

(class name)

Returns the Java class for the given name. Throws an exception if the class is not found.

```
(class :java.util.ArrayList)

=> class java.util.ArrayList

SEE ALSO

class—of
Returns the Java class of a value.

class—name
Returns the Java class name of a class.

class—version
Returns the major version of a Java class.

cast
Casts a Java object to a specific type

formal—type
Returns the formal type of a Java object.

remove—formal—type
Removes the formal type from a Java object.
```

```
class-name

(class-name class)

Returns the Java class name of a class.

(class-name (class :java.util.ArrayList))
=> "java.util.ArrayList"

SEE ALSO

class
Returns the Java class for the given name. Throws an exception if the class is not found.

class-of
Returns the Java class of a value.

class-version
Returns the major version of a Java class.
```

```
class-of
(class-of x)

Returns the Java class of a value.

(class-of 100)
=> class com.github.jlangch.venice.impl.types.VncLong

(class-of (.:java.awt.Point :new 10 10))
=> class java.awt.Point
```

#### class

Returns the Java class for the given name. Throws an exception if the class is not found.

#### class-name

Returns the Java class name of a class.

### class-version

Returns the major version of a Java class.

top

## class-version

(class-version class)

Returns the major version of a Java class.

Java major versions:

- Java 8 uses major version 52
- Java 9 uses major version 53
- Java 10 uses major version 54
- Java 11 uses major version 55
- Java 12 uses major version 56
- Java 13 uses major version 57
- Java 14 uses major version 58
- Java 15 uses major version 59

(class-version :com.github.jlangch.venice.Venice)

=> 52

### SEE ALSO

### class

Returns the Java class for the given name. Throws an exception if the class is not found.

### class-of

Returns the Java class of a value.

### class-name

Returns the Java class name of a class.

ton

## classloader

(classloader)
(classloader type)

Returns the classloader.

;; Returns the current classloader

(classloader)

=> class sun.misc.Launcher\$AppClassLoader

```
;; Returns the system classloader
(classloader :system)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the classloader which loaded the Venice classes
(classloader :application)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

;; Returns the thread-context classloader
(classloader :thread-context)
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

### class

Returns the Java class for the given name. Throws an exception if the class is not found.

#### classloader-of

Returns the classloader of a value or a Java class.

top

## classloader-of

(classloader-of x)

Returns the classloader of a value or a Java class.

#### Note:

Some Java VM implementations may use 'null' to represent the bootstrap class loader. This method will return 'nil' in such implementations if this class was loaded by the bootstrap class loader.

```
(classloader-of (class :java.awt.Point))
=> nil

(classloader-of (. :java.awt.Point :new 10 10))
=> nil

(classloader-of (class-of "abcdef"))
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a

(classloader-of "abcdef")
=> sun.misc.Launcher$AppClassLoader@4e0e2f2a
```

### **SEE ALSO**

### class

Returns the Java class for the given name. Throws an exception if the class is not found.

### classloader

Returns the classloader.

top

## coalesce

```
(coalesce args*)

Returns nil if all of its arguments are nil, otherwise it returns the first non nil argument. The arguments are evaluated lazy.

(coalesce)
=> nil

(coalesce 2)
=> 2

(coalesce nil 1 2)
=> 1
```

```
coll?

(coll? coll)

Returns true if coll is a collection

(coll? {:a 1})
=> true

(coll? [1 2])
=> true
```

combinations

(combinations coll n)

All the unique ways of taking n different elements from the items in the collection

```
(combinations [0 1 2 3] 1)
=> ([0] [1] [2] [3])

(combinations [0 1 2 3] 2)
=> ([0 1] [0 2] [0 3] [1 2] [1 3] [2 3])

(combinations [0 1 2 3] 3)
=> ([0 1 2] [0 1 3] [1 2 3])

(combinations [0 1 2 3] 4)
=> ([0 1 2 3])
```

**SEE ALSO** 

cartesian-product

Returns the cartesian product of two or more collections.

## comment

```
(comment & body)

Ignores body, yields nil

(comment
    (println 1)
     (println 5))
=> nil
```

top

## comp

```
(comp f*)
```

Takes a set of functions and returns a fn that is the composition of those fns. The returned fn takes a variable number of args, applies the rightmost of fns to the args, the next fn (right-to-left) to the result, etc.

```
((comp str +) 8 8 8)
=> "24"

(map (comp - (partial + 3) (partial * 2)) [1 2 3 4])
=> (-5 -7 -9 -11)

((reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100)
=> 207

(filter (comp not zero?) [0 1 0 2 0 3 0 4])
=> (1 2 3 4)

(do
    (def fifth (comp first rest rest rest))
    (fifth [1 2 3 4 5]))
=> 5
```

ton

## compare

```
(compare x y)
```

Comparator. Returns -1, 0, or 1 when x is logically 'less than', 'equal to', or 'greater than' y. For list and vectors the longer sequence is always 'greater' regardless of its contents. For sets and maps only the size of the collection is compared.

```
(compare nil 0)
=> -1
(compare 0 nil)
=> 1
```

```
(compare 1 0)
=> 1
(compare 1 1)
=> 0
(compare 1M 2M)
=> -1
(compare 1 nil)
=> 1
(compare nil 1)
=> -1
(compare "aaa" "bbb")
=> -1
(compare [0 1 2] [0 1 2])
=> 0
(compare [0 1 2] [0 9 2])
(compare [0 9 2] [0 1 2])
=> 1
(compare [1 2 3] [0 1 2 3])
(compare [0 1 2] [3 4])
```

to

# compare-and-set!

```
(compare-and-set! atom oldval newval)
```

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set happened, else false.

```
(do
  (def counter (atom 2))
  (compare-and-set! counter 2 4)
  @counter)
=> 4
```

### SEE ALSO

### atom

Creates an atom with the initial value x.

## complement

=> (1 3)

```
(complement f)

Takes a fn f and returns a fn that takes the same arguments as f, has the same effects, if any, and returns the opposite truth value.

(complement even?)
=> anonymous-1950dcdb-3e21-4208-b155-da2aa1a2b1e7
```

top

## complete-on-timeout

(filter (complement even?) '(1 2 3 4))

```
(complete-on-timeout p value time-unit)
```

Completes the promise with the given value if not otherwise completed before the given timeout.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
    (complete-on-timeout "The fox did not jump" 500 :milliseconds)
    (deref))
=> "The quick brown fox"
(-> (promise (fn [] (sleep 500) "The quick brown fox"))
    (complete-on-timeout "The fox did not jump" 100 :milliseconds)
    (deref))
=> "The fox did not jump"
(-> (promise (fn [] (sleep 500) "The quick brown fox"))
    (complete-on-timeout "The fox did not jump" 100 :milliseconds)
    (then-apply str/upper-case)
    (deref))
=> "THE FOX DID NOT JUMP"
(-> (promise (fn [] (sleep 50) 100))
    (complete-on-timeout 888 100 :milliseconds)
    (then-apply #(do (sleep 200) (* % 3)))
    (complete-on-timeout 999 220 :milliseconds)
    (deref))
=> 999
```

## SEE ALSO

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### then-accept

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

### then-accept-both

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

### then-apply

Applies a function f on the result of the previous stage of the promise p.

#### then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

#### then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

#### when-complete

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

#### accept-either

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result ...

#### apply-to-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

### or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

top

## component/Component

Defines a protocol for components.

Definition:

```
(defprotocol Component
  (start [component] component)
  (stop [component] component))
```

Function start:

Begins operation of this component. Synchronous, does not return until the component is started. Returns an updated version of this component.

Function stop:

Ceases operation of this component. Synchronous, does not return until the component is stopped. Returns an updated version of this component.

top

# component/dep

```
(dep c k)
```

Returns a dependency given by its key 'k' from the component 'c' dependencies.

component/deps

(deps c)

Returns the dependencies of the component 'c' or nil if there aren't any dependencies.

```
(do
  (load-module :component ['component :as 'c])
  (deftype :server []
     c/Component
       (start [this] (println "Dependencies: " (c/deps this)) this)
       (stop [this] this))
  (deftype :database []
     c/Component
       (start [this] this)
       (stop [this] this))
  (defn create-system []
    (-> (c/system-map
          :server (server. )
          :store (database. ))
        (c/system-using {:server [:store]})))
  (-> (create-system)
      (c/start)
      (c/stop))
Dependencies: {:store {:custom-type* :user/database} :component-info {:custom-type* :component/component-info :
id :server :system-name test :components {}}}
=> nil
```

SEE ALSO

component/dep

Returns a dependency given by its key 'k' from the component 'c' dependencies.

### component/id

Returns id of the component 'c'.

top

# component/id

```
(id c)
```

Returns id of the component 'c'.

```
(load-module :component ['component :as 'c])
  (deftype :server []
    c/Component
       (start [this] (println "ID: " (c/id this)) this)
       (stop [this] this))
  (defn create-system []
    (-> (c/system-map
          "test"
          :server (server. ))
        (c/system-using {:server []})))
  (-> (create-system)
      (c/start)
      (c/stop))
 nil)
ID: :server
=> nil
```

### **SEE ALSO**

### component/dep

Returns a dependency given by its key 'k' from the component 'c' dependencies.

### component/deps

Returns the dependencies of the component 'c' or nil if there aren't any dependencies.

top

# component/system-map

```
(system-map name keyval*)
```

Returns a system constructed of components given as key/value pairs. The 'key' is a keyword (the component's id) referencing the component given as 'value'.

The system has default implementations of the Lifecycle 'start' and 'stop' methods which recursively starts/stops all components in the system.

### Note:

system-map just creates a raw system without any dependencies between the components. Use system-using after creating the system map to establish the dependencies.

```
(load-module :component ['component :as 'c])
(deftype :server [port :long]
   c/Component
     (start [this] (println "server started") this)
     (stop [this] (println "server stopped") this))
(deftype :database [user
                               :string
                   password :string]
   c/Component
     (start [this] (println "database started") this)
     (stop [this] (println "database stopped") this))
(c/system-map
  "test"
  :server (server. 4600)
  :store (database. "foo" "123"))
nil)
```

### component/system-using

Associates a component dependency graph with the 'system' that has been created through a call to system-map. 'dependency-map' is a ...

top

## component/system-using

```
(system-using system dependency-map)
```

Associates a component dependency graph with the 'system' that has been created through a call to system-map. 'dependency-map' is a map of keys to maps or vectors specifying the the dependencies of the component at that key in the system.

Throws an exception if a component dependency circle is detected.

The system is started and stopped calling the lifecycle start or stop method on the system component.

Upon successfully starting a component the flag {:started true} is added to the component's meta data. It's up to the components lifecycle start method to decide what to do with multiple start requests. The lifecycle start method can for instance simply return the unaltered component if it has already been started.

Upon successfully stopping a component the flag {:started false} is added to the component's meta data. It's up to the components lifecycle stop method to decide what to do with multiple stop requests. The lifecycle stop method can for instance simply return the unaltered component if it has not been started or has already been stopped.

```
user :string
                      password
                                :string]
     c/Component
       (start [this]
         (println "database" (:name this) "started")
         this)
       (stop [this]
         (println "database" (:name this) "stopped")
         this))
  (defn create-system []
    (-> (c/system-map
          "test"
         :server (server. 4600)
          :store1 (database. "store1" "foo" "123")
          :store2 (database. "store2" "foo" "123"))
        (c/system-using {:server [:store1 :store2]})))
  (defn start []
    (-> (create-system)
        (c/start)))
  (let [system (start)
        server (-> system :components :server)]
    ; access server component
    (println "Accessing the system...")
    (c/stop system))
 nil)
database storel started
database store2 started
server started. using the stores store1 , store2 \,
Accessing the system...
server stopped
database store2 stopped
database storel stopped
=> nil
```

### component/system-map

Returns a system constructed of components given as key/value pairs. The 'key' is a keyword (the component's id) referencing the component  $\dots$ 

concat

```
(concat coll)
(concat coll & colls)
```

Returns a list of the concatenation of the elements in the supplied collections.

```
(concat [1 2])
=> (1 2)

(concat [1 2] [4 5 6])
=> (1 2 4 5 6)

(concat '(1 2))
=> (1 2)
```

```
(concat '(1 2) [4 5 6])
=> (1 2 4 5 6)

(concat {:a 1})
=> ([:a 1])

(concat {:a 1} {:b 2 :c 3})
=> ([:a 1] [:b 2] [:c 3])

(concat "abc")
=> (#\a #\b #\c)

(concat "abc" "def")
=> (#\a #\b #\c #\d #\e #\f)
```

#### into

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

#### merge

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

ισρ

## cond

(cond & clauses)

Takes a set of test/expr pairs. It evaluates each test one at a time. If a test returns logical true, cond evaluates and returns the value of the corresponding expr and doesn't evaluate any of the other tests or exprs. (cond) returns nil.

```
(let [n 5]
  (cond
    (< n 0) "negative"
    (> n 0) "positive"
    :else "zero"))
=> "positive"
```

## SEE ALSO

### condp

Takes a binary predicate, an expression, and a set of clauses.

### case

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

top

# cond->

```
(cond-> expr & clauses)
```

Takes an expression and a set of test/form pairs. Threads expr (via -> ) through each form for which the corresponding test expression is true. Note that, unlike cond branching, cond-> threading does not short circuit after the first true test expression.

### **SEE ALSO**

### cond->>

Takes an expression and a set of test/form pairs. Threads expr (via ->>) through each form for which the corresponding test expression ...

top

## cond->>

```
(cond->> expr & clauses)
```

Takes an expression and a set of test/form pairs. Threads expr (via ->> ) through each form for which the corresponding test expression is true. Note that, unlike cond branching, cond->> threading does not short circuit after the first true test expression.

### SEE ALSO

### cond->

Takes an expression and a set of test/form pairs. Threads expr (via ->) through each form for which the corresponding test expression ...

top

# condp

(condp pred expr & clauses)

Takes a binary predicate, an expression, and a set of clauses.

Each clause can take the form of either:

```
test-expr result-expr
test-expr :>> result-fn
Note :>> is an ordinary keyword.
```

For each clause, (pred test-expr expr) is evaluated. If it returns logical true, the clause is a match. If a binary clause matches, the result-expr is returned, if a ternary clause matches, its result-fn, which must be a unary function, is called with the result of the predicate as its argument, the result of that call being the return value of condp. A single default expression can follow the clauses, and its value will be returned if no clause matches. If no default expression is provided and no clause matches, a VncException is thrown.

```
(condp some [1 2 3 4]

#{0 6 7} :>> inc

#{4 5 9} :>> dec
```

```
#{1 2 3} :>> #(* % 10))

=> 3

(condp some [-10 -20 0 10]
pos? 1
neg? -1
(constantly true) 0)
=> 1

case
```

tor

# config/build

```
(build & parts)
```

Merges given configuration parts and returns it as a map.

Takes an expression and a set of clauses. Each clause takes the form of test-constant result-expr

Configuration parts:

- JSON classpath resource file
- JSON file
- Environment variables
- System properties

```
Example:
```

```
;; Example II) Using configurations with the component module
(do
  (load-module :config ['config :as 'cfg])
  (load-module :component ['component :as 'cmp])
  ;; define the server component
  (deftype :server []
     cmp/Component
        (start [this]
           (let [config (cmp/dep this :config)
                  port (get-in config [:server :port])]
             (println (cmp/id this) "started at port" port)
             this))
        (stop [this]
           (println (cmp/id this) "stopped")
           this))
  ;; note that the configuration is a plain vanilla Venice map and
  ;; does not implement the protocol 'Component'
  (defn create-system []
    (-> (cmp/system-map
            "test"
            :config (cfg/build
                       (cfg/env-var "SERVER_PORT" [:server :port] "8800"))
            :server (server. ))
         (cmp/system-using
            {:server [:config]})))
  (-> (create-system)
       (cmp/start)
       (cmp/stop))
  nil)
SEE ALSO

Reads configuration part from system properties, filtered by a prefix. nil may passed as prefix to get property vars.
```

top

# config/env

(env prefix)

Reads configuration part from environment variables, filtered by a prefix. nil may passed as prefix to get env vars. The reader splits the environment variable names on the underscores to build a map. (base) \$ env | grep JAVA\_ JAVA\_11\_OPENJDK\_HOME=/Library/Java/JavaVirtualMachines/adoptopenjdk-11.jdk/Contents/Home JAVA\_11\_ZULU\_HOME=/Library/Java/JavaVirtualMachines/zulu-11.jdk/Contents/Home JAVA\_11\_HOME=/Library/Java/JavaVirtualMachines/adoptopenjdk-11.jdk/Contents/Home JAVA\_8\_ZULU\_HOME=/Library/Java/JavaVirtualMachines/zulu-8.jdk/Contents/Home JAVA\_8\_OPENJDK\_HOME=/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home JAVA\_8\_HOME=/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home JAVA\_HOME=/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home venice> (config/env "java") => { :11 { :zulu { :home "/Library/Java/JavaVirtualMachines/zulu-11.jdk/Contents/Home" } :openjdk { :home "/Library/Java/JavaVirtualMachines/adoptopenjdk-11.jdk/Contents/Home" } :home "/Library/Java/JavaVirtualMachines/adoptopenjdk-11.jdk/Contents/Home" } :8 { :zulu { :home "/Library/Java/JavaVirtualMachines/zulu-8.jdk/Contents/Home" } :openjdk { :home "/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home" } :home "/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home" :home "/Library/Java/JavaVirtualMachines/adoptopenjdk-8.jdk/Contents/Home" (config/env "DATABASE\_") **SEE ALSO** config/env-var Reads a configuration value from an environment variable and associates it to the given path in a map. config/properties Reads configuration part from system properties, filtered by a prefix. nil may passed as prefix to get property vars. config/build Merges given configuration parts and returns it as a map.

# config/env-var

```
(env-var name path)
(env-var name path default-val)
```

Reads a configuration value from an environment variable and associates it to the given path in a map.

```
(config/env-var "JAVA_HOME" [:java-home])
=> {:java-home "/Library/Java/JavaVirtualMachines/zulu-8.jdk/Contents/Home"}

(config/env-var "SERVER_PORT" [:http :port])
=> nil

(config/env-var "SERVER_PORT" [:http :port] "8080")
=> {:http {:port "8080"}}
```

### config/property-var

Reads a configuration value from an system property and associates it to the given path in a map.

### config/env

Reads configuration part from environment variables, filtered by a prefix. nil may passed as prefix to get env vars.

### config/build

Merges given configuration parts and returns it as a map.

top

# config/file

```
(file f)
(file f reader-opts)
```

Reads a JSON configuration part from given file f.

f may be a:

- string file path, e.g: "/temp/foo.json"
- java.io.File, e.g: (io/file "/temp/foo.json")
- java.io.InputStream
- java.io.Reader
- java.net.URL
- java.net.URI

The optional 'reader-opts' are defined by  $\ensuremath{\texttt{json/read-str}}$  .

 $\hbox{E.g.: } \verb!:key-fn keyword will convert all config keys to keywords$ 

### **SEE ALSO**

### config/resource

Reads a JSON configuration part from given path in classpath.

### config/build

Merges given configuration parts and returns it as a map.

### json/read-str

Reads a JSON string and returns it as a Venice datatype.

# config/properties

```
(properties prefix)
```

Reads configuration part from system properties, filtered by a prefix. nil may passed as prefix to get property vars.

The reader splits the property names on the underscores to build a map.

```
(config/properties "DATABASE_")
```

### **SEE ALSO**

### config/property-var

Reads a configuration value from an system property and associates it to the given path in a map.

## config/build

Merges given configuration parts and returns it as a map.

top

# config/property-var

```
(property-var name path)
(property-var name path default-val)
```

Reads a configuration value from an system property and associates it to the given path in a map.

```
(config/property-var "java.vendor" [:java :vendor])
=> {:java {:vendor "Azul Systems, Inc."}}

(config/property-var "java.version" [:java :version])
=> {:java {:version "1.8.0_392"}}

(config/property-var "SERVER_PORT" [:http :port])
=> nil

(config/property-var "SERVER_PORT" [:http :port] "8080")
=> {:http {:port "8080"}}
```

### **SEE ALSO**

### config/env-var

Reads a configuration value from an environment variable and associates it to the given path in a map.

### config/properties

Reads configuration part from system properties, filtered by a prefix. nil may passed as prefix to get property vars.

### config/build

Merges given configuration parts and returns it as a map.

ton

# config/resource

```
(resource path)
(resource path reader-opts)
Reads a JSON configuration part from given path in classpath.
The optional 'reader-opts' are defined by <code>json/read-str</code> .
E.g.: :key-fn keyword will convert all config keys to keywords
(config/resource "com/github/jlangch/venice/examples/database-config.json"
                    :key-fn keyword)
=> {:db {:classname "com.mysql.jdbc.Driver" :subname "//127.0.0.1:3306/test" :user "test" :subprotocol "mysql" :
password "123"}}
SEE ALSO
config/file
Reads a JSON configuration part from given file f.
config/build
Merges given configuration parts and returns it as a map.
json/read-str
Reads a JSON string and returns it as a Venice datatype.
```

## conj

```
(conj)
(conj x)
(conj coll x)
(conj coll x & xs)
```

 $Returns\ a\ new\ collection\ with\ the\ x,\ xs\ 'added'.\ (conj\ nil\ item)\ returns\ (item)\ and\ (conj\ item)\ returns\ item\ .$ 

For ordered collections like list, vectors and ordered sets/maps the value is added at the end. For all other collections the position is undefined.

```
(conj [1 2 3] 4)

=> [1 2 3 4]

(conj [1 2 3] 4 5)

=> [1 2 3 4 5]

(conj [1 2 3] [4 5])

=> [1 2 3 [4 5]]

(conj '(1 2 3) 4)

=> (1 2 3 4)

(conj '(1 2 3) 4 5)

=> (1 2 3 4 5)

(conj '(1 2 3) 4 5)

=> (1 2 3 (4 5))

(conj '(1 2 3) '(4 5))

=> (1 2 3 (4 5))

(conj (set 1 2 3) 4)

=> #{1 2 3 4}
```

```
(conj {:a 1 :b 2} [:c 3])
=> {:a 1 :b 2 :c 3}

(conj {:a 1 :b 2} {:c 3})
=> {:a 1 :b 2 :c 3}

(conj {:a 1 :b 2} (map-entry :c 3))
=> {:a 1 :b 2 :c 3}

(conj)
=> []

(conj 4)
=> 4
```

#### cons

Returns a new collection where x is the first element and coll is the rest.

#### into

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

#### concat

Returns a list of the concatenation of the elements in the supplied collections.

#### lict\*

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

### vector\*

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

conj!

```
(conj!)
(conj! x)
(conj! coll x)
(conj! coll x & xs)
```

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

For mutable ordered collections like lists the value is added at the end. For all other mutable collections the position is undefined.

```
(conj! (mutable-list 1 2 3) 4)
=> (1 2 3 4)

(conj! (mutable-list 1 2 3) 4 5)
=> (1 2 3 4 5)

(conj! (mutable-list 1 2 3) '(4 5))
=> (1 2 3 (4 5))

(conj! (mutable-set 1 2 3) 4)
=> #{1 2 3 4}
```

```
(conj! (mutable-map :a 1 :b 2) [:c 3])
=> {:a 1 :b 2 :c 3}

(conj! (mutable-map :a 1 :b 2) {:c 3})
=> {:a 1 :b 2 :c 3}

(conj! (mutable-map :a 1 :b 2) (map-entry :c 3))
=> {:a 1 :b 2 :c 3}

(conj! (stack) 1 2 3)
=> (3 2 1)

(conj! (queue) 1 2 3)
=> (1 2 3)

(conj!)
=> ()
```

ton

### cons

```
(cons x coll)
```

Returns a new collection where x is the first element and coll is the rest.

For ordered collections like list, vectors and ordered sets/maps the value is added at the beginning. For all other collections the position is undefined.

```
(cons 1 '(2 3 4 5 6))
=> (1 2 3 4 5 6)
(cons 1 nil)
=> (1)
(cons [1 2] [4 5 6])
=> [[1 2] 4 5 6]
(cons 3 (set 1 2))
=> #{1 2 3}
(cons {:c 3} {:a 1 :b 2})
=> {:a 1 :b 2 :c 3}
(cons (map-entry :c 3) {:a 1 :b 2})
=> {:a 1 :b 2 :c 3}
; cons a value to a lazy sequence
(->> (cons -1 (lazy-seq 0 #(+ % 1)))
    (take 5)
    (doall))
=> (-1 0 1 2 3)
```

```
; recursive lazy sequence (fibonacci example)
(do
    (defn fib
        ([] (fib 1 1))
        ([a b] (cons a (fn [] (fib b (+ a b))))))

        (doall (take 6 (fib))))
=> (1 1 2 3 5 8)
```

### conj

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

#### lict\*

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

#### vector\*

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

top

## cons!

```
(cons! x coll)
```

Adds x to the mutable collection coll.

For mutable ordered collections like lists the value is added at the beginning. For all other mutable collections the position is undefined.

```
(cons! 1 (mutable-list 2 3))
=> (1 2 3)

(cons! 3 (mutable-set 1 2))
=> #{1 2 3}

(cons! {:c 3} (mutable-map :a 1 :b 2))
=> {:a 1 :b 2 :c 3}

(cons! (map-entry :c 3) (mutable-map :a 1 :b 2))
=> {:a 1 :b 2 :c 3}

(cons! 1 (stack))
=> (1)
```

ton

# constantly

```
(constantly x)
```

Returns a function that takes any number of arguments and returns always the value x.

```
(do
  (def fix (constantly 10))
  (fix 1 2 3)
  (fix 1)
  (fix ))
=> 10
```

### repeat

Returns a lazy sequence of x values or a collection with the value x repeated n times.

#### repeatedly

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

### dotimes

Repeatedly executes body with name bound to integers from 0 through n-1.

top

## contains?

```
(contains? coll key)
```

Returns true if key is present in the given collection, otherwise returns false.

Note: To test if a value is in a vector or list use any?

```
(contains? #{:a :b} :a)
=> true

(contains? {:a 1 :b 2} :a)
=> true

(contains? [10 11 12] 1)
=> true

(contains? [10 11 12] 5)
=> false

(contains? "abc" 1)
=> true

(contains? "abc" 5)
=> false
```

### **SEE ALSO**

### not-contains?

Returns true if key is not present in the given collection, otherwise returns false.

### any?

Returns true if the predicate is true for at least one collection item, false otherwise.

top

## count

```
(count coll)

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

(count {:a 1 :b 2})
=> 2

(count [1 2])
=> 2

(count "abc")
=> 3
```

```
Cpus

(cpus)

Returns the number of available processors or number of hyperthreads if the CPU supports hyperthreads.

(cpus)
=> 8
```

# crypt/ciphers

```
(crypt/ciphers)
(crypt/ciphers opt)
```

Returns a list of the ciphers the Java VM supports

Argument opt

:default returns the names of the cipher suites which are enabled by default.

:available returns the names of the cipher suites which could be enabled for use on an SSL connection created by this SSLServerSocketFactory .

```
(do
  (load-module :crypt)
  (crypt/ciphers :default))

(do
    (load-module :crypt)
    (crypt/ciphers :available))

(do
    (load-module :crypt)
    (doad-module :crypt)
    (docoll println (crypt/ciphers :available)))
```

## crypt/decrypt

```
(crypt/decrypt algorithm passphrase & options)
```

Returns a new thread safe function to decrypt a string or a bytebuf given the algorithm and passphrase. If a string is passed it is base64 decoded, decrypted, and returned as string. If a bytebuf is passed the decrypted bytebuf is returned.

Supported algorithms: "DES", "3DES", "AES256"

Options:

:url-safe {true/false}

The boolean option directs the base64 decoder to decode standard or URL safe base64 encoded strings. If enabled (true) the base64 decoder will convert '-' and '\_' characters back to '+' and '/' before decoding.

Defaults to false.

```
(do
  (load-module :crypt)
  (def decrypt (crypt/decrypt "3DES" "secret" :url-safe true))
  (decrypt "ndmW1NLsDHA") ; => "hello"
  (decrypt "KPYjndkZ8vM") ; => "world"
  (decrypt (bytebuf [128 216 205 163 62 43 52 82]))) ; => [1 2 3 4]
=> [1 2 3 4]
```

top

## crypt/encrypt

```
(crypt/encrypt algorithm passphrase & options)
```

Returns a new thread safe function to encrypt a string or a bytebuf given the algorithm and passphrase. If a string is passed it is encrypted and returned as a base64 encoded string. If a bytebuf is passed the encryped bytebuf is returned.

Supported algorithms: "DES", "3DES", "AES256"

Options:

:url-safe {true/false}

The boolean option directs the base64 encoder to emit standard or URL safe base64 encoded strings. If true the base64 encoder will emit '-' and '\_' instead of the usual '+' and '/' characters.

Defaults to false.

Note: no padding is added when encoding using the URL-safe alphabet.

```
(do
  (load-module :crypt)
  (def encrypt (crypt/encrypt "3DES" "secret" :url-safe true))
  (encrypt "hello") ; => "ndmW1NLsDHA"
  (encrypt "world") ; => "KPYjndkZ8vM"
   (encrypt (bytebuf [1 2 3 4]))) ; => [128 216 205 163 62 43 52 82]
=> [128 216 205 163 62 43 52 82]
```

top

# crypt/md5-hash

```
(crypt/md5-hash data)
(crypt/md5-hash data salt)
```

```
Hashes a string or a bytebuf using MD5 with an optional salt.
Note: MD5 is not safe any more use PBKDF2 instead!
(-> (crypt/md5-hash "hello world")
    (str/bytebuf-to-hex :upper))
=> "5EB63BBBE01EEED093CB22BB8F5ACDC3"

(str/bytebuf-to-hex :upper))

(crypt/sha512-hash data)
(crypt/sha512-hash data salt)

```
csv/read
(csv/read source & options)
Reads CSV-data from a source.
The source may be a:
    • string
     • bytebuf
     • java.io.File, e.g: (io/file "/temp/foo.json")
     • java.nio.Path,
     • java.io.InputStream
     • java.io.Reader
Options:
:encoding enc used when reading from a binary data source e.g :encoding :utf-8, defaults to :utf-8
:separator val e.g. ",", defaults to a comma
             e.g. "'", defaults to a double quote
:quote val
(csv/read """1,"ab",false""")
=> (("1" "ab" "false"))
(csv/read "1|||'ab'|false" :separator "|" :quote "'")
=> (("1" nil nil "ab" "false"))
```

tor

# csv/write

(csv/write sink records & options)

Spits data to a sink in CSV format.

The sink may be a:

- java.io.File, e.g: (io/file "/temp/foo.json")
- java.nio.Path
- java.io.OutputStream

```
• java.io.Writer

Options:

:separator val e.g. ",", defaults to a comma
:quote val e.g. "", defaults to a double quote
:newline val :lf (default) or :cr+lf
:encoding enc used when writing to a binary data sink. e.g :encoding :utf-8, defaults to :utf-8

(csv/write (io/file "test.csv") [[1 "AC" false] [2 "WS" true]])
```

```
csv/write-str
(csv/write-str records & options)
Writes data to a string in CSV format.
All fields containing a quote char, a separator char or a newline are quoted.
Options:
:separator val e.g. ",", defaults to a comma
               e.g. "'", defaults to a double quote
:quote val
:newline val
             :lf (default) or :cr+lf
(csv/write-str [[1 "AC" false] [2 "WS" true]])
=> "1,AC,false\n2,WS,true"
(csv/write-str [[1 "AC" false] [2 "WS, '-1'" true]]
                :quote "'"
                :separator ","
                :newline :cr+lf)
=> "1,AC,false\r\n2,'WS, ''-1''',true"
```

```
current-time-millis

(current-time-millis)

Returns the current time in milliseconds.

(current-time-millis)
=> 1699215667143

SEE ALSO

nano-time
Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.
```

# cycle

```
(cycle coll)
```

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

```
(doall (take 5 (cycle [1 2])))
=> (1 2 1 2 1)
```

# **SEE ALSO**

## repeat

Returns a lazy sequence of x values or a collection with the value x repeated n times.

### repeatedly

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

#### datimas

Repeatedly executes body with name bound to integers from 0 through n-1.

## constantly

Returns a function that takes any number of arguments and returns always the value x.

top

# dag/add-edges

```
(add-edges edges*)
```

Add edges to a DAG. Returns a new DAG with added edges.

An edge is a vector of two nodes forming a parent/child relationship. Any Venice value can be used for a node.

Note: The graph is reconstructed after adding edges. To have best performance pass the edges with a single add-edges call to the DAG.

```
(dag/add-edges (dag/dag) ["A" "B"] ["B" "C"])
=> (["A" "B"] ["B" "C"])
```

## **SEE ALSO**

# dag/dag

Creates a new DAG (directed acyclic graph) built from edges

## dag/topological-sort

Topological sort of a DAG using Kahn's algorithm (https://en.wikipedia.org/wiki/Topological\_sorting)

top

# dag/add-nodes

(add-nodes nodes\*)

Add nodes to a DAG. Returns a new DAG with added nodes.

Any Venice value can be used for a node.

Note: The graph is reconstructed after adding nodes. To have best performance pass the nodes with a single add-nodes call to the DAG.

```
dag/child-of?

(child-of? dag c v)

Returns true if c is a transitive child of v

(-> (dag/dag ["A", "B"] ; A E ["B", "C"] ; | | ["C", "D"] ; B F ["E", "F"] ; | / \ ["F", "C"] ; C G ["F", "G"] ; \ / ["G", "D"]); D (dag/child-of? "G" "E"))

=> true

SEE ALSO

dag/dag
Creates a new DAG (directed acyclic graph) built from edges
dag/children
Returns the transitive child nodes
dag/parent-of?
Returns true if p is a transitive parent of v
```

# dag/children

(children dag node)

ιορ

```
Returns the transitive child nodes
```

# **SEE ALSO**

# dag/dag

Creates a new DAG (directed acyclic graph) built from edges

## dag/direct-children

Returns the direct child nodes

## dag/parents

Returns the transitive parent nodes

# dag/direct-parents

Returns the direct parent nodes

# dag/roots

Returns the root nodes of a DAG

ton

# dag/compare-fn

```
(compare-fn dag)
```

Returns a comparator fn which produces a topological sort based on the dependencies in the graph. Nodes not present in the graph will sort after nodes in the graph.

# SEE ALSO

## dag/dag

Creates a new DAG (directed acyclic graph) built from edges

# dag/topological-sort

Topological sort of a DAG using Kahn's algorithm (https://en.wikipedia.org/wiki/Topological\_sorting)

# dag/dag

```
(dag)
(dag edges*)
```

Creates a new DAG (directed acyclic graph) built from edges

An edge is a vector of two nodes forming a parent/child relationship.

## **SEE ALSO**

## dag/dag?

Returns true if coll is a DAG

# dag/add-edges

Add edges to a DAG. Returns a new DAG with added edges.

# dag/add-nodes

Add nodes to a DAG. Returns a new DAG with added nodes.

# dag/topological-sort

Topological sort of a DAG using Kahn's algorithm (https://en.wikipedia.org/wiki/Topological\_sorting)

# dag/edges

Returns the edges of a DAG

# dag/edge?

Returns true if the edge given by its parent and child node is part of the DAG

# dag/nodes

Returns the nodes of a DAG

# dag/node?

Returns true if v is a node in the DAG

## dag/roots

Returns the root nodes of a DAG

## dag/children

Returns the transitive child nodes

# dag/direct-children

Returns the direct child nodes

## dag/child-of?

Returns true if c is a transitive child of v

# dag/parents

Returns the transitive parent nodes

# dag/direct-parents

Returns the direct parent nodes

# dag/parent-of?

Returns true if p is a transitive parent of v

#### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

```
dag/dag?

(dag? coll)

Returns true if coll is a DAG

(dag/dag? (dag/dag))
=> true
```

# dag/direct-children

(direct-children dag node)

Returns the direct child nodes

# SEE ALSO

# delay

```
(delay & body)
```

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref / @), and will cache the result and return it on all subsequent force calls.

```
(do
  (def x (delay (println "working...") 100))
  (deref x))
working...
=> 100
```

# **SEE ALSO**

#### deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

#### force

If x is a delay, returns its value, else returns x

#### realized?

Returns true if a value has been produced for a promise, delay, or future.

#### delay?

Returns true if x is a Delay created with delay

#### memoize

Returns a memoized version of a referentially transparent function.

top

# delay-queue

(delay-queue)

Creates a new delay queue.

A delay-queue is an unbounded blocking queue of delayed elements, in which an element can only be taken when its delay has expired. The head of the queue is that delayed element whose delay expired furthest in the past. If no delay has expired there is no head and poll! will return nil. Unexpired elements cannot be removed using take! or poll!, they are otherwise treated as normal elements. For example, the count method returns the count of both expired and unexpired elements. This queue does not permit nil elements.

Example rate limiter:

```
(put! q :token p))))
      ;; create a limiter with a limit of 5 actions within a 2s period
      (def limiter (init (rate-limiter. (delay-queue) 5 2000)))
      ;; test the limiter
      (doseq [x (range 1 26)]
         (aquire limiter)
         (printf "%s: run %2d%n" (time/local-date-time) x)))
(let [q (delay-queue)]
  (put! q 1 100)
  (put! q 1 200)
  (take! q))
=> 1
SEE ALSO
For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...
Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.
Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.
Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.
Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...
Returns true if x is empty. Accepts strings, collections and bytebufs.
Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections
```

```
delay-queue?

(delay-queue? coll)

Returns true if coll is a delay-queue

(delay-queue? (delay-queue))

```

Return a set that is the first set without elements of the remaining sets

```
(difference (set 1 2 3))
=> #{1 2 3}

(difference (set 1 2) (set 2 3))
=> #{1}

(difference (set 1 2) (set 1) (set 1 4) (set 3))
=> #{2}

SEE ALSO

union
Return a set that is the union of the input sets
intersection
Return a set that is the intersection of the input sets

cons
Returns a new collection where x is the first element and coll is the rest.

conj
Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

disj
Returns a new set with the x, xs removed.
```

```
disj

(disj set x)
  (disj set x & xs)

Returns a new set with the x, xs removed.

(disj (set 1 2 3) 3)
=> #{1 2}
```

top

# dissoc

```
(dissoc coll key)
(dissoc coll key & ks)
```

Returns a new coll of the same type, that does not contain a mapping for key(s)

```
(dissoc {:a 1 :b 2 :c 3} :b)
=> {:a 1 :c 3}

(dissoc {:a 1 :b 2 :c 3} :c :b)
=> {:a 1}

(dissoc [1 2 3] 0)
=> [2 3]

(do
    (deftype :complex [real :long, imaginary :long])

Updates a value in a mutable associative structure, where k is a key and f is a function that will take the old value and any supplied ...

top

# dissoc-in

```
(dissoc-in m ks)
```

Dissociates an entrye in a nested associative structure, where ks is a sequence of keys and returns a new nested structure.

top

# distinct

```
(distinct coll)
```

Returns a collection with all duplicates removed.

Returns a stateful transducer when no collection is provided.

```
(distinct [1 2 3 4 2 3 4])
=> [1 2 3 4]

(distinct '(1 2 3 4 2 3 4))
=> (1 2 3 4)
```

SEE ALSO

## dedupe

Returns a collection with all consecutive duplicates removed.

## distinct?

Returns true if no two of the arguments are equal

ton

# distinct?

```
(distinct? x) (distinct? x y) (distinct? x y & more)
```

Returns true if no two of the arguments are equal

```
(distinct? 1 2 3)
=> true

(distinct? 1 2 3 3)
=> false

(distinct? 1 2 3 1)
=> false

SEE ALSO

distinct
Returns a collection with all duplicates removed.
```

```
do

(do exprs)

Evaluates the expressions in order and returns the value of the last.

(do (println "Test...") (+ 1 1))
Test...
=> 2
```

doall

```
(doall coll)
(doall n coll)
```

When lazy sequences are produced doall can be used to force any effects and realize the lazy sequence. Returns the relaized items in a list!

```
(->> (lazy-seq #(rand-long 100))
    (take 4)
    (doall))
=> (8 45 32 6)

(->> (lazy-seq #(rand-long 100))
     (doall 4))
=> (18 22 11 97)
```

**SEE ALSO** 

## lazy-seq

Creates a new lazy sequence.

## cycle

Returns a lazy (infinite!) sequence of repetitions of the items in coll.

### repeat

Returns a lazy sequence of x values or a collection with the value x repeated n times.

cons

Returns a new collection where x is the first element and coll is the rest.

top

# dobench

```
(dobench iterations expr)
(dobench warm-up-iterations gc-runs iterations expr)
```

Runs the expr iterations times in the most effective way and returns a list of elapsed nanoseconds for each invocation. It's main purpose is supporting benchmark tests.

Note: For best performance enable macroexpand-on-load!

top

# doc

```
(doc x)
```

Prints documentation for a var or special form given x as its name. Prints the definition of custom types.

Displays the source of a module if x is a module: (doc :ansi)

If the var could not be found, searches for a similiar var with the **Levenshtein distance** 1.

E.g.

dec

```
> (doc dac)
Symbol 'dac' not found!
Did you mean?
  dag/dag
```

```
(doc +)

(doc def)

(do
   (deftype :complex [real :long, imaginary :long])
   (doc :complex))
```

### **SEE ALSO**

## ns-list

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

### modules

Lists the available Venice modules

#### finder

Finds symbols that match one more glob patterns or regular expressions.

Create and run a new container from an image.

## docker/container-find-by-name

Find all containers with a specified name

## docker/container-exists-with-name?

Returns true if there is container with the specified name else false.

### docker/container-remove-by-name

Removes a container with the specified name.

top

# docker/container-stop-by-name

(docker/container-stop-by-name name)
(docker/container-stop-by-name name time)

Stops a container with the specified name.

(docker/container-stop-by-name "myapp")

## **SEE ALSO**

### docker/rur

Create and run a new container from an image.

### docker/container-running-with-name?

Checks if there is container with the specified name in 'running' state.

### docker/container-stop-by-name

Stops a container with the specified name.

### docker/container-remove-by-name

Removes a container with the specified name.

### docker/container-status-by-name

Returns the status of container with the specified name.

### docker/container-logs

Returns the container logs.

top

# docker/cp

(docker/cp src-path dst-path & options)

Copy files/folders between a container and the local filesystem

Options:

:archive {true, false}

Archive mode (copy all uid/gid information)
:follow-link {true, false}

Always follow symbol link in SRC\_PATH

:quiet {true, false} Suppress progress output during copy. Progress output is automatically suppressed if no terminal is

attached

```
;; Copy file from host to docker container
(docker/cp "data.txt" "74789744g489:/data.txt")

;; Copy file from docker container to host
(docker/cp "74789744g489:/data.txt" "data.txt")

;; Copy a folder from host to docker container
(docker/cp "Desktop/images" "74789744g489:/root/img_files/car_photos/images")

;; Copy a folder from docker container to host
(docker/cp "74789744g489:/root/img_files/car_photos/images Desktop/images")
```

## **SEE ALSO**

### docker/diff

Inspect changes to files or directories on a container's filesystem.

## docker/ps

List containers.

### docker/run

Create and run a new container from an image.

top

# docker/debug

(docker/debug mode)

Sets the debugging mode.

Without argument returns the current debug mode.

Mode:

:off No debug output

:on Prints the raw docker command line to the current stdout channel ahead of running the

command

:on-no-exec Prints the raw docker command line to the current stdout channel without running the command

(docker/debug :on)
(docker/debug :on-no-exec)

(docker/debug :off)

top

# docker/diff

(docker/diff container & options)

Inspect changes to files or directories on a container's filesystem.

Options:

:format {:string, :json} Returns the output either as a string or as JSON data

(println (docker/diff "74789744g489"))

(docker/diff "74789744g4892" :format :json)

**SEE ALSO**

top

# docker/run

```
(docker/run image & options)
```

Create and run a new container from an image.

Images can be run by name, name and tag, or image id

Options:

:detach {true, false} Run container in background and return container ID

:attach {stdin, stdout, stderr} Attach to STDIN, STDOUT or STDERR

:publish port Publish a container's port to the host. To expose port 8080 inside the container to port 3000 outside

the container, pass "3000:8080"

:envs vars Set environment variable (a sequence of env var defs)

:memory limit Memory limit

:name name Assign a name to the container :quiet {true, false} Suppress the pull output

:volumes vol Bind mount a volume (a sequence of volume defs)

:workdir dir Working directory inside the container

:args args Arguments passed to container process (a sequence of args or a string)

See also cargo/start / cargo/stop for a smarter way to start/stop a container.

```
;; Run an ArangoDB container (use bind mounts, very slow on macOSX)
(docker/run "arangodb/arangodb:3.10.10"
            :name "myapp"
            :publish "8529:8529"

tor

# docoll

```
(docoll f coll)
```

Applies f to the items of the collection presumably for side effects. Returns nil.

```
(docoll #(println %) [1 2 3 4])
1
2
3
4
=> nil
(docoll
   (fn [[k v]] (println (pr-str k v)))
   {:a 1 :b 2 :c 3 :d 4})
:a 1
:b 2
:c 3
:d 4
=> nil
;; docoll all elements of a queue. calls (take! queue) to get the
;; elements of the queue.
;; note: use nil to mark the end of the queue otherwise docoll will
;; block forever!
(let [q (conj! (queue) 1 2 3 nil)]
  (docoll println q))
2
3
=> nil
```

## SEE ALSO

### mapv

 $Returns\ a\ vector\ consisting\ of\ the\ result\ of\ applying\ f\ to\ the\ set\ of\ first\ items\ of\ each\ coll,\ followed\ by\ applying\ f\ to\ the\ set\ of\ ...$ 

top

# done?

```
(done? f)
```

Returns true if the future or promise is done otherwise false

```
(do
  (def wait (fn [] (sleep 200) 100))
  (let [f (future wait)]
        (sleep 50)
        (printf "After 50ms: done=%b\n" (done? f))
        (sleep 300)
        (printf "After 300ms: done=%b\n" (done? f))))
```

```
After 50ms: done=false
After 300ms: done=true
=> nil
```

### SEE ALSO

#### future

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

#### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

### realized?

Returns true if a value has been produced for a promise, delay, or future.

#### cancel

Cancels a future or a promise

### cancelled?

Returns true if the future or promise is cancelled otherwise false

top

# dorun

(dorun count expr)

Runs the expr count times in the most effective way. It's main purpose is supporting benchmark tests. Returns the expression result of the last invocation.

### Note:

For best performance enable macroexpand-on-load! The expression is evaluated for every run. Alternatively a zero or one arg function referenced by a symbol can be passed:

```
(let [f (fn [] (+ 1 1))]
(dorun 10 f))
```

When passing a one arg function dorun passes the incrementing counter value (0..N) to the function:

```
(let [f (fn [x] (+ x 1))]
(dorun 10 f))
```

```
(dorun 10 (+ 1 1))
=> 2
```

top

# doseq

(doseq seq-exprs & body)

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head of the sequence. Returns nil.

Supported modifiers are: :when predicate

```
(doseq [x (range 10)] (print x))
0123456789
=> nil
```

```
(doseq [x (range 10)] (print x) (print "-"))
0-1-2-3-4-5-6-7-8-9-
=> nil
(doseq [x (range 5)] (print (* x 2)))
=> nil
(doseq [x (range 10) :when (odd? x)] (print x))
=> nil
(doseq [x (range 10) : when (odd? x)] (print (* x 2)))
26101418
=> nil
(doseq [x [1 2 3] y [1 2 3]] (println [x y]))
[1 2]
[1 3]
[2 1]
[2 2]
[2 3]
[3 1]
[3 2]
[3 3]
=> nil
(doseq [[x y] [[0 1] [1 2]]] (println [x y]))
[0 1]
[1 2]
=> nil
(doseq [[c vals] (group-by count ["a" "as" "asd" "aa" "asdf" "qwer"])]
  (println c vals))
1 [a]
2 [as aa]
3 [asd]
4 [asdf qwer]
=> nil
SEE ALSO
list-comp
List\ comprehension.\ Takes\ a\ vector\ of\ one\ or\ more\ binding-form\ or\ collection-expr\ pairs,\ each\ followed\ by\ zero\ or\ more\ modifiers,\ and\ ...
```

# dotimes

(dotimes bindings & body)

Repeatedly executes body with name bound to integers from 0 through n-1.

Repeatedly executes body with name bound to integers from 0 through n-1.

```
(dotimes [n 3] (println (str "n is " n)))
n is 0
```

```
n is 1
n is 2
=> nil
```

### **SEE ALSO**

### repeat

Returns a lazy sequence of x values or a collection with the value x repeated n times.

### repeatedly

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

#### doseo

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

#### list-comp

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and ...

top

# doto

```
(doto x & forms)
```

Evaluates x then calls all of the methods and functions with the value of x supplied at the front of the given arguments. The forms are evaluated in order. Returns x.

top

# double

```
(double x)
```

Converts to double

```
(double 1)
=> 1.0

(double nil)
=> 0.0

(double false)
=> 0.0

(double true)
=> 1.0

(double 1.2)
=> 1.2
```

```
(double 1.2M)
=> 1.2

(double "1.2")
=> 1.2
```

double-array

```
(double-array coll)
(double-array len)
(double-array len init-val)
```

Returns an array of Java primitive doubles containing the contents of coll or returns an array with the given length and optional init value

double?

(double? n)

Returns true if n is a double

```
(double? 4.0)
=> true

(double? 3)
=> false

(double? 3I)
=> false

(double? 3.0M)
=> false

(double? true)
=> false
```

```
(double? nil)
=> false

(double? {})
=> false
```

```
drop
```

```
(drop n coll)
```

Returns a collection of all but the first n items in coll. Returns a stateful transducer when no collection is provided.

```
(drop 3 [1 2 3 4 5])
=> [4 5]
(drop 10 [1 2 3 4 5])
=> []
```

# drop-last

```
(drop-last n coll)
```

Return a sequence of all but the last n items in coll. Returns a stateful transducer when no collection is provided.

```
(drop-last 3 [1 2 3 4 5])
=> [1 2]

(drop-last 10 [1 2 3 4 5])
=> []
```

top

# drop-while

```
(drop-while predicate coll)
```

Returns a list of the items in coll starting from the first item for which (predicate item) returns logical false. Returns a stateful transducer when no collection is provided.

```
(drop-while neg? [-2 -1 0 1 2 3])
=> [0 1 2 3]
```

top

# empty

```
(empty coll)
```

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection and returns the the emptied collection.

```
(empty {:a 1})
=> {}

(empty [1 2])
=> []

(empty '(1 2))
=> ()
```

# empty-to-nil

```
(empty-to-nil x)
```

Returns nil if x is empty

```
(empty-to-nil "")
=> nil

(empty-to-nil [])
=> nil

(empty-to-nil '())
=> nil

(empty-to-nil {})
=> nil
```

top

# empty?

```
(empty? x)
```

Returns true if x is empty. Accepts strings, collections and bytebufs.

```
(empty? {})
=> true

(empty? [])
=> true
```

```
(empty? '())
=> true

(empty? "")
=> true

SEE ALSO
not-empty?
Returns true if x is not empty. Accepts strings, collections and bytebufs.
```

# entries

```
(entries m)
```

Returns a collection of the map's entries.

### keys

Returns a collection of the map's keys.

### vals

Returns a collection of the map's values.

## map-entry

Creates a new map entry

# eval

```
(eval form)
```

Evaluates the form data structure (not text!) and returns the result.

```
(eval '(let [a 10] (+ 3 4 a)))
=> 17

(eval (list + 1 2 3))
=> 6

(let [s "(+ 2 x)" x 10]
        (eval (read-string s))))
=> 12
```

### **SEE ALSO**

#### read-string

Reads Venice source from a string and transforms its content into a Venice data structure, following the rules of the Venice syntax.

```
even?

(even? n)

Returns true if n is even, throws an exception if n is not an integer

(even? 4)
=> true

(even? 3)
=> false

(even? (int 3))
=> false

SEE ALSO
odd?
Returns true if n is odd, throws an exception if n is not an integer
```

top

# every-pred

```
(every-pred p1 & p)
```

Takes a set of predicates and returns a function f that returns true if all of its composing predicates return a logical true value against all of its arguments, else it returns false. Note that f is short-circuiting in that it will stop execution on the first argument that triggers a logical false result against the original predicates.

```
((every-pred number?) 1)
=> true

((every-pred number?) 1 2)
=> true

((every-pred number? even?) 2 4 6)
=> true
```

```
every?
(every? pred coll)
Returns true if the predicate is true for all collection items, false otherwise.
(every? number? nil)
=> false
(every? number? [])
=> false
(every? number? [1 2 3 4])
=> true
(every? number? [1 2 3 :a])
=> false
(every? #(>= % 10) [10 11 12])
=> true
SEE ALSO
Returns true if the predicate is true for at least one collection item, false otherwise.
not-any?
Returns false if the predicate is true for at least one collection item, true otherwise
```

ex

(ex class)
(ex class args\*)

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

Returns false if the predicate is true for all collection items, true otherwise

The exception types:

- :java.lang.Exception
- :java.lang.RuntimeException

- :com.github.jlangch.venice.VncException
- :com.github.jlangch.venice.ValueException

are imported implicitly so its alias: Exception,: Runtime Exception,: Vnc Exception, and: Value Exception can be used.

### Checked vs unchecked exceptions

All exceptions in Venice are unchecked.

If checked exceptions are thrown in Venice they are immediately wrapped in a :RuntimeException before being thrown!

If Venice catches a checked exception from a Java Interop call it wraps it in a :RuntimeException before handling it by the catch block selectors.

```
(try
   (throw (ex :VncException))
   (catch :VncException e "caught :VncException"))
=> "caught :VncException"
(try
   (throw (ex :RuntimeException "#test"))
   (catch :Exception e
          "msg: ~(ex-message e)"))
=> "msg: #test"
(try
   (throw (ex :ValueException 100))
   (catch :ValueException e
          "value: ~(ex-value e)"))
=> "value: 100"
(do
   (defn throw-ex-with-cause []
          (throw (ex :java.io.IOException "I/O failure"))
          (catch :Exception e
                 (throw (ex :VncException "failure" (ex-cause e))))))
   (try
       (throw-ex-with-cause)
       (catch :Exception e
              "msg: ~(ex-message e), cause: ~(ex-message (ex-cause e))")))
=> "msg: failure, cause: I/O failure"
SEE ALSO
throw
Throws an exception.
Exception handling: try - catch - finally
try-with
try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...
Returns true if x is a an instance of :java.lang.Throwable
ex-venice?
Returns true if x is a an instance of :VncException
```

top

### ex-cause

```
Returns the exception cause or nil

(ex-cause (ex :VncException "a message" (ex :RuntimeException "..cause..")))
=> java.lang.RuntimeException: ..cause..

(ex-cause (ex :VncException "a message"))
=> nil

SEE ALSO

ex
Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception
ex-message
Returns the message of the exception
ex-value
Returns the value associated with a :ValueException or nil if the exception is not a :ValueException
```

```
ex-java-stacktrace x)
(ex-java-stacktrace x)
(ex-java-stacktrace x format)

Returns the Java stacktrace for an exception.
The optional format (:string or :list) controls the format of the returned stacktrace. The default format is :string.

(println (ex-java-stacktrace (ex :RuntimeException "message")))

(println (ex-java-stacktrace (ex :VncException "message") :list))

SEE ALSO

ex
Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception
ex-venice-stacktrace
Returns the Venice stacktrace for an exception or nil if the exception is not a venice exception.
```

```
ex-message x)

Returns the message of the exception

(ex-message (ex :VncException "a message"))
=> "a message"
```

```
(ex-message (ex :RuntimeException))
=> nil
SEE ALSO
Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception
```

ex-cause Returns the exception cause or nil

ex-value

Returns the value associated with a :ValueException or nil if the exception is not a :ValueException

ex-value (ex-value x)Returns the value associated with a :ValueException or nil if the exception is not a :ValueException (ex-value (ex :ValueException [10 20])) => (10 20) (ex-value (ex :RuntimeException)) => nil **SEE ALSO** ex Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception ex-message Returns the message of the exception Returns the exception cause or nil

ex-venice-stacktrace

(ex-venice-stacktrace x) (ex-venice-stacktrace x format)

Returns the Venice stacktrace for an exception or nil if the exception is not a venice exception.

The optional format (:string or :list) controls the format of the returned stacktrace. The default format is :string.

```
(println (ex-venice-stacktrace (ex :ValueException [10 20])))
Exception in thread "main" ValueException:
[Callstack]
   at: ex (example: line 30, col 43)
```

```
(println (ex-venice-stacktrace (ex :RuntimeException "message")))
nil
=> nil

(println (ex-venice-stacktrace (ex :ValueException [10 20]) :list))
({:fn ex :file example :line 30 :col 43})
=> nil

SEE ALSO
ex
Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception
ex-java-stacktrace
Returns the Java stacktrace for an exception.
```

```
ex-venice?

(ex-venice? x)

Returns true if x is a an instance of :VncException

(ex-venice? (ex :VncException))
=> true

(ex-venice? (ex :RuntimeException))
=> false

SEE ALSO

ex
Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception
ex?
Returns true if x is a an instance of :java.lang.Throwable
```

```
ex?

(ex? x)

Returns true if x is a an instance of :java.lang.Throwable

(ex? (ex :RuntimeException))
=> true

SEE ALSO

## excel/add-column

```
(add-column sheet title)
(add-column sheet title options)
```

Defines a column with optional attributes on the sheet.

*Note:* The column cell value is just read from the passed tabular dataset. If there is any mapping or conversion needed it has to be applied to the dataset before writing it to the sheet!

Options:

:field f a field, e.g. :first-name

```
:width n
                    width in points, e.g. 100
:hidden b
                    hidden, e.g. true, false
:header-style r
                    style name for header row, e.g. :header
:body-style r
                    style name for body rows, e.g. :body
:footer-style r
                    style name for footer row, e.g. :footer
:footer-value v
                    explicit text or numeric value for the column's footer cell, e.g. "done", 10000.00M, nil
:footer-aggregate e
                    aggregation mode for the column's footer cell value, e.g. {:min, :max, :avg, :sum, :none}
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe" :weight 70.5 }
                  {:first "Sue" :last "Ford" :weight 54.2 } ]
         wbook (excel/writer :xlsx)]
    (excel/add-font wbook :header { :bold true })
    (excel/add-style wbook :header { :font :header
                                         :bg-color :GREY_25_PERCENT
                                         :h-align :center })
    (excel/add-style wbook :weight { :format, "#,##0.0"
                                         :h-align :right })
    (let [sheet (excel/add-sheet wbook "Sheet 1"
                                     { :no-header-row false
                                       :default-header-style :header })]
       (excel/add-column sheet "First Name" { :field :first })
       (excel/add-column sheet "Last Name" { :field :last })

    (excel/add-image sheet 2 2 data :PNG 0.5 0.5)
    (excel/write->file wbook "sample.xlsx")))
```

SEE ALSO

excel/write-items

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

#### excel/write-item

Render a single data item to the sheet

#### excel/cell-formula

Set a formula for a specific cell given by its row and col.

#### excel/auto-size-columns

Auto size the width of all columns in the sheet.

#### excel/auto-size-column

Auto size the width of column col (1..n) in the sheet.

#### excel/row-height

Set the height of a row (1..n) in the sheet.

top

## excel/add-line-chart

#### Adds a line chart.

Arguments:

chart-title The chart title

chart-addr-range The chart position in the Excel

legend-position The legend position: :TOP , :TOP\_RIGHT , :RIGHT , :BOTTOM , :LEFT

category-axis-title The category axis title

 $\hbox{\it category-axis-position} \qquad \hbox{\it The category axis position: :TOP, :TOP\_RIGHT, :RIGHT, :BOTTOM, :LEFT }$ 

value-axis-title The value axis title

value-axis-position The value axis position: :TOP , :TOP\_RIGHT , :RIGHT , :BOTTOM , :LEFT

three-dimensional? Render in 3D: true or false
vary-colors? Vary the colors: true or false
categories-addr-range The category names in the Excel
series The value series data. 1 to N series

```
(excel/write-data sheet data)

  (excel/write-value sheet 6 3 9_006_398)
  (excel/write->file wbook "sample.xlsx")))
SEE ALSO

excel/add-sheet
Adds a sheet with optional attributes to an Excel.
```

excel/add-pie-chart

Adds a pie chart.

Arguments:

chart-title The chart title

chart-addr-range The chart position in the Excel

legend-position The legend position: :TOP , :TOP\_RIGHT , :RIGHT , :BOTTOM , :LEFT

three-dimensional? Render in 3D: true or false
vary-colors? Vary the colors: true or false
categories-addr-range The category names in the Excel
series The value series data. 1 series required

## excel/add-sheet

```
(add-sheet wbook title)
(add-sheet wbook title options)
```

Adds a sheet with optional attributes to an Excel.

Options:

:no-header-row b without header row, e.g. true, false
:default-column-width n default column width in points, e.g. 100
:default-header-style s default header style, e.g. :header
:default-body-style s default body style, e.g. :footer

:merged-region r merged region [row-from row-to col-from col-to], e.g. [1 1 4 10]

:display-zeros b display zeros, e.g. true, false. Defines if a cell should show 0 (zero) when containing zero value. When false, cells

with zero value appear blank instead of showing the number zero.

```
(do
  (load-module :excel)
  (let [data [ {:first "John" :last "Doe"
                                           :age 28 }
               {:first "Sue" :last "Ford" :age 26 } ]
       wbook (excel/writer :xlsx)
       sheet (excel/add-sheet wbook "Sheet 1")]

      (excel/write->file wbook "sample.xlsx"))))
SEE ALSO
excel/add-column
Defines a column with optional attributes on the sheet.
excel/add-merge-region
Add a merge region to the sheet.
```

# excel/add-style

```
(add-style wbook style-id)
(add-style wbook style-id options)
```

Add a style with optional attributes to an Excel.

Options:

:format s cell format, e.g. "#0"

Default formats:

- long: "#,##0" - integer: "#,##0" - float: "#,##0.00" - double: "#,##0.00"

- date: "d.m.yyyy" - datetime: "d.m.yyyy hh:mm:ss"

:font r font name, e.g. :header

:bg-color c background color, either an Excel indexed color or a HTML color, e.g. :PLUM, "#00FF00"

Note: only XLSX supports 24 bit colors

:wrap-text b wrap text, e.g. true, false

:h-align e horizontal alignment {:left, :center, :right} :v-align e vertical alignment {:top, :middle, :bottom}

:rotation r rotation angle [degree], e.g. 45
 :border-top s border top style, e.g. :thin
 :border-right s border right style, e.g. :none

top

```
border bottom style, e.g. :thin
:border-bottom s
:border-left s
                 border left style, e.g. :none
Available border styles:
           :dotted
                      :medium-dashed
                                            :medium-dash-dot-dot
:none
:thin
           :thick
                      :dash-dot

     (excel/auto-size-column sheet 3)
     (excel/write->file wbook "sample.xlsx")))
SEE ALSO
excel/auto-size-columns
Auto size the width of all columns in the sheet.
excel/write-items
Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.
excel/write-item
Render a single data item to the sheet
excel/write-value
Writes a value to a specific cell given by its row and col.
excel/cell-formula
Set a formula for a specific cell given by its row and col.
excel/row-height
Set the height of a row (1..n) in the sheet.
```

# excel/auto-size-columns

(auto-size-columns sheet)

Auto size the width of all columns in the sheet.

#### **SEE ALSO**

#### excel/auto-size-column

Auto size the width of column col (1..n) in the sheet.

#### excel/write-items

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

#### excel/write-item

Render a single data item to the sheet

#### excel/write-value

Writes a value to a specific cell given by its row and col.

#### excel/cell-formula

Set a formula for a specific cell given by its row and col.

#### excel/row-height

Set the height of a row (1..n) in the sheet.

top

## excel/bar-data-series

```
(bar-data-series title data-address-range)
```

Build a bar chart data series

Arguments:

title The series title

data-address-range The series data in the Excel

(excel/bar-data-series "Countries" (excel/cell-address-range 2 2 1 5))

**SEE ALSO** 

excel/cell-address-range

Build a cell address range

     (excel/evaluate-formulas wbook)
     (excel/auto-size-columns sheet)
     (excel/write->file wbook "sample.xlsx")))
SEE ALSO
excel/addr->string
Returns an Excel A1-style cell address string representation for a row and column address
excel/sum-formula
Returns a sum formula for the given cell area
excel/write-items
Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.
excel/write-item
Render a single data item to the sheet
excel/write-value
Writes a value to a specific cell given by its row and col.
excel/auto-size-columns
Auto size the width of all columns in the sheet.
excel/auto-size-column
Auto size the width of column col (1..n) in the sheet.
excel/row-height
Set the height of a row (1..n) in the sheet.
```

# excel/cell-formula-result-type

```
(cell-formula-result-type sheet row col)
```

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown } after formula cell evaluation. For non formula cells this function is the same as the cell-type function.

```
SEE ALSO
excel/cell-type
Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }
excel/cell-empty?
Returns true if the sheet cell given by row/col is empty.
excel/read-string-val
Returns the sheet cell value as string.
excel/read-boolean-val
Returns the sheet cell value as boolean.
excel/read-long-val
Returns the sheet cell value as long.
excel/read-double-val
Returns the sheet cell value as double.
excel/read-date-val
Returns the sheet cell value as a date (:java.time.LocalDate).
excel/read-datetime-val
Returns the sheet cell value as a datetime (:java.time.LocalDateTime).
```

excel/cell-style

```
(cell-style sheet row col style-id)
(cell-style sheet row-from row-to col-from col-to style-id)
Apply a defined cell style to a cell

    (excel/write-value sheet 3 4 301)
    (excel/cell-style sheet 2 3 2 4 :style)
    (excel/write->file wbook "sample.xlsx")))
SEE ALSO
excel/add-style
Add a style with optional attributes to an Excel.
excel/add-font
Add font with optional attributes to an Excel.
excel/write-value
Writes a value to a specific cell given by its row and col.
```

# excel/cell-type

```
(cell-type sheet row col)
```

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

Note:

- 1. Excel returns cells containing long, double, date or datetime values as :numeric . The reader decides how to read a numeric cell using either of excel/read-long-val, excel/read-double-val, or excel/read-date-val.
- 2. To evaluate formulas to values call excel/evaluate-formulas on the workbook the right after opening the excel document.

```
SEE ALSO
```

#### excel/cell-formula-result-type

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown } after formula ...

#### excel/cell-empty?

Returns true if the sheet cell given by row/col is empty.

#### excel/read-string-val

Returns the sheet cell value as string.

#### excel/read-boolean-val

Returns the sheet cell value as boolean.

#### excel/read-long-val

Returns the sheet cell value as long.

#### excel/read-double-val

Returns the sheet cell value as double.

#### excel/read-date-val

Returns the sheet cell value as a date (:java.time.LocalDate).

#### excel/read-datetime-val

Returns the sheet cell value as a datetime (:java.time.LocalDateTime).

# excel/col->string

(col->string col)

Returns an Excel A-style column number string representation for a column number

(excel/col->string 1)

(excel/col->string 56)

#### **SEE ALSO**

#### excel/addr->string

Returns an Excel A1-style cell address string representation for a row and column address

## excel/col-width

(col-width sheet col width)

Set the width of a column (1..n) in the sheet.

top

on

```
(excel/add-column sheet "Last Name" { :field :last })
     (excel/add-column sheet "Age" { :field :age })
     (excel/write-items sheet data)
     (excel/col-width sheet 1 80)
     (excel/col-width sheet 2 80)
     (excel/col-width sheet 3 60)
     (excel/write->file wbook "sample.xlsx")))
SEE ALSO
excel/row-height
Set the height of a row (1..n) in the sheet.
excel/auto-size-columns
Auto size the width of all columns in the sheet.
excel/write-items
Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.
excel/write-item
Render a single data item to the sheet
excel/write-value
Writes a value to a specific cell given by its row and col.
excel/cell-formula
Set a formula for a specific cell given by its row and col.
excel/auto-size-column
Auto size the width of column col (1..n) in the sheet.
```

# excel/convert->reader

```
(convert->reader builder)
```

Converts an excel or sheet builder to the corresponding reader.

```
(do
  (load-module :excel)
  (let [data [ {:a 100 :b 200 }
               {:a 101 :b 201 }
               {:a 102 :b 202 } ]
       wbook (excel/writer :xlsx)
       sheet (excel/add-sheet wbook "Sheet 1"
                               { :no-header-row true })]
    (excel/add-column sheet "A" { :field :a })
    (excel/add-column sheet "B" { :field :b })
    (excel/add-column sheet "C" { :field :c })
    (excel/write-items sheet data)
    (excel/cell-formula sheet 1 3 "SUM(A1,B1)")
    (excel/cell-formula sheet 2 3 "SUM(A2,B2)")
    (excel/cell-formula sheet 3 3 "SUM(A3,B3)")
    (let [reader (excel/convert->reader sheet)]
     (excel/evaluate-formulas reader)
      (excel/read-long-val reader 1 3))))
```

# excel/convert->writer

top

# excel/freeze-pane

```
(freeze-pane sheet rows cols)
```

Creates a split (freezepane). Any existing freezepane or split pane is overwritten.

If both rows and cols are 0 then the existing freeze pane is removed.

rows: the number of rows to freeze (starting from the first row) cols: the number of columns to freeze (starting from the first column)

```
excel/line-data-series
(line-data-series title smooth? marker data-address-range)
Build a line chart data series
Arguments:
title
                    The series title
smooth?
                     Smooth rendering (splines): true or false
marker
                    The marker type: :CIRCLE , :DASH , :DIAMOND , :DOT , :NONE , :PLUS , :SQUARE , :STAR , :TRIANGLE
data-address-range
                    The series data in the Excel
(excel/line-data-series "Countries"
                           (excel/cell-address-range 2 2 1 5))
SEE ALSO
excel/cell-address-range
Build a cell address range
```

#### **SEE ALSO**

#### excel/sheet-count

Returns the number of sheets in the Excel.

#### excel/sheet

Returns a sheet from the Excel reader referenced by its name or sheet index.

#### excel/evaluate-formulas

Evaluate all formulas in the Excel.

excel/pie-data-series

(pie-data-series data-address-range)

Build a pie chart data series

Arguments:
data-address-range The series data in the Excel

(excel/pie-data-series (excel/cell-address-range 2 2 1 5))

SEE ALSO

excel/cell-address-range

Build a cell address range

## excel/read-boolean-val

(read-boolean-val sheet row col)

Returns the sheet cell value as boolean.

#### **SEE ALSO**

#### excel/cell-empty?

Returns true if the sheet cell given by row/col is empty.

#### excel/cell-type

Returns the sheet cell type as one of { :notfound, :blank, :string, :boolean, :numeric, :formula, :error, or :unknown }

```
excel/read-string-val
Returns the sheet cell value as string.

excel/read-long-val
Returns the sheet cell value as long.

excel/read-double-val
Returns the sheet cell value as double.

excel/read-date-val
Returns the sheet cell value as a date (:java.time.LocalDate).

excel/read-datetime-val
Returns the sheet cell value as a datetime (:java.time.LocalDateTime).

excel/read-val
Returns the sheet cell value.
```

```
excel/read-date-val
(read-date-val sheet row col)
Returns the sheet cell value as a date (:java.time.LocalDate).

    (excel/auto-size-columns sheet)
    (excel/write->file wbook "sample.xlsx")))
SEE ALSO
excel/write->stream
Writes the excel to a Java :OutputStream.
excel/write->bytebuf
Writes the excel to a bytebuf. Returns the bytebuf.
```

## excel/write-item

(write-item sheet item)

Render a single data item to the sheet

**SEE ALSO** 

#### excel/write-items

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

#### excel/write-value

Writes a value to a specific cell given by its row and col.

#### excel/cell-formula

Set a formula for a specific cell given by its row and col.

#### excel/auto-size-columns

Auto size the width of all columns in the sheet.

#### excel/auto-size-column

Auto size the width of column col (1..n) in the sheet.

## excel/row-height

Set the height of a row (1..n) in the sheet.

top

# excel/write-items

```
(write-items sheet items)
```

Writes the passed data items, a sequence of maps of name/value pairs, to the sheet.

#### **SEE ALSO**

# excel/write-item

Render a single data item to the sheet

## excel/write-value

Writes a value to a specific cell given by its row and col.

### excel/cell-formula

Set a formula for a specific cell given by its row and col.

#### excel/auto-size-columns

Auto size the width of all columns in the sheet.

#### excel/auto-size-column

Auto size the width of column col (1..n) in the sheet.

## excel/row-height

Set the height of a row (1..n) in the sheet.

```
(write-value sheet row col val)
Writes a value to a specific cell given by its row and col.
(do
  (load-module :excel)
  (let [wbook (excel/writer :xlsx)
        sheet (excel/add-sheet wbook "Sheet 1")]

SEE ALSO
exp
Returns Euler's number e raised to the power of a value.
```

# extend

(extend type protocol fns\*)

Extends protocol for type with the supplied functions.

Formats:

- (extend :core/long P (foo [x] x))
- (extend :core/long P (foo [x] x) (foo [x y] x))
- (extend :core/long P (foo [x] x) (bar [x] x))

# SEE ALSO

### defprotocol

Defines a new protocol with the supplied function specs.

#### extends?

Returns true if the type extends the protocol.

# extends?

```
(extends? type protocol)
```

Returns true if the type extends the protocol.

## SEE ALSO

## defprotocol

Defines a new protocol with the supplied function specs.

#### extend

Extends protocol for type with the supplied functions.

tor

# false?

```
(false? x)
```

Returns true if x is false, false otherwise

```
(false? true)
=> false

(false? false)
=> true

(false? nil)
=> false

(false? 0)
=> false

(false? (== 1 2))
=> true
```

**SEE ALSO** 

true?

Returns true if x is true, false otherwise

not

Returns true if x is logical false, false otherwise.

top

# filter

```
(filter predicate coll)
```

Returns a collection of the items in coll for which (predicate item) returns logical true.

Returns a transducer when no collection is provided.

```
(filter even? [1 2 3 4 5 6 7])
=> (2 4 6)

(filter #(even? (val %)) {:a 1 :b 2})
=> ([:b 2])

(filter even? #{1 2 3})
=> (2)
```

#### **SEE ALSO**

#### map

Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

#### reduce

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then  $\dots$ 

ton

# filter-k

```
(filter-k f map)
```

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.

```
(filter-k #(= % :a) {:a 1 :b 2 :c 3})
=> {:a 1}
```

SEE ALSO

#### filtor-ky

Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

tor

# filter-kv

```
(filter-kv f map)
```

```
Returns a map with entries for which the predicate (f key value) returns logical true. f is a function with two arguments.

(filter-kv (fn [k v] (= k :a)) {:a 1 :b 2 :c 3})
=> {:a 1}

(filter-kv (fn [k v] (= v 2)) {:a 1 :b 2 :c 3})
=> {:b 2}

SEE ALSO

filter-k

Returns a map with entries for which the predicate (f key) returns logical true. f is a function with one arguments.
```

```
find

(find map key)

Returns the map entry for key, or nil if key not present.

(find {:a 1 :b 2} :b)
=> [:b 2]

(find {:a 1 :b 2} :z)
=> nil
```

# finder

```
(finder & args)
```

Finds symbols that match one more glob patterns or regular expressions.

Filters the symbol names by 0 to n glob patterns or regular expressions.

Glob patterns and regular expressions are ANDed, flags are ORed.

Flags:

:function filter functions:macro filter macros:special-form filter special forms:protocol filter protocols:value filter values

:machine return the result as Venice data otherwise print it in table format

[io/zip? :core/function])
SEE ALSO
Prints documentation for a var or special form given x as its name. Prints the definition of custom types.
```

#### ns-lis

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

#### modules

Lists the available Venice modules

first

(first coll)

Returns the first element of coll or nil if coll is nil or empty.

(first nil)

=> nil

```
(first [])
=> nil

(first [1 2 3])
=> 1

(first '())
=> nil

(first '(1 2 3))
=> 1

(first "abc")
=> #\a
```

# flatten

(flatten coll)

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. (flatten nil) returns an empty list.

Returns a transducer when no collection is provided.

```
(flatten [])
=> []

(flatten [[1 2 3] [4 [5 6]] [7 [8 [9]]]])
=> [1 2 3 4 5 6 7 8 9]

(flatten [1 2 {:a 3 :b [4 5 6]}])
=> [1 2 {:a 3 :b [4 5 6]}]

(flatten (seq {:a 1 :b 2}))
=> (:a 1 :b 2)
```

# **SEE ALSO**

mapcat

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

# float-array

```
(float-array coll)
(float-array len)
(float-array len init-val)
```

Returns an array of Java primitive floats containing the contents of coll or returns an array with the given length and optional init value

```
(float-array '(1.0 2.0 3.0))
=> [1.0, 2.0, 3.0]
```

```
floor

(floor x)

Returns the largest integer that is less than or equal to x

(floor 1.4)
=> 1.0

(floor -1.4)
=> -2.0

(floor -1.23M)
=> 1.00M

(floor -1.23M)
=> -2.00M

SEE ALSO
ceil
Returns the largest integer that is greater than or equal to x
```

```
flush

(flush)
(flush os)

Without arg flushes the output stream that is the current value of *out*. With arg flushes the passed stream that must be a subclass of either
:java.io.OutputStream or :java.io.Writer.

Returns nil.

(flush)
=> nil

(flush *out*)
=> nil

(flush *err*)
=> nil
```

## **SEE ALSO**

#### io/flush

Flushes a :java.io.OutputStream or a :java.io.Writer.

#### in/close

Closes a :java.io.InputStream, :java.io.OutputStream, :java.io.Reader, or a :java.io.Writer.

top

# fn

```
(fn name? [params*] condition-map? expr*)
```

Defines an anonymous function.

```
(def sum (fn [x y] (+ x y)))
 (sum 2 3))
;; multi-arity anonymous function
(let [f (fn ([x] x) ([x y] (+ x y)))]
  [(f 1) (f 4 6)])
=> [1 10]
(map (fn double [x] (* 2 x)) (range 1 5))
=> (2 4 6 8)
(map #(* 2 %) (range 1 5))
=> (2 4 6 8)
(map #(* 2 %1) (range 1 5))
=> (2 4 6 8)
;; anonymous function with two params, the second is destructured
(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})
=> {1 :a 2 :b 3 :c}
;; defining a pre-condition
(do
  (def square-root
        (fn [x]
           { :pre [(>= x 0)] }
           (. :java.lang.Math :sqrt x)))
   (square-root 4))
=> 2.0
;; closures
  (defn pow [n]
    (fn [x] (apply * (repeat n x)))); closes over n
  ;; n is provided here as 2 and 3, then n goes out of scope
  (def square (pow 2))
```

## defn

Same as (def name (fn name [args\*] condition-map? expr\*)) or (def name (fn name ([args\*] condition-map? expr\*)+))

#### defn-

Same as defn, yielding non-public def

#### dof

Creates a global variable.

top

# fn-about

```
(fn-about f)
```

Returns the meta information about a function

```
(fn-about and)
=> {:name "and" :ns "core" :type :macro :visibility :public :native false :class :VncMultiArityFunction :source
{:file "core" :line 482 :column 3}}

(fn-about println)
=> {:name "println" :ns "core" :type :function :visibility :public :native false :class :VncMultiArityFunction :
source {:file "core" :line 1475 :column 3}}

(fn-about +)
=> {:name "+" :ns "core" :type :function :visibility :public :native true :class :VncFunction :source {}}
```

## **SEE ALSO**

# fn-name

Returns the qualified name of a function or macro

#### fn-body

Returns the body (a list of forms) of a function.

# fn-pre-conditions

Returns the pre-conditions (a vector of forms) of a function.

top

# fn-body

```
(fn-body fn)
(fn-body fn arity)
Returns the body (a list of forms) of a function.
Returns nil if fn is not a function or if fn is a native function.
(do
  (defn calc [& x]
    (->> x
          (filter even?)
          (map #(* % 10))))
  (fn-body (var-get calc)))
=> ((->> x (filter even?) (map (fn [%] (* % 10)))))
SEE ALSO
fn-name
Returns the qualified name of a function or macro
fn-about
Returns the meta information about a function
fn-pre-conditions
Returns the pre-conditions (a vector of forms) of a function.
```

fn-name

(fn-name f)

Returns the qualified name of a function or macro

```
(fn-name (fn sum [x y] (+ x y)))
=> "user/sum"

(let [f str/digit?]
   (fn-name f))
=> "str/digit?"
```

# **SEE ALSO**

#### name

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

#### namespace

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

## fn-about

Returns the meta information about a function

# fn-body

Returns the body (a list of forms) of a function.

# fn-pre-conditions

Returns the pre-conditions (a vector of forms) of a function.

# fn-pre-conditions

```
(fn-pre-conditions fn)
(fn-pre-conditions fn arity)
```

Returns the pre-conditions (a vector of forms) of a function.

Returns nil if fn is not a function.

```
(do
  (defn sum [x y]
      { :pre [(> x 0) (> y 0)] }
      (+ x y))
  (fn-pre-conditions (var-get sum)))
=> [(> x 0) (> y 0)]
```

## **SEE ALSO**

#### fn-name

Returns the qualified name of a function or macro

#### fn-about

Returns the meta information about a function

# fn-body

Returns the body (a list of forms) of a function.

top

# fnil

```
(fnil f x)
(fnil f x y)
(fnil f x y z)
```

Takes a function f, and returns a function that calls f, replacing a nil first argument to f with the supplied value x. Higher arity versions can replace arguments in the second and third positions (y, z). Note that the function f can take any number of arguments, not just the one(s) being nil-patched.

```
;; e.g.: change the `str/lower-case` handling of nil arguments by
;; returning an empty string instead of nil.
((fnil str/lower-case "") nil)
=> ""
((fnil + 10) nil)
=> 10
((fnil + 10) nil 1)
=> 11
((fnil + 10) nil 1 2)
((fnil + 10) 20 1 2)
=> 23
((fnil + 10) nil 1 2 3 4)
=> 20
((fnil + 1000 100) nil nil)
=> 1100
((fnil + 1000 100) 2000 nil 1)
=> 2101
((fnil + 1000 100) nil 200 1 2)
=> 1203
((fnil + 1000 100) nil nil 1 2 3 4)
=> 1110
```

# fonts/download-font-family

(download-font-family family-name options\*)

Download a font family from the Google fonts repository

```
Some useful font families with name and true type font files globbing pattern to extract the files from the family zip file:
Family
                       TTF glob pattern
"Open Sans"
                       "static/OpenSans/*.ttf"
"Source Code Pro"
                       "static/*.ttf"
"Audiowide"
                       "*.ttf"
"Roboto"
                       "*.ttf"
Options:
:extract {true,false}
                        if true extract the TTF files from the font family ZIP, else just download the ZIP
                        an optional glob pattern to select the TTF files to be extracted. E.g.: "*.ttf"
:glob-pattern {pat}
                        download dir, defaults to "."
:dir path
:silent {true,false}
                        if silent is true does not print download info, defaults to true
(do
   (load-module :fonts)
```

force

(force x)

If x is a delay, returns its value, else returns x

```
(do
    (def x (delay (println "working...") 100))
    (force x))
working...
=> 100

(force (+ 1 2))
=> 3
```

**SEE ALSO** 

## delay

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

#### deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

#### realized?

Returns true if a value has been produced for a promise, delay, or future.

ton

# formal-type

(formal-type object)

Returns the *formal type* of a Java object.

The formal type of an object is defined as the explicit Java return type given by the function's definition. The formal type may differ from the real type of the returned Java object. A type cast will also change the object's formal type and set it to the cast type.

Venice must honor Java's static type system while interacting with Java objects. Therefore Venice adheres to *formal types* strictly when calling methods of Java objects.

```
Venice
```

```
;; The Circle constructor returns an object of type Circle
   (let [c (. :Circle :new 1.5)]
                  ;; OK Circle::area()
     (. c :area)
     (. c :radius)) ;; OK
                             Circle::radius()
   ;; Builder::circle returns an object of the formal type Shape
   (let [c (. :Builder :circle 1.5)]
     (. c :area) ;; OK Shape::area()
     (. c :radius)) ;; FAIL Shape::radius(), undefined method
Java
   public class Builder {
     public static Shape circle(double radius) {
       return new Circle(radius);
   }
   public interface Shape {
     double area();
   public class Circle implements Shape {
     public Circle(double radius) {...}
     public double area() {...}
     public double radius() {...}
(do
   (import :java.awt.Point)
   (import :java.awt.geom.Point2D)
   ;; upcasting :java.awt.Point to :java.awt.geom.Point2D
   ;; Point2D does not define the translate method!
   (let [p1 (. :Point :new 1.0 1.0)
         p2 (cast :Point2D p1)]
     (println "p1 ->" p1)
     (println "p2 ->" p2)
     (println "Formal type p1 ->" (formal-type p1))
     (println "Formal type p2 ->" (formal-type p2))

;; Turn a frequency map back into a coll.
(mapcat (fn [[x n]] (repeat n x)) {:a 2 :b 1 :c 3})
=> (:a :a :b :c :c :c)
```

top

# future

(future fn)

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result and return it on all subsequent calls to deref. If the computation has not yet finished, calls to deref will block, unless the variant of deref with timeout is used.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
(do
   (defn wait [] (sleep 300) 100)
   (let [f (future wait)]
     (deref f)))
=> 100
(let [f (future #(do (sleep 300) 100))]
  (deref f))
=> 100
(do
   (defn wait [x] (sleep 300) (+ x 100))
   (let [f (future (partial wait 10))]
      (deref f)))
=> 110
(do
   (defn sum [x y] (+ x y))
   (let [f (future (partial sum 3 4))]
      (deref f)))
=> 7
;; demonstrates the use of thread locals with futures
   ;; parent thread locals
   (binding [a 10 b 20]
      ;; future with child thread locals
      (let [f (future (fn [] (binding [b 90] {:a a :b b})))]
        {:child @f :parent {:a a :b b}})))
=> {:parent {:a 10 :b 20} :child {:a 10 :b 90}}
```

## **SEE ALSO**

# deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

#### realized?

Returns true if a value has been produced for a promise, delay, or future.

#### done?

Returns true if the future or promise is done otherwise false

#### cance

Cancels a future or a promise

#### cancelled?

Returns true if the future or promise is cancelled otherwise false

#### future-task

Takes a function f without arguments and yields a future object that will invoke the function in another thread.

#### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

## futures-fork

Creates a list of count futures. The worker factory is single argument function that gets the worker index (0..count-1) as argument ...

#### futures-wait

Waits for all futures to get terminated. If the waiting thread is interrupted the futures are cancelled.

# future-task

```
(future-task f completed-fn)
(future-task f sucess-fn failure-fn)
```

Takes a function f without arguments and yields a future object that will invoke the function in another thread.

If a single completed function is passed it will be called with the future as its argument as soon as the future has completed. If a success and a failure function are passed either the success or failure function will be called as soon as the future has completed. Upon success the success function will be called with the future's result as its argument, upon failure the failure function will be called with the exception as its argument.

In combination with a queue a completion service can be built. The tasks appear in the queue in the order they have completed.

Thread local vars will be inherited by the future child thread. Changes of the child's thread local vars will not be seen on the parent.

```
;; building a completion service
;; CompletionService = incoming worker queue + worker threads + output data queue
(do
   (def q (queue 10))
   (defn process [s v] (sleep s) v)
   (defn failure [s m] (sleep s) (throw (ex :VncException m)))
   (future-task (partial process 200 2) #(offer! q %) #(offer! q %))

top

# geoip/ip-to-city-loc-resolver

```
(geoip/ip-to-city-loc-resolver geoip-zip)
```

Returns a resolve function that resolves an IP address to its associated city and latitude/longitude location. The resolve function returns the city and the latitude/longitude or nil if no data is found.

The MindMax city geoip-zip may be a bytebuf, a file, a string (file path) or an InputStream.

The resolver loads the MindMax IPv4 and IPv6 city database and caches the data for IP address resolves.

As of July 2020 the MaxMind city database has:

```
2'917'097 IPv4 blocks
459'294 IPv6 blocks
118'189 cities
```

#### Note:

The MaxMind city IPv4 and IPv6 databases have 220MB of size on disk. It takes considerable time to load the data. Preprocessed and ready to work in the GEO IP modules ~3GB of memory is required.

Once the resolver has loaded the data the lookups are very fast.

(geoip/ip-to-city-loc-resolver-mem-optimized geoip-zip)
```

Returns a resolve function that resolves an IP address to its associated city and latitude/longitude location. The resolve function returns the city and the latitude/longitude or nil if no data is found.

The MindMax city geoip-zip may be a bytebuf, a file, a string (file path) or an InputStream.

The resolver loads the MindMax IPv4 and IPv6 city database and caches the data for IP address resolves.

As of July 2020 the MaxMind city database has:

```
2'917'097 IPv4 blocks
459'294 IPv6 blocks
118'189 cities
```

#### Note:

The MaxMind city IPv4 and IPv6 databases have 220MB of size on disk. It takes considerable time to load the data. This is a memory optimized resolver version on the cost of performance.

For best performance on the cost of memory use the resolver 'geoip/ip-to-city-loc-resolver' instead!

(geoip/parse-maxmind-country-db zip)
```

Parses the MaxMind country-location CSV file. Returns a map with the country geoname-id as key and the country data as value.

Return:

```
{ "49518" {:country-iso "RW" :country-name "Rwanda"}
    "51537" {:country-iso "SO" :country-name "Somalia"} }

(do
```

```
(do
  (load-module :geoip)
  (geoip/download-maxmind-db-to-zipfile "./geoip-country.zip"
```

#### **SEE ALSO**

#### geoip/download-maxmind-db-to-zipfile

Downloads the MaxMind country or city GEO IP database to the given ZIP file. The type is either :country or :city.

#### geoip/parse-maxmind-city-db

Parses the MaxMind city-location CSV file. Returns a map with the city geoname-id as key and the city/country data as value.

top

# geoip/parse-maxmind-country-ip-db

```
(geoip/parse-maxmind-country-ip-db ip-type zip maxmind-countries)
```

Parses the MaxMind country IP blocks database. Expects a Maxmind country IP database zip. ip-type is either :IPv4 or :IPv6. The zip may be a bytebuf, a file, a string (file path) or an InputStream.

The maxmind-countries are optional and map the geoname-id to country data.

Returns a trie datastructure with the CIDR address as the key and a map with country data as the value.

maxmind-countries:

```
(do
  (load-module :geoip)
  (geoip/download-maxmind-db-to-zipfile "./geoip-country.zip"
                                        "YOUR-MAXMIND-LIC-KEY")
  (geoip/parse-maxmind-country-ip-db
     :IPv4
     "./geoip-country.zip"
     nil))
(do
  (load-module :geoip)
  (geoip/download-maxmind-db-to-zipfile "./geoip-country.zip"
                                        "YOUR-MAXMIND-LIC-KEY")
  (geoip/parse-maxmind-country-ip-db
     :IPv6
     "./geoip-country.zip"
      (geoip/parse-maxmind-country-db "./geoip-country.zip")))
```

# SEE ALSO

### geoip/download-maxmind-db-to-zipfile

Downloads the MaxMind country or city GEO IP database to the given ZIP file. The type is either :country or :city.

# geoip/parse-maxmind-country-db

Parses the MaxMind country-location CSV file. Returns a map with the country geoname-id as key and the country data as value.

# geoip/parse-maxmind-city-ip-db

Parses the MaxMind city IP blocks database. Expects a MaxMind city IP database zip. ip-type is either :IPv4 or :IPv6. The zip may be ...

```
get

(get map key)
(get map key not-found)

Returns the value mapped to key, not-found or nil if key not present.

Note: (get :x foo) is almost twice as fast as (:x foo)

(get {:a 1 :b 2} :b)
=> 2

(get [0 1 2 3] 1)
=> 1

;; keywords act like functions on maps
(:b {:a 1 :b 2})
=> 2
```

# get-in

```
(get-in m ks)
(get-in m ks not-found)
```

Returns the value in a nested associative structure, where ks is a sequence of keys. Returns nil if the key is not present, or the not-found value if supplied.

```
(get-in {:a 1 :b {:c 2 :d 3}} [:b :c])
=> 2

(get-in [:a :b :c] [0])
=> :a

(get-in [:a :b [:c :d :e]] [2 1])
=> :d

(get-in {:a 1 :b {:c [4 5 6]}} [:b :c 1])
=> 5
```

top

# gradle/task

ton

# grep/grep

```
(grep dir file-glob line-pattern & options)
```

Search for lines that match a regular expression in text files. The search starts from a base directory and chooses all files that match a globbing pattern.

Options:

:print b e.g :print false, defaults to true

With the print option :print true , grep prints the matches in a human readable form, one line per match in the format "{{filename}}: {{line}}".

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match ...

io/file-matches-glob?

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

top

# grep/grep-zip

```
(grep/grep-zip dir zipfile-glob file-glob line-pattern & options)
```

Search for lines that match a regular expression in text files within ZIP files. The search chooses all files in the ZIP that match a globbing pattern. The search starts from a base directory and chooses all ZIP files that match the zipfile globbing pattern.

Options:

:print b e.g :print false, defaults to true

With the print option :print true, grep-zip prints the matches in a human readable form, one line per match in the format "{{zipfile}}!{{filename}}:{{line}}".

With the print option :print false, grep-zip prints the matches in a machine readable form. It returns a list of tuples [{{zipname}}, {{filename}}, {{lineno}}, {{line}}].

```
(do
  (load-module :grep)
  (grep/grep-zip "/Users/foo/logs" "logs*.zip" "**/*.log" ".*Error.*"))
```

## SEE ALSO

### grep/grep

 $Search for lines that match a regular expression in text files. The search starts from a base directory and chooses all files that \dots \\$ 

## io/file-matches-glob?

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

top

# group-by

```
(group-by f coll)
```

Returns a map of the elements of coll keyed by the result of f on each element. The value at each key will be a vector of the corresponding elements, in the order they appeared in coll.

```
(group-by count ["a" "as" "asd" "asd" "qwer"])
=> {1 ["a"] 2 ["as" "aa"] 3 ["asd"] 4 ["asdf" "qwer"]}
```

```
(group-by odd? (range 10))
=> {false [0 2 4 6 8] true [1 3 5 7 9]}

(group-by identity (seq "abracadabra"))
=> {#\a [#\a #\a #\a #\a #\a] #\b [#\b] #\r [#\r #\r] #\c [#\c] #\d [#\d]}
```

top

## halt-when

```
(halt-when pred)
(halt-when pred retf)
```

Returns a transducer that ends transduction when pred returns true for an input. When retf is supplied it must be a fn of 2 arguments - it will be passed the (completed) result so far and the input that triggered the predicate, and its return value (if it does not throw an exception) will be the return value of the transducer. If retf is not supplied, the input that triggered the predicate will be returned. If the predicate never returns true the transduction is unaffected.

```
(do
  (def xf (comp (halt-when #(== % 10)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> [1 3 5 7 9]

(do
  (def xf (comp (halt-when #(> % 5)) (filter odd?)))
  (transduce xf conj [1 2 3 4 5 6 7 8 9]))
=> 6
```

top

# hash-map

```
(hash-map & keyvals)
(hash-map map)
```

Creates a new hash map containing the items.

```
(hash-map :a 1 :b 2)
=> {:a 1 :b 2}

(hash-map (sorted-map :a 1 :b 2))
=> {:a 1 :b 2}
```

top

# hash-map?

```
(hash-map? obj)
```

Returns true if obj is a hash map

```
(hash-map? (hash-map :a 1 :b 2))
=> true
```

hexdump/dump

```
(dump s & opts)
```

Prints a hexdump of the given argument to \*out\* . Optionally supply byte offset (:offset, default: 0) and size (:size, default: :all) arguments. Can create hexdump from a collection of values, a bytebuf, a java.io.File, or a string representing a path to a file.

```
Example: (hexdump/dump (range 100))
```

```
(hexdump/dump [0 1 2 3])
(hexdump/dump (range 10000))
(hexdump/dump (range 10000) :offset 9000 :size 256)
(hexdump/dump "./img.png")
(hexdump/dump "./img.png" :offset 0 :size 64)
(try-with [ps (io/capturing-print-stream)]
  (binding [*out* ps]
    (hexdump/dump [0 1 2 3])
    (str ps)))
```

tor

# highlight

```
(highlight form)
```

Syntax highlighting. Reads the form and returns a list of (token, token-class) tuples.

Token classes:

```
:quote
                     :quasi-quote
                     :unquote
                     :unquote-splicing
                                                                                                         ~@
                                                                                                         ^private, ^{:arglist '() :doc "...."}
                     :meta
                     :at
                     :hash
                                                                                                          #
                                                                                                          {
                     :brace-begin
                     :brace-end
                                                                                                           {
                                                                                                          [
                    :bracket-begin
                    :bracket-end
                                                                                                          ]
                    :parenthesis-begin
                                                                                                           (
                    :parenthesis-end
                     :unknown
                                                                                                       anything that could not be classified

# import

```
(import class & classes)
(import class :as alias)
Imports one or multiple Java classes. Imports are bound to the current namespace.
Example
Without import
    (. :java.lang.Math :max 2 10)
With import
    (do
      (import :java.lang.Math)
      (.:Math:max 2 10))
Aliases
Aliases are helpful if Java classes have the same name but different packages like java.util.Date and java.sql.Date:
    (do
      (import :java.util.Date)
      (import :java.sql.Date :as :SqlDate)
      (println (. :Date :new))
      (println (. :SqlDate :valueOf "2022-06-24")))
Static nested classes
Venice
    (do
      (import :foo.OuterClass)
      (import :foo.OuterClass$NestedStaticClass)
      (-> (. :OuterClass :new)
         (. :message))
      (-> (. :OuterClass$NestedStaticClass :new)
          (. :message)))
Java
   package foo;
   public class OuterClass {
     public String message() {
       return "OuterClass::message()";
     public static class NestedStaticClass {
       public String message() {
         return "NestedStaticClass::message()";
     }
   }
(do
  (import :java.lang.Math)
  (. :Math :max 2 10))
=> 10
(do
  (import :java.awt.Point
          :java.lang.Math)
  (. :Math :max 2 10))
=> 10
```

```
(do
  (import :java.awt.Color :as :AwtColor)
  (. :AwtColor :new 200I 230I 255I 180I))
=> java.awt.Color[r=200,g=230,b=255]
(do
  (ns util)
  (defn import? [clazz ns_]
    (any? #(== % clazz) (map first (imports ns_))))
  (ns alpha)
  (import :java.lang.Math)
  (println "alpha:" (util/import? :java.lang.Math 'alpha))
  (println "beta:" (util/import? :java.lang.Math 'beta))
  (ns alpha)
  (println "alpha:" (util/import? :java.lang.Math 'alpha))
alpha: true
beta: false
alpha: true
=> nil
```

### inet/inet-addr

(inet/inet-addr addr)

Converts a stringified IPv4 or IPv6 to a Java InetAddress.

```
(inet/inet-addr "222.192.0.0")
=> /222.192.0.0

(inet/inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")
=> /2001:db8:85a3:8d3:1319:8a2e:370:7347
```

```
inet/inet-addr-from-bytes

(inet/inet-addr-bytes addr)

Converts a IPv4 or IPv6 byte address (a vector of unsigned integers) to a Java InetAddress.

(inet/inet-addr-from-bytes [222I 192I 12I 0I])
=> /222.192.12.0

(inet/inet-addr-from-bytes [32I 1I 13I 184I 133I 163I 8I 21II 19I 25I 138I 46I 3I 112I 115I 71I])
=> /2001:db8:85a3:8d3:1319:8a2e:370:7347
```

# inet/inet-addr-to-bytes

(inet/inet-addr-to-bytes addr)

Converts a stringified IPv4/IPv6 address or a Java InetAddress to an InetAddress byte vector.

```
(inet/inet-addr-to-bytes "222.192.12.0")
=> [222I 192I 12I 0I]

(inet/inet-addr-to-bytes "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")
=> [32I 1I 13I 184I 133I 163I 8I 211I 19I 25I 138I 46I 3I 112I 115I 71I]

(inet/inet-addr-to-bytes (inet/inet-addr "222.192.0.0"))
=> [222I 192I 0I 0I]
```

# inet/ip4?

(inet/ip4? addr)

Returns true if addr is an IPv4 address.

```
(inet/ip4? "222.192.0.0")
=> true

(inet/ip4? (inet/inet-addr "222.192.0.0"))
=> true
```

```
inet/ip6?
(inet/ip6? addr)

Returns true if addr is an IPv6 address.

(inet/ip6? "2001:0db8:85a3:08d3:1319:8a2e:0370:7347")
=> true
(inet/ip6? (inet/inet-addr "2001:0db8:85a3:08d3:1319:8a2e:0370:7347"))
=> true
```

```
inet/linklocal-addr?

(inet/linklocal-addr? addr)

Returns true if addr is a link local address.

(inet/linklocal-addr? "169.254.0.0")
=> true

(inet/linklocal-addr? (inet/inet-addr "169.254.0.0"))
=> true
```

```
inet/multicast-addr?

(inet/multicast-addr? addr)

Returns true if addr is a multicast address.

(inet/multicast-addr? "224.0.0.1")
=> true

(inet/multicast-addr? (inet/inet-addr "224.0.0.1"))
=> true
```

inet/reachable?

(inet/reachable? addr timeout)

Test whether that address is reachable. Best effort is made by the implementation to try to reach the host, but firewalls and server configuration may block requests resulting in a unreachable status while some specific ports may be accessible. A typical implementation will use ICMP ECHO REQUESTs if the privilege can be obtained, otherwise it will try to establish a TCP connection on port 7 (Echo) of the destination host.

The timeout value, in milliseconds, indicates the maximum amount of time the try should take. If the operation times out before getting an answer, the host is deemed unreachable.

```
(inet/reachable? "google.com" 500)
=> false
(inet/reachable? "74.125.193.113" 500)
=> false
```

inet/sitelocal-addr?

(inet/sitelocal-addr? addr)

Returns true if addr is a site local address.

(inet/sitelocal-addr? "192.168.0.0")
=> true

(inet/sitelocal-addr? (inet/inet-addr "192.168.0.0"))
=> true

### infinite?

(infinite? x)

Returns true if x is infinite else false. x must be a double!

```
(infinite? 1.0E300)
=> false

(infinite? (* 1.0E300 1.0E100))
=> true

(infinite? (/ 1.0 0))
=> true

(pr (/ 4.1 0))
:Infinite
=> nil
```

### **SEE ALSO**

nan?

Returns true if x is a NaN else false. x must be a double!

double

Converts to double

```
instance-of?

(instance-of? type x)

Returns true if x is an instance of the given type

(instance-of? :long 500)
=> true

(instance-of? :java.math.BigInteger 500)
=> false

SEE ALSO

type
Returns the type of x.
supertype
Returns the super type of x.
supertypes
Returns the super types of x.
```

```
int
(int x)
Converts to int
(int 1)
=> 1I
(int nil)
=> 0I
(int false)
=> 0I
(int true)
=> 1I
(int 1.2)
=> 1I
(int 1.2M)
=> 1I
(int "1")
=> 1I
```

```
(int (char "A"))
=> 65I
```

```
int-array

(int-array coll)
  (int-array len)
  (int-array len init-val)

Returns an array of Java primitive ints containing the contents of coll or returns an array with the given length and optional init value

(int-array '(11 21 31))
=> [11, 21, 31]

(int-array '(11 2 3.2 3.56M))
=> [11, 21, 31, 31]

(int-array 10)
=> [01, 01, 01, 01, 01, 01, 01, 01, 01]

(int-array 10 421)
```

```
int?
(int? n)

Returns true if n is an int

(int? 4I)
=> true
(int? 4)
=> false
(int? 3.1)
=> false
(int? true)
=> false
(int? true)
=> false
(int? nil)
=> false
```

## interleave

```
(interleave c1 c2)
(interleave c1 c2 & colls)
```

Returns a collection of the first item in each coll, then the second etc.

Supports lazy sequences as long at least one collection is not a lazy sequence.

```
(interleave [:a :b :c] [1 2])
=> (:a 1 :b 2)

(interleave [:a :b :c] (lazy-seq 1 inc))
=> (:a 1 :b 2 :c 3)

(interleave (lazy-seq (constantly :v)) [1 2 3])
=> (:v 1 :v 2 :v 3)
```

# interpose

(interpose sep coll)

Returns a collection of the elements of coll separated by sep.

```
(interpose ", " [1 2 3])
=> (1 ", " 2 ", " 3)

(apply str (interpose ", " [1 2 3]))
=> "1, 2, 3"
```

top

### intersection

```
(intersection s1)
(intersection s1 s2)
(intersection s1 s2 & sets)
```

Return a set that is the intersection of the input sets

```
(intersection (set 1))
=> #{1}

(intersection (set 1 2) (set 2 3))
=> #{2}

(intersection (set 1 2) (set 3 4))
=> #{}
SEE ALSO
```

### union

Return a set that is the union of the input sets

### difference

Return a set that is the first set without elements of the remaining sets

#### cons

Returns a new collection where x is the first element and coll is the rest.

#### con

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

### disj

Returns a new set with the x, xs removed.

ton

### into

```
(into)
(into to)
(into to from)
```

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

```
(into (sorted-map) [ [:a 1] [:c 3] [:b 2] ])
=> {:a 1 :b 2 :c 3}
(into (sorted-map) [ {:a 1} {:c 3} {:b 2} ])
=> {:a 1 :b 2 :c 3}
(into (sorted-map) [(map-entry :b 2) (map-entry :c 3) (map-entry :a 1)])
=> {:a 1 :b 2 :c 3}
(into (sorted-map) {:b 2 :c 3 :a 1})
=> {:a 1 :b 2 :c 3}
(into [] {:a 1, :b 2})
=> [[:a 1] [:b 2]]
(into '() '(1 2 3))
=> (3 2 1)
(into [1 2 3] '(4 5 6))
=> [1 2 3 4 5 6]
(into '() (bytebuf [0 1 2]))
=> (0 1 2)
(into [] (bytebuf [0 1 2]))
=> [0 1 2]
(into '() "abc")
=> (#\a #\b #\c)
(into [] "abc")
=> [#\a #\b #\c]
```

### **SEE ALSO**

#### concat

Returns a list of the concatenation of the elements in the supplied collections.

#### merge

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

into! (into!) (into! to) (into! to from) Adds all of the items of 'from' conjoined to the mutable 'to' collection (into! (queue) [1 2 3 4]) => (1 2 3 4) (into! (stack) [1 2 3 4]) => (4 3 2 1) (into! (. :java.util.concurrent.CopyOnWriteArrayList :new) (doto (. :java.util.ArrayList :new) (. :add 3) (. :add 4)))) => (3 4) (do (into! (. :java.util.concurrent.CopyOnWriteArrayList :new) '(3 4))) => (3 4) **SEE ALSO** 

### concat

Returns a list of the concatenation of the elements in the supplied collections.

### merge

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

io/->uri

```
(io/->uri s)
(io/->uri scheme user-info host port path)
(io/->uri scheme user-info host port path query)
(io/->uri scheme user-info host port path query fragment)
```

Converts s to an URI or builds an URI from its spec elements.

s may be:

```
• a string (a spec string to be parsed as a URI.)
     • a java.io.File
     • a java.nio.file.Path
     • a java.net.URL
Arguments:
 scheme Scheme name
 userInfo User name and authorization information
 host Host name
 port Port number
 path Path
 query Query
 fragment Fragment
(io/->uri "file:/tmp/test.txt")
=> file:/tmp/test.txt
(io/->uri (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt
(io/->uri (io/->url (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt
(str (io/->uri (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"
;; to create an URL from spec details:
(io/->uri "http" nil "foo.org" 8080 "/info.html" nil nil)
=> http://foo.org:8080/info.html
SEE ALSO
io/file
Returns a java.io. File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...
```

## io/->url

(io/->url s)
(io/->url protocol host port file)

Converts s to an URL or builds an URL from its spec elements.

Converts s to an URL or builds an URL from its spec elements.

s may be:

- a string (a spec string to be parsed as a URL.)
- a java.io.File
- a java.nio.file.Path
- a java.net.URI

### Arguments:

**protocol** the name of the protocol to use.

```
host the name of the host.
port the port number on the host.
file the file on the host

(io/->url "file:/tmp/test.txt")
=> file:/tmp/test.txt

(io/->url (io/file "/tmp/test.txt"))
=> file:/tmp/test.txt

(io/->url (io/->uri (io/file "/tmp/test.txt")))
=> file:/tmp/test.txt

(str (io/->url (io/file "/tmp/test.txt")))
=> "file:/tmp/test.txt"

;; to create an URL from spec details:
(io/->url "http" "foo.org" 8080 "/info.html")
=> http://foo.org:8080/info.html
```

### **SEE ALSO**

#### io/file

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

#### io/->uri

Converts s to an URI or builds an URI from its spec elements.

top

## io/await-for

```
(io/await-for timeout time-unit file & modes)
```

Blocks the current thread until the file has been created, deleted, or modified according to the passed modes {:created, :deleted, :modified}, or the timeout has elapsed. Returns logical false if returning due to timeout, logical true otherwise.

Supported time units are: {:milliseconds, :seconds, :minutes, :hours, :days}

```
(io/await-for 10 :seconds "/tmp/data.json" :created)
```

### **SEE ALSO**

### io/watch-dir

Watch a directory for changes, and call the function event-fn when it does. Calls the optional failure-fn if errors occur. On closing ...

top

# io/buffered-reader

(io/buffered-reader f & options)

Create a java.io.Reader from f.

f may be a:

string

```
    bytebuffer

     • java.io.File, e.g: (io/file "/temp/foo.json")
     • java.nio.file.Path
       java.io.InputStream
     • java.io.Reader
     • java.net.URL
     • java.net.URI
Options:
:encoding enc
                e.g.: :encoding :utf-8 , defaults to :utf-8
io/buffered-reader supports load paths. See the loadpath/paths doc for a description of the load path feature.
Note: The caller is responsible for closing the reader!
(let [data (bytebuf [108 105 110 101 32 49 10 108 105 110 101 32 50])]
  (try-with [rd (io/buffered-reader data :encoding :utf-8)]
    (println (read-line rd))
    (println (read-line rd))))
line 1
line 2
=> nil
(try-with [rd (io/buffered-reader "1\n2\n3\n4")]
  (println (read-line rd))
  (println (read-line rd)))
2
=> nil
SEE ALSO
read-line
Without arg reads the next line from the stream that is the current value of *in*. With arg reads the next line from the passed stream ...
io/string-reader
Creates a java.io.StringReader from a string.
io/buffered-writer
Creates a java.io.Writer for f.
```

# io/buffered-writer

(io/buffered-writer f & options)

Creates a java.io.Writer for f.

f may be a:

- java.io.File, e.g: (io/file "/temp/foo.json")
- java.nio.file.Path
- java.io.OutputStream
- java.io.Writer Options:

:append true/false e.g.: :append true , defaults to false :encoding enc e.g.: :encoding :utf-8 , defaults to :utf-8

io/buffered-writer supports load paths. See the loadpath/paths doc for a description of the load path feature.

### SEE ALSO

#### println

Prints the values xs to the stream that is the current value of \*out\* or to the passed output stream os if given followed by a (newline).

### io/string-writer

Creates a java.io.StringWriter.

#### io/buffered-reader

Create a java.io.Reader from f.

io/bytebuf-in-stream

(io/bytebuf-in-stream buf)

Returns a java.io.InputStream from a bytebuf.

Note: The caller is responsible for closing the stream!

(try-with [is (io/bytebuf-in-stream (bytebuf [97 98 99]))]
; do something with is
)

SEE ALSO

io/slurp-stream
Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...
io/file-in-stream
Returns a java.io.InputStream for the file f.
io/string-in-stream
Returns a java.io.InputStream for the string s.

# io/bytebuf-out-stream

(io/bytebuf-out-stream)

Returns a new java.io.ByteArrayOutputStream.

Dereferencing a :ByteArrayOutputStream returns the captured bytebuf.

Note: The caller is responsible for closing the stream!

```
(try-with [os (io/bytebuf-out-stream)]
  (io/spit-stream os (bytebuf [97 98 99]) :flush true)
  (str/format-bytebuf @os ", " :prefix0x))
=> "0x61, 0x62, 0x63"
```

### **SEE ALSO**

io/slurp-stream

Slurps binary or string data from a java.io.InputStream is. Supports the option: binary to either slurp binary or string data. For ...

io/file-in-stream

Returns a java.io.InputStream for the file f.

io/string-in-stream

Returns a java.io.lnputStream for the string s.

top

# io/capturing-print-stream

(io/capturing-print-stream)

Creates a new capturing print stream.

Dereferencing a capturing print stream returns the captured string.

Note: The caller is responsible for closing the stream!

top

# io/classpath-resource?

(io/classpath-resource? name)

Returns true if the classpath resource exists otherwise false.

(io/classpath-resource? "com/github/jlangch/venice/images/venice.png")

=> true

**SEE ALSO** 

io/load-classpath-resource

Loads a classpath resource. Returns a bytebuf

top

## io/close

```
(io/close s)
```

Closes a :java.io.InputStream , :java.io.OutputStream , :java.io.Reader ,Ora :java.io.Writer .

Often it is more elegant to use try-with to let Venice implicitly close the stream when its leaves the scope:

```
(let [file (io/file "foo.txt")]
  (try-with [is (io/file-in-stream file)]
        (io/slurp-stream is :binary false)))
```

### **SEE ALSO**

### io/flush

Flushes a :java.io.OutputStream or a :java.io.Writer.

top

## io/close-watcher

(io/close-watcher watcher)

Closes a watcher created from 'io/watch-dir'.

### **SEE ALSO**

### io/watch-dir

Watch a directory for changes, and call the function event-fn when it does. Calls the optional failure-fn if errors occur. On closing ...

top

# io/copy-file

(io/copy-file source dest & options)

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a string (file path), or an java.io.OutputStream.

Options:

:replace true/false e.g.: if true replace an existing file, defaults to false

### **SEE ALSO**

### io/move-file

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

### io/delete-file

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f ...

### io/touch-file

Updates the lastModifiedTime of the file to the current time, or creates a new empty file if the file doesn't already exist. File must ...

### io/copy-stream

Copies the input stream to the output stream. Returns nil on sucess or throws a VncException on failure. Input and output must be a ...

# io/copy-stream

(io/copy-stream in-stream out-stream)

Copies the input stream to the output stream. Returns nil on sucess or throws a VncException on failure. Input and output must be a java. io.InputStream and java.io.OutputStream.

### **SEE ALSO**

### io/copy-file

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

top

## io/default-charset

(io/default-charset)

Returns the default charset.

top

## io/delete-file

(io/delete-file f & files)

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f must be a file or a string (file path).

### **SEE ALSO**

### io/delete-files-glob

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

Moves source to target. Returns nil or throws a VncException. Source and target must be a file or a string (file path).

top

## io/delete-file-on-exit

(io/delete-file-on-exit f)

Requests that the file or directory be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse order that they are registered. Invoking this method to delete a file or directory that is already registered for deletion has no effect. Deletion will be attempted only for normal termination of the virtual machine, as defined by the Java Language Specification.

f must be a file or a string (file path).

#### **SEE ALSO**

### io/delete-file-on-exit

Requests that the file or directory be deleted when the virtual machine terminates. Files (or directories) are deleted in the reverse ...

top

# io/delete-files-glob

(io/delete-files-glob dir glob)

Removes all files in a directory that match the glob pattern. dir must be a file or a string (file path).

### Globbing patterns

\*.txt Matches a path that represents a file name ending in .txt

\*.\* Matches file names containing a dot\*.{txt,xml} Matches file names ending with .txt or .xml

foo.?[xy] Matches file names starting with foo. and a single character extension followed by a 'x' or 'y'

character

/home/\*/\* Matches /home/gus/data on UNIX platforms

/home/\*\* Matches /home/gus and /home/gus/data on UNIX platforms C:\\\* Matches C:\\foo and C:\\bar on the Windows platform

Ranges

The pattern [A-E] would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by [A-Za-z0-9]. This would match the following:

- [A-Z] All uppercase letters from A to Z
- [a-z] All lowercase letters from a to z
- [0-9] All numbers from 0 to 9

### Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks (!) and backslashes (\).

The exclamation mark can negate a pattern that it is put in front of. As [CBR]at matches Cat, Bat, or Rat the negated pattern [!CBR]at matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters '?', '\*', and '[', so that they can be used in patterns.

```
(io/delete-files-glob "." "*.log")
=> ()
```

### SEE ALSO

### io/delete-file

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f...

#### io/delete-file-tree

Deletes a file or a directory with all its content. Silently skips delete if the file or directory does not exist. f must be a file ...

#### io/list-files-glob

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

top

### io/download

```
(io/download uri & options)
```

Downloads the content from the uri and reads it as text (string) or binary (bytebuf). Supports http and https protocols!

### Options:

```
    :binary true/false
    :user-agent agent
    :user-agent "Mozilla", defaults to nil
    :encoding enc
    :encoding :utf-8, defaults to :utf-8
    :conn-timeout val
    :conn-timeout 10000, connection timeout in milliseconds.
    0 is interpreted as an infinite timeout.
```

:read-timeout val e.g.: :read-timeout 10000 , read timeout in milliseconds.

0 is interpreted as an infinite timeout. a progress function that takes 2 args

[1] progress (0..100%)

[2] status {:start :progress :end :failed}

### Note:

:progress-fn fn

If the server returns the HTTP response status code 403 (Access Denied) sending a user agent like "Mozilla" may fool the website and solve the problem.

```
(-<> "https://live.staticflickr.com/65535/51007202541_ea453871d8_o_d.jpg"
    (io/download <> :binary true :user-agent "Mozilla")
    (io/spit "space-x.jpg" <>))
```

top

## io/exists-dir?

```
(io/exists-dir? f)
```

Returns true if the file f exists and is a directory. f must be a file or a string (file path).

```
(io/exists-dir? (io/file "/temp"))
=> false
```

### **SEE ALSO**

#### io/exists-file?

Returns true if the file f exists and is a file. f must be a file or a string (file path).

### io/file-symbolic-link?

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

top

### io/exists-file?

```
(io/exists-file? f)
```

Returns true if the file f exists and is a file. f must be a file or a string (file path).

```
(io/exists-file? "/tmp/test.txt")
=> false
```

### SEE ALSO

### io/exists-dir?

Returns true if the file f exists and is a directory. f must be a file or a string (file path).

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

tor

### io/file

```
(io/file path)
(io/file parent child)
(io/file parent child & children)
```

Returns a java.io. File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string (file path), child and children must be strings.

```
(io/file "/tmp/test.txt")
=> /tmp/test.txt

(io/file "/temp" "test.txt")
=> /temp/test.txt

(io/file "/temp" "test" "test.txt")
=> /temp/test/test.txt

(io/file (io/file "/temp") "test" "test.txt")
=> /temp/test/test.txt

(io/file (.:java.io.File :new "/tmp/test.txt"))
=> /tmp/test.txt
```

### **SEE ALSO**

### io/file-name

Returns the name of the file f as a string. f must be a file or a string (file path).

#### io/file-parent

Returns the parent file of the file f. f must be a file or a string (file path).

#### io/file-path

Returns the path of the file f as a string. f must be a file or a string (file path).

### io/file-absolute

Returns the absolute path of the file f. f must be a file or a string (file path).

### io/file-canonical

Returns the canonical path of the file f. f must be a file or a string (file path).

top

## io/file-absolute

```
(io/file-absolute f)
```

Returns the absolute path of the file f. f must be a file or a string (file path).

## io/file-can-execute?

(io/file-can-execute? f)

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

(io/file-can-execute? "/tmp/test.txt")

### **SEE ALSO**

### io/file-can-read?

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

#### io/file-can-write?

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

#### io/file-hidden?

Returns true if the file or directory f exists and is hidden. f must be a file or a string (file path).

### io/file-symbolic-link?

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

top

## io/file-can-read?

(io/file-can-read? f)

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

(io/file-can-read? "/tmp/test.txt")

### **SEE ALSO**

### io/file-can-write?

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

### io/file-can-execute?

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

### io/file-hidden?

Returns true if the file or directory f exists and is hidden. f must be a file or a string (file path).

### io/file-symbolic-link?

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

top

## io/file-can-write?

(io/file-can-write? f)

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

(io/file-can-write? "/tmp/test.txt")

### **SEE ALSO**

### io/file-can-read?

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

io/file-can-execute?

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

### io/file-hidden?

Returns true if the file or directory f exists and is hidden. f must be a file or a string (file path).

### io/file-symbolic-link?

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

top

## io/file-canonical

```
(io/file-canonical f)
```

Returns the canonical path of the file f. f must be a file or a string (file path).

```
(io/file-canonical (io/file "/tmp/test/../x.txt"))
=> /private/tmp/x.txt
```

### **SEE ALSO**

### io/file-path

Returns the path of the file f as a string. f must be a file or a string (file path).

#### io/file-absolute

Returns the absolute path of the file f. f must be a file or a string (file path).

#### io/file

Returns a java.io. File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

top

### io/file-ext

```
(io/file-ext f)
```

Returns the file extension of a file. f must be a file or a string (file path).

```
(io/file-ext "some.txt")
=> "txt"

(io/file-ext "/tmp/test/some.txt")
=> "txt"

(io/file-ext "/tmp/test/some")
=> nil
```

### **SEE ALSO**

### io/file-ext?

Returns true if the file f hast the extension ext. f must be a file or a string (file path).

### io/file-basename

Returns the base name (file name without file extension) of the file f as a string. f must be a file or a string (file path).

## io/file-ext?

```
(io/file-ext? f ext)
```

Returns true if the file f hast the extension ext. f must be a file or a string (file path).

```
(io/file-ext? "/tmp/test/x.txt" "txt")
=> true
(io/file-ext? (io/file "/tmp/test/x.txt") ".txt")
```

### SEE ALSO

#### io/file-ext

Returns the file extension of a file. f must be a file or a string (file path).

Ор

## io/file-hidden?

(io/file-hidden? f)

Returns true if the file or directory f exists and is hidden. f must be a file or a string (file path).

(io/file-hidden? "/tmp/test.txt")

### **SEE ALSO**

### io/file-can-read?

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

### io/file-can-write?

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

### io/file-can-execute?

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

### io/file-symbolic-link?

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

top

## io/file-in-stream

(io/file-in-stream f)

Returns a java.io.InputStream for the file f.

f may be a:

- string file path, e.g: "/temp/foo.json"
- java.io.File, e.g: (io/file "/temp/foo.json")

io/file-in-stream supports load paths. See the loadpath/paths doc for a description of the load path feature.

Note: The caller is responsible for closing the stream!

### SEE ALSO

#### io/slurp

Reads the content of file f as text (string) or binary (bytebuf).

### io/slurp-stream

Slurps binary or string data from a java.io.InputStream is. Supports the option: binary to either slurp binary or string data. For ...

### io/string-in-stream

Returns a java.io.InputStream for the string s.

### io/bytebuf-in-stream

Returns a java.io.lnputStream from a bytebuf.

### loadpath/paths

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

top

## io/file-last-modified

(io/file-last-modified f)

Returns the last modification time (a Java LocalDateTime) of f or nil if f does not exist. f must be a file or a string (file path).

(io/file-last-modified "/tmp/test.txt")

### **SEE ALSO**

### io/file-can-read?

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

### io/file-can-write?

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

### io/file-can-execute?

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

top

# io/file-matches-glob?

(io/file-matches-glob? glob f)

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

### Globbing patterns

\*.txt Matches a path that represents a file name ending in .txt

\*.\* Matches file names containing a dot

\*.{txt,xml} Matches file names ending with .txt or .xml

foo.?[xy] Matches file names starting with foo. and a single character extension followed by a 'x' or 'y'

characte

/home/\*/\* Matches /home/gus/data on UNIX platforms

/home/\*\* Matches /home/gus and /home/gus/data on UNIX platforms

C:\\\*

Matches C:\\foo and C:\\bar on the Windows platform

#### Ranges

The pattern [A-E] would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by [A-Za-z0-9]. This would match the following:

- [A-Z] All uppercase letters from A to Z
- [a-z] All lowercase letters from a to z
- [0-9] All numbers from 0 to 9

#### Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks (!) and backslashes (\).

The exclamation mark can negate a pattern that it is put in front of. As [CBR]at matches Cat, Bat, or Rat the negated pattern [!CBR]at matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters '?', '\*', and '[', so that they can be used in patterns.

```
(io/file-matches-glob? "**.log" "file.log")
=> true

(io/file-matches-glob? "**/*.log" "x/y/file.log")
=> true

(io/file-matches-glob? "**/*.log" "file.log") ; take care, doesn't match!
=> false

(io/file-matches-glob? (io/glob-path-matcher "*.log") (io/file "file.log"))
=> true

(io/file-matches-glob? (io/glob-path-matcher "**/*.log") (io/file "x/y/file.log"))
=> true
```

### SEE ALSO

### io/glob-path-matcher

Returns a file matcher for glob file patterns.

### io/list-files-glob

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

tor

### io/file-name

```
(io/file-name f)
```

Returns the name of the file f as a string. f must be a file or a string (file path).

```
(io/file-name (io/file "/tmp/test/x.txt"))
=> "x.txt"
```

### SEE ALSO

### io/file-basename

Returns the base name (file name without file extension) of the file f as a string. f must be a file or a string (file path).

### io/file-parent

Returns the parent file of the file f. f must be a file or a string (file path).

#### io/file

Returns a java.io. File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

top

## io/file-out-stream

(io/file-out-stream f options)

Returns a java.io.OutputStream for the file f.

f may be a:

- string file path, e.g: "/temp/foo.json"
- java.io.File, e.g: (io/file "/temp/foo.json")

Options:

:append true/false e.g.: :append true , defaults to false :encoding enc e.g.: :encoding :utf-8 , defaults to :utf-8

io/file-out-stream supports load paths. See the loadpath/paths doc for a description of the load path feature.

Note: The caller is responsible for closing the stream!

### **SEE ALSO**

### io/slurp

Reads the content of file f as text (string) or binary (bytebuf).

### io/slurp-stream

Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...

### io/string-in-stream

Returns a java.io.InputStream for the string s.

### io/bytebuf-in-stream

Returns a java.io.lnputStream from a bytebuf.

### loadpath/paths

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

tor

# io/file-parent

(io/file-parent f)

Returns the parent file of the file f. f must be a file or a string (file path).

(io/file-path (io/file-parent (io/file "/tmp/test/x.txt")))
=> "/tmp/test"

### **SEE ALSO**

io/file-name

Returns the name of the file f as a string. f must be a file or a string (file path).

### io/file

Returns a java.io. File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

top

# io/file-path

(io/file-path f)

Returns the path of the file f as a string. f must be a file or a string (file path).

(io/file-path (io/file "/tmp/test/x.txt"))
=> "/tmp/test/x.txt"

**SEE ALSO** 

#### io/file-absolute

Returns the absolute path of the file f. f must be a file or a string (file path).

#### io/file-canonical

Returns the canonical path of the file f. f must be a file or a string (file path).

#### io/file

Returns a java.io. File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

top

## io/file-size

(io/file-size f)

Returns the size of the file f. f must be a file or a string (file path).

(io/file-size "/tmp/test.txt")

**SEE ALSO** 

### io/file

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

top

# io/file-symbolic-link?

(io/file-symbolic-link? f)

Returns true if the file f exists and is a symbolic link. f must be a file or a string (file path).

(io/file-symbolic-link? "/tmp/test.txt")

SEE ALSO

### io/file-hidden?

Returns true if the file or directory f exists and is hidden. f must be a file or a string (file path).

#### io/file-can-read?

Returns true if the file or directory f exists and can be read. f must be a file or a string (file path).

#### io/file–can–write?

Returns true if the file or directory f exists and can be written. f must be a file or a string (file path).

#### io/file-can-execute?

Returns true if the file or directory f exists and can be executed. f must be a file or a string (file path).

top

### io/file-within-dir?

```
(io/file-within-dir? dir file)
```

Returns true if the file is within the dir else false.

The file and dir args must be absolute paths.

### **SEE ALSO**

### io/file

Returns a java.io.File from file path, or from a parent path and one or multiple children. The path and parent may be a file or a string ...

top

### io/file?

```
(io/file? f)
```

Returns true if x is a java.io.File.

```
(io/file? (io/file "/tmp/test.txt"))
=> true
```

ton

# io/filesystem-total-space

```
(io/filesystem-total-space)
(io/filesystem-total-space file)
```

Returns the total diskspace in bytes. With no args returns the total disk space of the current working directory's file store. With a file argument returns the total disk space of the file store the file is located.

(io/filesystem-total-space)

**SEE ALSO** 

## io/filesystem-usable-space

Returns the usable diskspace in bytes. With no args returns the usable disk space of the current working directory's file store. With ...

top

# io/filesystem-usable-space

(io/filesystem-usable-space)
(io/filesystem-usable-space file)

Returns the usable diskspace in bytes. With no args returns the usable disk space of the current working directory's file store. With a file argument returns the usable disk space of the file store the file is located.

(io/filesystem-usable-space)

**SEE ALSO** 

#### io/filesystem-total-space

Returns the total diskspace in bytes. With no args returns the total disk space of the current working directory's file store. With ...

top

# io/flush

(io/flush s)

Flushes a :java.io.OutputStream or a :java.io.Writer.

**SEE ALSO** 

#### io/close

 ${\it Closes a: java.io. Input Stream,: java.io. Output Stream,: java.io. Reader, or a: java.io. Writer.}$ 

ton

# io/glob-path-matcher

(io/glob-path-matcher pattern)

Returns a file matcher for glob file patterns.

## Globbing patterns

\*.txt Matches a path that represents a file name ending in .txt

\*.\* Matches file names containing a dot\*.{txt,xml} Matches file names ending with .txt or .xml

foo.?[xy] Matches file names starting with foo. and a single character extension followed by a 'x' or 'y'

character

/home/\*/\*

Matches /home/gus/data on UNIX platforms

/home/\*\*

Matches /home/gus and /home/gus/data on UNIX platforms

C:\\\* Matches C:\\foo and C:\\bar on the Windows platform

#### Ranges

The pattern [A-E] would match any character that included ABCDE. Ranges can be used in conjunction with each other to make powerful patterns. Alphanumerical strings are matched by [A-Za-z0-9]. This would match the following:

- [A-Z] All uppercase letters from A to Z
- [a-z] All lowercase letters from a to z
- [0-9] All numbers from 0 to 9

#### Complementation

Globs can be used in complement with special characters that can change how the pattern works. The two complement characters are exclamation marks (!) and backslashes (\) .

The exclamation mark can negate a pattern that it is put in front of. As [CBR]at matches Cat, Bat, or Rat the negated pattern [!CBR]at matches anything like Kat, Pat, or Vat.

Backslashes are used to remove the special meaning of single characters '?', '\*', and '[', so that they can be used in patterns.

```
(io/glob-path-matcher "**/*.log")
(io/glob-path-matcher "**/*.log")
```

#### **SEE ALSO**

#### io/file-matches-glob?

Returns true if the file f matches the glob pattern. f must be a file or a string (file path).

#### io/list-files-glob

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

io/gzip

(io/gzip f)

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

```
(->> (io/gzip "a.txt")
        (io/spit "a.gz"))

(io/gzip (bytebuf-from-string "abcdef" :utf-8))
```

## **SEE ALSO**

#### io/gzip

Returns true if f is a gzipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

#### io/ungzin

ungzips f. f may be a file, a string (file path), a bytebuf, or an InputStream. Returns a bytebuf.

#### io/zin

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

## io/spit

Opens file f, writes content, and then closes f. f may be a file or a string (file path). The content may be a string or a bytebuf.

top

# io/gzip-to-stream

```
(io/gzip f os)
```

gzips f to the OutputStream os. f may be a file, a string (file path), a bytebuf, or an InputStream.

SEE ALSO

io/gzip

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

top

# io/gzip?

```
(io/gzip? f)
```

Returns true if f is a gzipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

```
(-> (io/gzip (bytebuf-from-string "abc" :utf-8))
     (io/gzip?))
=> true
```

SEE ALSO

io/gzip

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

top

# io/internet-avail?

```
(io/internet-avail?)
(io/internet-avail? url)
```

Checks if an internet connection is present for a given url. Defaults to URL http://www.google.com.

```
(io/internet-avail?)
(io/internet-avail? "http://www.google.com")
```

top

# io/list-file-tree

```
(io/list-file-tree dir)
(io/list-file-tree dir filter-fn)
```

Lists all files in a directory tree. dir must be a file or a string (file path). filter-fn is an optional filter that filters the files found. The filter gets a java.io.File as argument. Returns files as java.io.File

```
(io/list-file-tree "/tmp")
(io/list-file-tree "/tmp" #(io/file-ext? % ".log"))
```

## **SEE ALSO**

#### io/list-files

Lists files in a directory. dir must be a file or a string (file path). filter-fn is an optional filter that filters the files found.

#### io/list-files-glob

Lists all files in a directory that match the glob pattern. dir must be a file or a string (file path). Returns files as java.io.File

top

# io/list-files

```
(io/list-files dir)
(io/list-files dir filter-fn)
```

Lists files in a directory. dir must be a file or a string (file path). filter-fn is an optional filter that filters the files found. The filter gets a java. io. File as argument. Returns files as java.io. File

```
(io/list-files "/tmp")
(io/list-files "/tmp" #(io/file-ext? % ".log"))
```

## SEE ALSO

#### io/read-char

With arg reads the next char from the passed stream that must be a subclass of :java.io.Reader.

tor

# io/slurp

(io/slurp f & options)

Reads the content of file f as text (string) or binary (bytebuf).

f may be a:

- string file path, e.g: "/temp/foo.json"
- bytebuffer
- java.io.File, e.g: (io/file "/temp/foo.json")
- java.io.InputStream
- java.io.Reader
- java.nio.file.Path
- java.net.URL
- java.net.URI

Returns a bytebuf or string depending on the passed :binary option.

Options:

:binary true/false e.g.: :binary true , defaults to false

:encoding enc e.g.: :encoding :utf-8 , defaults to :utf-8

io/slurp supports load paths. See the loadpath/paths doc for a description of the *load path* feature.

Note: For HTTP and HTTPS downloads prefer to use io/download .

## **SEE ALSO**

## io/slurp-lines

Read all lines from f.

#### io/slurp-stream

Slurps binary or string data from a java.io.InputStream is. Supports the option :binary to either slurp binary or string data. For ...

Copies source to dest. Returns nil or throws a VncException. Source must be a file or a string (file path), dest must be a file, a ...

#### io/delete-file

Deletes one or multiple files. Silently skips delete if the file does not exist. If f is a directory the directory must be empty. f...

# io/ungzip-to-stream

(io/ungzip-to-stream buf)

ungzips a bytebuf returning an InputStream to read the deflated data from.

```
(-> (bytebuf-from-string "abcdef" :utf-8)
     (io/gzip)
     (io/ungzip-to-stream)
     (io/slurp-stream :binary false :encoding :utf-8))
=> "abcdef"
```

#### **SEE ALSO**

## io/gzip

gzips f. f may be a file, a string (file path), a bytebuf or an InputStream. Returns a bytebuf.

top

# io/unzip

```
(io/unzip f entry-name)
```

Unzips an entry from zip f the entry's data as a bytebuf. f may be a bytebuf, a file, a string (file path) or an InputStream.

```
(-> (io/zip "a.txt" (bytebuf-from-string "abcdef" :utf-8))
     (io/unzip "a.txt"))
=> [97 98 99 100 101 102]
```

#### **SEE ALSO**

#### io/zip

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

#### io/zip?

Returns true if f is a zipped file. f may be a file, a string (file path), a bytebuf, or an InputStream

top

# io/unzip-all

```
(io/unzip-all f)
(io/unzip-all glob f)
```

Unzips all entries of the zip f returning a map with the entry names as key and the entry data as bytebuf values. f may be a bytebuf, a file, a string (file path) or an InputStream.

An optional globbing pattern can be passed to filter the files to be unzipped.

Note: globbing patterns with unzip are always relative. E.g. static/\*\*/\*.png

Globbing patterns:

```
*.txt Matches a path that represents a file name ending in .txt
```

\*.\* Matches file names containing a dot\*.{txt,xml} Matches file names ending with .txt or .xml

foo.? Matches file names starting with foo. and a single character extension

/home/\*/\* Matches /home/gus/data on UNIX platforms

/home/\*\* Matches /home/gus and /home/gus/data on UNIX platforms
C:\\\* Matches C:\\foo and C:\\bar on the Windows platform

Remove entries from a zip file f.

top

# io/zip-file

```
(io/zip-file options* zip-file & files)
Zips files and directories recursively. Does not zip hidden files and does not follow symbolic links. The zip-file my be a file, a string (file path) or
an OutputStream.
Options:
:filter-fn fn
                a predicate function that filters the files to be added to the zip.
:mapper-fn fn
                a mapper function that can map the file content of a file before it gets zipped. Returns nil or a :java.io.lnputStream. The real
                file is used when nil is returned.
:silent b
                if false prints the added entries to out, defaults to false
Example:
   venice> (io/zip-file :silent false "test.zip" "dirA" "dirB")
   Output:
      adding: dirA/
     adding: dirA/a1.png
      adding: dirA/a2.png
      adding: dirB/
      adding: dirB/b1.png
; zip files
(io/zip-file "test.zip" "a.txt" "x/b.txt")
; zip all files from a directory
(io/zip-file "test.zip" "dir")
; zip all files in from two directories
(io/zip-file "test.zip" "dirA" "dirB")
; zip all files in from two directories and print the added entries
(io/zip-file :silent false "test.zip" "dirA" "dirB")
```

; zip all \*.txt files from a directory

"test.zip"
"dir")

(io/zip-file :filter-fn (fn [dir name] (str/ends-with? name ".txt"))

#### io/zip

Creates a zip containing the entries. An entry is given by a name and data. The entry data may be nil, a bytebuf, a file, a string ...

#### io/zip-list

List the content of a the zip f and prints it to the current value of out. f may be a bytebuf, a file, a string (file path), or an ...

# io/zip-list

```
(io/zip-list options* f)
```

List the content of a the zip f and prints it to the current value of *out*. f may be a bytebuf, a file, a string (file path), or an InputStream. Returns nil in print mode otherwise returns a list with attributes for each zip file entry.

#### Options:

:verbose b if true print verbose output, defaults to false:print b if true print the entries to *out*, defaults to true

## Example:

venice> (io/zip-list :verbose true "test.zip")

Length	Method	Size	Cmpr	Date/Time	CRC-32	Name
0	Stored	0	0%	2021-01-05 10:32	00000000	dirA/
309977	Defl:N	297691	4%	2021-01-05 10:32	C7F24B5C	dirA/a1.png
309977	Defl:N	297691	4%	2021-01-05 10:32	C7F24B5C	dirA/a2.png
0	Stored	Θ	0%	2021-01-05 10:32	00000000	dirB/
309977	Defl:N	297691	4%	2021-01-05 10:32	C7F24B5C	dirB/b1.png
929931	null	893073	4%			5 files
=> nil						

```
venice> (io/zip-list :print false "test.zip")
=> ({:size 0 :method "Stored" :name "dirA/" ...} ...)
```

```
(io/zip-list "test-file.zip")
```

```
(io/zip-list :verbose true "test-file.zip")
```

# SEE ALSO

## io/zip-list-entry-names

Returns a list of the zip's entry names.

java/javadoc

(javadoc class-or-object)

Opens a browser window displaying the javadoc for argument.

(java/javadoc :java.lang.String)

# json/pretty-print

(json/pretty-print s & options)

Pretty prints a JSON string

Options:

:indent s The indent for indented output. Must contain spaces or tabs only. Defaults to two spaces.

```
(-> (json/write-str {:a 100 :b 100 :c [1 2 3]})
    (json/pretty-print)
    (println))
 "a": 100,
 "b": 100,
 "c": [1,2,3]
=> nil
(-> (json/write-str {:a 100 :b 100 :c [1 2 {:x 7 :y 8}] :d {:z 9}})
    (json/pretty-print :indent " ")
    (println))
   "a": 100,
   "b": 100,
    "c": [1,2,{
       "x": 7,
       "y": 8
   }],
    "d": {
       "z": 9
=> nil
```

#### json/write-str

Writes the val to a JSON string.

#### json/read-str

Reads a JSON string and returns it as a Venice datatype.

#### ison/spit

Spits the JSON converted val to the output.

#### json/slurp

Slurps a JSON data from a source and returns it as a Venice data.

top

# json/read-str

```
(json/read-str s & options)
```

Reads a JSON string and returns it as a Venice datatype.

#### Options:

:key-fn fn Single argument function called on JSON property names; return value will replace the property names in the output. Default is

'identity', use 'keyword' to get keyword properties.

:value-fn fn Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the

property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The

default value-fn returns the value unchanged.

### **SEE ALSO**

### json/write-str

Writes the val to a JSON string.

### json/spit

Spits the JSON converted val to the output.

## json/slurp

Slurps a JSON data from a source and returns it as a Venice data.

#### json/pretty-print

Pretty prints a JSON string

top

# json/slurp

```
(json/slurp source & options)
Slurps a JSON data from a source and returns it as a Venice data.
The source may be a:
     • java.io.File, e.g: (io/file "/temp/foo.json")
     • java.nio.Path
     • java.io.InputStream
     • java.io.Reader
Options:
:key-fn fn
               Single-argument function called on JSON property names; return value will replace the property names in the output. Default is
               'identity', use 'keyword' to get keyword properties.
               Function\ to\ transform\ values\ in\ JSON\ objects\ in\ the\ output.\ For\ each\ JSON\ property,\ value-fn\ is\ called\ with\ two\ arguments:\ the\ output
:value-fn fn
               property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The
               default value-fn returns the value unchanged.
               If true use BigDecimal for decimal numbers instead of Double. Default is false.
:decimal b
:encoding e
               e.g :encoding :utf-8, defaults to :utf-8
(let [json (json/write-str {:a 100 :b 100 :c 1.233})]

SEE ALSO
json/write-str
Writes the val to a JSON string.
json/read-str
Reads a JSON string and returns it as a Venice datatype.
json/spit
Spits the JSON converted val to the output.
json/pretty-print
Pretty prints a JSON string
```

# json/spit

(json/spit out val & options)

Spits the JSON converted val to the output.

The out may be a:

- java.io.File, e.g: (io/file "/temp/foo.json")
- java.nio.Path
- java.io.OutputStream
- java.io.Writer

```
Options:
                        Enables/disables pretty printing. Defaults to false.
:pretty b
:decimal-as-double b
                        If true emit a decimal as double else as string. Defaults to false.
:encoding e
                        e.g :encoding :utf-8, defaults to :utf-8
(try-with [out (io/bytebuf-out-stream)]

Slurps a JSON data from a source and returns it as a Venice data.
json/pretty-print
Pretty prints a JSON string
```

json/write-str (json/write-str val & options) Writes the val to a JSON string. Options: :pretty b Enables/disables pretty printing. Defaults to false. :decimal-as-double b If true emit a decimal as double else as string. Defaults to false. (json/write-str {:a 100 :b 100}) => "{\"a\":100,\"b\":100}" (json/write-str {:a 100 :b 100} :pretty true) => "{\n \"a\": 100,\n \"b\": 100\n}" SEE ALSO json/read-str Reads a JSON string and returns it as a Venice datatype. json/spit Spits the JSON converted val to the output. json/slurp Slurps a JSON data from a source and returns it as a Venice data. json/pretty-print

Pretty prints a JSON string

## jsonl/lazy-seq-slurper

```
(jsonl/lazy-seq-slurper in & options)
Returns a lazy sequence of the parsed JSON line strings from the input 'in'.
'in' may be a: `java.io.InputStream` java.io.Reader
Note: The caller is responsible for closing the in stream/reader!
Options:
:key-fn fn
              Single argument function called on JSON property names; return value will replace the property names in the output. Default is
              'identity', use 'keyword' to get keyword properties.
:value-fn fn
              Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the
              property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The
              default value-fn returns the value unchanged.
:decimal b
              If true use BigDecimal for decimal numbers instead of Double. Default is false.
:filter-fn fn
              Single argument function called on every read value from a JSON line. If it returns true the value will be kept otherwise it will be
              skipped
:encoding e
              e.g :encoding :utf-8, defaults to :utf-8
jsonl/lazy-seq-slurper supports load paths. See the loadpath/paths doc for a description of the load path feature.
;; use a lazy sequence to read the JSON lines data
(do
  (load-module :jsonl)
  (let [file (io/temp-file "data-" ".jsonl")]

        (pr-str (transduce xform conj slurper))))))
=> "[{:a 100 :b 205} {:a 100 :b 207}]"
```

#### jsonl/slurp

Slurps a list of JSON line strings from the input 'in' and returns it as a list of Venice data types.

#### jsonl/read-str

Reads a JSON line string 's' and returns it as a Venice data type.

top

# jsonl/read-str

```
(jsonl/read-str s & options)
```

Reads a JSON line string 's' and returns it as a Venice data type.

Options:

:key-fn fn Single argument function called on JSON property names; return value will replace the property names in the output. Default is

'identity', use 'keyword' to get keyword properties.

:value-fn fn Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the

property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The

default value-fn returns the value unchanged.

```
(do
  (load-module :jsonl)
  (let [json (jsonl/write-str {:a 100 :b 200})]
   (jsonl/read-str json :key-fn keyword)))
=> ({:a 100 :b 200})
(do
  (load-module :jsonl)
  (let [json (jsonl/write-str [{:a 100 :b 200} {:a 100 :b 200}])]
    (jsonl/read-str json :key-fn keyword)))
=> ({:a 100 :b 200} {:a 100 :b 200})
(do
  (load-module :jsonl)
  (try-with [sw (io/string-writer)]
    (println sw (jsonl/write-str {:a 100 :b 200}))
    (println sw (jsonl/write-str {:a 101 :b 201}))
    (println sw (jsonl/write-str {:a 102 :b 202}))
    (flush sw)
    (let [json @sw]
      (jsonl/read-str json :key-fn keyword))))
=> ({:a 100 :b 200} {:a 101 :b 201} {:a 102 :b 202})
```

### **SEE ALSO**

### jsonl/write-str

Writes the value 'val' to a JSON lines string.

top

# jsonl/slurp

```
(jsonl/slurp in & options)
Slurps a list of JSON line strings from the input 'in' and returns it as a list of Venice data types.
'in' may be a: string bytebuf `java.io.File`, e.g: `(io/file "/temp/foo.json")` java.nio.file.Path `java.io.InputStream` java.io.Reader
Note: The caller is responsible for closing the in stream/reader!
Options:
:key-fn fn
              Single argument function called on JSON property names; return value will replace the property names in the output. Default is
              'identity', use 'keyword' to get keyword properties.
:value-fn fn
              Function to transform values in JSON objects in the output. For each JSON property, value-fn is called with two arguments: the
              property name (transformed by key-fn) and the value. The return value of value-fn will replace the value in the output. The
              default value-fn returns the value unchanged.
:decimal b
              If true use BigDecimal for decimal numbers instead of Double. Default is false.
:filter-fn fn
              Single argument function called on every read value from a JSON line. If it returns true the value will be kept otherwise it will be
              skipped. The filter is applied after the 'key-fn' and the 'value-fn' have been applied to the line data value.
:encoding e
              e.g :encoding :utf-8, defaults to :utf-8
jsonl/slurp supports load paths. See the loadpath/paths doc for a description of the load path feature.

SEE ALSO
jsonl/read-str
Reads a JSON line string 's' and returns it as a Venice data type.
jsonl/lazy-seq-slurper
```

Returns a lazy sequence of the parsed JSON line strings from the input 'in'.

# jsonl/spit

```
(jsonl/spit out val & options)
```

Spits the JSON Lines converted value 'val' to the output 'out'.

The 'out' may be a:

- java.io.File, e.g: (io/file "/temp/foo.json")
- java.nio.Path
- java.io.OutputStream
- java.io.Writer

Note: The caller is responsible for closing the out stream/writer!

Any reasonable Venice value like string, integer, long, double, decimal, boolean, list, vector, set, or map can be passed. Sequences like list or vector are converted to multiple JSON lines, one line for each value in the sequence. All other types are converted to a single JSON line.

#### Options:

:append true/false e.g.: :append true , defaults to false :encoding e e.g :encoding :utf-8, defaults to :utf-8

jsonl/spit supports load paths. See the loadpath/paths doc for a description of the load path feature.

```
(load-module :jsonl)
  (let [file (io/temp-file "data-" ".jsonl")]
    (io/delete-file-on-exit file)
    (try-with [wr (io/buffered-writer file)]
      (jsonl/spit wr [{:a 100 :b 200} {:a 101 :b 201} {:a 102 :b 202}])
      (flush wr))
    ;; print the json lines data
    (println (io/slurp file :encoding :utf-8))))
{"a":100,"b":200}
{"a":101, "b":201}
{"a":102,"b":202}

{"a":100,"b":200}
{"a":101,"b":201}
{"a":102,"b":202}
=> nil
```

#### jsonl/write-str

Writes the value 'val' to a JSON lines string.

#### isonl/slurg

Slurps a list of JSON line strings from the input 'in' and returns it as a list of Venice data types.

top

# jsonl/spitln

```
(jsonl/spitln out val & options)
```

Spits the JSON Lines converted value 'val' to the output 'out' and adds a new line after the last emitted line.

This function is useful when lines are spitted to a stream/writer line by line.

The 'out' may be a:

- java.io.File, e.g: (io/file "/temp/foo.json")
- java.nio.Path
- java.io.OutputStream
- java.io.Writer

**Note**: The caller is responsible for closing the out stream/writer!

Any reasonable Venice value like string, integer, long, double, decimal, boolean, list, vector, set, or map can be passed. Sequences like list or vector are converted to multiple JSON lines, one line for each value in the sequence. All other types are converted to a single JSON line.

Options:

:append true/false e.g.: :append true , defaults to false :encoding e e.g :encoding :utf-8, defaults to :utf-8

jsonl/spitln supports load paths. See the loadpath/paths doc for a description of the load path feature.

```
;; spit a list of json lines line by line
(do
  (load-module :jsonl)
  (let [file (io/temp-file "data-" ".jsonl")]
     (io/delete-file-on-exit file)
     (try-with [wr (io/buffered-writer file)]
      (jsonl/spitln wr {"a" 100, "b" 200})
      (jsonl/spitln wr {"a" 101, "b" 201})
      (jsonl/spit wr {"a" 102, "b" 202}) ;; last line no LF
```

```
(flush wr))
;; print the json lines from the written file
   (println (io/slurp file :encoding :utf-8))))
{"a":100,"b":200}
{"a":101,"b":201}
{"a":102,"b":202}
=> nil
```

#### jsonl/write-str

Writes the value 'val' to a JSON lines string.

#### jsonl/slurp

Slurps a list of JSON line strings from the input 'in' and returns it as a list of Venice data types.

top

# jsonl/write-str

```
(jsonl/write-str val & options)
```

Writes the value 'val' to a JSON lines string.

Any reasonable Venice value like string, integer, long, double, decimal, boolean, list, vector, set, or map can be passed. Sequences like list or vector are converted to multiple JSON lines, one line for each value in the sequence. All other types are converted to a single JSON line.

#### Options:

## SEE ALSO

#### jsonl/spit

Spits the JSON Lines converted value 'val' to the output 'out'.

### jsonl/read-str

Reads a JSON line string 's' and returns it as a Venice data type.

top

# just

```
(just x)

Creates a wrapped x, that is dereferenceable

(just 10)
=> (just 10)

(just "10")
=> (just "10")

(deref (just 10))
=> 10
```

```
just?

(just? x)

Returns true if x is of type just

(just? (just 1))
=> true
```

juxt

```
(juxt f)
(juxt f g)
(juxt f g h)
(juxt f g h & fs)
```

Takes a set of functions and returns a fn that is the juxtaposition of those fns. The returned fn takes a variable number of args, and returns a vector containing the result of applying each fn to the args (left-to-right).

# keep

```
(keep f coll)
```

Returns a sequence of the non-nil results of (f item). Note, this means false return values will be included. f must be free of side-effects. Returns a transducer when no collection is provided.

```
(keep even? (range 1 4))
=> (false true false)

(keep (fn [x] (if (odd? x) x)) (range 4))
=> (1 3)

(keep #{3 5 7} '(1 3 5 7 9))
=> (3 5 7)
```

top

## key

```
(key e)
```

Returns the key of the map entry.

```
(key (find {:a 1 :b 2} :b))
=> :b

(key (first (entries {:a 1 :b 2 :c 3})))
=> :a
```

## SEE ALSO

#### map

Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

#### entries

Returns a collection of the map's entries.

#### va

Returns the val of the map entry.

### keys

Returns a collection of the map's keys.

tor

# keys

```
(keys map)
```

Returns a collection of the map's keys.

Please note that the functions 'keys' and 'vals' applied to the same map are not guaranteed not return the keys and vals in the same order!

To achieve this, keys and vals can calculated based on the map's entry list:

```
keyword

(keyword name)

Returns a keyword from the given name

(keyword "a")
=> :a

(keyword :a)
=> :a
```

```
keyword?

(keyword? x)

Returns true if x is a keyword

(keyword? (keyword "a"))
=> true

(keyword? :a)
=> true

(keyword? nil)
=> false

(keyword? 'a)
=> false
```

top

# kira/escape-html

```
(kira/escape-html val)
(kira/escape-html val f)
```

Returns a HTML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

An optional function f transforms the value before being converted to a string and HTML escaped.

#### **SEE ALSO**

### kira/escape-xml

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

top

# kira/escape-xml

```
(kira/escape-xml val)
(kira/escape-xml val f)
```

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

An optional function f transforms the value before being converted to a string and XML escaped.

### **SEE ALSO**

#### kira/escape-html

Returns a HTML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

## kira/eval

```
(kira/eval source)
(kira/eval source bindings)
(kira/eval source delimiters bindings)
```

Evaluate a template using the supplied bindings. The template source may be a string, or an I/O source such as a File, Reader or InputStream.

```
(do
  (ns test)
  (load-module :kira)
  (println (kira/eval "Hello <%= name %>" { :name "Alice" }))
  (println (kira/eval "1 + 2 = <%= (+ 1 2) %>"))
  (println (kira/eval "2 + 3 = <% (print (+ 2 3)) %>"))
  (println (kira/eval "{=x} + {=y} = {= (+ x y) }"
                     ["${" "}$"]
                      {:x 4 :y 5}))
  (println (kira/eval "margin: <%= (if large 100 10) %>"
                      { :large false }))
  (println (kira/eval "fruits: <% (doseq [f fruits] %><%= f %> <% ) %>"
                      { :fruits '("apple" "peach") }))
  (println (kira/eval "fruits: <% (doseq [f fruits] %><%= f %> <% ) %>"
                      { :fruits '("apple" "peach") }))
  (println (kira/eval "when: <% (when large %>is large<% ) %>"
                      { :large true }))
  (println (kira/eval "if: <% (if large (do %>100<% ) (do %>1<% )) %>"
                      { :large true }))
  (println (kira/eval "<div><%= (kira/escape-html formula) %></div>"
                      { :formula "12 < 15" })))
Hello Alice
1 + 2 = 3
2 + 3 = 5
4 + 5 = 9
margin: 10
fruits: apple peach
fruits: apple peach
when: is large
if: 100
<div>12 &lt; 15</div>
=> nil
```

#### **SEE ALSO**

#### kira/fr

Compile a template into a function that takes the supplied arguments. The template source may be a string, or an I/O source such as ...

#### kira/escape-xml

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

#### kira/escape-html

Returns a HTML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

## kira/fn

```
(kira/fn args source)
(kira/fn args source delimiters)
```

Compile a template into a function that takes the supplied arguments. The template source may be a string, or an I/O source such as a File, Reader or InputStream.

```
(do
  (load-module :kira)

  (def hello (kira/fn [name] "Hello <%= name %>"))
   (println (hello "Alice"))
   (println (hello "Bob")))

Hello Alice
Hello Bob
=> nil
```

### **SEE ALSO**

### kira/eval

Evaluate a template using the supplied bindings. The template source may be a string, or an I/O source such as a File, Reader or InputStream.

#### kira/escape-xml

Returns an XML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

#### kira/escape-html

Returns a HTML escaped string. If the passed data is not of type string it will be converted first to a string using the 'str' function.

top

## last

(last coll)

Returns the last element of coll.

```
(last nil)
=> nil

(last [])
=> nil

(last [1 2 3])
=> 3

(last '())
=> nil

(last '(1 2 3))
=> 3

(last 'abc")
=> #\c
```

## lazy-seq

```
(lazy-seq)
(lazy-seq f)
(lazy-seq seed f)
(lazy-seq head tail-lazy-seq)
Creates a new lazy sequence.
(lazy-seq)
empty lazy sequence
(lazy-seq f)
(theoretically) infinitely lazy sequence using a repeatedly invoked supplier function for each next value. The supplier function f is a no arg
function. The sequence ends if the supplier function returns nil.
(lazy-seq seed f)
(theoretically) infinitely lazy sequence with a seed value and a supplier function to calculate the next value based on the previous. f is a single
arg function. The sequence ends if the supplier function returns nil.
(lazy-seq head tail-lazy-seq)
Constructs a lazy sequence of a head element and a lazy sequence tail supplier.
; empty lazy sequence
(->> (lazy-seq)
     (doall))
=> ()
; lazy sequence with a supplier function producing random longs
(->> (lazy-seq rand-long)
     (take 4)
     (doall))
=> (830382735450606766 2873751294738042271 4782590586671472056 4163761247357749930)
; lazy sequence with a constant value
(->> (lazy-seq (constantly 5))
     (take 4)
     (doall))
=> (5 5 5 5)
; lazy sequence with a seed value and a supplier function
; producing of all positive numbers (1, 2, 3, 4, ...)
(->> (lazy-seq 1 inc)
     (take 10)
     (doall))
=> (1 2 3 4 5 6 7 8 9 10)
; producing of all positive even numbers (2, 4, 6, ...)
(->> (lazy-seq 2 #(+ % 2))
     (take 10)
     (doall))
=> (2 4 6 8 10 12 14 16 18 20)
; lazy sequence as value producing function
(interleave [:a :b :c] (lazy-seq 1 inc))
=> (:a 1 :b 2 :c 3)
; lazy sequence with a mapping
```

(->> (lazy-seq 1 (fn [x] (do (println "realized" x)

(inc x))))

```
(take 10)
                           (map #(* 10 %))
                          (take 2)
                          (doall))
realized 1
=> (10 20)
 ; finite lazy sequence from a vector
 (->> (lazy-seq [1 2 3 4])
                          (doall))
=> (1 2 3 4)
; finite lazy sequence with a supplier function that
 ; returns nil to terminate the sequence
               (def counter (atom 5))
                (defn generate []
                               (swap! counter dec)
                                (if (pos? @counter) @counter nil))
                 (doall (lazy-seq generate)))
=> (4 3 2 1)
; lazy sequence from a head element and a tail lazy % \left\{ 1\right\} =\left\{ 1\right\}
 ; sequence
 (->> (cons -1 (lazy-seq 0 #(+ % 1)))
                          (take 5)
                          (doall))
=> (-1 0 1 2 3)
 ; lazy sequence from a head element and a tail lazy
 (->> (lazy-seq -1 (lazy-seq 0 #(+ % 1)))
                          (take 5)
                          (doall))
=> (-1 0 1 2 3)
 ; lazy sequence show its power to generate the Fibonacci sequence
(do
          (def fib (map first (lazy-seq [0N 1N] (fn [[a b]] [b (+ a b)]))))
          (doall (take 10 fib)))
=> (0N 1N 1N 2N 3N 5N 8N 13N 21N 34N)
SEE ALSO
When lazy sequences are produced doall can be used to force any effects and realize the lazy sequence. Returns the relaized items in a list!
lazy-seq?
Returns true if obj is a lazyseq
cons
Returns a new collection where x is the first element and coll is the rest.
Returns a lazy (infinite!) sequence of repetitions of the items in coll.
repeat
Returns a lazy sequence of x values or a collection with the value x repeated n times.
```

```
(lazy-seq? obj)

Returns true if obj is a lazyseq

(lazy-seq? (lazy-seq rand-long))
=> true

SEE ALSO
lazy-seq
Creates a new lazy sequence.
```

top

## let

```
(let [bindings*] exprs*)
```

Evaluates the expressions and binds the values to symbols in the new local context.

```
(let [x 1] x)
=> 1
(let [x 1
    y 2]
 (+ \times y))
=> 3
;; Destructured list
(let [[x y] '(1 2)]
 (printf "x: %d, y: %d%n" x y))
x: 1, y: 2
=> nil
;; Destructured map
(let [{:keys [width height title ]
       :or {width 640 height 500}
      :as styles}
     {:width 1000 :title "Title"}]
     (println "width: " width)
     (println "height: " height)
     (println "title: " title)
     (println "styles: " styles))
width: 1000
height: 500
title: Title
styles: {:width 1000 :title Title}
=> nil
```

### **SEE ALSO**

### letfn

Takes a vector of function specs and a body, and generates a set of bindings of functions to their names. All of the names are available ...

#### if-let

bindings is a vector with 2 elements: binding-form test.

### when-let

bindings is a vector with 2 elements: binding-form test.

#### binding

Evaluates the expressions and binds the values to dynamic (thread-local) symbols

top

## letfn

```
(letfn [fnspec*] exprs*)
```

Takes a vector of function specs and a body, and generates a set of bindings of functions to their names. All of the names are available in all of the definitions of the functions, as well as the body.

### **SEE ALSO**

let

Evaluates the expressions and binds the values to symbols in the new local context.

ton

## list

```
(list & items)
```

Creates a new list containing the items.

```
(list) => ()

(list 1 2 3) => (1 2 3)

(list 1 2 3 [:a :b]) => (1 2 3 [:a :b])
```

top

# list\*

```
(list* args)
```

```
(list* a args)
(list* a b c args)
(list* a b c d & more)
```

Creates a new list containing the items prepended to the rest, the last of which will be treated as a collection.

```
(list* 1 '(2 3))
=> (1 2 3)

(list* 1 2 3 [4])
=> (1 2 3 4)

(list* 1 2 3 '(4 5))
=> (1 2 3 4 5)

(list* '(1 2) 3 [4])
=> ((1 2) 3 4)

(list* nil)
=> nil

(list* nil [2 3])
=> (nil 2 3)

(list* 1 2 nil)
=> (1 2)
```

#### **SEE ALSO**

#### cons

Returns a new collection where x is the first element and coll is the rest.

#### con

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

#### concat

Returns a list of the concatenation of the elements in the supplied collections.

#### vector\*

Creates a new vector containing the items prepended to the rest, the last of which will be treated as a collection.

ton

# list-comp

```
(list-comp seq-exprs body-expr)
```

List comprehension. Takes a vector of one or more binding-form or collection-expr pairs, each followed by zero or more modifiers, and yields a collection of evaluations of expr.

Supported modifiers are: :when predicate

```
(list-comp [x (range 10)] x)
=> (0 1 2 3 4 5 6 7 8 9)

(list-comp [x (range 5)] (* x 2))
=> (0 2 4 6 8)
```

```
(list-comp [x (range 10) :when (odd? x)] x)
=> (1 3 5 7 9)

(list-comp [x (range 10) :when (odd? x)] (* x 2))
=> (2 6 10 14 18)

(list-comp [x (seq "abc") y [0 1 2]] [x y])
=> ([#\a 0] [#\a 1] [#\a 2] [#\b 0] [#\b 1] [#\b 2] [#\c 0] [#\c 1] [#\c 2])
```

#### dosea

Repeatedly executes body (presumably for side-effects) with bindings and filtering as provided by list-comp. Does not retain the head ...

#### dotimes

Repeatedly executes body with name bound to integers from 0 through n-1.

```
list?

(list? obj)

Returns true if obj is a list

(list? (list 1 2))
=> true

(list? '(1 2))
=> true
```

top

# load-classpath-file

```
(load-classpath-file f)
(load-classpath-file f force)
(load-classpath-file f nsalias)
(load-classpath-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the classpath file. The function is restricted to classpath files with the extension '. venice'.

Returns a tuple with the file's name and the keyword :loaded if the file has been successfully loaded or :already-loaded if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to false (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to true it is always loaded and interpreted.

Loaded files are cached by Venice and subsequent loads are just skipped. To enforce a reload call the file load with the force flag set to true: (load-classpath-file "com/github/jlangch/venice/test.venice" true)

An optional namespace alias can passed: (load-classpath-file "com/github/jlangch/venice/test.venice" ['test :as 't])

load-classpath-file supports load paths. See the loadpath/paths doc for a description of the load path feature.

```
(do
  (load-classpath-file "com/github/jlangch/venice/test-support.venice")
```

```
(test-support/test-fn "hello"))
=> "test: hello"

(do
    (load-classpath-file "com/github/jlangch/venice/test-support.venice")
    (test-support/test-fn "hello")
    ; reload the classpath file
    (ns-remove 'test-support)
    (load-classpath-file "com/github/jlangch/venice/test-support.venice" true)
    (test-support/test-fn "hello"))
=> "test: hello"

;; namespace aliases
(do
    (load-classpath-file "com/github/jlangch/venice/test-support.venice" ['test-support :as 't])
    (t/test-fn "hello"))
=> "test: hello"
```

#### load-file

Sequentially read and evaluate the set of forms contained in the file.

#### load-string

Sequentially read and evaluate the set of forms contained in the string.

#### load-module

Loads a Venice predefined extension module.

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

top

## load-file

```
(load-file f)
(load-file f force)
(load-file f nsalias)
(load-file f force nsalias)
```

Sequentially read and evaluate the set of forms contained in the file.

If the file is found on one of the defined load paths it is read and the forms it contains are evaluated. If the file is not found an exception is raised.

Returns a tuple with the file's name and the keyword :loaded if the file has been successfully loaded or :already-loaded if the file has been already loaded. Throws an exception on any loading error.

With 'force' set to false (the default) the file is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to true it is always loaded and interpreted.

The function is restricted to load files with the extension '.venice'. If the file extension is missing '.venice' will be implicitely added.

An optional namespace alias can passed: (load-file "coffee.venice" ['coffee :as 'c])

load-file supports load paths. See the loadpath/paths doc for a description of the load path feature.

```
;; With load-paths: [/users/foo/scripts]
;;     -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee")
```

```
;; With load-paths: [/users/foo/scripts]
;;        -> loads: /users/foo/scripts/coffee.venice
(load-file "coffee.venice")

;; With load-paths: [/users/foo/scripts]
;;        -> loads: /users/foo/scripts/beverages/coffee.venice
(load-file "beverages/coffee")

;; With load-paths: [/users/foo/resources.zip]
;;        -> loads: /users/foo/resources.zip!beverages/coffee.venice
(load-file "beverages/coffee")
```

#### load-classpath-file

Sequentially read and evaluate the set of forms contained in the classpath file. The function is restricted to classpath files with ...

#### load-string

Sequentially read and evaluate the set of forms contained in the string.

top

## load-module

```
(load-module m)
(load-module m force)
(load-module m nsalias)
(load-module m force nsalias)
```

Loads a Venice predefined extension module.

Returns a tuple with the module's name and the keyword :loaded if the module has been successfully loaded or :already-loaded if the module has been already loaded. Throws an exception on any loading error.

With 'force' set to false (the default) the module is only loaded once and interpreted once. Subsequent load attempts will be skipped. With 'force' set to true it is always loaded and interpreted.

Loaded modules are cached by Venice and subsequent loads are just skipped. To enforce a reload call the module load with the force flag set to true: (load-module :hexdump true)

An optional namespace alias can passed: (load-module :hexdump ['hexdump :as 'h])

load-module supports load paths. See the loadpath/paths doc for a description of the load path feature.

```
(load-module :trace)

;; loading the :trace modul and define a ns alias 't for namespace
;; 'trace used in the module
(load-module :trace ['trace :as 't])

;; reloading a module
(do
    (load-module :trace)
```

```
; reload the module
  (ns-remove 'trace)
  (load-module :trace true))

;; namespace aliases
(do
    (load-module :hexdump ['hexdump :as 'h])
    (h/dump (range 32 64)))
```

### load-file

# loadpath/normalize

(loadpath/normalize f)

Normalize a relative file regarding the load paths.

With the load paths: ["/Users/foo/img.png", "/Users/foo/resources"]

- (loadpath/normalize "img.png") -> "/Users/foo/img.png"
- (loadpath/normalize "test.json") -> "/Users/foo/resources/test.json"
- (loadpath/normalize "/tmp/data.json") -> "/tmp/data.json"

#### **SEE ALSO**

### loadpath/paths

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the ...

### loadpath/unrestricted?

Returns true if the load paths are unrestricted.

ton

# loadpath/paths

(loadpath/paths)

Returns the list of the defined load paths. A load path is either a file, a ZIP file, or a directory. Load paths are defined at the application level. They are passed as part of the sandbox to the Venice evaluator.

The functions that support load paths try sequentially every load path to access files. If a load path is a ZIP file, files can be read from within that ZIP file.

Example:

```
/Users/foo/demo

|
+--- resources.zip
|
+--- /data
|
+--- config.json
|
+--- /scripts
|
+--- script1.venice
```

With a load path configuration of ["/Users/foo/demo/resources.zip", "/Users/foo/demo/data"]

- (io/slurp "config.json") -> slurps /Users/foo/demo/data/config.json
- (io/slurp "scripts/script1.venice") -> slurps/Users/foo/demo/data/scripts/script1.venice
- (io/slurp "img1.png") -> slurps /Users/foo/demo/resources.zip!img1.png

I/O functions with support for load paths:

- load-file
- io/slurp
- io/slurp-lines
- io/spit
- io/file-in-stream
- io/file-out-stream
- io/delete-file

To enforce a Venice script to read/write files on the load paths only:

- Define a custom sandbox
- Disable all I/O functions
- Enable the I/O functions that support load paths

## SEE ALSO

## lock

#### (lock)

Creates a new lock object.

 $\label{thm:continuous} The lock object implements the {\tt Java} \ \ {\tt AutoClosable} \ \ interface thus it can be used with try-with-resources.$ 

(let [l (lock)]
 (acquire l)

```
;; do something
  (release l))
=> nil

(let [l (lock)]
  (try-with [l (acquire l)]
        ;; do something
        ))
=> nil
```

### acquire

Acquires a lock, blocking until the lock is available.

#### try-acquire

Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

#### release

Releases a lock.

#### locked?

Returns true if the lock is in use else false.

### lock?

Returns true if o is a lock object else false.

lock?

(lock? o)

Returns true if o is a lock object else false.

(let [l (lock)]
 (lock? l))
=> true

SEE ALSO

acquire
Acquires a lock, blocking until the lock is available.

try-acquire
Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

# locked?

Returns true if the lock is in use else false.

release Releases a lock.

locked?

(locked? lock)

top

Returns true if the lock is in use else false.

try-acquire
Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

top

# locking

Releases a lock.

```
(locking x & exprs)
```

Executes 'exprs' in an implicit do, while holding the monitor of 'x'. Will release the monitor of 'x' in all circumstances. Locking operates like the synchronized keyword in Java.

```
(do
   (def x 1)
   (locking x
     (println 100)
      (println 200)))
100
200
=> nil
;; Locks are reentrant
   (def x 1)
   (locking x
      (locking x
         (println "in"))
      (println "out")))
in
out
=> nil
(do
  (defn log [msg] (locking log (println msg)))
  (log "message"))
message
=> nil
```

long
(long x)

```
Converts to long
(long 1)
=> 1
(long nil)
=> 0
(long false)
=> 0
(long true)
=> 1
(long 1.2)
=> 1
(long 1.2M)
=> 1
(long "1")
=> 1
(long (char "A"))
=> 65
```

long?

(long? n)

```
Returns true if n is a long

(long? 4)
=> true

(long? 4I)
=> false

(long? 3.1)
=> false

(long? true)
=> false

(long? nil)
=> false

(long? {})
=> false
```

loop

(loop [bindings\*] exprs\*)

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

```
;; tail recursion
(loop [x 10]
   (when (> x 1)
     (println x)
     (recur (- x 2))))
10
8
6
4
2
=> nil
;; tail recursion
   (defn sum [n]
     (loop [cnt n acc 0]
         (if (zero? cnt)
            acc
             (recur (dec cnt) (+ acc cnt)))))
   (sum 10000))
=> 50005000
```

**SEE ALSO** 

recur

 $Evaluates \ the \ exprs. \ The \ recur \ expression \ must \ be \ at \ the \ ...$ 

```
macro?

(macro? x)

Returns true if x is a macro

(macro? and)
=> true
```

.

## macroexpand

(macroexpand form)

If form represents a macro form, returns its expansion, else returns form.

To recursively expand all macros in a form use (macroexpand-all form).

```
(macroexpand '(-> c (+ 3) (* \frac{2}{2}))) => (* (+ c 3) 2)
```

**SEE ALSO** 

defmacro

Macro definition

macroexpand-all

Recursively expands all macros in the form.

top

# macroexpand-all

(macroexpand-all form)

Recursively expands all macros in the form.

```
(macroexpand-all '(and true true))
=> (let [cond__21635__auto true] (if cond__21635__auto true cond__21635__auto))

(macroexpand-all '(and true (or true false) true))
=> (let [cond__21658__auto true] (if cond__21658__auto (let [cond__21658__auto (let [cond__21659__auto true] (if cond__21659__auto cond__21659__auto false))] (if cond__21658__auto true cond__21658__auto))

cond__21658__auto))

(macroexpand-all '(let [n 5] (cond (< n 0) -1 (> n 0) 1 :else 0)))
=> (let [n 5] (if (< n 0) -1 (if (> n 0) 1 (if :else 0 nil)))))
```

**SEE ALSO** 

macroexpand

If form represents a macro form, returns its expansion, else returns form.

defmacro

Macro definition

top

# macroexpand-on-load?

```
(macroexpand-on-load?)
```

Returns true if macroexpand-on-load feature is enabled else false.

The activation of macroexpand-on-load (upfront macro expansion) results in 3x to 15x better performance. Upfront macro expansion can be activated through the !macroexpand command in the REPL.

```
(macroexpand-on-load?)
=> false
```

top

# make-array

```
(make-array type len)
(make-array type dim &more-dims)
```

Returns an array of the given type and length

```
(str (make-array :long 5))
=> "[0, 0, 0, 0, 0]"

(str (make-array :java.lang.Long 5))
=> "[nil, nil, nil, nil]"

(str (make-array :long 2 3))
=> "[[0 0 0], [0 0 0]]"

(aset (make-array :java.lang.Long 5) 3 9999)
=> [nil, nil, nil, 9999, nil]
```

top

## map

```
(map f coll colls*)
```

Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the colls is exhausted. Any remaining items in other colls are ignored.

Returns a transducer when no collection is provided.

Note: if Java collections are used the mapper converts all mapped items back to Java data types to keep Java compatibility as much as possible! To avoid this just convert the Java collection to a Venice collection. E.g.: (into [] ...).

```
(map inc [1 2 3 4])
=> (2 3 4 5)
```

```
(map + [1 2 3 4] [10 20 30 40])
=> (11 22 33 44)
(map list '(1 2 3 4) '(10 20 30 40))
=> ((1 10) (2 20) (3 30) (4 40))
(map vector (lazy-seq 1 inc) [10 20 30 40])
=> ([1 10] [2 20] [3 30] [4 40])
(map (fn [e] [(key e) (inc (val e))]) {:a 1 :b 2})
=> ([:a 2] [:b 3])
(map inc #{1 2 3})
=> (2 3 4)
;; Venice enforces Java types when using java collections instead
;; of Venice collections!
;; -> The returned element type is a 'java.util.ArrayList'
    and not a 'core/vector'
(->> (doto (. :java.util.ArrayList :new) (. :add 1) (. :add 2))
    (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
     (first)
     (type))
=> :java.util.ArrayList
;; Same example with a Venice collection!
;; -> The returned element type is a 'core/vector'
(->> [1 2]
     (map (fn [x] [(inc x)])) ;; map to a 'core/vector'
     (first)
     (type))
=> :core/vector
```

### filter

Returns a collection of the items in coll for which (predicate item) returns logical true.

#### reduce

 $f \ should \ be \ a \ function \ of \ 2 \ arguments. \ If \ val \ is \ not \ supplied, \ returns \ the \ result \ of \ applying \ f \ to \ the \ first \ 2 \ items \ in \ coll, \ then \ ...$ 

#### map-indexed

Returns a collection of applying f to 0 and the first item of coll, followed by applying f to 1 and the second item of coll, etc. until ...

```
map-entry

(map-entry key val)

Creates a new map entry

(map-entry :a 1)
=> [:a 1]

(key (map-entry :a 1))
=> :a
```

```
(val (map-entry :a 1))
=> 1

(entries {:a 1 :b 2 :c 3})
=> ([:a 1] [:b 2] [:c 3])

SEE ALSO

map-entry?
Returns true if m is a map entry
entries
Returns a collection of the map's entries.

map
Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...
key
Returns the key of the map entry.
val
Returns the val of the map entry.
```

```
map-entry?

(map-entry? m)

Returns true if m is a map entry

(map-entry? (map-entry :a 1))
=> true

(map-entry? (first (entries {:a 1 :b 2})))
=> true

SEE ALSO

map-entry
Creates a new map entry
entries
Returns a collection of the map's entries.
map
Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...
```

· ·

# map-indexed

(map-indexed f coll)

Returns a collection of applying f to 0 and the first item of coll, followed by applying f to 1 and the second item of coll, etc. until coll is exhausted. Returns a stateful transducer when no collection is provided.

```
(map-indexed (fn [idx val] [idx val]) [:a :b :c])
=> ([0 :a] [1 :b] [2 :c])

(map-indexed vector [:a :b :c])
=> ([0 :a] [1 :b] [2 :c])

;; start at index 1 instead of zero
(map-indexed #(vector (inc %1) %2) [:a :b :c])
=> ([1 :a] [2 :b] [3 :c])

(map-indexed vector "abcdef")
=> ([0 #\a] [1 #\b] [2 #\c] [3 #\d] [4 #\e] [5 #\f])

(map-indexed hash-map [:a :b :c])
=> ({0 :a} {1 :b} {2 :c})

SEE ALSO

map
Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...
```

```
map-invert

(map-invert m)

Returns the map with the vals mapped to the keys.

(map-invert {:a 1 :b 2 :c 3})
=> {1 :a 2 :b 3 :c}
```

```
map-keys

(map-keys f m)

Applys function f to the keys of the map m.

(map-keys name {:a 1 :b 2 :c 3})
=> {"a" 1 "b" 2 "c" 3}

SEE ALSO

map-vals
Applys function f to the values of the map m.

map-invert
Returns the map with the vals mapped to the keys.
```

top

```
(map-vals f m)

Applys function f to the values of the map m.

(map-vals inc {:a 1 :b 2 :c 3})
=> {:a 2 :b 3 :c 4}

(map-vals :len {:a {:col 1 :len 10} :b {:col 2 :len 20} :c {:col 3 :len 30}})
=> {:a 10 :b 20 :c 30}

SEE ALSO

map-keys
Applys function f to the keys of the map m.

map-invert
Returns the map with the vals mapped to the keys.
```

```
map?

(map? obj)

Returns true if obj is a map

(map? {:a 1 :b 2})
=> true
```

top

# mapcat

```
(mapcat fn & colls)
```

Returns the result of applying concat to the result of applying map to fn and colls. Thus function fn should return a collection.

```
(mapcat identity [[1 2 3] [4 5 6] [7 8 9]])
=> (1 2 3 4 5 6 7 8 9)

(mapcat identity [[1 2 [3 4]] [5 6 [7 8]]])
=> (1 2 [3 4] 5 6 [7 8])

(mapcat reverse [[3 2 1 ] [6 5 4] [9 8 7]])
=> (1 2 3 4 5 6 7 8 9)

(mapcat list [:a :b :c] [1 2 3])
=> (:a 1 :b 2 :c 3)

(mapcat #(remove even? %) [[1 2] [2 2] [2 3]])
=> (1 3)
```

```
(mapcat #(repeat 2 %) [1 2])
=> (1 1 2 2)

(mapcat (juxt inc dec) [1 2 3 4])
=> (2 0 3 1 4 2 5 3)

;; Turn a frequency map back into a coll.
(mapcat (fn [[x n]] (repeat n x)) {:a 2 :b 1 :c 3})
=> (:a :a :b :c :c :c)
```

#### man

Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

## flatten

Takes any nested combination of collections (lists, vectors, etc.) and returns their contents as a single, flat sequence. (flatten ...

top

# mapv

```
(mapv f coll colls*)
```

Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the colls is exhausted. Any remaining items in other colls are ignored.

```
(mapv inc [1 2 3 4])
=> [2 3 4 5]

(mapv + [1 2 3 4] [10 20 30 40])
=> [11 22 33 44]

(mapv vector [1 2 3 4] [10 20 30 40])
=> [[1 10] [2 20] [3 30] [4 40]]
```

# SEE ALSO

# docoll

Applies f to the items of the collection presumably for side effects. Returns nil.

tor

# match?

```
(match? s regex)
```

Returns true if the string s matches the regular expression regex.

The argument 'regex' may be a string representing a regular expression or a :java.util.regex.Pattern.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. regex/matches? performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"[0-9]+" "")]
  (filter #(regex/matches? m %) ["100" "1a1" "200"]))
```

```
(match? "1234" "[0-9]+")
=> true

(match? "1234ss" "[0-9]+")
=> false

(match? "1234" #"[0-9]+")
=> true
```

#### not-match?

Returns true if the string s does not match the regular expression regex.

# regex/matches?

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

# regex/matches-not?

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

# regex/pattern

Returns an instance of java.util.regex.Pattern.

# regex/matcher

Returns an instance of java.util.regex.Matcher.

# regex/matches

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

#### regex/find

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

# regex/find-all

Returns all regex matches as list or an empty list if there are no matches.

ton

# math/acos

```
(math/acos x)
```

Returns the arc cosine of a value; the returned angle is in the range 0.0 through pi

# (math/acos 0.5)

# merge-deep

Recursively merges maps.

#### into

Returns a new coll consisting of to coll with all of the items of from coll conjoined.

#### concat

Returns a list of the concatenation of the elements in the supplied collections.

top

# merge-deep

```
(merge-deep values)
(merge-deep strategy & values)
```

Recursively merges maps.

If the first parameter is a keyword it defines the strategy to use when merging non-map collections. Options are:

- 1. :replace, the default, the last value is used
- 2. :into, if the value in every map is a collection they are concatenated using into . Thus the type of (first) value is maintained.

```
(merge-deep {:a {:c 2}} {:a {:b 1}})
=> {:a {:b 1 :c 2}}

(merge-deep :replace {:a [1]} {:a [2]})
=> {:a [2]}

(merge-deep :into {:a [1]} {:a [2]})
=> {:a [1 2]}

(merge-deep {:a 1} nil)
=> nil
```

# **SEE ALSO**

# merge

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...

# merge-with

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from ...

top

# merge-with

```
(merge-with f & maps)
```

Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping(s) from the latter (left-to-right) will be combined with the mapping in the result by calling (f val-in-result val-in-latter).

```
(merge-with + {:a 1 :b 2} {:a 9 :b 98 :c 0})
=> {:a 10 :b 100 :c 0}

(merge-with into {:a [1] :b [2]} {:b [3 4] :c [5 6]})
=> {:a [1] :b [2 3 4] :c [5 6]}

SEE ALSO
merge
Returns a map that consists of the rest of the maps conj-ed onto the first. If a key occurs in more than one map, the mapping from ...
merge-deep
Recursively merges maps.
```

```
meta

(meta obj)

Returns the metadata of obj, returns nil if there is no metadata.

(meta (vary-meta [1 2] assoc :foo 3))
=> {:foo 3 :line 30 :column 28 :file "example"}

SEE ALSO

vary-meta
Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

with-meta
Returns a copy of the object obj, with a map m as its metadata.

var-val-meta
Returns the var's value meta data.

var-sym-meta
Returns the var's symbol meta data.
```

```
min

(min x)
(min x y)
(min x y & more)

Returns the smallest of the values

(min 1)
=> 1
(min 1 2)
=> 1
(min 4 3 2 1)
=> 1
```

```
(min 1I 2I)
=> 1I
(min 1.0)
=> 1.0
(min 1.0 2.0)
=> 1.0
(min 4.0 3.0 2.0 1.0)
=> 1.0
(min 1.0M)
=> 1.0M
(min 1.0M 2.0M)
=> 1.0M
(min 4.0M 3.0M 2.0M 1.0M)
=> 1.0M
(min 1.0M 2)
=> 1.0M
SEE ALSO
max
Returns the greatest of the values
```

# mod (mod n d) Modulus of n and d. (mod 10 4) => 2 (mod -1 5) => 4 (mod 101 41) => 21 SEE ALSO mod-floor floor a number towards 0 to the nearest multiple of a number

top

```
(mod-floor n m)

floor a number towards 0 to the nearest multiple of a number

(mod-floor 9 3)
=> 9
(mod-floor 10 3)
=> 9

(mod-floor 11 3)
=> 9

(mod-floor -11 3)
=> -9

SEE ALSO
mod
Modulus of n and d.
```

module-name

(module-name class)

Returns the Java module name of a class.

(module-name (class :java.util.ArrayList))

SEE ALSO

class
Returns the Java class for the given name. Throws an exception if the class is not found.

class-name
Returns the Java class name of a class.

top

modules

(modules)

Lists the available Venice modules

SEE ALSO

dod

Prints documentation for a var or special form given x as its name. Prints the definition of custom types.

ns-list

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

```
mutable-list

(mutable-list & items)

Creates a new mutable list containing the items.
The list is backed by java.util.ArrayList and is not thread-safe.

(mutable-list)
=> (1 2 3)

(mutable-list 1 2 3)
=> (1 2 3 [:a :b])
=> (1 2 3 [:a :b])
```

```
mutable-list?

(mutable-list? obj)

Returns true if obj is a mutable list

(mutable-list? (mutable-list 1 2))
=> true
```

```
mutable-map

(mutable-map & keyvals)
(mutable-map map)

Creates a new mutable threadsafe map containing the items.

(mutable-map :a 1 :b 2)
=> {:a 1 :b 2}

(mutable-map {:a 1 :b 2})
=> {:a 1 :b 2}
```

top

# mutable-map?

```
(mutable-map? obj)

Returns true if obj is a mutable map

(mutable-map? (mutable-map :a 1 :b 2))
=> true
```

```
mutable-set

(mutable-set & items)

Creates a new mutable set containing the items.

(mutable-set)
=> #{{}}

(mutable-set nil)
=> #{nil}

(mutable-set 1)
=> #{1}

(mutable-set 2 3)
=> #{1 2 3}

(mutable-set [1 2] 3)
=> #{3 [1 2]}
```

```
mutable-set?

(mutable-set? obj)

Returns true if obj is a mutable-set

(mutable-set? (mutable-set 1))
=> true
```

```
mutable-vector

(mutable-vector & items)

Creates a new mutable threadsafe vector containing the items.

(mutable-vector)
=> []
```

```
(mutable-vector 1 2 3)
=> [1 2 3]

(mutable-vector 1 2 3 [:a :b])
=> [1 2 3 [:a :b]]
```

```
mutable-vector?

(mutable-vector? obj)

Returns true if obj is a mutable vector

(mutable-vector? (mutable-vector 1 2))
=> true
```

# name

(name x)

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

```
(name 'foo) ;; symbol
=> "foo"
(name 'user/foo) ;; symbol
=> "foo"
(name (symbol "user/foo")) ;; symbol
=> "foo"
(name :foo) ;; keyword
=> "foo"
(name :user/foo) ;; keyword
=> "foo"
(name +) ;; function
=> "+"
(name str/digit?) ;; function
=> "digit?"
(name "ab/text") ;; string
=> "ab/text"
```

# **SEE ALSO**

qualified-name

Returns the qualified name String of a string, symbol, keyword, or function

# namespace

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

#### fn-name

Returns the qualified name of a function or macro

top

# namespace

```
(namespace x)
```

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

Throws an exception if x does not support namespaces like (namespace 2).

```
(namespace 'user/foo) ;; symbol
=> "user"

(namespace (symbol "user/foo")) ;; symbol
=> "user"

(namespace :user/foo) ;; keyword
=> "user"

(namespace str/digit?) ;; function
=> "str"

(namespace *ns*) ;; symbol
=> "user"
```

# **SEE ALSO**

# name

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

# fn-name

Returns the qualified name of a function or macro

# ns

Opens a namespace.

# \*ns

The current namespace

# var-ns

Returns the namespace of the var's symbol.

+---

# nan?

(nan? x)

Returns true if x is a NaN else false. x must be a double!

```
(nan? 0.0)
=> false

(nan? (/ 0.0 0))
=> true

(nan? (sqrt -1))
=> true

(pr (sqrt -1))
:NaN
=> nil

SEE ALSO
infinite?
Returns true if x is infinite else false, x must be a double!
double
Converts to double
```

```
nano-time

(nano-time)

Returns the current value of the running Java Virtual Machine's high-resolution time source, in nanoseconds.

(nano-time)
=> 174994977572583

(let [t (nano-time)
_ (sleep 100)
_ e (nano-time)]
(format-nano-time (- e t) :precision 2))
=> "105.03ms"

SEE ALSO
current-time-millis
Returns the current time in milliseconds.
format-nano-time
Formats a time given in nanoseconds as long or double.
```

```
neg?

(neg? x)

Returns true if x smaller than zero else false

(neg? -3)
=> true
```

```
(neg? 3)
=> false
(neg? (int -3))
=> true
(neg? -3.2)
=> true
(neg? -3.2M)
=> true

SEE ALSO
zero?
Returns true if x zero else false
pos?
Returns true if x greater than zero else false
negate
Negates x
```

```
negate

(negate x)

Negates x

(negate 10)

>> -10

(negate 10T)

>> -18T

(negate 1.23)

>> -1.23

(negate 1.23M)

>> -1.23M

SEE ALSO

abs
Returns the absolute value of the number

sgn
sgn function for a number.
```

newline

top

```
(newline)
(newline os)
```

Without arg writes a platform-specific newline to the output channel that is the current value of \*out\*. With arg writes a newline to the passed stream that must be a subclass of either :java.io.PrintStream or :java.io.Writer.

Returns nil.

```
(newline)
=> nil

(newline *out*)
=> nil

(newline *err*)
=> nil
```

# **SEE ALSO**

#### print

Prints the values xs to the stream that is the current value of \*out\* or to the passed stream os that must be a subclass of either ...

#### println

Prints the values xs to the stream that is the current value of \*out\* or to the passed output stream os if given followed by a (newline).

#### print

 $Without output stream prints formatted output as per format to the stream that is the current value of \verb§*out§*. With a stream prints ...$ 

nfirst

(nfirst coll n)

Returns a collection of the first n items

```
(nfirst nil 2)
=> ()

(nfirst [] 2)
=> []

(nfirst [1] 2)
=> [1]

(nfirst [1 2 3] 2)
=> [1 2]

(nfirst '() 2)
=> ()

(nfirst '(1) 2)
=> (1)
```

```
(nfirst "abcdef" 2)
=> (#\a #\b)

(nfirst (lazy-seq 1 #(+ % 1)) 4)
=> (...)

SEE ALSO

str/nfirst
Returns a string of the n first characters of s.
```

```
nil?

(nil? x)

Returns true if x is nil, false otherwise

(nil? nil)
=> true

(nil? 0)
=> false

(nil? false)
=> false

SEE ALSO
some?
Returns true if x is not nil, false otherwise
```

```
nlast

(nlast coll n)

Returns a collection of the last n items

(nlast nil 2)

>> ()

(nlast [] 2)

=> []

(nlast [] 2)

=> [1]

(nlast [1 2 3] 2)

=> [2 3]
```

```
(nlast '() 2)
=> ()

(nlast '(1) 2)
=> (1)

(nlast '(1 2 3) 2)
=> (2 3)

(nlast "abcdef" 2)
=> (#\e #\f)

SEE ALSO
str/nlast
Returns a string of the n last characters of s.
```

```
not

(not x)

Returns true if x is logical false, false otherwise.

(not true)
=> false
(not (== 1 2))
=> true

SEE ALSO
and
Ands the predicate forms
or
Ors the predicate forms
```

```
not-any?

(not-any? pred coll)

Returns false if the predicate is true for at least one collection item, true otherwise

(not-any? number? nil)
=> true

(not-any? number? [])
=> true
```

```
(not-any? number? [1 :a :b])
=> false
(not-any? number? [1 2 3])
=> false
(not-any? #(>= % 10) [1 5 10])
=> false

SEE ALSO
any?
Returns true if the predicate is true for at least one collection item, false otherwise.
every?
Returns true if the predicate is true for all collection items, false otherwise.
not-every?
Returns false if the predicate is true for all collection items, true otherwise
```

# not-contains?

(not-contains? coll key)

Returns true if key is not present in the given collection, otherwise returns false.

```
(not-contains? #{:a :b} :c)
=> true

(not-contains? {:a 1 :b 2} :c)
=> true

(not-contains? [10 11 12] 1)
=> false

(not-contains? [10 11 12] 5)
=> true

(not-contains? "abc" 1)
=> false

(not-contains? "abc" 5)
=> true
```

# SEE ALSO

# contains?

Returns true if key is present in the given collection, otherwise returns false.

top

# not-empty?

```
(not-empty? x)

Returns true if x is not empty. Accepts strings, collections and bytebufs.

(not-empty? {:a 1})
=> true

(not-empty? [1 2])
=> true

(not-empty? '(1 2))
=> true

(not-empty? "abc")
=> true

SEE ALSO
empty?
Returns true if x is empty. Accepts strings, collections and bytebufs.
```

# not-every?

(not-every? pred coll)

Returns false if the predicate is true for all collection items, true otherwise

```
(not-every? number? nil)
=> true

(not-every? number? [])
=> true

(not-every? number? [1 2 3 4])
=> false

(not-every? number? [1 2 3 :a])
=> true

(not-every? #(>= % 10) [10 11 12])
=> false
```

# SEE ALSO

# every?

Returns true if the predicate is true for all collection items, false otherwise.

# any?

Returns true if the predicate is true for at least one collection item, false otherwise.

# not-any?

Returns false if the predicate is true for at least one collection item, true otherwise

# not-match?

```
(not-match? s regex)
```

Returns true if the string s does not match the regular expression regex.

The argument 'regex' may be a string representing a regular expression or a :java.util.regex.Pattern.

See the functions in the 'regex' namespace if more than a simple regex match is required! E.g. regex/matches-not? performs much better on matching many strings against the same pattern:

```
(let [m (regex/matcher #"[0-9]+" "")]
  (filter #(regex/matches-not? m %) ["100" "1a1" "200"]))
```

```
(not-match? "S1000" "[0-9]+")
=> true

(not-match? "S1000" #"[0-9]+")
=> true

(not-match? "1000" "[0-9]+")
=> false
```

# **SEE ALSO**

# match?

Returns true if the string s matches the regular expression regex.

#### regex/matches-not?

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

# regex/matches?

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

# regex/pattern

Returns an instance of java.util.regex.Pattern.

# regex/matcher

Returns an instance of java.util.regex.Matcher.

# regex/matches

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

# regex/find

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

# regex/find-all

Returns all regex matches as list or an empty list if there are no matches.

top

# not=

```
(not= x)
(not= x y)
(not= x y & more)
```

Same as (not (= x y))

```
(not= "abc" "abc")
=> false
(not= 0 0)
=> false
(not= 0 1)
=> true
(not= 0 0.0)
=> true
(not= 0 0.0M)
=> true
(not= "0" 0)
=> true
(not= 4)
=> false
(not= 1 2 3)
=> true
SEE ALSO
Returns true if both operands have equivalent type and value
Returns true if both operands have equivalent value.
```

# 

ns-unmap

Removes the mappings for the symbol from the namespace.

# ns-remove

Removes the mappings for all symbols from the namespace.

#### ns-list

Without arg lists the loaded namespaces, else lists all the symbols in the specified namespace ns.

#### namespace

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

# var-ns

Returns the namespace of the var's symbol.

ns?

(ns? n)

Returns true if n is an existing namespace that has been defined with (ns n) else false.

(do (ns foo) (ns? foo))
=> true

SEE ALSO
ns
Opens a namespace.

# nth

(nth coll idx)

Returns the nth element of coll.

```
(nth nil 1)
=> nil

(nth [1 2 3] 1)
=> 2

(nth '(1 2 3) 1)
=> 2

(nth "abc" 2)
=> #\c
```

top

```
number?
(number? n)

Returns true if n is a number (int, long, double, or decimal)

(number? 41))
=> true

(number? 4.0M)
=> true

(number? 4.0M)
=> true

(number? true)
=> false

(number? "a")
=> false
```

```
(object-array coll)
(object-array len)
(object-array len init-val)
```

Returns an array of Java Objects containing the contents of coll or returns an array with the given length and optional init value

top

## odd?

object-array

```
(odd? n)
```

Returns true if n is odd, throws an exception if n is not an integer

```
(odd? 3)
=> true

(odd? 4)
=> false

(odd? (int 4))
=> false
```

#### **SEE ALSO**

#### even?

Returns true if n is even, throws an exception if n is not an integer

top

## offer!

```
(offer! queue v)
(offer! queue timeout v)
```

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary for space to become available. For an indefinite timeout pass the timeout value :indefinite. If no timeout is given returns immediately false if the queue does not have any more capacity. Returns true if the element was added to this queue, else false.

```
(let [q (queue)]
  (offer! q 1)
  (offer! q 1000 2)
  (offer! q :indefinite 3)
  (offer! q 3)
   (poll! q)
  q)
=> (2 3 3)
```

## SEE ALSO

## queue

Creates a new mutable threadsafe bounded or unbounded queue.

#### put!

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

#### take

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

#### poll!

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

#### peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the  $\dots$ 

#### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

```
or
```

```
(or x)
(or x & next)

Ors the predicate forms

(or true false)
=> true

(or false false)
=> false

(or nil 100)
=> 100

(or)
=> false

SEE ALSO
and
Ands the predicate forms
not
Returns true if x is logical false, false otherwise.
```

tor

## or-timeout

```
(or-timeout p time time-unit)
```

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
    (or-timeout 500 :milliseconds)
    (then-apply str/upper-case)
    (deref))
=> "THE QUICK BROWN FOX"

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
    (or-timeout 200 :milliseconds)
    (then-apply str/upper-case)
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException

(-> (promise (fn [] (sleep 300) "The quick brown fox"))
    (then-apply str/upper-case)
    (or-timeout 200 :milliseconds)
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException
```

**SEE ALSO** 

#### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

#### then-accept

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

#### then-accept-both

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

#### then-apply

Applies a function f on the result of the previous stage of the promise p.

#### then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

#### then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

#### when-complete

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

#### accept-either

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result ...

#### apply-to-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

#### complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

ordered-map

(ordered-map & keyvals)
 (ordered-map map)

Creates a new ordered map containing the items.

(ordered-map :a 1 :b 2)
=> {:a 1 :b 2}

(ordered-map (hash-map :a 1 :b 2))
=> {:a 1 :b 2}

top

# ordered-map?

(ordered-map? obj)

Returns true if obj is an ordered map

(ordered-map? (ordered-map :a 1 :b 2))
=> true

# OS-arch (os-arch) Returns the OS architecture. E.g: "x86\_64" (os-arch) => "aarch64" SEE ALSO os-type Returns the OS type. Type is one of :windows, :mac-osx, :linux, :unix, or :unknown os-type? tor

# parsifal/>>

```
(>> p)
(>> p q)
(>> p q & ps)
```

Returns a new parser that parses a list of parsers. Returns the value of the last parser if all parsers succeed, else the parser fails.

**Note:** Parsifal is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like lookahead and attempt.

The parser >> does not rewind the input state if any of the sub parsers fails. >>\* is the backtracking version of >> that wraps the parsers within a call to attempt . See the backtracking example below.

```
(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/run (p/>> (p/char #\lparen) (p/digit) (p/char #\rparen)) "(1)")
 ; => #\)
 ; Using bindings
 (p/run (p/let->> [l (p/char #\lparen)
                    d (p/digit)
                    r (p/char #\rparen)]
            (p/always (str l d r)))
         "(1)")
  ; => "(1)"
)
; Backtracking demo
  (load-module :parsifal ['parsifal :as 'p])
  ; No backtracking with `>>` parser
  (p/run (p/either (p/>> (p/letter) (p/digit))
                   (p/letter))
         "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2
  ; Backtracking with `>>*` parser
  (p/run (p/either (p/>>* (p/letter) (p/digit))
                   (p/letter))
         "abc")
 ; => #\a
```

## parsifal/SourcePosition

```
Defines a protocol to add line and column information for custom tokens.
Definition:
   (defprotocol SourcePosition
     (line [p])
     (column [p]))
  (load-module :parsifal ['parsifal :as 'p])
  (deftype :Token [type :keyword, val :string, line :long, column :long]
      (toString [this] (str/format "[%s %s (%d,%d)]"
                                     (pr-str (:type this))
                                     (pr-str (:val this))
                                     (:line this)
                                     (:column this)))
    p/SourcePosition
      (line [this] (:line this))
      (column [this] (:column this)))
  (p/defparser lbracket []
    (p/let->> [[l c] (p/pos)
              t (p/char #\[)]
       (p/always (Token. :lbracket (str t) l c))))
  (p/run (lbracket) "[1,2,3]")
  ; => [:lbracket "[" (1,1)]
SEE ALSO
defprotocol
Defines a new protocol with the supplied function specs.
```

Defines a new custom record type for the name with the fields.

# parsifal/always

```
(always x)
```

A parser that always succeeds with the value given and consumes no input.

```
(load-module :parsifal ['parsifal :as 'p])
(p/defparser integer []
 (p/let->> [t (p/many1 (p/digit))]
     (p/always (long (apply str t)))))
(p/run (integer) "400")
; => 400
```

```
parsifal/any-char
```

(p/run (p/any) [#\C #\a #\t #\s])

(any-char)

; => #\C

; => #\C

Consume any character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/any-char) "Cats")
  ; => #\C

  (p/run (p/any-char) [#\C #\a #\t #\s])
  ; => #\C
)
```

top

## parsifal/any-char-of

top

# parsifal/attempt

```
(attempt p)
```

A parser that will attempt to parse p, and upon failure never consume any input.

**Note:** Parsifal is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like lookahead and attempt.

The parsers >> and let->> do not rewind the input state if any of the sub parsers fails. To add backtracking parsers can be wrapped with attempt!

```
(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/defparser optional [p default-value]
    (p/either (p/attempt p)
              (p/always default-value)))
  (p/run (optional (p/char #\X) #\?) "400")
  ; => #\?
  (load-module :parsifal ['parsifal :as 'p])
  ; Backtracking
  ; No implicit backtracking with `>>` parser!
  (p/run (p/either (p/>> (p/letter) (p/digit))
                   (p/letter))
         "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2
  ; Explicit backtracking with `>>` parser using `attempt`!
  (p/run (p/either (p/attempt (p/>> (p/letter) (p/digit)))
                   (p/letter))
         "abc")
  ; => #\a
)
```

ton

# parsifal/between

```
(between open close p)
```

Returns a new parser that parses open , p , and close returning the value of p and discarding the values of open and close . Does not consume any input on failure.

top

# parsifal/char

(char)

Consume the given character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/run (p/char #\H) "Hello")
  ; => #\H
  (p/run (p/char #\H) [#\H #\e #\l #\l #\o])
  ; => #\H
)
```

top

# parsifal/choice

```
(choice & p)
```

Returns a new parser that tries each given parsers in turn, returning the value of the first one that succeeds.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

(p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "Hello")
; => [#\H #\e #\l #\l #\l #\o]
```

```
(p/run (p/choice (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
; => [#\4 #\2]
)
```

top

## parsifal/defparser

```
(defparser name args & body)
```

The defparser macro defines \_functions\_ that create parsers.

**Note:** *Parsifal* is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like lookahead and attempt.

The parsers created by this macro do not rewind the input state if one of the sub parsers fails. To allow backtracking attempt can be used!

```
(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/defparser sample []
   (p/string "Hello")
   (p/always 42))
 (p/run (sample) "Hello, world!")
  ; => 42
(do
  (load-module :parsifal ['parsifal :as 'p])
  ; Backtracking
  (p/defparser letter-and-digit []
   (p/letter)
    (p/digit))
  ; No implicit backtracking!
  (p/run (p/either (letter-and-digit) (p/letter)) "abc")
  ; => ParseError: Unexpected token 'b' at line: 1 column: 2
 ; Explicit backtracking with `attempt`!
 (p/run (p/either (p/attempt (letter-and-digit)) (p/letter)) "abc")
```

tor

# parsifal/digit

```
(digit)
```

Consume a digit [0-9] character.

Note: Works with char items only!

```
(do (load-module :parsifal ['parsifal :as 'p])
```

```
(p/run (p/digit) "123")
; => #\1
  (p/run (p/any-char) [#\1 #\2 #\3])
; => #\1
)
```

top

## parsifal/either

```
(either p q)
```

Returns a new parser that tries p, upon success, returning its value, and upon failure (if no input was consumed) tries to parse q

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter))) "Hello")
  ; => [#\H #\e #\l #\l #\o]

  (p/run (p/either (p/many1 (p/digit)) (p/many1 (p/letter))) "42")
  ; => [#\4 #\2]
)
```

top

# parsifal/eof

```
(eof)
(eof err-msg)
```

A parser to detect the end of input. If there is nothing more to consume from the underlying input, this parser suceeds with a nil value, otherwise it fails.

A custom error message can be provided for the case the parser fails.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/eof) "")
  ; => nil

  (p/run (p/eof) "a")
  ; => ParseError: Expected end of input at line: 1 column: 1
)
```

top

# parsifal/hexdigit

(hexdigit)

Consume a hex digit [0-9a-fA-F] character.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/hexdigit) "A00")
  ; => #\A

  (p/run (p/hexdigit) [#\A #\0 #\0])
  ; => #\A
)
```

top

## parsifal/let->>

```
(let->> [[& bindings_] & body])
```

Binds parser results to names for further processing input.

**Note:** Parsifal is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like lookahead and attempt.

The parser let->> does not rewind the input state if one of the sub parsers fails. let->>\* is the backtracking version of let->> that wraps the parsers within a call to attempt. See the backtracking example below.

```
(do
  (load-module :parsifal ['parsifal :as 'p])
  (p/defparser float []
    (p/let->> [i (p/many1 (p/digit))
               d (p/char #\.)
               f (p/many1 (p/digit))]
       (p/always (apply str (flatten (list i d f))))))
  (p/run (float) "10.56")
  ; => "10.56"
  (load-module :parsifal ['parsifal :as 'p])
  (p/defparser int []
    (p/let->> [i (p/many1 (p/digit))]
       (let [n (long (apply str i))]
         (if (even? n)
           (p/always (str n " is even"))
           (p/always (str n " is odd"))))))
  (p/run (int) "500")
  ; => "500 is even"
; Backtracking demo
  (load-module :parsifal ['parsifal :as 'p])
  ; No backtracking with `let->>` parser!
 (p/run (p/either (p/let->> [c (p/letter)
```

```
parsifal/letter

(letter)

Consume a letter character defined by Java Character.isLetter(ch).

Note: Works with char items only!

(do
    (load-module :parsifal ['parsifal :as 'p])
    (p/run (p/letter) "Cats")
    ; => #\C
    (p/run (p/letter) [#\C #\a #\t #\s])
    ; => #\C
)
```

```
(letter-or-digit)

Consume a letter or digit character defined by Java Character.isLetterOrDigit(ch).
```

Note: Works with char items only!

parsifal/letter-or-digit

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/letter-or-digit) "Cats")
  ; => #\C

  (p/run (p/letter-or-digit) "5Cats")
  ; => #\S

  (p/run (p/letter-or-digit) [#\C #\a #\t #\s])
  ; => #\C
)
```

## parsifal/lineno

```
(lineno)
```

A parser that returns the current line number. It consumes no input.

ton

## parsifal/lookahead

(lookahead p)

A parser that upon success consumes no input, but returns what was parsed.

**Note:** Parsifal is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like lookahead and attempt.

top

# parsifal/many

```
(many p)
```

Returns a new parser that will parse zero or more items that match the given parser p. The matched items are concatenated into a sequence.

Note: A ParseError will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/many (p/digit)) "1234-0000")
  ; => [#\1 #\2 #\3 #\4]

  (p/run (p/many (p/digit)) "ABC-12345")
  ; => []
)
```

top

## parsifal/many1

```
(many1 p)
```

Returns a new parser that will parse one or more items that match the given parser p . The matched items are concatenated into a sequence.

*Note*: A ParseError will be thrown if this combinator is applied to a parser that accepts the empty string, as that would cause the parser to loop forever.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/many1 (p/digit)) "1234-0000")
  ; => [#\1 #\2 #\3 #\4]

  (p/run (p/many1 (p/digit)) "ABC-12345")
  ; => ParseError: Unexpected token 'A' at line: 1 column: 1
)
```

top

# parsifal/never

```
(never)
(never err-msg)
(never err-msg line column)
```

A parser that always fails, consuming no input.

```
(p/never (str "Unexpected token '" t "'"))))

(p/run (single-integer) "400")
; => "400"

(p/run (single-integer) "400-")
; => ParseError: Unexpected token '-' at line: 1 column: 5
)
```

```
parsifal/not-char

(not-char)

Consume all but the given character

(do
    (load-module :parsifal ['parsifal :as 'p])
    (p/run (p/not-char #\x) "Cats")
    ; => #\C
    (p/run (p/not-char #\x) [#\C #\a #\t #\s])
    ; => #\C
)
```

parsifal/pos

(pos)

A parser that returns the current line/column number as tuple of [line col] . It consumes no input.

top

# parsifal/run

```
(run p input)
```

Run a parser p over some input. The input can be a string or a seq of tokens, if the parser produces an error, its message is wrapped in a *ParseError* and thrown, and if the parser succeeds, its value is returned.

Parsifal is port of Nate Young's Clojure Parsatron parser combinators project.

Parsifal is not implementing backtracking by default, and instead relies on the programmer to implement backtracking using constructs like lookahead and attempt.

A simple parser example:

top

# parsifal/string

```
(string s)
```

Consume the given string and returns a string. Does not consume any input upon failure.

Note: Works with char items only!

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/string "Hello") "Hello, world!")
  ; => "Hello"

  (p/run (p/string "Hello") (seq "Hello, world!"))
  ; => "Hello"
)
```

```
(do
  (load-module :parsifal ['parsifal :as 'p])

(p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
; => "Hello"

(p/run (p/either (p/string "Hello") (p/letter)) "Hello, world!")
; => #\H
)
```

top

## parsifal/times

```
(times n p)
```

Returns a new parser that consumes exactly n times what the parser p matches. The matched items are concatenated into a sequence. Does not consume any input if not all of the repetitions match.

top

# parsifal/token

(token)

Consume a single item from the head of the input if (consume? item) predicate is not nil. This parser will fail to consume if either the consume? test returns false or if the input is empty.

```
(do
  (load-module :parsifal ['parsifal :as 'p])

  (p/run (p/token #(< % 5)) [3 5 7])
  ; => 3

  (p/run (p/token str/upper-case) "Hello")
  ; => #\H
)
```

## partial

```
(partial f args*)
```

Takes a function f and fewer than the normal arguments to f, and returns a fn that takes a variable number of additional args. When called, the returned function calls f with args + additional args.

```
((partial * 2) 3)
=> 6

(map (partial * 2) [1 2 3 4])
=> (2 4 6 8)

(map (partial reduce +) [[1 2 3 4] [5 6 7 8]])
=> (10 26)

(do
    (def hundred-times (partial * 100))
    (hundred-times 5))
=> 500
```

top

## partition

```
(partition n coll)
(partition n step coll)
(partition n step padcoll coll)
```

Returns a collection of lists of n items each, at offsets step apart. If step is not supplied, defaults to n, i.e. the partitions do not overlap. If a padcoll collection is supplied, use its elements as necessary to complete last partition upto n items. In case there are not enough padding elements, return a partition with less than n items. padcoll may be a lazy sequence

```
(partition 3 [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5])

(partition 3 3 (repeat 99) [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6 99 99])

(partition 3 3 [] [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6])

(partition 2 3 [0 1 2 3 4 5 6])
=> ([0 1] [3 4])

(partition 3 1 [0 1 2 3 4 5 6])
=> ([0 1 2] [1 2 3] [2 3 4] [3 4 5] [4 5 6])

(partition 3 6 ["a"] (range 20))
=> ((0 1 2) (6 7 8) (12 13 14) (18 19 "a"))

(partition 4 6 ["a" "b" "c" "d"] (range 20))
=> ((0 1 2 3) (6 7 8 9) (12 13 14 15) (18 19 "a" "b"))
```

#### **SEE ALSO**

#### partition-all

Returns a collection of lists of n items each, at offsets step apart. If step is not supplied, defaults to n, i.e. the partitions do ...

#### partition-by

Applies f to each value in coll, splitting it each time f returns a new value.

top

## partition-all

```
(partition-all n coll)
(partition-all n step coll)
```

Returns a collection of lists of n items each, at offsets step apart. If step is not supplied, defaults to n, i.e. the partitions do not overlap. May include partitions with fewer than n items at the end.

```
(partition-all 3 [0 1 2 3 4 5 6])
=> ([0 1 2] [3 4 5] [6])

(partition-all 2 3 [0 1 2 3 4 5 6])
=> ([0 1] [3 4] [6])

(partition-all 3 1 [0 1 2 3 4 5 6])
=> ([0 1 2] [1 2 3] [2 3 4] [3 4 5] [4 5 6] [5 6])

(partition-all 3 6 ["a"])
=> (["a"])

(partition-all 2 2 ["a" "b" "c" "d"])
=> (["a" "b"] ["c" "d"])
```

#### **SEE ALSO**

#### partition

Returns a collection of lists of n items each, at offsets step apart. If step is not supplied, defaults to n, i.e. the partitions do ...

## partition-by

Applies f to each value in coll, splitting it each time f returns a new value.

tor

# partition-by

```
(partition-by f coll)
```

## pcalls

```
(pcalls & fns)
```

Executes the no-arg *fns* in parallel, returning a sequence of their values in the same order the functions are passed. In contrast, side effects of *fns* (if any) are coming in random order!

pcalls is implemented using Venice futures and processes (+ 2 (cpus)) functions in parallel.

```
(pcalls #(+ 1 2) #(+ 2 3) #(+ 3 4))
=> (3 5 7)
```

#### **SEE ALSO**

# pdf/available?

(pdf/available?)

Checks if the 3rd party libraries required for generating PDFs are available.

(pdf/available?)

top

# pdf/check-required-libs

(pdf/check-required-libs)

Checks if the 3rd party libraries required for generating PDFs are available. Throws an exception if not.

top

# pdf/copy

```
(pdf/copy pdf & page-nr)
```

Copies pages from a PDF to a new PDF. The PDF is passed as bytebuf. Returns the new PDF as a bytebuf.

```
; copy the first and second page
(pdf/copy pdf :1 :2)

; copy the last and second last page
(pdf/copy pdf :-1 :-2)

; copy the pages 1, 2, 6-10, and 12
(pdf/copy pdf :1 :2 :6-10 :12)
```

#### **SEE ALSO**

#### pdf/merge

Merge multiple PDFs into a single PDF. The PDFs are passed as bytebuf. Returns the new PDF as a bytebuf.

#### ndf/nages

Returns the number of pages of a PDF. The PDF is passed as bytebuf.

#### ndf/watermark

Adds a watermark text to the pages of a PDF. The passed PDF pdf is a bytebuf. Returns the new PDF as a bytebuf.

top

# pdf/watermark

```
(pdf/watermark pdf options-map)
(pdf/watermark pdf & options)
```

Adds a watermark text to the pages of a PDF. The passed PDF pdf is a bytebuf. Returns the new PDF as a bytebuf.

Options:

:text s watermark text (string), defaults to "WATERMARK"

:font-size n font size in pt (double), defaults to 24.0

```
:font-char-spacing n
                        font character spacing (double), defaults to 0.0
:color s
                        font color (HTML color string), defaults to #000000
:opacity n
                         opacity 0.0 ... 1.0 (double), defaults to 0.4
:outline-color s
                        font outline color (HTML color string), defaults to #000000
:outline-opacity n
                        outline opacity 0.0 ... 1.0 (double), defaults to 0.8
:outline-witdh n
                        outline width 0.0 ... 10.0 (double), defaults to 0.5
                        angle 0.0 ... 360.0 (double), defaults to 45.0
:angle n
                        print text over the content (boolean), defaults to true
:over-content b
:skip-top-pages n
                        the number of top pages to skip (long), defaults to 0
:skip-bottom-pages n
                        the number of bottom pages to skip (long), defaults to 0
(pdf/watermark pdf :text "CONFIDENTIAL" :font-size 64 :font-char-spacing 10.0)
(let [watermark { :text "CONFIDENTIAL"

```

## peek

(peek coll)

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the head element (or nil if the queue is empty).

## perf

(perf expr warmup-iterations test-iterations)

Performance test with the given expression.

Runs the test in 3 phases:

- 1. Runs the expr in a warmup phase to allow the HotSpot compiler to do optimizations.
- 2. Runs the garbage collector.
- 3. Runs the expression under profiling. Returns nil.

After a test run metrics data can be obtained with (prof:data-formatted)

```
(do
(perf (+ 120 200) 12000 1000)
(println (prof :data-formatted)))
```

### **SEE ALSO**

#### time

Evaluates expr and prints the time it took. Returns the value of expr.

#### prof

Controls the code profiling. See the companion functions/macros 'dorun' and 'perf'. The perf macro is built on prof and dorun and provides ...

pid

(pid)

Returns the PID of this process.

(pid)

=> "69689"

top

## pmap

```
(pmap f coll)
(pmap f coll & colls)
```

Like map, except f is applied in parallel. Only useful for computationally intensive functions where the time of f dominates the coordination overhead.

The result collection is sorted in the same way as for map, i.e. it preserves the items' order in the coll (or colls) parameter(s) of pmap. In other words: calculation is done parallel, but the result is delivered in the order the input came (in coll/colls). In contrast, side effects of f (if any) are coming in random order!

pmap is implemented using Venice futures and processes (+ 2 (cpus)) items in parallel.

```
;; With `pmap`, the total elapsed time is just over 2 seconds: (do
```

```
(defn long-running-job [n]
  (sleep 2000) ; wait for 2 seconds
  (+ n 10))
  (time (pmap long-running-job (range 4))))
Elapsed time: 2.01s
=> (10 11 12 13)

;; With `map`, the total elapsed time is roughly 4 * 2 seconds:
  (do
    (defn long-running-job [n]
        (sleep 2000) ; wait for 2 seconds
        (+ n 10))
    (time (map long-running-job (range 4))))
Elapsed time: 8.02s
=> (10 11 12 13)
```

## poll!

```
(poll! queue)
(poll! queue timeout)
```

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite. If no timeout is given returns the item if one is available else returns nil. With a timeout returns the item if one is available within the given timeout else returns nil.

```
(let [q (conj! (queue) 1 2 3 4)]
  (poll! q)
  (poll! q 1000)
  q)
=> (3 4)
```

## **SEE ALSO**

#### queue

Creates a new mutable threadsafe bounded or unbounded queue.

#### put!

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

#### take!

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

#### offer!

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

## peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

#### empty

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### corin

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

pop

(pop coll)

For a list, returns a new list without the first item, for a vector, returns a new vector without the last item.

(pop '(1 2 3 4))
=> (2 3 4)

(pop [1 2 3 4])
=> [1 2 3]

# pop!

(pop! stack)

Pops an item from a stack.

```
(let [s (stack)]
  (push! s 1)
  (push! s 2)
  (push! s 3)
  (pop! s))
=> 3
```

## SEE ALSO

#### stack

Creates a new mutable threadsafe stack.

## peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the  $\dots$ 

#### push!

Pushes an item to a stack.

#### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### count

 $Returns\ the\ number\ of\ items\ in\ the\ collection.\ (count\ nil)\ returns\ 0.\ Also\ works\ on\ strings,\ and\ Java\ Collections$ 

top

# pos?

```
(pos? x)
```

Returns true if x greater than zero else false

```
(pos? 3)
=> true

(pos? -3)
=> false

(pos? (int 3))
=> true

(pos? 3.2)
=> true

(pos? 3.2M)
=> true
```

### **SEE ALSO**

#### zero?

Returns true if x zero else false

#### neg?

Returns true if x smaller than zero else false

top

# postwalk

```
(postwalk f form)
```

Performs a depth-first, post-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

## SEE ALSO

## prewalk

Performs a depth-last, pre-order traversal of form. Calls f on each sub-form, uses f's return value in place of the original.

## postwalk-replace

```
(postwalk-replace smap form)
```

Recursively transforms form by replacing keys in smap with their values. Like replace but works on any data structure. Does replacement at the leaves of the tree first

postwalk-replace is the equivalent of Common Lisp's sublis function.

```
(postwalk-replace {:a 1 :b 2} [:a :b])
=> [1 2]

(postwalk-replace {:a 1 :b 2} [:a :b :c])
=> [1 2 :c]

(postwalk-replace {:a 1 :b 2} [:a :b [:a :b] :c])
=> [1 2 [1 2] :c]

(postwalk-replace {'x 1 'y 2} '(+ x y))
=> (+ 1 2)
```

```

tor

## pr

```
(pr & xs)
```

```
(pr os & xs)
```

Prints the values xs to the output stream that is the current value of \*out\* or to the passed output stream os if given. The passed stream must be a subclass of either :java.io.PrintStream or :java.io.Writer.

Prints the values, separated by spaces if there is more than one. pr and prn print in a way that objects can be read by the reader.

Returns nil.

```
(pr "hello")
"hello"
=> nil

(pr {:foo "hello" :bar 34.5})
{:foo "hello" :bar 34.5}
=> nil

(pr ['a :b "\n" #\space "c"])
[a :b "\n" #\space "c"]
=> nil

(pr *out* [10 20 30])
[10 20 30]
=> nil

(pr *err* [10 20 30])
[10 20 30]
=> nil
```

### **SEE ALSO**

#### prn

Prints the values xs to the output stream that is the current value of \*out\* or to the passed stream os if given followed by a (newline).

#### newline

 $Without arg writes a platform-specific newline to the output channel that is the current value of \verb§*out§§. With arg writes a newline ...$ 

#### pr-st

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of ...

top

## pr-str

```
(pr-str & xs)
```

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of the str values of the args with delimiter ' '.

```
(pr-str)
=> ""

(pr-str 1 2 3)
=> "1 2 3"
```

## SEE ALSO

With no args, returns the empty string. With one arg x, returns x.toString(). (str nil) returns the empty string. With more than one ...

## preduce

```
(preduce n combine-fn combine-seed reduce-fn reduce-seed coll)
(preduce n reduce-fn reduce-seed coll)
```

Reduces a collection using a parallel reduce-combine strategy. The collection is partitioned into groups of approximately n items, each of which is reduced with reduce-fn (with reduce-seed as its seed value) in parallel. The results of these reductions are then reduced with the combine-fn (with combine-seed as its seed value). Withhout an explicit combine-fn the reduce-fn and its seed reduce-seed will be used as combine-fn and combine-seed.

```
(preduce 3 + 0 + 0 [1 2 3 4 5])
=> 15

(preduce 3 (fn [acc x] (+ acc x)) 0 (fn [acc x] (+ acc x)) 0 [1 2 3 4 5])
=> 15

(preduce 3 + 0 [1 2 3 4 5])
=> 15

(preduce 3 (fn [acc x] (+ acc x)) 0 [1 2 3 4 5])
=> 15
```

#### **SEE ALSO**

## print

```
(print & xs)
(print os & xs)
```

Prints the values xs to the stream that is the current value of \*out\* or to the passed stream os that must be a subclass of either :java.io. Writer .

Prints the values, separated by spaces if there is more than one. print and println print in a human readable form.

If the printed data needs to be read back by a Venice reader use the functions pr and prn instead.

Returns nil.

```
(print [10 20 30])
[10 20 30]
=> nil

(print *out* [10 20 30])
[10 20 30]
=> nil

(print *err* [10 20 30])
[10 20 30]
=> nil
```

## SEE ALSO

ιορ

# prof

```
(prof opts)
```

Controls the code profiling. See the companion functions/macros 'dorun' and 'perf'. The perf macro is built on prof and dorun and provides all for simple Venice profiling.

The profiler reports a function's elapsed time as "time with children"!

Profiling recursive functions:

Because the profiler reports "time with children" and accumulates the elapsed time across all recursive calls the resulting time for a particular recursive function is higher than the effective time.

```
(do
  (prof :on) ; turn profiler on
  (prof :off) ; turn profiler off
  (prof :status) ; returns the profiler on/off staus
  (prof :clear) ; clear profiler data captured so far
```

```
(prof :data) ; returns the profiler data as map
  (prof :data-formatted) ; returns the profiler data as formatted text
  (prof :data-formatted "Metrics") ; returns the profiler data as formatted text with a title
  nil)
=> nil
```

#### perf

Performance test with the given expression.

#### tima

Evaluates expr and prints the time it took. Returns the value of expr.

top

## promise

```
(promise)
(promise fn)
```

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, unless the variant of deref with timeout is used. All subsequent derefs will return the same delivered value without blocking.

Promises are implemented on top of Java's CompletableFuture.

```
(do
   (def p (promise))
   (deliver p 10)
   (deliver p 20); no effect
=> 10
;; deliver the promise from a future
(do
  (def p (promise))
   (defn task1 [] (sleep 500) (deliver p 10))
   (defn task2 [] (sleep 800) (deliver p 20))
   (future task1)
   (future task2)
   (ap)
=> 10
;; deliver the promise from a task's return value
   (defn task [] (sleep 300) 10)
   (def p (promise task))
   @p)
=> 10
(let [p (promise #(do (sleep 300) 10))]
   @p)
=> 10
```

## SEE ALSO

#### deliver

Delivers the supplied value to the promise, releasing any pending derefs. A subsequent call to deliver on a promise will have no effect.

## promise?

Returns true if f is a Promise otherwise false

#### realized?

Returns true if a value has been produced for a promise, delay, or future.

#### deref

Dereferences an atom, a future or a promise object. When applied to an atom, returns its current state. When applied to a future, will ...

#### done?

Returns true if the future or promise is done otherwise false

#### cancel

Cancels a future or a promise

#### cancelled?

Returns true if the future or promise is cancelled otherwise false

#### all-of

Returns a new promise that is completed when all of the given promises complete. If any of the given promises complete exceptionally, ...

#### anv-of

Returns a new promise that is completed when any of the given promises complete, with the same result. Otherwise, if it completed exceptionally, ...

#### then-accept

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

## then-accept-both

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

#### then-apply

Applies a function f on the result of the previous stage of the promise p.

#### then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

### then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

## when-complete

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

## accept-either

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result ...

## apply-to-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

## or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

### complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

#### timeout-after

Returns a promise that timouts afer the specified time. The promise throws a TimeoutException.

top

# promise?

(promise? p)

Returns true if f is a Promise otherwise false

(promise? (promise)))

=> true

# proxify

```
(proxify interface method-map)
```

Proxifies a Java interface to be passed as a Callback object to Java functions. The interface's methods are implemented by Venice functions.

The dynamic invocation handler takes care that the methods are called in the context of a Venice sandbox even if the Java method that invokes the callback methods is running in another thread.

Supports default method implementations in the proxied Java interface. These Java interface methods can be either overriden by a Venice function or just be omitted. In the latter case the return value of methods default implementation will be handed back.

In case a Java FunctionalInterface is required the proxy wrappers from the :java module are often simpler to use:

- java/as-runnable
- java/as-callable
- java/as-predicate
- java/as-function
- java/as-consumer
- java/as-supplier
- java/as-bipredicate
- java/as-bifunction
- java/as-biconsumer
- java/as-binaryoperator

```
(do
   (import :java.io.File :java.io.FilenameFilter)
   (def file-filter
      (fn [dir name] (str/ends-with? name ".xxx")))
   (let [dir (io/tmp-dir)]
      ;; create a dynamic proxy for the interface FilenameFilter
      ;; and implement its function 'accept' by 'file-filter'
      (. dir :list (proxify :FilenameFilter {:accept file-filter}))))
=> []
;; Instead of explicit proxies, functional interface wrappers are
;; often simpler to use
(do
   (load-module :java)
   (import :java.util.stream.Collectors)
   (-> (. [1 2 3 4] :stream)
       (. :filter (java/as-predicate #(> % 2)))
       (. :map (java/as-function #(* % 10)))
       (. :collect (. :Collectors :toList))))
=> (30 40)
```

## **SEE ALSO**

## java/as-runnable

Wraps the function f in a java.lang.Runnable (https://docs.oracle.com/javase/8/docs/api/java/lang/Runnable.html)

## java/as-callable

Wraps the function f in a java.util.concurrent.Callable (https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/Callable.html)

Wraps the function f in a java.util.function.BinaryOperator (https://docs.oracle.com/javase/8/docs/api/java/util/function/BinaryOperator.html)

top

# push!

```
(push! stack v)
```

Pushes an item to a stack.

```
(let [s (stack)]
  (push! s 1)
  (push! s 2)
  (push! s 3)
  (pop! s))
=> 3
```

## **SEE ALSO**

#### stack

Creates a new mutable threadsafe stack.

### peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the  $\dots$ 

#### pop

Pops an item from a stack.

#### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

ton

# put!

```
(put! queue val)
```

```
(put! queue val delay)
```

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

```
queue: (put! queue val)
```

Puts the value 'val' to the tail of the queue.

```
delay-queue: (put! queue val delay)
```

Puts the value 'val' with a delay of 'delay' milliseconds to a delay-queue

```
(let [q (queue)]
  (put! q 1)
  (poll! q)
  q)
=> ()

(let [q (delay-queue)]
  (put! q 1 100)
    (take! q))
=> 1
```

#### **SEE ALSO**

#### queue

Creates a new mutable threadsafe bounded or unbounded queue.

#### takol

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

#### offer!

Offers an item to a queue with an optional timeout in milliseconds. If a timeout is given waits up to the specified wait time if necessary ...

#### !llog

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

#### peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the ...

#### empty?

Returns true if  $\boldsymbol{x}$  is empty. Accepts strings, collections and bytebufs.

#### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

top

# qrref/format

```

# qualified-name

```
(name x)
```

Returns the qualified name String of a string, symbol, keyword, or function

```
(qualified-name :user/x)
=> "user/x"

(qualified-name 'x)
=> "x"

(qualified-name "x")
=> "x"

(qualified-name str/digit?)
=> "str/digit?"
```

## **SEE ALSO**

## name

Returns the name string of a string, symbol, keyword, or function. If applied to a string it returns the string itself.

## namespace

Returns the namespace string of a symbol, keyword, or function. If x is a registered namespace returns x.

## fn-name

Returns the qualified name of a function or macro

top

# qualified-symbol?

```
(qualified-symbol? x)
```

Returns true if x is a qualified symbol

```
(qualified-symbol? 'foo/a)
=> true
```

```
(qualified-symbol? (symbol "foo/a"))
=> true

(qualified-symbol? 'a)
=> false

(qualified-symbol? nil)
=> false

(qualified-symbol? :a)
=> false
```

top

# quasiquote

(quasiquote form)

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

unquote:

It is possible to unquote part of the form that is quoted with  $\sim$  . Unquoting allows you to evaluate parts of the syntax quoted expression.

unquote-splicing:

Unquote evaluates to a collection of values and inserts the collection into the quoted form. But sometimes you want to unquote a list and insert its elements (not the list) inside the quoted form. This is where ~@ (unquote-splicing) comes to rescue.

```
(quasiquote (16 17 (inc 17)))
=> (16 17 (inc 17))

'(16 17 (inc 17))
=> (16 17 (inc 17))

'(16 17 ~(inc 17))
=> (16 17 18)

'(16 17 ~(map inc [16 17]))
=> (16 17 (17 18))

'(16 17 ~@(map inc [16 17]))
=> (16 17 17 18)

'(1 2 ~@#{1 2 3})
=> (1 2 1 2 3)

'(1 2 ~@{:a 1 :b 2 :c 3})
=> (1 2 [:a 1] [:b 2] [:c 3])
```

## SEE ALSO

quote

There are two equivalent ways to quote a form either with quote or with '. They prevent the quoted form from being evaluated.

## queue

```
(queue)
(queue capacity)
```

Creates a new mutable threadsafe bounded or unbounded queue.

The queue can be turned into a synchronous queue when using the functions put! and take! . put! waits until the value be added and `take! waits until a value is available from queue thus synchronizing the producer and consumer.

```
; unbounded queue
(let [q (queue)]
  (offer! q 1)
  (offer! q 2)
  (offer! q 3)
  (poll! q)
 q)
=> (2 3)
; bounded queue
(let [q (queue 10)]
  (offer! q 1000 1)
  (offer! q 1000 2)
  (offer! q 1000 3)
  (poll! q 1000)
 q)
=> (2 3)
; synchronous unbounded queue
(let [q (queue)]
  (put! q 1)
  (put! q 2)
  (put! q 3)
  (take! q)
  q)
=> (2 3)
; synchronous bounded queue
(let [q (queue 10)]
  (put! q 1)
  (put! q 2)
  (put! q 3)
  (take! q)
 q)
=> (2 3)
```

## SEE ALSO

#### peek

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

#### empty

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

#### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

#### queue?

Returns true if coll is a queue

#### reduce

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then ...

#### transduce

Reduce with a transformation of a reduction function f(xf). If init is not supplied, (f) will be called to produce it. f should be ...

#### docol

Applies f to the items of the collection presumably for side effects. Returns nil.

#### into!

Adds all of the items of 'from' conjoined to the mutable 'to' collection

#### coni

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

queue?

(queue? coll)

Returns true if coll is a queue

(queue? (queue))
=> true

tor

## quote

(quote form)

There are two equivalent ways to quote a form either with quote or with '. They prevent the quoted form from being evaluated.

Regular quotes work recursively with any kind of forms and types: strings, maps, lists, vectors...

```
(quote (1 2 3))
=> (1 2 3)

(quote (+ 1 2))
=> (+ 1 2)

'(1 2 3)
=> (1 2 3)
```

```
'(+ 1 2)
=> (+ 1 2)

'(a (b (c d (+ 1 2))))
=> (a (b (c d (+ 1 2))))
```

#### quasiquote

Quasi quotes also called syntax quotes (a backquote) suppress evaluation of the form that follows it and all the nested forms.

Takes a body of expressions and yields a Delay object that will invoke the body only the first time it is forced (with force or deref ...

### promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

top

## recur

```
(recur expr*)
```

Evaluates the exprs and rebinds the bindings of the recursion point to the values of the exprs. The recur expression must be at the tail position. The tail position is a postion which an expression would return a value from.

```
;; tail recursion
(loop [x 10]
   (when (> x 1)
     (println x)
      (recur (- x 2))))
10
8
6
4
2
=> nil
;; tail recursion
(do
   (defn sum [n]
         (loop [cnt n acc 0]
            (if (zero? cnt)
                (recur (dec cnt) (+ acc cnt)))))
   (sum 10000))
=> 50005000
```

## **SEE ALSO**

## loop

Evaluates the exprs and binds the bindings. Creates a recursion point with the bindings.

## reduce

```
(reduce f coll)
(reduce f val coll)
```

f should be a function of 2 arguments. If val is not supplied, returns the result of applying f to the first 2 items in coll, then applying f to that result and the 3rd item, etc. If coll contains no items, f must accept no arguments as well, and reduce returns the result of calling f with no arguments. If coll has only 1 item, it is returned and f is not called. If val is supplied, returns the result of applying f to val and the first item in coll, then applying f to that result and the 2nd item, etc. If coll contains no items, returns val and f is not called.

reduce can work with queues as collection, given that the end of the queue is marked by addding a nil element. Otherwise the reducer does not not when to stop reading elements from the queue.

```
(reduce + [1 2 3 4 5 6 7])
=> 28
(reduce + 10 [1 2 3 4 5 6 7])
=> 38
(reduce (fn [x y] (+ x y 10)) [1 2 3 4 5 6 7])
(reduce (fn [x y] (+ x y 10)) 10 [1 2 3 4 5 6 7])
=> 108
((reduce comp [(partial + 1) (partial * 2) (partial + 3)]) 100)
=> 207
(reduce (fn [m [k v]] (assoc m k v)) {} [[:a 1] [:b 2] [:c 3]])
=> {:a 1 :b 2 :c 3}
(reduce (fn [m [k v]] (assoc m v k)) {} {:b 2 :a 1 :c 3})
=> {1 :a 2 :b 3 :c}
(reduce (fn [m c] (assoc m (first c) c)) {} [[:a 1] [:b 2] [:c 3]])
=> {:a [:a 1] :b [:b 2] :c [:c 3]}
;; sliding window (width 3) average
(->> (partition 3 1 (repeatedly 10 #(rand-long 30)))
     (map (fn [window] (/ (reduce + window) (count window)))))
=> (20 20 16 17 11 12 10 18)
;; reduce all elements of a queue.
;; calls (take! queue) to get the elements of the queue.
;; note: use nil to mark the end of the queue otherwise
         reduce will block forever!
(let [q (conj! (queue) 1 2 3 4 5 6 7 nil)]
  (reduce + q))
=> 28
;; reduce data supplied by a finit lazy seq
(do
  (def counter (atom 5))
  (defn generate []
    (swap! counter dec)
    (if (pos? @counter) @counter nil))
```

```
(reduce + 100 (lazy-seq generate)))
=> 110
```

(reduced? x)
```

Returns true if x is the result of a call to reduced.

top

# regex/count

```
(regex/count matcher)
```

Returns the matcher's group count.

```
(let [m (regex/matcher #"([0-9]+)(.*)" "100abc")]
    (regex/count m))
=> 2
```

## **SEE ALSO**

#### match?

Returns true if the string s matches the regular expression regex.

### regex/matcher

Returns an instance of java.util.regex.Matcher.

## regex/pattern

Returns an instance of java.util.regex.Pattern.

top

# regex/find

```
(regex/find matcher)
(regex/find pattern s)
```

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

To get the positional data for the matched group use <code>(regex/find+ matcher)</code> .

```
(regex/find #"[0-9]+" "672-345-456-3212")
=> "672"

(let [m (regex/matcher #"[0-9]+" "672-345-456-3212")]
    (println (regex/find m))
    (println (regex/find m))
    (println (regex/find m))
    (println (regex/find m))
    (println (regex/find m)))
672
345
456
```

```
3212
nil
=> nil
```

#### match?

Returns true if the string s matches the regular expression regex.

#### regex/find-all

Returns all regex matches as list or an empty list if there are no matches.

#### regex/find+

Returns the next regex match and returns the group with its positional data. Returns nil if there is no match.

#### regex/matcher

Returns an instance of java.util.regex.Matcher.

### regex/pattern

Returns an instance of java.util.regex.Pattern.

top

# regex/find+

```
(regex/find+ matcher)
(regex/find+ pattern s)
```

Returns the next regex match and returns the group with its positional data. Returns nil if there is no match.

## SEE ALSO

#### match?

Returns true if the string s matches the regular expression regex.

### regex/find-all+

Returns the all regex matches and returns the groups with its positional data. Returns an empty list if there are no matches.

#### regex/find

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

## regex/matcher

Returns an instance of java.util.regex.Matcher.

#### regex/patterr

Returns an instance of java.util.regex.Pattern.

tor

# regex/find-all

```
(regex/find-all matcher)
(regex/find-all pattern s)
```

Returns all regex matches as list or an empty list if there are no matches.

To get the positional data for the matched groups use 'regex/find-all+'.

### **SEE ALSO**

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

#### regex/find?

Attempts to find the next subsequence that matches the pattern. If the match succeeds then more information can be obtained via the ...

### regex/reset

Resets the matcher with a new string

#### regex/matches

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

#### regex/find

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

#### regex/find-all

Returns all regex matches as list or an empty list if there are no matches.

top

# regex/matches

```
(regex/matches pattern str)
```

Returns the matches, if any, for the matcher with the pattern of a string, using <code>java.util.regex.Matcher.matches()</code> .

If the matcher's pattern matches the entire region sequence returns a list with the entire region sequence and the matched groups otherwise returns an empty list.

Returns matching info as meta data on the region and the groups.

Region meta data:

start start pos of the overall group:end end pos of the overall group

:group-count the number of matched elements groups

Group meta data:

:start start pos of the element group :end end pos of the element group

JavaDoc: Pattern

```
;; Entire region sequence matched
(regex/matches "hello, (.*)" "hello, world")
=> ("hello, world" "world")
;; Entire region sequence not matched
(regex/matches "HEllo, (.*)" "hello, world")
=> ()
;; Matching multiple groups
(regex/matches "([0-9]+)-([0-9]+)-([0-9]+)" "672-345-456-212")
=> ("672-345-456-212" "672" "345" "456" "212")
;; Matching multiple groups
(let [p (regex/pattern "([0-9]+)-([0-9]+)")]
  (regex/matches p "672-345"))
=> ("672-345" "672" "345")
;; Access matcher's region meta info
(let [pattern "([0-9]+)-([0-9]+)-([0-9]+)-([0-9]+)"
     matches (regex/matches pattern "672-345-456-212")]
   (println "meta info:" (pr-str (meta matches)))
   (println "matches: " (pr-str matches)))
meta info: {:group-count 4 :start 0 :end 15}
matches: ("672-345-456-212" "672" "345" "456" "212")
=> nil
```

```
;; Access matcher's region meta info and the meta info of each group
(let [pattern "([0-9]+)-([0-9]+)-([0-9]+)-([0-9]+)"
    matches (regex/matches pattern "672-345-456-212")]
 (println "group matches: " (pr-str (nth matches ⊕)) (meta (nth matches ⊕)))
                      " (pr-str (nth matches 1)) (meta (nth matches 1)))
 (println "
 (println "
                      " (pr-str (nth matches 2)) (meta (nth matches 2)))
 (println "
                      " (pr-str (nth matches 3)) (meta (nth matches 3)))
 (println "
                      " (pr-str (nth matches 4)) (meta (nth matches 4))))
region info: {:group-count 4 :start 0 :end 15}
group count: 5 (region included)
group matches: "672-345-456-212" {:start 0 :end 15}
             "672" {:start 0 :end 3}
             "345" {:start 4 :end 7}
             "456" {:start 8 :end 11}
             "212" {:start 12 :end 15}
=> nil
```

#### match?

Returns true if the string s matches the regular expression regex.

#### regex/pattern

Returns an instance of java.util.regex.Pattern.

top

# regex/matches-not?

```
(regex/matches-not? matcher)
(regex/matches-not? matcher str)
```

Attempts to match the entire region against the pattern. Returns false if the patterns matches the string else true.

```
(let [m (regex/matcher #"[0-9]+" "10A")]
  (regex/matches-not? m))
=> true

(let [m (regex/matcher #"[0-9]+" "value: 10A")]
    (regex/matches-not? m))
=> true

(let [m (regex/matcher #"[0-9]+" "")]
    (filter #(regex/matches-not? m %) ["100" "10A" "200"]))
=> ("10A")
```

### **SEE ALSO**

#### match?

Returns true if the string s matches the regular expression regex.

### regex/matcher

Returns an instance of java.util.regex.Matcher.

## regex/matches

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

### regex/pattern

Returns an instance of java.util.regex.Pattern.

top

# regex/matches?

```
(regex/matches? matcher)
(regex/matches? matcher str)
```

Attempts to match the entire region against the pattern. Returns true if the patterns matches the string else false.

```
(let [m (regex/matcher #"[0-9]+" "100")]
    (regex/matches? m))
=> true

(let [m (regex/matcher #"[0-9]+" "value: 100")]
    (regex/matches? m))
=> false

(let [m (regex/matcher #"[0-9]+" "")]
    (filter #(regex/matches? m %) ["100" "1a1" "200"]))
=> ("100" "200")
```

#### **SEE ALSO**

#### match?

Returns true if the string s matches the regular expression regex.

#### regex/matcher

Returns an instance of java.util.regex.Matcher.

### regex/matches

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

## regex/pattern

Returns an instance of java.util.regex.Pattern.

tor

# regex/pattern

```
(regex/pattern s)
```

Returns an instance of java.util.regex.Pattern .

Patterns are immutable and are safe for use by multiple concurrent threads!

Alternatively regex pattern literals can be used to define a pattern: #"[0-9+]"

```
"\\d" ;; regex string to match one digit
```

Notice that you have to escape the backslash to get a literal backslash in the string. However, regex pattern literals are smart. They don't need to double escape:

```
#"\d" ;; regex pattern literal to match one digit
```

JavaDoc: Pattern

```
(regex/pattern "[0-9]+")
=> [0-9]+
```

```
(regex/pattern "\\d+")
=> \d+

#"[0-9]+"
=> [0-9]+

#"\d+"
=> \d+
```

#### match?

Returns true if the string s matches the regular expression regex.

#### regex/matcher

Returns an instance of java.util.regex.Matcher.

## regex/matches

Returns the matches, if any, for the matcher with the pattern of a string, using java.util.regex.Matcher.matches().

## regex/find

Returns the next regex match or nil if there is no further match. Returns nil if there is no match.

#### regex/find-all

Returns all regex matches as list or an empty list if there are no matches.

# regex/reset

```
(regex/reset matcher str)
```

Resets the matcher with a new string

## **SEE ALSO**

### match?

Returns true if the string s matches the regular expression regex.

## regex/matcher

Returns an instance of java.util.regex.Matcher.

## regex/pattern

Returns an instance of java.util.regex.Pattern.

top

## release

```
(release lock)

Releases a lock.

(let [l (lock)]
  (acquire l)
    ;; do something
    (release l))
=> nil

SEE ALSO

lock
Creates a new lock object.
acquire
Acquires a lock, blocking until the lock is available.

try-acquire
Acquires a lock within the given timeout time. Without a timeout returns immediately if the lock is not available.

locked?
Returns true if the lock is in use else false.
```

remove

(remove predicate coll)

Returns a collection of the items in coll for which (predicate item) returns logical false.
Returns a transducer when no collection is provided.

(remove nil? [1 nil nil 4 5 6])
=> (1 4 5 6)

(remove even? [1 2 3 4 5 6 7])
=> (1 3 5 7)

(remove #{3 5} '(1 3 5 7 9))
=> (1 7 9)

(remove #(= 3 %) '(1 2 3 4 5 6))
=> (1 2 4 5 6)

remove-formal-type

(remove-formal-type object)

Removes the *formal type* from a Java object.

This is identical to casting an object back to its real type without knowing its real type.

```
(do
   (let [p0 (. :java.awt.Point :new 0 0)
         p1 (cast :java.lang.Object p0)
         p2 (remove-formal-type p1)]
     (println "p0 ->" (formal-type p0))
     (println "p1 ->" (formal-type p1))
     (println "p2 ->" (formal-type p2))))
p0 -> :java.awt.Point
p1 -> :java.lang.Object
p2 -> :java.awt.Point
=> nil
SEE ALSO
formal-type
Returns the formal type of a Java object.
Casts a Java object to a specific type
class
Returns the Java class for the given name. Throws an exception if the class is not found.
```

repeat

(repeat x)
(repeat n x)

Returns a lazy sequence of x values or a collection with the value x repeated n times.

(repeat 3 "hello")
=> ("hello" "hello" "hello")

```
(repeat 5 [1 2])
=> ([1 2] [1 2] [1 2] [1 2] [1 2])

(repeat ":")
=> (...)

(interleave [:a :b :c] (repeat 100))
=> (:a 100 :b 100 :c 100)
```

### repeatedly

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

#### dotimes

Repeatedly executes body with name bound to integers from 0 through n-1.

### constantly

Returns a function that takes any number of arguments and returns always the value x.

repeatedly

(repeatedly n fn)

Takes a function of no args, presumably with side effects, and returns a collection of n calls to it

```
(repeatedly 5 #(rand-long 11))
=> (9 1 3 7 8)

;; compare with repeat, which only calls the 'rand-long'
;; function once, repeating the value five times.
(repeat 5 (rand-long 11))
=> (10 10 10 10 10)
```

## **SEE ALSO**

#### repeat

Returns a lazy sequence of x values or a collection with the value x repeated n times.

#### dotimes

Repeatedly executes body with name bound to integers from 0 through n-1.

## constantly

Returns a function that takes any number of arguments and returns always the value  $\boldsymbol{x}$ .

repl/fonts-dir

(repl/fonts-dir)

Returns the REPL fonts directory!

top

#### repl?

Returns true if running within a REPL.

## repl/home-dir

Returns the REPL home directory!

## repl/libs-dir

Returns the REPL libs directory!

top

# repl/home-dir

```
(repl/home-dir)
```

Returns the REPL home directory!

#### **SEE ALSO**

#### repl?

Returns true if running within a REPL.

## repl/libs-dir

Returns the REPL libs directory!

## repl/fonts-dir

Returns the REPL fonts directory!

top

# repl/info

```
(repl/info)
```

Returns information on the REPL.

Note: This function is only available when called from within a REPL!

E.g.:

```
{ :term-name "JLine terminal"
   :term-type "xterm-256color"
   :term-cols 80
   :term-rows 24
   :term-colors 256
   :term-class :org.repackage.org.jline.terminal.impl.PosixSysTerminal
   :color-mode :light }
```

## SEE ALSO

## repl?

Returns true if running within a REPL.

#### repl/term-rows

Returns number of rows in the REPL terminal.

## repl/term-cols

Returns number of columns in the REPL terminal.

# repl/term-cols

(repl/term-cols)

Returns number of columns in the REPL terminal.

Note: This function is only available when called from within a REPL!

## SEE ALSO

#### repl?

Returns true if running within a REPL.

## repl/term-rows

Returns number of rows in the REPL terminal.

## repl/info

Returns information on the REPL.

repl/term-rows

(repl/term-rows)

Returns number of rows in the REPL terminal.

Note: This function is only available when called from within a REPL!

## **SEE ALSO**

#### repl?

Returns true if running within a REPL.

top

#### repl/term-cols

Returns number of columns in the REPL terminal.

#### repl/info

Returns information on the REPL.

```
repl?

(repl?)

Returns true if running within a REPL.

(repl?)
```

# replace

(replace smap coll)

Given a map of replacement pairs and a collection, returns a collection with any elements that are a key in smap replaced with the corresponding value in smap.

```
(replace {2 :two, 4 :four} [4 2 3 4 5 6 2])
=> [:four :two 3 :four 5 6 :two]

(replace {2 :two, 4 :four} #{1 2 3 4 5})
=> #{1 3 5 :four :two}

(replace {[:a 10] [:c 30]} {:a 10 :b 20})
=> {:b 20 :c 30}
```

top

## reset!

(reset! box newval)

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

```
(do
  (def counter (atom 0))
  (reset! counter 99)
  @counter)
=> 99

(do
  (def counter (atom 0))
  (reset! counter 99))
=> 99
```

```
(do
  (def counter (volatile 0))
  (reset! counter 99)
  @counter)
=> 99

SEE ALSO

atom
Creates an atom with the initial value x.

volatile
Creates a volatile with the initial value x
```

```
reset-ns-meta!
(reset-ns-meta! n datamap)
Resets the metadata for a namespace
  (ns foo)
  (reset-ns-meta! foo {}))
=> {}
(do
 (ns foo)
 (def n 'foo)
 (reset-ns-meta! (var-get n) {})
 (pr-str (ns-meta (var-get n))))
=> "{}"
SEE ALSO
Returns the meta data of the namespace n or nil if n is not an existing namespace
alter-ns-meta!
Alters the metadata for a namespace. f must be free of side-effects.
Opens a namespace.
```

```
resolve

(resolve symbol)

Resolves a symbol.

(resolve '+)
=> +
```

```
(resolve 'y)
=> nil

(resolve (symbol "+"))
=> +

((-> "first" symbol resolve) [1 2 3])
=> 1
```

```
rest
(rest coll)
Returns a possibly empty collection of the items after the first.
(rest nil)
=> nil
(rest [])
=> []
(rest [1])
=> []
(rest [1 2 3])
=> [2 3]
(rest '())
=> ()
(rest '(1))
=> ()
(rest '(1 2 3))
=> (2 3)
(rest "1234")
=> (#\2 #\3 #\4)
SEE ALSO
Returns a possibly empty string of the characters after the first.
```

restart-agent

(restart-agent agent state)

When an agent is failed, changes the agent state to new-state and then un-fails the agent so that sends are allowed again.

top

```
(do
    (def x (agent 100))
    (restart-agent x 200)
    (deref x))
=> 200
```

#### agent

Creates and returns an agent with an initial value of state and zero or more options.

reverse

(reverse coll)

Returns a collection of the items in coll in reverse order.
Returns a stateful transducer when no collection is provided.

(reverse [1 2 3 4 5 6])
=> [6 5 4 3 2 1]

(reverse "abcdef")
=> (#\f #\e #\d #\c #\b #\a)

SEE ALSO
str/reverse
Reverses a string

top

## rf-any?

(rf-any? pred)

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

(transduce (filter number?) (rf-any? pos?) [true -1 1 2 false])
=> true

### **SEE ALSO**

#### rf-first

Returns a reducing function for a transducer that returns the first item.

#### rf-last

Returns a reducing function for a transducer that returns the last item.

#### rf-every?

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

# rf-every?

```
(rf-every? pred)
```

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

```
(transduce (filter number?) (rf-every? pos?) [1 2 3])
=> true
```

### **SEE ALSO**

#### rf-first

Returns a reducing function for a transducer that returns the first item.

#### rf\_lact

Returns a reducing function for a transducer that returns the last item.

#### rf-any?

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

top

## rf-first

```
(rf-first)
```

Returns a reducing function for a transducer that returns the first item.

```
(transduce (filter number?) rf-first [false 1 2])
=> 1

(transduce identity rf-first [nil 1 2])
=> nil
```

### **SEE ALSO**

#### rf-last

Returns a reducing function for a transducer that returns the last item.

#### rf-anv?

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

#### rf-every?

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

tor

## rf-last

(rf-last)

Returns a reducing function for a transducer that returns the last item.

```
(transduce (filter number?) rf-last [false 1 2])
=> 2

(transduce identity rf-last [1 2 1.2])
=> 1.2
```

#### rf\_first

Returns a reducing function for a transducer that returns the first item.

#### rf-anv?

Returns a reducing function for a transducer that returns true if the predicate is true for at least one the items, false otherwise.

#### rf-every?

Returns a reducing function for a transducer that returns true if the predicate is true for all the items, false otherwise.

run!

(run! f coll)

Runs the supplied function, for purposes of side effects, on successive items in the collection. Returns nil

(run! prn [1 2 3 4])

1
2
3
4
=> nil

SEE ALSO

docoll
Applies f to the items of the collection presumably for side effects. Returns nil.

mapv
Returns a vector consisting of the result of applying f to the set of first items of each coll, followed by applying f to the set of ...

ton

## sandbox/functions

(sandbox/functions group)

Lists the sandboxed functions defined by a sandbox function group.

Groups:

- :io
- :print
- :concurrency
- :java-interop
- :system
- :special-forms
- :unsafe

(sandbox/functions :print)

**SEE ALSO** 

sandboxed?

Returns true if there is a sandbox other than :AcceptAllInterceptor otherwise false.

top

# sandbox/type

(sandbox/type)

Returns the sandbox type.

Venice sandbox types:

- :AcceptAllInterceptor accepts all (no restrictions)
- RejectAllInterceptor safe sandbox, rejects access to all I/O functions, system properties, environment vars, extension modules, dynamic code loading, multi-threaded functions (futures, agents, ...), and Java calls
- :SandboxInterceptor customized sandbox

#### (sandbox/type)

=> :AcceptAllInterceptor

**SEE ALSO** 

sandboxed?

Returns true if there is a sandbox other than :AcceptAllInterceptor otherwise false.

top

## sandboxed?

(sandboxed?)

Returns true if there is a sandbox other than : AcceptAllInterceptor : otherwise false.

(sandboxed?)

=> false

SEE ALSO

sandbox/type

Returns the sandbox type.

top

## schedule-at-fixed-rate

(schedule-at-fixed-rate fn initial-delay period time-unit)

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period. Returns a future. (future? f) , (cancel f) , and (done? f) will work on the returned future.

Time unit is one of :milliseconds, :seconds, :minutes, :hours, or :days.

```
(schedule-at-fixed-rate #(println "test") 1 2 :seconds)

(let [s (schedule-at-fixed-rate #(println "test") 1 2 :seconds)]
   (sleep 16 :seconds)
   (cancel s))
```

#### **SEE ALSO**

#### schedule-delay

Creates and executes a one-shot action that becomes enabled after the given delay.

top

# schedule-delay

```
(schedule-delay fn delay time-unit)
```

Creates and executes a one-shot action that becomes enabled after the given delay.

Returns a future. (deref f), (future? f), (cancel f), and (done? f) will work on the returned future.

Time unit is one of :milliseconds, :seconds, :minutes, :hours, or :days.

```
(schedule-delay (fn[] (println "test")) 1 :seconds)
(deref (schedule-delay (fn [] 100) 2 :seconds))
```

### **SEE ALSO**

#### schedule-at-fixed-rate

Creates and executes a periodic action that becomes enabled first after the given initial delay, and subsequently with the given period.

top

### second

```
(second coll)
```

Returns the second element of coll.

```
(second nil)
=> nil

(second [])
=> nil

(second [1 2 3])
=> 2

(second '())
=> nil
```

```
(second '(1 2 3))
=> 2
```

select-keys

(select-keys map keyseq)

Returns a map containing only those entries in map whose key is in keys

```
(select-keys {:a 1 :b 2} [:a])
=> {:a 1}

(select-keys {:a 1 :b 2} [:a :c])
=> {:a 1}

(select-keys {:a 1 :b 2 :c 3} [:a :c])
=> {:a 1 :c 3}
```

**SEE ALSO** 

#### keys

Returns a collection of the map's keys.

#### entries

Returns a collection of the map's entries.

#### map

 $Applys\ f\ to\ the\ set\ of\ first\ items\ of\ each\ coll,\ followed\ by\ applying\ f\ to\ the\ set\ of\ second\ items\ in\ each\ coll,\ until\ any\ one\ of\ the\ ...$ 

semver/cmp

(semver/cmp a b)

Compares versions a and b, returning -1 if a is older than b, 0 if they're the same version, and 1 if a is newer than b.

```
(semver/cmp "1.2.3" "1.5.4")
=> -1

(semver/cmp (semver/version "1.2.3") (semver/version "1.5.4"))
=> -1
```

SEE ALSO

semver/equal?

Is version a the same as version b?

semver/newer?

Is version a newer than version b?

semver/older?

Is version a older than version b?

Compares versions a and b, returning -1 if a is older than b, 0 if they're the same version, and 1 if a is newer than b.

semver/newer?

(semver/newer? a b)

Is version a newer than version b?

(semver/newer? "1.5.4" "1.2.3")
=> true

(semver/newer? (semver/version "1.5.4") (semver/version "1.2.3"))
=> true

SEE ALSO
semver/older?
Is version a older than version b?
semver/equal?
Is version a the same as version b?
semver/cmp
Compares versions a and b, returning -1 if a is older than b, 0 if they're the same version, and 1 if a is newer than b.

top

## semver/older?

semver/cmp

(semver/older? a b)

```
| Is version a older than version b?

(semver/newer? "1.2.3" "1.5.4")
=> false

(semver/newer? (semver/version "1.2.3") (semver/version "1.5.4"))
=> false

SEE ALSO
semver/newer?
|s version a newer than version b?
semver/equal?
|s version a the same as version b?
semver/cmp
Compares versions a and b, returning -1 if a is older than b, 0 if they're the same version, and 1 if a is newer than b.
```

semver/parse

```
(semver/parse s)
```

Parses string 's' into a semantic version map.

Semantic verioning format:

```
standard
     version:
                    1.0.0
     pre-release:
                    1.0.0-beta
     meta data:
                    1.0.0-beta+001
  with revision
     version:
                    1.0.0.0
     pre-release: 1.0.0.0-beta
     meta data:
                    1.0.0.0-beta+001
E.g.: { :major 1, :minor 3, :patch 5 }
      { :major 1, :minor 3, :patch 5 :pre-release "beta"}
      { :major 1, :minor 3, :patch 5 :pre-release "beta"}
      { :major 1, :minor 3, :patch 5 :pre-release "beta" :meta "001"}
```

```
(semver/parse "1.2.3")
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}

(semver/parse "1.2.3-beta")
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release "beta"}

(semver/parse "1.2.3-beta+001")
=> {:patch 3 :meta-data "001" :minor 2 :major 1 :revision nil :pre-release "beta"}
```

### **SEE ALSO**

#### semver/version

If 'o' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'o' and return a version map.

### semver/valid-format?

Checks the string 's' for semantic versioning formatting

top

semver/valid-format?

(semver/valid-format? s)

Checks the string 's' for semantic versioning formatting

(semver/valid-format? "1.2.3")
=> true

SEE ALSO
semver/parse
Parses string 's' into a semantic version map.
semver/valid?
Checks if the supplied version map is valid regarding semantic versioning or not.

semver/valid?

(semver/valid? v)

Checks if the supplied version map is valid regarding semantic versioning or not.

(semver/valid? (semver/parse "1.2.3"))
=> true

SEE ALSO
semver/parse
Parses string 's' into a semantic version map.
semver/valid?
Checks if the supplied version map is valid regarding semantic versioning or not.

tor

## semver/version

(semver/version o)

If 'o' is a valid version map, returns the map. Otherwise, it'll attempt to parse 'o' and return a version map.

(semver/version "1.2.3")
=> {:patch 3 :meta-data nil :minor 2 :major 1 :revision nil :pre-release nil}

**SEE ALSO** 

semver/parse

Parses string 's' into a semantic version map.

top

## send

```
(send agent action-fn args)
```

Dispatch an action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do
  (def x (agent 100))
  (send x + 5)
  (send x (partial + 7))
  (sleep 100)
  (deref x))
=> 112
```

### **SEE ALSO**

#### agent

Creates and returns an agent with an initial value of state and zero or more options.

#### send-off

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

ton

## send-off

```
(send-off agent fn args)
```

Dispatch a potentially blocking action to an agent. Returns the agent immediately.

The state of the agent will be set to the value of:

```
(apply action-fn state-of-agent args)
```

```
(do
    (def x (agent 100))
    (send-off x + 5)
    (send-off x (partial + 7))
    (sleep 100)
    (deref x))
=> 112
```

### **SEE ALSO**

### agent

Creates and returns an agent with an initial value of state and zero or more options.

#### send

Dispatch an action to an agent. Returns the agent immediately.

## seq

```
(seq coll)
```

Returns a seq on the collection. If the collection is empty, returns nil. (seq nil) returns nil. seq also works on Strings and converts Java streams to lists.

```
(seq nil)
=> nil

(seq [])
=> nil

(seq [1 2 3])
=> (1 2 3)

(seq '(1 2 3))
=> (1 2 3)

(seq '(1 2 3))
=> (1 2 3)

(seq {:a 1 :b 2})
=> ([:a 1] [:b 2])

(seq "abcd")
=> (#\a #\b #\c #\d)
```

ton

# sequential?

```
(sequential? coll)
```

Returns true if coll is a sequential collection

```
(sequential? '(1))
=> true

(sequential? [1])
=> true

(sequential? {:a 1})
=> false

(sequential? nil)
=> false

(sequential? "abc")
=> false
```

top

## service

```
(service name method & args)
```

Calls a service with the specified name from the Venice's service registry.

Venice's service registry is used with application scripting scenarios where multiple external services must be made available to Venice. E.g.: the service registry can be used to register an application's *Spring Framework* services and make them discoverable by a Venice script.

Example:

```
Venice venice = new Venice();
   venice.getServiceRegistry()
        .register("Calculator", new Calculator())
        .registerServiceDiscovery(new TestServiceDiscovery());
   long r = (Long)venice.eval("(service :Calculator :multiply 10 20)");
   venice.eval("(service :Logger :log (version))");
while Calculator and TestServiceDiscovery are defined as:
   public static class TestServiceDiscovery implements IServiceDiscovery {
       @Override public Object lookup(final String name) {
           if (name == null) {
               throw new IllegalArgumentException("A service name must not be null");
           }
           else if (name.equals("Logger")) {
             return logger;
           }
           else {
             throw new VncException("Service " + name + " is not registered");
       }
       private final Logger logger = new Logger();
   }
   public class Calculator {
     public long multiply(long v1, long v2) {
       return v1 * v2;
     }
   }
   public static class Logger {
     public void log(String message) {
       System.out.println(message);
     }
   }
```

(service :UserService :find "Smith" "John")

### **SEE ALSO**

#### service?

Returns true if the named service exists otherwise false

top

## service?

(service? name)

Returns true if the named service exists otherwise false

```
SEE ALSO
service
Calls a service with the specified name from the Venice's service registry.
```

```
set

(set & items)

Creates a new set containing the items.

(set)
=> #{}

(set nil)
=> #{nil}

(set 1)
=> #{1}

(set 1)
=> #{1}

(set 1)
=> #{1}
```

```
set!
```

(set! var-symbol expr)

Sets a global or thread-local variable to the value of the expression.

```
(do
  (def x 10)
  (set! x 20)
  x)
=> 20

(do
    (def-dynamic x 100)
    (set! x 200)
    x)
=> 200

(do
    (def-dynamic x 100)
    (with-out-str
        (print x)
        (binding [x 200]
```

```
(print (str "-" x))
    (set! x (inc x))
    (print (str "-" x)))
    (print (str "-" x))))
=> "100-200-201-100"
```

#### def

Creates a global variable.

#### def-dynamic

Creates a dynamic variable that starts off as a global variable and can be bound with 'binding' to a new value on the local thread.

top

## set-error-handler!

```
(set-error-handler! agent handler-fn)
```

Sets the error-handler of an agent to handler-fn . If an action being run by the agent throws an exception handler-fn will be called with two arguments: the agent and the exception.

## SEE ALSO

#### agent

Creates and returns an agent with an initial value of state and zero or more options.

#### agent-error-mode

Returns the agent's error mode

#### agent-error

Returns the exception thrown during an asynchronous action of the agent if the agent is failed. Returns nil if the agent is not failed.

top

### set?

```
(set? obj)
```

Returns true if obj is a set

```
(set? (set 1))
=> true
```

```
sgn
```

```
(sgn x)
sgn function for a number.
    -1 \text{ if } x < 0
     0 \text{ if } x = 0
     1 \text{ if } x > 0
(sgn -10)
=> -1
(sgn 0)
=> 0
(sgn 10)
=> 1
(sgn -10I)
=> -1
(sgn -10.1)
=> -1
(sgn - 10.12M)
SEE ALSO
abs
Returns the absolute value of the number
negate
Negates x
```

sh

(sh & args)

Launches a new sub-process.

Options:

in may be given followed by input source as InputStream, Reader, File, ByteBuf, or String, to be fed to the sub-process's stdin.

in-enc option may be given followed by a String, used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the input string specified by the :in option to the sub-process's stdin. Defaults to "UTF-8". If the :in option provides a byte array, then

the bytes are passed unencoded, and this option is ignored.

option may be given followed by :bytes or a String. If a String is given, it will be used as a character encoding name (for example "UTF-8" or "ISO-8859-1") to convert the sub-process's stdout to a String which is returned. If :bytes is given, the sub-process's

stdout will be stored in a Bytebuf and returned. Defaults to UTF-8.

:out-fn a function with a single string argument that receives line by line from the process' stdout. If passed the :out value in the return

map will be empty.

:err-fn a function with a single string argument that receives line by line from the process' stderr. If passed the :err value in the return

```
map will be empty.
           override the process env with a map.
:env
           override the process dir with a String or java.io.File.
:dir
:throw-ex
           If true throw an exception if the exit code is not equal to zero, if false returns the exit code. Defaults to false.
           It's recommended to use
              (with-sh-throw (sh "ls" "-l"))
           instead.
           A timeout in milliseconds
:timeout
You can bind :env, :dir for multiple operations using with-sh-env or with-sh-dir . with-sh-throw is binds :throw-ex as true.
sh returns a map of
   :exit => sub-process's exit code
   :out => sub-process's stdout (as Bytebuf or String)
   :err => sub-process's stderr (String via platform default encoding)
E.g.:
   (sh "uname" "-r")
   => {:err "" :out "20.5.0\n" :exit 0}
(println (sh "ls" "-l"))
(println (sh "ls" "-l" "/tmp"))
(println (sh "sed" "s/[aeiou]/oo/g" :in "hello there\n"))
(println (sh "cat" :in "x\u25bax\n"))
(println (sh "echo" "x\u25bax"))
(println (sh "/bin/sh" "-c" "ls -l"))
(sh "ls" "-l" :out-fn println)
(sh "ls" "-l" :out-fn println :err-fn println)
;; background process
(println (sh "/bin/sh" "-c" "sleep 30 >/dev/null 2>&1 &"))
(println (sh "/bin/sh" "-c" "nohup sleep 30 >/dev/null 2>&1 &"))
;; asynchronously slurping stdout and stderr
(sh "/bin/sh"
    "-c" "for i in \{1..5\}; do sleep 1; echo \"Hello i\"; done"
    :out-fn println
    :err-fn println)
;; asynchronously slurping stdout and stderr with a timeout
(sh "/bin/sh"
    "-c" "for i in {1..5}; do sleep 1; echo \"Hello $i\"; done"
    :out-fn println
    :err-fn println
    :timeout 2500)
;; reads 4 single-byte chars
(println (sh "echo" "x\u25bax" :out-enc "ISO-8859-1"))
```

```
;; reads binary file into bytes[]
(println (sh "cat" "birds.jpg" :out-enc :bytes))
;; working directory
(println (with-sh-dir "/tmp" (sh "ls" "-l") (sh "pwd")))

(println (sh "pwd" :dir "/tmp"))
;; throw an exception if the shell's subprocess exit code is not equal to 0
(println (with-sh-throw (sh "ls" "-l")))

(println (sh "ls" "-l" :throw-ex true))
;; windows
(println (sh "cmd" "/c dir 1>&2"))

SEE ALSO
with-sh-throw
Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.
with-sh-dir
Sets the directory for use with sh, see sh for details.
```

sh/open

with-sh-env

(sh/open f)

Opens a *file* or an *URL* with the associated platform specific application.

Uses the OS commands:

• MacOS: /usr/bin/open f

Sets the environment for use with sh.

- Windows: cmd /C start f
- Linux: /usr/bin/xdg-open f

Note: sh/open can only be run from a REPL!

(sh/open "sample.pdf")
(sh/open "https://github.com/jlangch/venice")

ton

# sh/pwd

(sh/pwd)

Returns the current working directory.

#### Note:

You can't change the current working directory of the Java VM but if you were to launch another process using (sh & args) you can specify the working directory for the new spawned process.

(sh/pwd)

**SEE ALSO** 

ch

Launches a new sub-process.

top

## shell/alive?

(alive? pid)
(alive? process-handle)

Returns true if the process represented by a PID or a process handle is alive otherwise false.

Requires Java 9+.

(shell/alive? 4556)

#### **SEE ALSO**

#### shell/pid

Without argument returns the PID (type long) of this process. With a process-handle (:java.lang.ProcessHandle) returns the PID for ...

### shell/processes

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

top

# shell/descendant-processes

(descendant-processes pid)
(descendant-processes process-handle)

Returns the descendants (:java.lang.ProcessHandle) of a process represented by a PID or a process handle.

Requires Java 9+.

(shell/descendant-processes 4556)

(->> (shell/current-process)
 (shell/descendant-processes)
 (map shell/process-info))

## shell/process-info

```
(process-info pid)
(process-info process-handle)
```

Returns the process info for a process represented by a PID or a process handle.

The process info is a map with the keys:

:pid the PID

:alive true if the process is alive else false

:arguments the list of strings of the arguments of the process

:command the executable pathname of the process

:command-line the command line of the process :start-time the start time of the process

:user the user of the process.

Requires Java 9+.

```
(shell/process-info 4556)
```

SEE ALSO

#### shell/pid

Without argument returns the PID (type long) of this process. With a process-handle (:java.lang.ProcessHandle) returns the PID for ...

#### shell/process-handle

Returns the process handle (:java.lang.ProcessHandle) for a PID or nil if there is no process.

top

# shell/processes

```
(processes)
```

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

Requires Java 9+.

```
(shell/processes)
```

```
;; find the PID of the ArangoDB process
;; like: pgrep -lf ArangoDB3 | cut -d ' ' -f 1
(->> (shell/processes)
    (map shell/process-info)
    (filter #(str/contains? (:command-line %) "ArangoDB3"))
    (map :pid))
```

#### **SEE ALSO**

#### shell/processes-info

Returns a snapshot of all processes visible to the current process. Returns a list of process infos for the processes.

top

# shell/processes-info

```
(processes-info)
```

Returns a snapshot of all processes visible to the current process. Returns a list of process infos for the processes.

The process info is a map with the keys:

:pid the PID

:alive true if the process is alive else false

:arguments the list of strings of the arguments of the process

:command the executable pathname of the process

:command-line the command line of the process :start-time the start time of the process

:total-cpu-millis the total cputime accumulated of the process

:user the user of the process.

Requires Java 9+.

```
(shell/processes-info)
```

```
;; find the PID of the ArangoDB process
;; like: pgrep -lf ArangoDB3 | cut -d ' ' -f 1
(->> (shell/processes-info)
```

```
(filter #(str/contains? (:command-line %) "ArangoDB3"))
(map :pid))
```

#### shell/processes

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

top

## shell/wait-for-process-exit

```
(wait-for-process-exit pid timeout)
(wait-for-process-exit process-handle timeout)
```

Waits until the process with the pid exits. Waits max timeout seconds. Returns nil if the process exits before reaching the timeout, else the pid is returned. Accepts a PID or a process handle (:java.lang.ProcessHandle).

Requires Java 9+.

```
(shell/wait-for-process-exit 12345 20)
```

#### **SEE ALSO**

#### shell/pid

Without argument returns the PID (type long) of this process. With a process-handle (:java.lang.ProcessHandle) returns the PID for ...

#### chall/kil

Requests the process to be killed. Returns true if the process is killed and false if the process stays alive. Returns nil if the process ...

#### shell/processes

Returns a snapshot of all processes visible to the current process. Returns a list of :java.lang.ProcessHandle for the processes.

top

## shuffle

```
(shuffle coll)
```

Returns a collection of the items in coll in random order.

```
(shuffle '(1 2 3 4 5 6))
=> (2 6 3 1 5 4)

(shuffle [1 2 3 4 5 6])
=> [1 2 5 4 3 6]

(shuffle "abcdef")
=> (#\a #\f #\b #\e #\d #\c)
```

top

# shutdown-agents

```
(shutdown-agents)

Initiates a shutdown of the thread pools that back the agent system. Running actions will complete, but no new actions will been accepted

(do
    (def x1 (agent 100))
    (def x2 (agent 100))
    (shutdown-agents))

SEE ALSO

agent
Creates and returns an agent with an initial value of state and zero or more options.
```

```
shutdown-agents?

(shutdown-agents?)

Returns true if the thread-pool that backs the agents is shut down

(do
    (def x1 (agent 100))
    (def x2 (agent 100))
    (shutdown-agents)
    (sleep 300)
    (shutdown-agents?))

SEE ALSO
agent
Creates and returns an agent with an initial value of state and zero or more options.
```

shutdown-hook

(shutdown-hook f)

Registers the function f as a JVM shutdown hook.

Shutdown hooks can be tested in a REPL:

• start a REPL

• run (shutdown-hook (fn [] (println "SHUTDOWN") (sleep 3000)))

• exit the REPL with lexit

The sandbox is active within the shutdown hook:

• start a REPL

• run [sandbox customized

• run [sandbox add-rule blacklist:venice:func:+

• run (shutdown-hook (fn [] (try (+ 1 2) (catch :SecurityException ex (println ex) (sleep 3000)))))

• exit the REPL with lexit

```
(shutdown-hook (fn [] (println "shutdown")))
```

sleep

```
(sleep n)
(sleep n time-unit)
```

Sleep for the time n. The default time unit is milliseconds.

Time unit is one of :milliseconds, :seconds, :minutes, :hours, or :days or their abbreviations :msec, :ms, :sec, :s, :min, :hr, :h, :d.

```
(sleep 30)
=> nil

(sleep 30 :milliseconds)
=> nil

(sleep 30 :msec)
=> nil

(sleep 5 :seconds)
=> nil

(sleep 5 :sec)
=> nil
```

ton

## some

(some pred coll)

Returns the first logical true value of (pred x) for any x in coll, else nil.

Stops processing the collection if the first value is found that meets the predicate.

```
(some even? '(1 2 3 4))
=> true

(some even? '(1 3 5 7))
=> nil

(some #{5} [1 2 3 4 5])
=> 5

(some #(== 5 %) [1 2 3 4 5])
=> true

(some #(if (even? %) %) [1 2 3 4])
=> 2
```

## some->

```
(some-> expr & forms)
```

When expr is not nil, threads it into the first form (via -> ), and when that result is not nil, through the next etc.

#### **SEE ALSO**

#### some->>

When expr is not nil, threads it into the first form (via ->>), and when that result is not nil, through the next etc.

top

### some->>

```
(some->> expr & forms)
```

When expr is not nil, threads it into the first form (via ->> ), and when that result is not nil, through the next etc.

### **SEE ALSO**

#### some->

When expr is not nil, threads it into the first form (via ->), and when that result is not nil, through the next etc.

top

## some?

```
(some? x)
```

Returns true if x is not nil, false otherwise

```
(some? nil)
=> false

(some? 0)
=> true

(some? 4.0)
=> true

(some? false)
=> true

(some? [])
=> true

(some? {})
=> true
```

top

### sort

```
(sort coll)
(sort comparefn coll)
```

Returns a sorted list of the items in coll. If no compare function comparefn is supplied, uses the natural compare. The compare function takes two arguments and returns -1, 0, or 1

```
(sort [3 2 5 4 1 6])
=> [1 2 3 4 5 6]

(sort compare [3 2 5 4 1 6])
=> [1 2 3 4 5 6]

; reversed
(sort (comp - compare) [3 2 5 4 1 6])
=> [6 5 4 3 2 1]

(sort {:c 3 :a 1 :b 2})
=> ([:a 1] [:b 2] [:c 3])
```

### **SEE ALSO**

### sort-by

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, ...

top

# sort-by

```
(sort-by keyfn coll)
(sort-by keyfn compfn coll)
```

Returns a sorted sequence of the items in coll, where the sort order is determined by comparing (keyfn item). If no comparator is supplied, uses compare.

To sort by multiple values use juxt , see the examples below.

```
(sort-by :id [{:id 2 :name "Smith"} {:id 1 :name "Jones"} ])
=> [{:name "Jones" :id 1} {:name "Smith" :id 2}]
(sort-by count ["aaa" "bb" "c"])
=> ["c" "bb" "aaa"]
; reversed
(sort-by count (comp - compare) ["aaa" "bb" "c"])
=> ["aaa" "bb" "c"]
(sort-by first [[1 2] [3 4] [2 3]])
=> [[1 2] [2 3] [3 4]]
; sort tuples by first value, and where first value is equal,
; sort by second value
(sort-by (juxt first second) [[3 2] [1 3] [3 1] [1 2]])
=> [[1 2] [1 3] [3 1] [3 2]]
; reversed
(sort-by first (comp - compare) [[1 2] [3 4] [2 3]])
=> [[3 4] [2 3] [1 2]]
(sort-by :rank [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 1} {:rank 2} {:rank 3}]
; reversed
(sort-by :rank (comp - compare) [{:rank 2} {:rank 3} {:rank 1}])
=> [{:rank 3} {:rank 2} {:rank 1}]
;sort entries in a map by value
(sort-by val {:foo 7, :bar 3, :baz 5})
=> ([:bar 3] [:baz 5] [:foo 7])
; sort by :foo, and where :foo is equal, sort by :bar
(do
 (def x [ {:foo 2 :bar 11}
           {:foo 1 :bar 99}
           {:foo 2 :bar 55}
           {:foo 1 :bar 77} ])
  (sort-by (juxt :foo :bar) x))
=> [{:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11} {:foo 2 :bar 55}]
; sort by a given key order
  (def x [ {:foo 2 :bar 11}
           {:foo 1 :bar 99}
           {:foo 2 :bar 55}
           {:foo 1 :bar 77} ])
  (def order [55 77 99 11])
  (sort-by #((into {} (map-indexed (fn [i e] [e i]) order)) (:bar %))
=> [{:foo 2 :bar 55} {:foo 1 :bar 77} {:foo 1 :bar 99} {:foo 2 :bar 11}]
```

#### sor

Returns a sorted list of the items in coll. If no compare function comparefn is supplied, uses the natural compare. The compare function ...

```
sorted

(sorted cmp coll)

Returns a sorted collection using the compare function cmp. The compare function takes two arguments and returns -1, 0, or 1.
Returns a stateful transducer when no collection is provided.

(sorted compare [4 2 1 5 6 3])
=> [1 2 3 4 5 6]

(sorted (comp (partial * -1) compare) [4 2 1 5 6 3])
=> [6 5 4 3 2 1]
```

```
sorted-map

(sorted-map & keyvals)
  (sorted-map map)

Creates a new sorted map containing the items.

(sorted-map :a 1 :b 2)
=> {:a 1 :b 2}

(sorted-map (hash-map :a 1 :b 2))
=> {:a 1 :b 2}
```

```
sorted-map?
(sorted-map? obj)

Returns true if obj is a sorted map

(sorted-map? (sorted-map :a 1 :b 2))
=> true
```

top

## sorted-set

```
(sorted-set & items)

Creates a new sorted-set containing the items.

(sorted-set)
=> #{}

(sorted-set nil)
=> #{nil}

(sorted-set 1)
=> #{1}

(sorted-set 6 2 4)
=> #{2 4 6}

(str (sorted-set [2 3] [1 2]))
=> "#{[1 2] [2 3]}"

top

sorted-set?

(sorted-set? obj)
```

```
split-at

(split-at n coll)

Returns a vector of [(take n coll) (drop n coll)]

(split-at 2 [1 2 3 4 5])
=> [(1 2) (3 4 5)]

(split-at 3 [1 2])
=> [(1 2) ()]
```

# split-with

(split-with pred coll)

Returns true if obj is a sorted-set

=> true

(sorted-set? (sorted-set 1))

Splits the collection at the first false/nil predicate result in a vector with two lists

```
(split-with odd? [1 3 5 6 7 9])
=> [(1 3 5) (6 7 9)]

(split-with odd? [1 3 5])
=> [(1 3 5) ()]

(split-with odd? [2 4 6])
=> [() (2 4 6)]
```

```
sqrt
(sqrt x)
Square root of \boldsymbol{x}
(sqrt 10)
=> 3.1622776601683795
(sqrt 10I)
=> 3.1622776601683795
(sqrt 10.23)

(sqrt 10N)
=> 3.162277660168379522787063251598738133907318115234375M
SEE ALSO
square
Square of x
```

```
Square
(square x)

Square of x

(square 10)
=> 100

(square 10I)
=> 100I

(square 10.23)
=> 104.6529
```

```
(square 10.23M)
=> 104.6529M

SEE ALSO
sqrt
Square root of x
```

stack

(stack)

Creates a new mutable threadsafe stack.

```
(let [s (stack)]
  (push! s 1)
  (push! s 2)
  (push! s 3))
=> (3 2 1)
```

#### **SEE ALSO**

#### naak

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the  $\dots$ 

#### pop!

Pops an item from a stack.

### push!

Pushes an item to a stack.

#### empty

Returns an empty collection of the same category as coll, or nil if coll is nil. If the collection is mutable clears the collection ...

#### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

#### into!

Adds all of the items of 'from' conjoined to the mutable 'to' collection

#### conj

Returns a new mutable collection with the x, xs 'added'. (conj! nil item) returns (item) and (conj! item) returns item.

### stack?

Returns true if coll is a stack

stack?

(stack? coll)

Returns true if coll is a stack

top

```
(stack? (stack))
=> true
```

```
stacktrace
(stacktrace ex)
Returns the stacktrace of a java exception
(println (stacktrace (. :VncException :new (str "test"))))
```

```
str
```

(str & xs)

With no args, returns the empty string. With one arg x, returns x.toString(). (str nil) returns the empty string. With more than one arg, returns the concatenation of the str values of the args.

```
(str)
=> ""

(str 1 2 3)
=> "123"

(str +)
=> "+"

(str [1 2 3])
=> "[1 2 3]"

(str "total " 100)
=> "total 100"

(str #\h #\i)
=> "hi"
```

#### **SEE ALSO**

pr-str

With no args, returns the empty string. With one arg x, returns x.toString(). With more than one arg, returns the concatenation of ...

## str/blank?

(str/blank? s)

True if s is nil, empty, or contains only whitespace.

```
(str/blank? nil)
=> true
(str/blank? "")
=> true
(str/blank? " ")
=> true
(str/blank? "abc")
=> false

SEE ALSO
str/not-blank?
True if s contains at least one non whitespace char.
empty?
Returns true if x is empty. Accepts strings, collections and bytebufs.
not-empty?
Returns true if x is not empty. Accepts strings, collections and bytebufs.
nil?
Returns true if x is nil, false otherwise
```

```
str/butlast

(str/butlast s)

Returns a possibly empty string of the characters without the last.

(str/butlast "abcdef")
=> "abcde"
```

```
str/butnlast

(str/butnlast s n)

Returns a possibly empty string of the characters without the n last characters.

(str/butnlast "abcdef" 3)
=> "abc"
```

top

# str/bytebuf-to-hex

```
(str/bytebuf-to-hex data)
(str/bytebuf-to-hex data :upper)

Converts byte data to a hex string using the hexadecimal digits: 0123456789abcdef.

If the :upper options is passed the hex digits 0123456789ABCDEF are used.

(str/bytebuf-to-hex (bytebuf [0 1 2 3 4 5 6]))
=> "00010203040506"

(str/bytebuf-to-hex (bytebuf [202 254]) :upper)
=> "CAFE"
```

```
str/char?

(str/char? s)

Returns true if s is a char or a single char string.

(str/char? "x")
=> true

(str/char? #\x)
=> true
```

```
str/chars

(str/chars s)

Converts a string to a char list.

(str/chars "abcdef")
=> (#\a #\b #\c #\d #\e #\f)

(str/join (str/chars "abcdef"))
=> "abcdef"
```

```
str/contains?

(str/contains? s substr)

True if s contains with substr.

(str/contains? "abc" "ab")
=> true
```

```
(str/contains? "abc" #\b)
 str/cr-lf
 (str/cr-lf s mode)
 Convert a text to use LF or CR-LF.
 (str/cr-lf "line1
 line2
 line3" :cr-lf)
 (str/cr-lf "line1
 line2
 line3" :lf)
 str/decode-base64
 (str/decode-base64 s)
 Base64 decode.
 (str/decode-base64 (str/encode-base64 (bytebuf [0 1 2 3 4 5 6])))
 => [0 1 2 3 4 5 6]
                                                                                                                top
 str/decode-url
 (str/decode-url s)
 URL decode.
 (str/decode-url "The+string+%C3%BC%40foo-bar")
 => "The string ü@foo-bar"
 str/digit?
 (str/digit? s)
 True if s is a char and the char is a digit.
 Defined by Java Character.isDigit(ch).
```

```
(str/digit? #\8)
=> true

(str/digit? "8")
=> false

SEE ALSO

str/letter?
True if s is a char and the char is a letter.
str/hexdigit?
True if s is a char and the char is a hex digit.
```

```
str/double-quote

(str/double-quote str)

Double quotes a string.

(str/double-quote "abc")
=> "\"abc\""

(str/double-quote "")
=> "\"\""
```

```
str/double-quoted?

(str/double-quoteed? str)

Returns true if the string is double quoted.

(str/double-quoted? "\"abc\"")
=> true
```

```
str/double-unquote

(str/double-unquote str)

Unquotes a double quoted string.

(str/double-unquote "\"abc\"")
=> "abc"
```

```
(str/double-unquote "\"\"")
=> ""

(str/double-unquote nil)
=> nil
```

```
str/encode-base64

(str/encode-base64 data)

Base64 encode.

(str/encode-base64 (bytebuf [0 1 2 3 4 5 6]))
=> "AAECAwQFBg=="
```

```
str/encode-url

(str/encode-url s)

URL encode.

(str/encode-url "The string ü@foo-bar")
=> "The+string+%C3%BC%40foo-bar"
```

```
str/ends-with?

(str/ends-with? s substr)

True if s ends with substr.

(str/ends-with? "abc" "bc")
=> true
```

```
str/equals-ignore-case?

(str/equals-ignore-case? s1 s2)

Compares two strings ignoring case. True if both are equal.
```

```
(str/equals-ignore-case? "abc" "abC")
=> true
```

```
str/escape-html

(str/escape-html s)

HTML escape. Escapes &, <, >, ", ', and the non blocking space U+00A0

(str/escape-html "1 2 3 & < > \" ' \u00A0")
=> "1 2 3 & amp; & lt; & gt; & quot; & apos; "
```

```
str/escape-xml
(str/escape-xml s)

XML escape. Escapes &, <, >, ", "

(str/escape-xml "1 2 3 & < > \" '")
=> "1 2 3 & amp; &lt; &gt; &quot; &apos;"
```

str/expand

(str/expand s len fill mode\*)

Expands a string to the max lenght len. Fills up with the fillstring if the string needs to be expanded. The fill string is added to the start or end of the string depending on the mode :start, :end. The mode defaults to :end

```
(str/expand "abcdefghij" 8 ".")
=> "abcdefghij"
(str/expand "abcdefghij" 20 ".")
=> "abcdefghij......"
(str/expand "abcdefghij" 20 "." :start)
=> ".....abcdefghij" 20 "." :end)
=> "abcdefghij......"
(str/expand "abcdefghij" 30 "1234" :start)
=> "12341234123412341234abcdefghij"
(str/expand "abcdefghij" 30 "1234" :end)
=> "abcdefghij......"
```

### str/format

```
(str/format format args*)
(str/format locale format args*)
Returns a formatted string using the specified format string and arguments.
Venice uses the Java format syntax.
JavaDoc: Format Syntax
(str/format "value: %.4f" 1.45)
=> "value: 1.4500"
(str/format (. :java.util.Locale :new "de" "DE") "value: %.4f" 1.45)
=> "value: 1,4500"
(str/format (. :java.util.Locale :GERMANY) "value: %.4f" 1.45)
=> "value: 1,4500"
(str/format (.:java.util.Locale:new "de" "CH") "value: %,d" 2345000)
=> "value: 2'345'000"
(str/format [ "de" ] "value: %,.2f" 100000.45)
=> "value: 100.000,45"
(str/format [ "de" "DE" ] "value: %,.2f" 100000.45)
=> "value: 100.000,45"
(str/format [ "de" "CH" ] "value: %,.2f" 100000.45)
=> "value: 100'000.45"
(str/format [ "en" "US" ] "value: %,.2f" 100000.45)
=> "value: 100,000.45"
(str/format [ "de" "DE" ] "value: %,d" 2345000)
=> "value: 2.345.000"
```

tor

# str/format-bytebuf

```
(str/format-bytebuf data delimiter & options)
```

Formats a bytebuffer.

Options

:prefix0x prefix with 0x

```
(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) nil) 
=> "002243E2FF"
```

```
(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) "")
=> "002243E2FF"

(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) ", ")
=> "00, 22, 43, E2, FF"

(str/format-bytebuf (bytebuf [0 34 67 -30 -1]) ", " :prefix0x)
=> "0x00, 0x22, 0x43, 0xE2, 0xFF"
```

```
str/hex-to-bytebuf

(str/hex-to-bytebuf hex)

Converts a hex string to a bytebuf

(str/hex-to-bytebuf "005E4AFF")
=> [0 94 74 255]

(str/hex-to-bytebuf "005e4aff")
=> [0 94 74 255]
```

# str/hexdigit?

(str/hexdigit? s)

True if s is a char and the char is a hex digit.

```
(str/hexdigit? #\8)
=> true

(str/hexdigit? #\a)
=> true

(str/hexdigit? #\A)
=> true

(str/hexdigit? #\Y)
=> false
```

## str/index-of

(str/index-of s value)
(str/index-of s value from-index)

top

Return index of value (string or char) in s, optionally searching forward from from-index. Return nil if value not found.

```
(str/index-of "abcdefabc" "ab")
-> @
```

SEE ALSO

str/last-index-of

Return last index of value (string or char) in s, optionally searching backward from from-index. Return nil if value not found.

top

# str/join

```
(str/join coll)
(str/join separator coll)
```

Joins all elements in coll separated by an optional separator.

```
(str/join [1 2 3])
=> "123"

(str/join "-" [1 2 3])
=> "1-2-3"

(str/join "-" [(char "a") 1 "xyz" 2.56M])
=> "a-1-xyz-2.56M"
```

top

### str/last-index-of

```
(str/last-index-of s value)
(str/last-index-of s value from-index)
```

Return last index of value (string or char) in s, optionally searching backward from from-index. Return nil if value not found.

```
(str/last-index-of "abcdefabc" "ab")
=> 6
```

SEE ALSO

str/index-of

 $Return\ index\ of\ value\ (string\ or\ char)\ in\ s,\ optionally\ searching\ forward\ from\ from\ -index.\ Return\ nil\ if\ value\ not\ found.$ 

top

### str/letter?

```
(str/letter? s)
```

True if s is a char and the char is a letter.

Defined by Java Character.isLetter(ch).

(str/letter? #\x)
=> true

top

### str/levenshtein

(str/levenshtein s1 s2)

Returns the Levenshtein distance of two strings.

The *Damerau-Levenshtein* algorithm is an extension to the *Levenshtein* algorithm which solves the edit distance problem between a source string and a target string with the following operations:

- Character Insertion
- Character Deletion
- Character Replacement
- Adjacent Character Swap

Note that the adjacent character swap operation is an edit that may be applied when two adjacent characters in the source string match two adjacent characters in the target string, but in reverse order, rather than a general allowance for adjacent character swaps.

This implementation allows the client to specify the costs of the various edit operations with the restriction that the cost of two swap operations must not be less than the cost of a delete operation followed by an insert operation. This restriction is required to preclude two swaps involving the same character being required for optimality which, in turn, enables a fast dynamic programming solution.

The cost of the *Damerau-Levenshtein* algorithm is O(n\*m) where n is the length of the source string and m is the length of the target string. This implementation consumes O(n\*m) space.

```
(str/levenshtein "Tier" "Tor")
=> 2

(str/levenshtein "Tier" "tor")
=> 3
```

top

### str/linefeed?

(str/linefeed? s)

True if s is a char and the char is a linefeed.

```
(str/linefeed? #\newline)
=> true

(str/linefeed? (first "
"))
=> true
```

top

## str/lorem-ipsum

```
(str/lorem-ipsum & options)
Creates an arbitrary length Lorem Ipsum text.
Options:
              returns n characters (limited to 1000000)
:chars n
:paragraphs n
              returns n paragraphs (limited to 100)
(str/lorem-ipsum :chars 250)
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis turpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat aliquet, lectus diam fringilla velit, finibus eleifend ipsum
urna at lacus. Phasellus sit am"
(str/lorem-ipsum :paragraphs 1)
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis turpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat aliquet, lectus diam fringilla velit, finibus eleifend ipsum
urna at lacus. Phasellus sit amet nisl fringilla, cursus est in, mollis lacus. Proin dignissim rhoncus dolor.
Cras tellus odio, elementum sed erat sit amet, euismod tincidunt nisl. In hac habitasse platea dictumst. Duis
aliquam sollicitudin tempor. Sed gravida tincidunt felis at fringilla. Morbi tempor enim at commodo vulputate.
Aenean et ultrices lorem, placerat pretium augue. In hac habitasse platea dictumst. Cras fringilla ligula quis
interdum hendrerit. Etiam at massa tempor, facilisis lacus placerat, congue erat."
```

ιορ

### str/lower-case

```
(str/lower-case s)
(str/lower-case locale s)
```

Converts s to lowercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/lower-case "aBcDeF")
=> "abcdef"

(str/lower-case #\A)
=> #\a

(str/lower-case (. :java.util.Locale :new "de" "DE") "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :GERMANY) "aBcDeF")
=> "abcdef"

(str/lower-case (. :java.util.Locale :new "de" "CH") "aBcDeF")
=> "abcdef"

(str/lower-case [ "de"] "aBcDeF")
=> "abcdef"
```

```
(str/lower-case [ "de" "DE"] "aBcDeF")
=> "abcdef"

(str/lower-case [ "de" "DE"] "aBcDeF")
=> "abcdef"

SEE ALSO
str/upper-case
Converts s to uppercase.
```

```
str/lower-case?

(str/lower-case? s)

True if s is a char and the char is a lower case char.

Defined by Java Character.isLowerCase(ch).

(str/lower-case? #\x)
=> true

(str/lower-case? #\X)
=> false

(str/lower-case? #\8)
=> false
```

```
str/nfirst

(str/nfirst s n)

Returns a string of the n first characters of s.

(str/nfirst "abcdef" 2)
=> "ab"

(str/nfirst "abcdef" 10)
=> "abcdef"

(str/nfirst "abcdef" 0)
=> ""
```

## str/nlast

```
(str/nlast s n)

Returns a string of the n last characters of s.

(str/nlast "abcdef" 2)
=> "ef"

(str/nlast "abcdef" 10)
=> "abcdef"

(str/nlast "abcdef" 0)
=> ""
```

## str/not-blank?

```
(str/not-blank? s)
```

True if s contains at least one non whitespace char.

```
(str/not-blank? "abc")
=> true

(str/not-blank? " a ")
=> true

(str/not-blank? nil)
=> false

(str/not-blank? "")
=> false
```

### SEE ALSO

### str/blank?

True if s is nil, empty, or contains only whitespace.

#### empty?

Returns true if  $\boldsymbol{x}$  is empty. Accepts strings, collections and bytebufs.

#### not-empty?

Returns true if  $\boldsymbol{x}$  is not empty. Accepts strings, collections and bytebufs.

nil?

Returns true if x is nil, false otherwise

top

### str/nrest

```
(str/nrest s n)
```

```
Returns a possibly empty string of the characters after the n first characters.

(str/nrest "abcdef" 3)
=> "def"
```

str/pos

(str/pos s pos)

Returns the 0 based row/column position within a string based on absolute character position. Returns a map with the keys 'row' and 'col'.

Note: CR & LF count together as one each regarding the absolute position.

```
(str/pos "abcdefghij" 4)
=> {:col 4 :row 0}

(str/pos "ab
cdefghij" 6)
=> {:col 3 :row 1}
```

str/quote

```
(str/quote str q)
(str/quote str start end)
```

Quotes a string.

```
(str/quote "abc" "-")
=> "-abc-"

(str/quote "abc" "<" ">")
=> "<abc>"
```

top

top

# str/quoted?

```
(str/quoted? str q)
(str/quoted? str start end)
```

Returns true if the string is quoted.

```
(str/quoted? "-abc-" "-")
=> true

(str/quoted? "<abc>" "<" ">")
=> true
```

## str/repeat

```
(str/repeat s n)
(str/repeat s n sep)
```

Repeats s n times with an optional separator.

```
(str/repeat "abc" 0)
=> ""

(str/repeat "abc" 3)
=> "abcabcabc"

(str/repeat "abc" 3 "-")
=> "abc-abc-abc"
```

top

# str/replace-all

```
(str/replace-all s search replacement)
```

Replaces the all occurrances of search in s. The search arg may be a string or a regex pattern

```
(str/replace-all "abcdefabc" "ab" "__")
=> "__cdef__c"

(str/replace-all "a0b01c012d" (regex/pattern "[0-9]+") "_")
=> "a_b_c_d"

(str/replace-all "a0b01c012d" #"[0-9]+" "_")
=> "a_b_c_d"
```

#### **SEE ALSO**

#### str/replace-first

Replaces the first occurrance of search in s. The search arg may be astring or a regex pattern. If the search arg is of type string ...

#### str/replace-last

Replaces the last occurrance of search in s.

top

# str/replace-first

```
(str/replace-first s search replacement & options)
```

Replaces the first occurrance of search in s. The search arg may be astring or a regex pattern. If the search arg is of type string the options: ignore-case and :nfirst are supported.

Options:

```
if true ignores case, defaults to false
:ignore-case b
:nfirst n
                e.g :nfirst 2, defaults to 1
(str/replace-first "ab-cd-ef-ab-cd" "ab" "XYZ")
=> "XYZ-cd-ef-ab-cd"
(str/replace-first "AB-CD-EF-AB-CD" "ab" "XYZ" :ignore-case true)
=> "XYZ-CD-EF-AB-CD"
(str/replace-first "ab-ab-cd-ab-ef-ab-cd" "ab" "XYZ" :nfirst 3)
=> "XYZ-XYZ-cd-XYZ-ef-ab-cd"
(str/replace-first "a0b01c012d" (regex/pattern "[0-9]+") "_")
=> "a_b01c012d"
(str/replace-first "a0b01c012d" #"[0-9]+" "_")
=> "a_b01c012d"
SEE ALSO
str/replace-last
Replaces the last occurrance of search in s.
str/replace-all
Replaces the all occurrances of search in s. The search arg may be a string or a regex pattern
```

## str/replace-last

(str/replace-last s search replacement & options)

Replaces the last occurrance of search in s.

Options:

:ignore-case b if true ignores case, defaults to false

```
(str/replace-last "abcdefabc" "ab" "XYZ")
=> "abcdefXYZc"

(str/replace-last "foo.JPG" ".jpg" ".png" :ignore-case true)
=> "foo.png"
```

#### **SEE ALSO**

str/replace-first

Replaces the first occurrance of search in s. The search arg may be astring or a regex pattern. If the search arg is of type string ...

str/replace-all

Replaces the all occurrances of search in s. The search arg may be a string or a regex pattern

top

### str/rest

```
(str/rest s)

Returns a possibly empty string of the characters after the first.

(str/rest "abcdef")
=> "bcdef"
```

```
str/reverse

(str/reverse s)

Reverses a string

(str/reverse "abcdef")
=> "fedcba"
```

# str/split

```
(str/split s regex)
(str/split s regex limit)
```

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

```
(str/split "abc,def,ghi" ",")
=> ("abc" "def" "ghi")
(str/split "James Peter Robert" " " 2)
=> ("James" "Peter Robert")
(str/split "abc , def , ghi" " \star , \star")
=> ("abc" "def" "ghi")
(str/split "abc,def,ghi" "((?<=,)|(?=,))")
=> ("abc" "," "def" "," "ghi")
(str/split "q1w2e3r4t5y6u7i8o9p0" #"\d+")
=> ("q" "w" "e" "r" "t" "y" "u" "i" "o" "p")
(str/split "q1w2e3r4t5y6u7i8o9p0" #"\d+" 5)
=> ("q" "w" "e" "r" "t5y6u7i8o9p0")
(str/split " q1w2 " #"")
=> (" " "q" "1" "w" "2" " ")
(str/split nil ",")
=> ()
```

SEE ALSO

str/split-lines
Splits s into lines.

```
str/split-at
(str/split-at s pos)
Splits string at the given position. Returns a list of the splits.
(str/split-at nil 1)
=> (""" "")
(str/split-at "" 1)
=> ("" "")
(str/split-at "abc" 0)
=> ("" "abc")
(str/split-at "abc" 1)
=> ("a" "bc")
(str/split-at "abc" 2)
=> ("ab" "c")
(str/split-at "abc" 3)
=> ("abc" "")
SEE ALSO
str/split-lines
```

# str/split-columns

Splits s into lines.

(str/split-columns s cols)

Splits a string into columns. The columns are given by their start positions.

(str/split-columns "labc 2d 3gh" [0 6 12]) => ("labc" "2d" "3gh")

**SEE ALSO** 

str/split

Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.

top

# str/split-lines

```
(str/split-lines s)

Splits s into lines.

(str/split-lines "line1
line2
line3")
=> ("line1" "line2" "line3")

SEE ALSO
str/split
Splits string on a regular expression. Optional argument limit is the maximum number of splits. Returns a list of the splits.
io/slurp-lines
Read all lines from f.
```

```
str/starts-with?

(str/starts-with? s substr)

True if s starts with substr.

(str/starts-with? "abc" "ab")
=> true
```

str/strip-end

(str/strip-end s substr)

Removes a substr only if it is at the end of a s, otherwise returns s.

(str/strip-end "abcdef" "def")
=> "abc"

(str/strip-end "abcdef" "abc")
=> "abcdef"

top

# str/strip-indent

(str/strip-indent s)

Strip the indent of a multi-line string. The first line's leading whitespaces define the indent.

```
(str/strip-indent " line1
    line2
    line3")
=> "line1\n line2\n line3"
```

```
str/strip-start

(str/strip-start s substr)

Removes a substr only if it is at the beginning of a s, otherwise returns s.

(str/strip-start "abcdef" "abc")
=> "def"

(str/strip-start "abcdef" "def")
=> "abcdef"
```

```
str/subs

(str/subs s start)
(str/subs s start end)

Returns the substring of s beginning at start inclusive, and ending at end (defaults to length of string), exclusive.

(str/subs "abcdef" 2)
=> "cdef"

(str/subs "abcdef" 2 5)
=> "cde"
```

## str/trim

```
(str/trim s)

Trims leading and trailing whitespaces from s.

(str/trim " abc ")
=> "abc"

SEE ALSO
str/trim—to-nil
Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty
str/trim—left
```

Trims leading whitespaces from s.

### str/trim-right

Trims trailing whitespaces from s.

str/trim-left

(str/trim-left s)

Trims leading whitespaces from s.

(str/trim-left " abc ")
=> "abc "

SEE ALSO
str/trim-right
Trims trailing whitespaces from s.
str/trim
Trims leading and trailing whitespaces from s.
str/trim-to-nil
Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

#### str/trim

Trims leading and trailing whitespaces from s.

#### str/trim-to-ni

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

top

### str/trim-to-nil

```
(str/trim-to-nil s)
```

Trims leading and trailing whitespaces from s. Returns nil if the resulting string is empty

```
(str/trim-to-nil "")
=> nil

(str/trim-to-nil " ")
=> nil

(str/trim-to-nil nil)
=> nil

(str/trim-to-nil " abc ")
=> "abc"
```

#### **SEE ALSO**

#### str/trim

Trims leading and trailing whitespaces from s.

#### str/trim-left

Trims leading whitespaces from s.

#### str/trim-right

Trims trailing whitespaces from s.

top

### str/truncate

```
(str/truncate s maxlen marker mode*)
```

Truncates a string to the max length maxlen and adds the marker if the string needs to be truncated. The marker is added to the start, middle, or end of the string depending on the mode :start, :middle, :end. The mode defaults to :end

```
(str/truncate "abcdefghij" 20 "...")
=> "abcdefghij"

(str/truncate "abcdefghij" 9 "...")
=> "abcdef..."

(str/truncate "abcdefghij" 4 "...")
=> "a..."
```

```
(str/truncate "abcdefghij" 7 "..." :start)
=> "...ghij"

(str/truncate "abcdefghij" 7 "..." :middle)
=> "ab...ij"

(str/truncate "abcdefghij" 7 "..." :end)
=> "abcd..."
```

### str/upper-case

```
(str/upper-case s)
(str/upper-case locale s)
```

Converts s to uppercase.

Since case mappings are not always 1:1 character mappings when a locale is given, the resulting string may be a different length than the original!

```
(str/upper-case "aBcDeF")
=> "ABCDEF"

(str/upper-case #\a)
=> #\A

(str/upper-case (. :java.util.Locale :new "de" "DE") "aBcDeF")
=> "ABCDEF"

(str/upper-case (. :java.util.Locale :GERMANY) "aBcDeF")
=> "ABCDEF"

(str/upper-case (. :java.util.Locale :new "de" "CH") "aBcDeF")
=> "ABCDEF"

(str/upper-case [ "de"] "aBcDeF")
=> "ABCDEF"

(str/upper-case [ "de" "DE"] "aBcDeF")
=> "ABCDEF"

(str/upper-case [ "de" "DE"] "aBcDeF")
=> "ABCDEF"
```

SEE ALSO

str/lower-case

Converts s to lowercase.

ton

# str/upper-case?

```
(str/upper-case? s)

True if s is a char and the char is an upper case char.

Defined by Java Character.isUpperCase(ch).

(str/upper-case? #\x)
=> false

(str/upper-case? #\X)
=> true

(str/upper-case? #\8)
=> false
```

```
str/valid-email-addr?

(str/valid-email-addr? e)

Returns true if e is a valid email address according to RFC5322, else returns false

(str/valid-email-addr? "user@domain.com")
=> true

(str/valid-email-addr? "user@domain.co.in")
=> true

(str/valid-email-addr? "user.name@domain.com")
=> true

(str/valid-email-addr? "user_name@domain.com")
=> true

(str/valid-email-addr? "user_name@domain.com")
=> true
```

```
str/whitespace?

(str/whitespace? s)

True if s is char and the char is a whitespace.
Defined by Java Character.isWhitespace(ch).

(str/whitespace? #\space)
=> true
```

```
str/wrap
```

```
(str/wrap text & options)
Wraps ascii text to lines with a length of maxlen characters .
:maxlen n
            the max len of line (default 80)
            controls the line wrap
:line-wrap
{:
anywhere,
:break-
word}
(-> (str/lorem-ipsum :paragraphs 1)
    (str/wrap :maxlen 80 :line-wrap :break-word))
=> "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Praesent ac iaculis\nturpis. Duis dictum id sem et
consectetur. Nullam lobortis, libero non consequat\naliquet, lectus diam fringilla velit, finibus eleifend
ipsum urna at lacus.\nPhasellus sit amet nisl fringilla, cursus est in, mollis lacus. Proin dignissim\nrhoncus
dolor. Cras tellus odio, elementum sed erat sit amet, euismod tincidunt\nnisl. In hac habitasse platea

commodo vulputate.\nAenean et ultrices lorem, placerat pretium augue. In hac habitasse platea\ndictumst. Cras
fringilla ligula quis interdum hendrerit. Etiam at massa tempor,\nfacilisis lacus placerat, congue erat."
```

string-array

```
(string-array coll)
(string-array len)
(string-array len init-val)
```

Returns an array of Java strings containing the contents of coll or returns an array with the given length and optional init value

tor

# string?

(string? x)

Returns true if x is a string

```
(string? "abc")
=> true

(string? 1)
=> false

(string? nil)
=> false
```

```
Sublist

(sublist l start) (sublist l start end)

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

sublist accepts a lazy-seq if both start and end is given.

(sublist '(1 2 3 4 5 6) 2)

=> (3 4 5 6)

(sublist '(1 2 3 4 5 6) 2 3)

=> (3)

(doall (sublist (lazy-seq 1 inc) 3 7))

=> (4 5 6 7)

SEE ALSO

subvec

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)
```

```
subset?

(subset? set1 set2)

Return true if set1 is a subset of set2

(subset? #{2 3} #{1 2 3 4})
=> true

(subset? #{2 5} #{1 2 3 4})
=> false

SEE ALSO

set
Creates a new set containing the items.
superset?
Return true if set1 is a superset of set2
```

union

Return a set that is the union of the input sets

#### difference

Return a set that is the first set without elements of the remaining sets

#### intersection

sublist

Return a set that is the intersection of the input sets

Subvec

(subvec v start) (subvec v start end)

Returns a vector of the items in vector from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count vector)

(subvec [1 2 3 4 5 6] 2)

=> [3 4 5 6]

(subvec [1 2 3 4 5 6] 2 3)

=> [3]

SEE ALSO

Supers

(supers class)

Returns the immediate and indirect superclasses and interfaces of class, if any.

(supers :java.util.ArrayList)
=> (:java.util.AbstractList :java.util.AbstractCollection :java.util.List :java.util.Collection :java.lang.
Iterable)

Returns a list of the items in list from start (inclusive) to end (exclusive). If end is not supplied, defaults to (count list).

Superset?

(superset? set1 set2)

Return true if set1 is a superset of set2

(superset? #{1 2 3 4} #{2 3} )
=> true

(superset? #{1 2 3 4} #{2 5})
=> false

```
set
Creates a new set containing the items.
subset?
Return true if set1 is a subset of set2
union
Return a set that is the union of the input sets
difference
Return a set that is the first set without elements of the remaining sets
intersection
Return a set that is the intersection of the input sets
```

```
supertype

(supertype x)

Returns the super type of x.

(supertype 5)
=> :core/number

(supertype [1 2])
=> :core/sequence

(supertype (. :java.math.BigInteger :valueOf 100))
=> :java.lang.Number

SEE ALSO

type
Returns the type of x.
supertypes
Returns the super types of x.
instance-of?
Returns true if x is an instance of the given type
```

```
supertypes

(supertypes x)

Returns the super types of x.

(supertypes 5)
=> (:core/number :core/val)

(supertypes [1 2])
=> (:core/sequence :core/collection :core/val)
```

```
(supertypes (. :java.math.BigInteger :valueOf 100))
=> (:java.lang.Number :java.lang.Object)

SEE ALSO

type
Returns the type of x.

supertype
Returns the super type of x.

instance-of?
Returns true if x is an instance of the given type
```

### swap!

```
(swap! box f & args)
```

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args) . Note that f may be called multiple times, and thus should be free of side effects. Returns the value that was swapped in.

```
(do
   (def counter (atom ⊙))
   (swap! counter inc))
=> 1
(do
   (def counter (atom ⊙))
   (swap! counter inc)
   (swap! counter + 1)
   (swap! counter #(inc %))
   (swap! counter (fn [x] (inc x)))
   @counter)
=> 4
(do
   (def fruits (atom ()))
   (swap! fruits conj :apple)
   (swap! fruits conj :mango)
   @fruits)
=> (:apple :mango)
   (def counter (volatile 0))
   (swap! counter (partial + 6))
   @counter)
=> 6
```

### SEE ALSO

#### swap-vals!

A to mically swaps the value of an atom to be: (apply f current-value-of-atom args). Note that f may be called multiple times, and thus ...

#### reset

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

### compare-and-set!

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

#### atom

Creates an atom with the initial value x.

#### volatile

Creates a volatile with the initial value x

top

# swap-vals!

```
(swap-vals! atom f & args)
```

Atomically swaps the value of an atom to be: (apply f current-value-of-atom args). Note that f may be called multiple times, and thus should be free of side effects. Returns [old new], the value of the atom before and after the swap.

```
(do
   (def queue (atom '(1 2 3)))
   (swap-vals! queue pop))
=> [(1 2 3) (2 3)]
```

#### **SEE ALSO**

#### swap!

Atomically swaps the value of an atom or a volatile to be: (apply f current-value-of-box args). Note that f may be called multiple ...

#### reset

Sets the value of an atom or a volatile to newval without regard for the current value. Returns newval.

#### compare-and-set!

Atomically sets the value of atom to newval if and only if the current value of the atom is identical to oldval. Returns true if set ...

#### atom

Creates an atom with the initial value x.

#### volatile

Creates a volatile with the initial value x

top

# symbol

```
(symbol name)
(symbol ns name)
```

Returns a symbol from the given name

```
(symbol "a")
=> a

(symbol "foo" "a")
=> foo/a

(symbol *ns* "a")
=> user/a
```

```
(symbol 'a) => a
```

```
symbol? (symbol? x)
```

Returns true if x is a symbol

```
(symbol? 'a)
=> true

(symbol? (symbol "a"))
=> true

(symbol? nil)
=> false

(symbol? :a)
=> false
```

system-env

```
(system-env)
(system-env name)
(system-env name default-val)
```

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

Without arguments returns all system env variables authorized by the configured sandbox.

```
(system-env :SHELL)
=> "/bin/zsh"

(system-env :F00 "test")
=> "test"

(system-env "SHELL")
=> "/bin/zsh"
```

SEE ALSO

system-prop

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

top

```
(system-exit-code code)
```

Defines the exit code that is used if the Java VM exits. Defaults to 0.

Note:

The exit code is only used when the Venice launcher has been used to run a script file, a command line script, a Venice app archive, or the REPL.

```
(system-exit-code ⊙)
```

top

### system-prop

```
(system-prop)
(system-prop name)
(system-prop name default-val)
```

Returns the system property with the given name. Returns the default-val if the property does not exist or it's value is nil.

Without arguments returns all system properties authorized by the configured sandbox.

```
(system-prop :os.name)
=> "Mac OS X"

(system-prop :foo.org "abc")
=> "abc"

(system-prop "os.name")
=> "Mac OS X"
```

#### **SEE ALSO**

system-env

Returns the system env variable with the given name. Returns the default-val if the variable does not exist or it's value is nil.

top

# tail-pos

```
(tail-pos)
(tail-pos name)
```

Throws a NotlnTailPositionException if the expr is not in tail position otherwise returns nil.

Definition:

The tail position is a position which an expression would return a value from. There are no more forms evaluated after the form in the tail position is evaluated.

```
;; in tail position
(do 1 (tail-pos))
=> nil

;; not in tail position
(do (tail-pos) 1)
=> NotInTailPositionException: Not in tail position
```

### take

```
(take n coll)
```

Returns a collection of the first n items in coll, or all items if there are fewer than n.

Returns a stateful transducer when no collection is provided. Returns a lazy sequence if coll is a lazy sequence.

```
(take 3 [1 2 3 4 5])
=> [1 2 3]

(take 10 [1 2 3 4 5])
=> [1 2 3 4 5]

(doall (take 4 (repeat 3)))
=> (3 3 3 3)

(doall (take 10 (cycle (range 0 3))))
=> (0 1 2 0 1 2 0 1 2 0)
```

top

### take!

```
(take! queue)
```

Retrieves and removes the head value of the queue, waiting if necessary until a value becomes available.

```
(let [q (queue)]
  (put! q 1)
  (take! q)
  q)
=> ()
```

#### **SEE ALSO**

#### aueue

Creates a new mutable threadsafe bounded or unbounded queue.

#### put!

Puts an item to a queue. The operation is synchronous, it waits indefinitely until the value can be placed on the queue. Returns always nil.

#### offer

 $Offers \ an \ item \ to \ a \ queue \ with \ an \ optional \ timeout \ in \ milliseconds. \ If \ a \ timeout \ is \ given \ waits \ up \ to \ the \ specified \ wait \ time \ if \ necessary \ ...$ 

#### poll

Polls an item from a queue with an optional timeout in milliseconds. For an indefinite timeout pass the timeout value :indefinite.

#### peek

For a list, same as first, for a vector, same as last, for a stack the top element (or nil if the stack is empty), for a queue the  $\dots$ 

#### empty?

Returns true if x is empty. Accepts strings, collections and bytebufs.

#### count

Returns the number of items in the collection. (count nil) returns 0. Also works on strings, and Java Collections

```
take-last

(take-last n coll)

Return a sequence of the last n items in coll.

Returns a stateful transducer when no collection is provided.

(take-last 3 [1 2 3 4 5])

=> [3 4 5]

(take-last 10 [1 2 3 4 5])

=> [1 2 3 4 5]
```

```
take-while

(take-while predicate coll)

Returns a list of successive items from coll while (predicate item) returns logical true.

Returns a transducer when no collection is provided.
```

```
(take-while neg? [-2 -1 0 1 2 3])
=> [-2 -1]
```

## test/deftest

(deftest name & body)

Defines a test function with no arguments.

All assertion macros are available for test assertions within the test function body:

- assert
- assert-false
- assert-eq
- assert-ne
- assert-throws
- assert-does-not-throw
- assert-throws-with-msg

It's recommended to use dedicated test namespaces for the tests and to group tests by namespaces.

Note: Actually, the test body goes in the :test metadata on the var, and the real function (the value of the var) calls test-var on itself.

```
(do
  (load-module :test)
```

```
(ns foo-test)
  (test/deftest add-test []
    (assert-eq 0 (+ 0 0))
    (assert-eq 3 (+ 1 2)))
  (test/deftest mul-test []
    (assert-eq 6 (* 2 3)))
  (ns bar)
  (test/run-tests 'foo-test))
Testing namespace 'foo-test
PASS foo-test/add-test
PASS foo-test/mul-test
Ran 2 tests with 3 assertions
0 failures, 0 errors.
=> {:assert 3 :error 0 :pass 2 :test 2 :type :summary :fail 0}
;; Explicit setup/teardown
(do
  (ns foo-test)
  (load-module :test)
  (test/deftest sum-test []
    (let [f (io/temp-file "test-", ".txt")]
        (io/spit f "1234" :append true)
        (assert-eq "1234" (io/slurp f :binary false))
        (finally
          (io/delete-file f)))))
  (test/run-tests *ns*))
Testing namespace 'foo-test
PASS foo-test/sum-test
Ran 1 tests with 1 assertions
0 failures, 0 errors.
=> {:assert 1 :error 0 :pass 1 :test 1 :type :summary :fail 0}
```

#### **SEE ALSO**

### test/run-tests

Runs all tests in the given namespaces; prints results. The tests are run grouped the namespace.

#### test/run-test-var

Runs a single test; prints results. Returns a map summarizing the test results.

#### test/use-fixtures

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different ...

#### test/successful?

Returns true if the given test summary indicates all tests were successful, false otherwise.

#### assert

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical true.

#### assert-false

Evaluates expr and throws an :AssertionException exception if it does not evaluate to logical false.

#### assert-ec

Assert that expected and actual are equal. Throws an :AssertionException exception if they are not equal.

#### assert-ne

Assert that unexpected and actual are not equal. Throws an :AssertionException exception if they are equal.

#### assert-throws

Evaluates expr and throws an :AssertionException exception if it does not throw the expected exception of type ex-type.

#### assert-does-not-throw

Evaluates expr and throws an :AssertionException exception if it does throw any kind of exception.

top

### test/run-test-var

```
(run-test-var v)
```

Runs a single test; prints results. Returns a map summarizing the test results.

```
(do
  (ns foo-test)
  (load-module :test)

  (test/deftest plus-test []
       (assert-eq 3 (+ 1 2)))

  (test/run-test-var plus-test))

Testing namespace 'foo-test

#### test/run-test-var

Runs a single test; prints results. Returns a map summarizing the test results.

### test/use-fixtures

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different ...

top

# test/use-fixtures

```
(use-fixtures ns fixture-type & fixture-fns)
```

Wrap test runs in a fixture function to perform setup and teardown. Fixtures are always bound to a namespace, hence tests from different namespaces have different fixtures.

A fixture of type :each is called before and after each test in the fixture's namespace.

A fixture of type : once is called before the first and after the last test in the fixture's namespace serving as an initial setup and final teardown.

To pass a value from a fixture to the tests dynamic vars can be used. See the 3rd example below.

```
;; Fixtures :each
;; Adds logic for a setup and teardown method that will be called
;; before and after each test
  (load-module :test)
  (defn each-time-setup []
   (println "FIXTURE each time setup"))
  (defn each-time-teardown []
    (println "FIXTURE each time teardown"))
  (defn each-fixture [f]
    (each-time-setup)
    (try
      (f)
      (finally (each-time-teardown))))
  ;; register as an each-time callback
  (test/use-fixtures *ns* :each each-fixture)
  (test/deftest add-test []
   (assert-eq 3 (+ 1 2)))
  (test/deftest sub-test []
    (assert-eq 3 (- 4 1)))
  (test/run-tests *ns*))
Testing namespace 'user
FIXTURE each time setup
PASS user/add-test
```

```
FIXTURE each time teardown
FIXTURE each time setup
PASS user/sub-test
FIXTURE each time teardown
Ran 2 tests with 2 assertions
0 failures, 0 errors.
=> {:assert 2 :error 0 :pass 2 :test 2 :type :summary :fail 0}
;; Fixtures :once
;; Adds logic for a setup and teardown method that will be called
;; before the first and after the last test as an initial setup
;; and final teardown
(do
  (load-module :test)
  (defn one-time-setup []
    (println "FIXTURE one time setup"))
  (defn one-time-teardown []
    (println "FIXTURE one time teardown"))
  (defn one-fixture [f]
    (one-time-setup)
    (try
      (f)
      (finally (one-time-teardown))))
  ;; register as a one-time callback

# thread

```
(thread f)
(thread f name)
```

Executes the function f in another thread, returning immediately to the calling thread. Returns a promise which will receive the result of calling the function f when completed. Optionally a name can be assigned to the spawned thread.

*Note:* Each call to thread creates a new expensive system thread. Consider to use futures or promises that use an *ExecutorService* to deal efficiently with threads.

```
@(thread #(do (sleep 100) 1))
=> 1
@(thread #(do (sleep 100) (thread-name)))
=> "venice-thread-3"
@(thread #(do (sleep 100) (thread-name)) "job")
=> "job-1"
;; consumer / producer
  (defn produce [q]
    (doseq [x (range 4)] (put! q x) (sleep 100))
    (put! q nil))
  (defn consume [q]
    (transduce (map println) (constantly nil) q))
  (let [q (queue 10)]
    (thread #(produce q))
    @(thread #(consume q))))
0
1
2
3
=> nil
```

# **SEE ALSO**

# future

Takes a function without arguments and yields a future object that will invoke the function in another thread, and will cache the result ...

# promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

# agen

Creates and returns an agent with an initial value of state and zero or more options.

top

# thread-daemon?

```
(thread-daemon?)
```

Returns true if this Thread is a daemon thread else false.

```
(thread-daemon?)
=> false
```

#### thread-name

Returns this thread's name.

top

# thread-id

(thread-id)

Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is unique and remains unchanged during its lifetime. When a thread is terminated, this thread ID may be reused.

(thread-id)

=> 1

**SEE ALSO** 

thread-name

Returns this thread's name.

top

# thread-interrupted

(thread-interrupted)

Tests whether the current thread has been interrupted. The interrupted status of the thread is cleared by this method. In other words, if this method were to be called twice in succession, the second call would return false (unless the current thread were interrupted again, after the first call had cleared its interrupted status and before the second call had examined it).

Returns true if the current thread has been interrupted else false.

(thread-interrupted)

=> false

**SEE ALSO** 

thread-interrupted?

Tests whether this thread has been interrupted. The interrupted status of the thread is unaffected by this method. Returns true if ...

Returns a snaphost of the thread local vars as a map.

Note

The returned map is a copy of the current thread local vars. Thus modifying this map is not modifying the thread local vars! Use assoc! and dissoc! for that purpose!

```
(do
  (thread-local-clear)
  (thread-local :a 1 :b 2)
   (thread-local-map))
=> {:a 1 :b 2 :*assertions* (0)}
```

**SEE ALSO** 

thread-local

Creates a new thread-local accessor

get

Returns the value mapped to key, not-found or nil if key not present.

assoc!

Associates key/vals with a mutable map, returns the map

dissoc

Dissociates keys from a mutable map, returns the map

top

# thread-local?

(thread-local? x)

Returns true if x is a thread-local, otherwise false

```
(do
    (def x (thread-local))
    (thread-local? x))
=> true

SEE ALSO
thread-local
Creates a new thread-local accessor
```

```
thread-name

(thread-name)

Returns this thread's name.

(thread-name)
=> "main"

SEE ALSO
thread-id
Returns the identifier of this Thread. The thread ID is a positive number generated when this thread was created. The thread ID is ...
```

```
throw
(throw)
(throw val)
(throw ex)
Throws an exception.
(throw)
Throws a :ValueException with nil as its value.
(throw val)
With val as a Venice value throws a :ValueException with val as its value.
E.g: (throw [1 2 3])
(throw ex)
With a ex as an exception type throws the exception.
E.g: (throw (ex :VncException "invalid data"))
(try
   (+ 100 200)
   (catch :Exception e
           "caught ~(ex-message e)"))
=> 300
```

(+ 100 200) (throw)

```
(catch :ValueException e
           "caught ~(pr-str (ex-value e))"))
=> "caught nil"
(try

```

# time/zoned-date-time-parse

```
(time/zoned-date-time-parse str format
(time/zoned-date-time-parse str format locale

Parses a zoned-date-time.
To parse a large number of dates a pre instantiated formatter delivers best performance:
    (let [fmt (time/formatter "yyyy-MM-dd'T'HH:mm:ssz")]
        (dotimes [n 100] (time/zoned-date-time-parse "2018-12-01T14:20:01+01:00" fmt)))

(time/zoned-date-time-parse "2018-08-01T14:20:01+01:00" "yyyy-MM-dd'T'HH:mm:ssz")
=> 2018-08-01T14:20:01+01:00

(time/zoned-date-time-parse "2018-08-01T14:20:01.000+01:00" "yyyy-MM-dd'T'HH:mm:ss.SSSz")
=> 2018-08-01T14:20:01+01:00
```

```
(time/zoned-date-time-parse "2018-08-01T14:20:01.000+01:00" :iso)
=> 2018-08-01T14:20:01+01:00

(time/zoned-date-time-parse "2018-08-01 14:20:01.000 +01:00" "yyyy-MM-dd' 'HH:mm:ss.SSS' 'z")
=> 2018-08-01T14:20:01+01:00
```

time/zoned-date-time?

(time/zoned-date-time? date)

Returns true if date is a zoned-date-time ('java.time.ZonedDateTime') else false

(time/zoned-date-time? (time/zoned-date-time))
=> true

# timeout-after

(timeout-after p time time-unit)

Returns a promise that timouts afer the specified time. The promise throws a TimeoutException.

```
(-> (promise (fn [] (sleep 100) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                   (fn [v] (println (pr-str v))))
    (deref))
"The quick brown fox"
=> nil
(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                   (fn [v] (println (pr-str v))))
    (deref))
=> TimeoutException: java.util.concurrent.TimeoutException
(-> (promise (fn [] (sleep 1000) "The quick brown fox"))
    (accept-either (timeout-after 500 :milliseconds)
                   (fn [v] (println (pr-str v))))
    (deref 2000 :timeout))
=> :timeout
(-> (promise (fn [] (sleep 200) "The quick brown fox"))
    (apply-to-either (timeout-after 100 :milliseconds)
                     identity)
=> TimeoutException: java.util.concurrent.TimeoutException
```

# **SEE ALSO**

# promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

then-accept

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

# then-accept-both

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

#### then-apply

Applies a function f on the result of the previous stage of the promise p.

#### then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

#### then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

# when-complete

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result ...

#### accept-either

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result ...

# apply-to-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

#### or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

# complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

timing/run

(timing/run f)
(timing/run f start-msg)

Runs a function f with printing the elapsed time. Returns the value that f has produced.

```
(timing/run #(sleep 500))
Elapsed: 505ms
=> nil

(timing/run #(sleep 500) "Sleeping...")
Sleeping...
Elapsed: 505ms
=> nil
```

top

top

# trampoline

```
(trampoline f)
(trampoline f & args)
```

trampoline can be used to convert algorithms requiring mutual recursion without stack consumption. Calls f with supplied args, if any. If f returns a fn, calls that fn with no arguments, and continues to repeat, until the return value is not a fn, then returns that non-fn value.

Note that if you want to return a fn as a final value, you must wrap it in some data structure and unpack it after trampoline returns.

ton

# transduce

```
(transduce xform f coll)
(transduce xform f init coll)
```

Reduce with a transformation of a reduction function f (xf). If init is not supplied, (f) will be called to produce it. f should be a reducing step function that accepts both 1 and 2 arguments. Returns the result of applying (the transformed) xf to init and the first item in coll, then applying xf to that result and the 2nd item, etc. If coll contains no items, returns init and f is not called.

transduce can work with queues as collection, given that the end of the queue is marked by addding a <code>nil</code> element. Otherwise the transducer does not not when to stop reading elements from the queue.

```
Transformations
                    Reductions
                                     Control

```

(try expr\*)
(try expr\* (catch selector ex-sym expr\*)\*)
(try expr\* (catch selector ex-sym expr\*)\* (finally expr\*))

Exception handling: try - catch - finally
 (try) without any expression returns nil.

top

- The exception types
  - :java.lang.RuntimeException

• :java.lang.Exception

- :com.github.jlangch.venice.VncException
- :com.github.jlangch.venice.ValueException

are imported implicitly so its alias :Exception, :RuntimeException, :VncException, and :ValueException can be used as selector without an import of the class.

## Selectors

- a class: (e.g., :RuntimeException, :java.text.ParseException), matches any instance of that class
- a key-values vector: (e.g., [key val & kvs]), matches any instance of :ValueException where the exception's value meets the expression (and (= (get ex-value key) val) ...)
- a predicate: (a function of one argument like map?, set?), matches any instance of :ValueException where the predicate applied to the exception's value returns true

#### Notes:

The finally block is just for side effects, like closing resources. It never returns a value!

All exceptions in Venice are *unchecked*. If *checked* exceptions are thrown in Venice they are immediately wrapped in a :RuntimeException before being thrown! If Venice catches a *checked* exception from a Java interop call it wraps it in a :RuntimeException before handling it by the catch block selectors.

Venice follows the Java rules when propagating exceptions:

- 1. exception from finally block
- 2. exception from catch block
- 3. exception from body block

```
(try
   (throw "test")

SEE ALSO
try-with
try-with-resources allows the declaration of resources to be used in a try block with the assurance that the resources will be closed ...
Throws an exception.
Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception
```

try-acquire

(try-acquire lock)
(try-acquired lock timeout time-unit)

 $Acquires\ a\ lock\ within\ the\ given\ timeout\ time.\ Without\ a\ timeout\ returns\ immediately\ if\ the\ lock\ is\ not\ available.$ 

```
(let [l (lock)]
  (when (try-acquire l)
    ;; do something
        (release l)))
=> nil

(let [l (lock)]
    (when (try-acquire l 3 :seconds)
        ;; do something
        (release l)))
=> nil
```

# **SEE ALSO**

## lock

Creates a new lock object.

#### acquire

Acquires a lock, blocking until the lock is available.

#### release

Releases a lock.

# locked?

Returns true if the lock is in use else false.

top

# try-with

```
(try-with [bindings*] expr*)
(try-with [bindings*] expr* (catch selector ex-sym expr*)*)
(try-with [bindings*] expr* (catch selector ex-sym expr*)* (finally expr))
```

*try-with-resources* allows the declaration of resources to be used in a try block with the assurance that the resources will be closed after execution of that block. The resources declared must implement the Closeable or AutoCloseable interface.

Venice follows the Java rules when propagating exceptions:

- 1. exception from finally block
- 2. exception from catch block
- 3. exception from body block
- 4. exception from resource auto-close

```
(do
  (let [file (io/temp-file "test-", ".txt")]
    (io/spit file "123456789" :append true)
    (try-with [is (io/file-in-stream file)]
        (io/slurp-stream is :binary false))))
=> "123456789"
```

# **SEE ALSO**

# trv

Exception handling: try - catch - finally

# throw

Throws an exception.

ex

Creates an exception of type class with optional args. The class must be a subclass of :java.lang.Exception

```
type
(type x)
Returns the type of x.
(type 5)
=> :core/long
(type [1 2])
=> :core/vector
(type (. :java.math.BigInteger :valueOf 100))
=> :java.math.BigInteger
SEE ALSO
supertype
Returns the super type of x.
supertypes
Returns the super types of x.
instance-of?
Returns true if x is an instance of the given type
```

# union

```
(union s1)
(union s1 s2)
(union s1 s2 & sets)
```

Return a set that is the union of the input sets

```
(union (set 1 2 3))
=> #{1 2 3}

(union (set 1 2) (set 2 3))
=> #{1 2 3}

(union (set 1 2 3) (set 1 2) (set 1 4) (set 3))
=> #{1 2 3 4}
```

# **SEE ALSO**

# difference

Return a set that is the first set without elements of the remaining sets

intersection

Return a set that is the intersection of the input sets

#### cons

Returns a new collection where x is the first element and coll is the rest.

#### con

Returns a new collection with the x, xs 'added'. (conj nil item) returns (item) and (conj item) returns item.

# disj

Returns a new set with the x, xs removed.

top

# update

```
(update m k f)
(update m k f & fargs)
```

Updates a value in an associative structure, where k is a key and f is a function that will take the old value and any supplied fargs and return the new value. Returns a new structure.

If the key does not exist, nil is passed as the old value. The optional fargs are passed to the function f as (f old-value (f old-value arg1 arg2 ...) ...).

```
(update [] 0 (fn [x] 5))
=> [5]
(update [0 1 2] 0 (fn [x] 5))
=> [5 1 2]
(update [0 1 2] 1 (fn [x] (+ x 3)))
=> [0 4 2]
(update {} :a (fn [x] 5))
=> {:a 5}
(update {:a 0} :b (fn [x] 5))
=> {:a 0 :b 5}
(update {:a 0 :b 1} :a (fn [x] (+ x 5)))
=> {:a 5 :b 1}
(update [0 1 2] 1 + 3)
=> [0 4 2]
(update {:a 0 :b 1} :b * 4)
=> {:a 0 :b 4}
```

# **SEE ALSO**

# assoc

When applied to a map, returns a new map of the same type, that contains the mapping of key(s) to val(s). When applied to a vector,  $\dots$ 

# dissoc

Returns a new coll of the same type, that does not contain a mapping for key(s)

# update!

```
(update! m k f & fargs)
```

Updates a value in a mutable associative structure, where k is a key and f is a function that will take the old value and any supplied fargs and return the new value. Returns a new structure.

If the key does not exist, nil is passed as the old value. The optional fargs are passed to the function f as (f old-value arg1 arg2 ...).

```
(update! (mutable-vector) 0 (fn [x] 5))
=> [5]

(update! (mutable-vector 0 1 2) 0 (fn [x] 5))
=> [5 1 2]

(update! (mutable-vector 0 1 2) 0 (fn [x] (+ x 1)))
=> [1 1 2]

(update! (mutable-map) :a (fn [x] 5))
=> {:a 5}

(update! (mutable-map :a 0) :b (fn [x] 5))
=> {:a 0 :b 5}

(update! (mutable-map :a 0 :b 1) :a (fn [x] 5))
=> {:a 5 :b 1}

(update! (mutable-wector 0 1 2) 0 + 4)
=> [4 1 2]

(update! (mutable-map :a 0 :b 1) :b * 4)
=> [3 0 :b 4]
```

# **SEE ALSO**

# assoc!

Associates key/vals with a mutable map, returns the map

# dissoc!

Dissociates keys from a mutable map, returns the map

tor

# update-in

```
(update-in [m ks f & fargs])
```

Updates' a value in a nested associative structure, where ks is a sequence of keys and f is a function that will take the old value and any supplied fargs and return the new value, and returns a new nested structure.

If any levels do not exist, hash-maps will be reated.

```
(do
  (def users [ {:name "James" :age 26})
```

```
{:name "John" :age 43} ])

(update-in users [1 :age] inc))

=> [{:name "James" :age 26} {:name "John" :age 44}]

(update-in {:a 12} [:a] * 4)

=> {:a 48}

(update-in {:a 12} [:a] + 3 4)

=> {:a 19}
```

```
used-memory

(used-memory)

Returns the currently used memory by the Java VM.

(used-memory)
=> "151.5MB"

SEE ALSO

total-memory
Returns the total amount of memory available to the Java VM.
```

# USEr-name (user-name) Returns the logged-in's user name. (user-name) => "juerg" SEE ALSO io/user-home-dir Returns the user's home dir as a java.io.File.

uuid

(uuid)

Generates a UUID.

(uuid)

=> "ff9f62e7-6a49-474c-88f1-9c7db419f17a"

top

# val

```
(val e)
```

Returns the val of the map entry.

```
(val (find {:a 1 :b 2} :b))
=> 2

(val (first (entries {:a 1 :b 2 :c 3})))
=> 1
```

# **SEE ALSO**

#### man

Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the ...

# entries

Returns a collection of the map's entries.

#### kev

Returns the key of the map entry.

## vals

Returns a collection of the map's values.

top

# vals

```
(vals map)
```

Returns a collection of the map's values.

Please note that the functions 'keys' and 'vals' applied to the same map are not guaranteed not return the keys and vals in the same order!

To achieve this, keys and vals can calculated based on the map's entry list:

```
(let [e (entries {:a 1 :b 2 :c 3})]
  (println (map key e))
  (println (map val e)))
```

```
(vals {:a 1 :b 2 :c 3})
=> (1 2 3)
```

# SEE ALSO

# keys

Returns a collection of the map's keys.

# entries

Returns a collection of the map's entries.

# map

Applys f to the set of first items of each coll, followed by applying f to the set of second items in each coll, until any one of the  $\dots$ 

# var-get

```
(var-get v)
```

Returns a var's value.

The var must exist (bound with a value) otherwise nil is returned.

```
(var-get +)
=> +

(var-get '+)
=> +

(var-get (symbol "+"))
=> +

# when

(when test & body)

Evaluates test. If logical true, evaluates body in an implicit do.

```
(when (== 1 1) true)
=> true
```

# **SEE ALSO**

# when-not

Evaluates test. If logical false, evaluates body in an implicit do.

# when-let

bindings is a vector with 2 elements: binding-form test.

## if

Evaluates test. If logical true, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

#### if-not

Evaluates test. If logical false, evaluates and returns then expression, otherwise else expression, if supplied, else nil.

#### if-let

bindings is a vector with 2 elements: binding-form test.

top

# when-complete

```
(when-complete p f)
```

Returns the promise p with the same result or exception at this stage, that executes the action f. Passes the current stage's result value as first and a possible exception as second argument to the function. The asynchronous function f is called presumably for handling side effects.

```
(-> (promise (fn [] "The Quick Brown Fox"))
        (then-apply str/upper-case)
        (when-complete (fn [v,e] (println (pr-str {:value v :ex e}))))
        (then-apply str/lower-case)
        (deref))
{:value "THE QUICK BROWN FOX" :ex nil}
=> "the quick brown fox"
```

# **SEE ALSO**

## promise

Returns a promise object that can be read with deref, and set, once only, with deliver. Calls to deref prior to delivery will block, ...

# then-accept

Returns a new promise that, when this promise completes normally, is executing the function f with this stage's result as the argument.

# then-accept-both

Returns a new promise that, when either this or the other given promise completes normally, is executing the function f with the two ...

# then-apply

Applies a function f on the result of the previous stage of the promise p.

# then-combine

Applies a function f to the result of the previous stage of promise p and the result of another promise p-other

# then-compose

Composes the result of two promises. f receives the result of the first promise p and returns a new promise that composes that value ...

# accept-either

Returns a new promise that, when either this or the other given promise completess normally, is executed with the corresponding result ...

# apply-to-either

Returns a new promise that, when either this or the other given promise completes normally, is executed with the corresponding result ...

# or-timeout

Exceptionally completes the promise with a TimeoutException if not otherwise completed before the given timeout.

# complete-on-timeout

Completes the promise with the given value if not otherwise completed before the given timeout.

top

# when-let

```
(when-let bindings & body)
bindings is a vector with 2 elements: binding-form test.
If test is true, evaluates the body expressions with binding-form bound to the value of test, if not, yields nil

(when-let [value (* 100 2)]
  (str "The expression is true. value=" value))
=> "The expression is true. value=200"

SEE ALSO

if-let
bindings is a vector with 2 elements: binding-form test.
let
Evaluates the expressions and binds the values to symbols in the new local context.
```

```
when-not

(when-not test & body)

Evaluates test. If logical false, evaluates body in an implicit do.

(when-not (== 1 2) true)
=> true

SEE ALSO

when
Evaluates test. If logical true, evaluates body in an implicit do.

when-let bindings is a vector with 2 elements: binding-form test.

```
while

(while test & body)

Repeatedly executes body while test expression is true. Presumes some side-effect will cause test to become false/nil. Returns nil.

(do
    (def a (atom 5))
    (while (pos? @a)
        (println @a)
```

```
(swap! a dec)))

5

4

3

2

1
=> nil
```

top

# with-err-str

```
(with-err-str & forms)
```

Evaluates exprs in a context in which \*err\* is bound to a capturing output stream. Returns the string created by any nested printing calls. with-err-str can be nested.

```
(with-err-str (println *err* "a string"))
=> "a string\n"
```

# **SEE ALSO**

# with-out-str

Evaluates exprs in a context in which \*out\* is bound to a capturing output stream. Returns the string created by any nested printing ...

top

# with-meta

```
(with-meta obj m)
```

Returns a copy of the object obj, with a map m as its metadata.

```
(meta (with-meta [1 2] {:foo 3}))
=> {:foo 3}
```

# **SEE ALSO**

# meta

Returns the metadata of obj, returns nil if there is no metadata. \\

# vary-meta

Returns a copy of the object obj, with (apply f (meta obj) args) as its metadata.

# var-val-meta

Returns the var's value meta data.

# var-sym-meta

Returns the var's symbol meta data.

ton

# with-out-str

(with-out-str & forms)

Evaluates exprs in a context in which \*out\* is bound to a capturing output stream. Returns the string created by any nested printing calls. with-out-str can be nested.

```
(with-out-str (println "a string"))
=> "a string\n"
```

# **SEE ALSO**

## with-err-str

Evaluates exprs in a context in which \*err\* is bound to a capturing output stream. Returns the string created by any nested printing ...

top

# with-sh-dir

(with-sh-dir dir & forms)

Sets the directory for use with sh, see sh for details.

```
(with-sh-dir "/tmp" (sh "ls" "-l"))
```

# **SEE ALSO**

# sh

Launches a new sub-process.

## with-sh-env

Sets the environment for use with sh.

# with-sh-throw

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

ton

# with-sh-env

(with-sh-env env & forms)

Sets the environment for use with sh.

(with-sh-env {"NAME" "foo"} (sh "ls" "-l"))

# SEE ALSO

# sh

Launches a new sub-process.

# with-sh-dir

Sets the directory for use with sh, see sh for details.

# with-sh-throw

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

# with-sh-throw

```
(with-sh-throw forms)
```

Shell commands executed within a with-sh-throw context throw an exception if the spawned shell process returns an exit code other than 0.

For use with sh, see sh for details. with-sh-throw can be nested.

```
(with-sh-throw (sh "ls" "-l"))
```

# **SEE ALSO**

sh

Launches a new sub-process.

# with-sh-env

Sets the environment for use with sh.

# with-sh-dir

Sets the directory for use with sh, see sh for details.

top

# xml/children

(xml/children nodes)

Returns the children of the XML nodes collection

```
(do
  (load-module :xml)
  (xml/children
     (list (xml/parse-str "<a><b>B</b></a>"))))
=> ({:content ["B"] :tag "b"})
```

top

# xml/parse

```
(xml/parse s)
(xml/parse s handler)
```

Parses and loads the XML from the source s with the parser XMLHandler handler. The source may be an InputSource or an InputStream.

Returns a tree of XML element maps with the keys :tag, :attrs, and :content.

top

# xml/parse-str

```
(xml/parse-str s)
(xml/parse-str s handler)
```

```
Parses an XML from the string s. Returns a tree of XML element maps with the keys :tag, :attrs, and :content.

(do
    (load-module :xml)
    (xml/parse-str "<a><b>B</b></a>"))

=> {:content [{:content ["B"] :tag "b"}] :tag "a"}
```

```
zero?

(zero? x)

Returns true if x zero else false

(zero? 0)
=> true
```

```
(zero? 2)
=> false

(zero? (int 0))
=> true

(zero? 0.0)
=> true

(zero? 0.0M)
=> true

SEE ALSO
neg?
Returns true if x smaller than zero else false
pos?
Returns true if x greater than zero else false
```

```
zipmap

(zipmap keys vals)

Returns a map with the keys mapped to the corresponding vals.

To create a list of tuples from two or more lists use
   (map list '(1 2 3) '(4 5 6)).

(zipmap [:a :b :c :d :e] [1 2 3 4 5])
=> {:a 1 :b 2 :c 3 :d 4 :e 5}

(zipmap [:a :b :c] [1 2 3 4 5])
=> {:a 1 :b 2 :c 3}
```

{}

Creates a hash map.

{:a 10 :b 20}
=> {:a 10 :b 20}
